PREFACE

A DISTINGUISHING feature of the modern world is that the only royal road to success is efficiency. The man who enters the race of life well prepared succeeds: he whose preparation has not been so thorough fails or is compelled to take the second place. Now two things are clear : the only real preparation is knowledge, and many have never had the opportunity to acquire a sufficiently wide knowledge. This book aims at providing this second class of people (which includes the vast majority of mankind) with the means of securing an all-round education. It aims, indeed, at being something of a fireside tutor who will teach an inquirer, quite simply, the outlines of a vast number of subjects, and will, moreover, give him practical help in pursuing his study as his inclination may direct. Anyone who has worked through this book and mastered its contents need feel little fear among almost any class of men. He may feel a reasonable assurance that he has the knowledge which only the most cultivated men possess.

And this suggests another use of the book. Even those who have had the advantages of a public school and university education are ignorant of many things which a really cultivated man should know. If they have taken classics they quite probably know little or nothing of science. If they have devoted their time to science they have shunned the classics. Even if they have graduated with honours in science they may know nothing of the sciences which lie all round those in which they have specialised. For such men this book will provide the opportunity of filling up many spaces in their mental equipment.

Special care has been given to the Courses of Reading. It is hoped that these will be really helpful: not mere catalogues of books, but reasoned and articulated courses such as a tutor might give to his pupils. The courses of reading alone will probably be welcomed by many who know the outlines of a subject but wish to have some specialist direction in pursuing their studies.

I. HISTORY

INTRODUCTION

A CHIEF interest of history lies in its imaginative appeal from the present to the past. Consciously or unconsciously in reading it we bring the story of things past to the touchstone of the things that are now. To the average man the selfish element in the study of history is very large, the eager desire to assess the contribution of lives dead and gone to the actuality of his own life now. This being so, it would seem advisable in a limited space to study more at large the things which have most largely and most obviously gone to create our environment, and so in this brief sketch especial attention is given to the history of England and English speaking people. But as national life and movement is vividly affected by the life of larger units it is treated in intimate relation to those larger movements which have affected it. And as any real history must be, in some sense, world history, so too in this study there can be no narrow limitation of time. The long ages in which prehistoric men were striving towards civilization had a very vital part in the making of modern England or America. The confused wanderings of primitive people in times and places remote from us had their share in the making of modern conditions. Only less vital than the tie of nationality is the romantic bond which binds branches of the same race to each other, and no modern historian may neglect the fascinating study of the contribution of the race to the story of the nation. He must bear in mind too the debt of nation to nation and race to race.

History has many sides, as many sides as there are aspects of civilization, and the historian may concern himself with any of these, the history of religion, of art, or of language, but as it was the grouping of men in society which made possible the growth of civilization, so it is primarily with politics in this larger sense that history is concerned.

EARLY MAN AND CIVILIZATION

The beginnings of man upon earth are wrapped in mystery. Modern criticism has shown that the old tradition which represented the first man and woman as living upon earth some 6000 years ago does not tally with the facts as they can be roughly deduced from the findings of modern science. The work of students of palæontology and prehistoric archæology has conclusively shown that for thousands of years, probably for at least a hundred thousand years, there have been men upon the earth, men little better than other animals at first but with an intelligence and potentiality of development which marked them off from these. In colloquial speech a distinction is made between savagery and civilization, but philosophically the savage state is a stage in civilization taken in the larger sense. Ethnologists have tabulated six clearly marked stages in the advance from bestiality to civilization proper. They are the Older, Middle, and Later Periods of Savagery, and the Older, Middle, and Later periods of Barbarism.

The first vital discovery made by men was the use of fire, a discovery like the use of tools and the employment of articulate speech made by man alone of all the animals. The discovery of the use of fire marks the end of the older period of savagery during which the power of articulate speech had also been developed. With the beginning of the Middle Period of Savagery men were now able to include flesh and fish among their foods, whilst before they must have lived on uncooked fruit and vegetables. Previously to this too men probably often slept in trees, for these were safer than the ground, but fire proved a valuable means of scaring away fierce animals by night, and so this habit was abandoned. Men could now leave the tropical regions to which they had probably been hitherto confined and travel into cooler climes, where their energies received more stimulation. The people who had the initiative to do this would advance more rapidly than the others, and hence would arise the differences between savage and civilized races. When the primitive natives of Australia were discovered a few gene-

rations ago they were still at this first stage, knowing the use of fire (as all men have done in historic times), but using the crudest weapons. For the character of the weapons used by men has developed on similar lines as men everywhere advanced in civilization, and some ethnologists mark the periods of development towards civilization by these. Hence we have the Rough Stone Age, the Age of Polished Stone, the Age of Bronze, and the Age of Iron. The great discovery of the use of the bow and arrow marked the Later Period of Savagery.

It was easy now to kill the quickest moving animals. Life became more secure and food and clothing more abundant. Men could now advance into even sub-Arctic regions. But they were still "savages." They rose to the status of "Barbarians" with the invention of pottery, and to a higher form of Barbarism with the domestication of animals in the East and the use of irrigation in the West.

Primitive men seem always to have been moving. Indeed the conditions of their lives would make this necessary. Later, when they began to breed sheep and cattle, they still moved from place to place to find new pasturage. This is known as the nomadic or pastoral stage. But with their arrival at especially fertile lands they sometimes settled down, bred fewer sheep, and used the land to grow more things. This is known as the agricultural stage. Life became then more complex, man's needs greater, and it was found easier to supply them by specialization of work and division of labour. The use of the camel and the horse made commerce possible. Cereals were carried from farther Asia and cultivated in the lands round the Mediterranean, and with this new source of food supply it became possible for large bodies of men to settle down in fairly elaborately organized political communities. In all such early communities there were a ruling class and a slave class, and at the head of all a king. To this period too belongs that most momentous development, the acquisition of private property, for previously all possessions had been communal.

The highest stage of Barbarism was reached when men discovered the art of smelting iron, an art which was to facilitate immensely the coming of civilization. It was the first new art not concerned primarily with the improvement of the food supply, though incidentally it served this purpose too. It helped man in the making of more powerful weapons to fight against beasts and other men and to work on other materials, such as wood and stone, for the building of houses and roads and walls. It helped too towards man's æsthetic satisfaction, which hitherto had been fed by drawings scratched on bone or ivory, or figures moulded from rough clay.

And now man was on the very brink of civilization in the narrower sense, the first stage of which is generally taken to coincide with the invention of writing, by which men could communicate their highest and best thoughts to their contemporaries, and one generation could hand on to another the record of its story. The first writing was of course hieroglyphic, but it was the symbolizing of events and the expression of ideas by the use of graphic signs which marked the transition from barbarism to civilization. The subsequent invention and general adoption of the Phœnician alphabet was but a minor change. It was then by these and numerous lesser inventions and discoveries that man reached the threshold of history proper.

Since then he has advanced wonderfully and subtly, but with Lewis H. Morgan, the great ethnologist, we may admit that the achievements of man in his barbaric days transcend, in relative importance, all his subsequent works.

The Egyptians.—The first records of continuous civilizations are of the Egyptians in the Valley of the Nile and the Akkadians or Sumerians round the Euphrates, for it was in the neighbourhood of great rivers like these that lasting communities first grew up. When both these peoples began to make records about 4000 years B.C. they were already highly civilized. The Egyptians belonged to the Hamitic race, the brown or red-brown, or yellow-skinned people, who inhabited the sub-tropical regions of the Eastern Hemisphere. In the hottest parts of that Hemisphere the people were black-skinned and black-haired and are called negroes, while the people who had spread over Europe and Asia have been called Mongolians, and to these the Akkadians belonged. It was after the establishment of the two great early civilizations that two new groups of people broke over Europe and Western Asia. They were both sometimes called Caucasian because they were, at one time, erroneously supposed to have come out of the region round the Caucasian mountains to the east of the Black Sea. One group is distinguished as Semitic, while the other is sometimes called Japhetic, both names taken like Hamitic, from the sons of Noah. The Japhetic group is better known as the Indo-European because it conquered India and Europe, and more commonly still, if less correctly, Aryan, because the Aryans were the first branch of the race to write down their records.

The Semites seem really to have had their origin in Arabia whence they spread over Western Asia, acting and reacting on the civilizations of both the Nile and Euphrates Valleys. The Aryans, on the other hand, did not touch on these for a long time, but great waves descended about 3000 years B.C. through Afghanistan into India, while others spread over Europe in successive inundations, the Celtic which rolled steadily forward into the British Isles and southward into Spain, the Hellenic and Italian which bore down upon the Greek and Italian peninsulas between 1500 and 1000 B.C. and rapidly became highly civilized peoples, the ruder Teutons who

spread over Germany and Scandinavia, and the Slavs who in the end won most of Eastern Europe for themselves.

The civilization of the Aryans, the great root stock of the nations of the West, must have a more compelling interest than those of ancient Egypt or Mesopotamia, as the land between the Tigris and Euphrates was called, but these for their antiquity and the debt which succeeding civilizations owe them are full of fascination too. Until half a century ago all knowledge about these ancient civilizations depended on the references to them in the Bible or on writings later than 500 B.C., but recently excavations of their sites on a vast scale have revealed in intimate detail the story of their development, confirming wonderfully the accuracy of the old authorities. The chief of these old authorities on the history of Egypt were Herodotus the Greek historian, who wrote in the fifth century B.C., and Manetho, an Egyptian, who at a somewhat later date based his account on the records of the Egyptain priests. The Egyptians measured time by their dynasties, of which the twenty-sixth ended with King Psammetichus in 664 B.C. The first ten dynasties are known as the Old Empire, the next seven as the Middle Empire, and the remainder as well as the last kings who are not reckoned as a dynasty belong to the New Empire. The eighteenth dynasty begins about 1580 B.C., a time which marks the driving out of a foreign race of kings, probably a Semitic dynasty under whose sway the Israelites had flourished in Egypt. The restoration of an Egyptain race of kings who "knew not Joseph" led to that policy of oppression which was successful in driving the Semites altogether out of Egypt.

It was the kings of the third and fourth dynasties who built the Pyramids at some time between 4000 and 3000 B.C. The Egyptians must at this time have had control over a vast amount of labour—slave labour—as in all ancient states. The evidence show too that they must have used metal tools, and they must have had a highly developed science of mathematics. But long before this age of the Pyramids the Egyptians were well on the way to civilization. Associated with the tombs of their kings are found stone tools of an advanced type.

The Civilization of Babylon.—It was probably about the year 1800 B.C. that the Semites of Arabia invaded Egypt, but long before this Semitic waves had flowed from that centre into Mesopotamia, so that the earliest records, at least as old as those of the Egyptian dynasties, show us a new Semitic and conquering race side by side with the Sumerian population.

Already the Sumerians were a civilized people and could write, for the "cuneiform" or arrow-shaped writing in which later the story of Assyria and Babylon was written was Sumerian in origin. The Semites, a more vigorous but less cultivated race, were probably quick to absorb the existing civilization.

About 2000 B.C. a second great Semitic wave rolled out of Arabia over Mesopotamia, and it was from this stock that Abraham, the father of the Hebrew people, came from Ur of the Chaldees into the land of Canaan. The Semitic invasion of Egypt was apparently part of the same movement. After this time communication between the two great centres became more frequent. The Egyptian civilization had developed quite independently, but as time went on the Babylonian culture dominated it, and in the second millennium B.C. the cuneiform writing and the language of Babylon had become the language of communication between the two centres and the lesser kingdoms neighbouring on Babylon.

Babylonia is the south-eastern part of Mesopotamia. The north-eastern part is Assyria, taking its name from its centre at Asshur, and also subdued by Semites. To the east of Assyria lay the non-Semitic kingdom of Elam. Shortly before Abraham went out from Ur to Canaan, Babylonia had dominated both of these under the first king of the "First Babylonian Dynasty," Sumu-abu. Fifth after him was Hammurabi, whose famous "Code" of laws is one of the landmarks of history. From it we glean what was the character of Babylonian civilization and the organization of its society with its three classes of nobles, freemen, and slaves. It shows that the civilization was of a very high type and the system of government extremely elaborate.

After the death of Hammurabi new kingdoms were set up in the neighbourhood of Babylonia and new peoples attacked Babylon. To the north of the Persian Gulf there arose a new "Kingdom of the Sea." The Hittites, a non-Semitic and non-Aryan people probably from Asia Minor, raided but did not conquer. Their attacks prepared the way for a real conquest by the Kassites, a barbarian people to the East. They succumbed to the Babylonian civilization. Soon afterwards a new Semitic invasion increased the importance of Assyria.

The eighteenth dynasty was now ruling in Egypt, and its history finds unique illustration in a great collection of tablets (discovered in 1888) known as the Tell-el-Amarna letters. They are letters to two Egypytian kings from the various rulers of these kingdoms of the East, the Kassite King of Babylon, the King of Assyria, two kings of Hittite kingdoms and others. This was just after the days of the great Egyptian King, Thotmes III, who had conquered Assyria. His successors gradually lost his conquests and Egypt fell back in the race for power. The Tell-el-Amarna letters show that at the end of the fifteenth century B.C. they had begun the policy of paying money to hostile peoples to avoid war. The documents are begging letters asking for more.

Decline of Egypt.—The great days of Egypt in Asia were over, but the period of decline is illuminated by the name of Amenhotep IV, or Akhenaten, who tried to turn the Egyptian worship of the Sun into a true adoration of One God, taking the Sun as His symbol. He was a voice calling in the wilderness, and after his death the old Egyptian orthodoxy prevailed.

The kings of the nineteenth dynasty, the Ramesides, were great builders, and through this much of the achievement of their predecessors was later attributed to them. By this time the Jews had long been established in Palestine, and while the twentieth Egyptian dynasty was reigning the Hebrew kingdom was set up under Saul and David. The Philistines, the conquest of whom plays so large a part in the story of that kingdom, were a people from Crete who had settled to the south of Palestine. After the death of Solomon, the third king, the Hebrew kingdom broke up into two unimportant principalities held in tribute successively by the greater kingdoms near.

It was not long before Egypt likewise broke up into minor states (between 930 and 730). Meanwhile, ever since the days of the Tell-el-Amarna letters, Assyria had been growing in strength and she soon engaged in a struggle with the Kassite dynasty of Babylon. The dynasty was overthrown, but a genuine Babylonian dynasty took its place, and for a while Babylonia recovered something of its former greatness, but not for long. For many years Assyria and Elam struggled for sway in Babylonia, but Assyria was generally the dominant power. During the eleventh and tenth centuries B.C. the Syrian region was left almost entirely without interference.

The Jews.—It was during this time that the Hebrew kingdoms rose and decayed and that the Phœnician city states formed by a group of the Canaanite Semites developed their enterprise by sea. During much of this time Assyria suffered eclipse, the Aramæan Semites honeycombing their empire, but in the second half of the ninth century B.C. there was a revival, and in the second half of the eighth century Assyria had become once more an aggressive and conquering state, and in the end got direct rule over Babylonia and constantly harassed the Jews, Phœnicians, and Egyptians. The last great King of Assyria was Ashurbanipal, an indefatigable collector of records, which remain as our chief authority on Assyrian history. After his death in 630 B.C. Assyria again declined. Egypt had thrown off its yoke and now there was a revival in Babylon under the Chaldean King Nabopolassar. The Chaldeans were a Semitic people in the extreme south of Mesopotamia. Later the names Chaldeans and Babylonians were used interchangeably. The son of Nabopolassar was the Nebuchadrezzar whom we read of in the Bible and who in his conquering course carried the Jews off to their "Babylonian captivity."

Nebuchadrezzar's name has been remembered too as the names of mighty builders always are. It was under him that the famous "hanging gardens" of Babylon were constructed. But before the end of the sixth century B.C. the Chaldean and Lydian empires and Egypt were all conquered by the power of Persia, which then threatened the lands farther west. The Lydian state west of a line from the middle of the south of the Black Sea to the north-east corner of the Mediterranean had been conquered by the Dorian Greeks long before this. The Persians were a people who together with the Medes, another Aryan branch, possessed the lands east of Mesopotamia. They had been there for a period of unknown length, and always it was the Medes who had predominated, but under the great soldier Cyrus, who in the middle of the sixth century seized the Median throne, the triumph of the Persians began.

It was he who conquered Lydia and Babylonia; it was left to his son, Cambyses, to annex Egypt. The next obvious place to attack was Asia Minor, but Babylonia had never been really able to hold that district, and here the power of Persia was to receive its first check.

Prehistoric Greece.—Asia Minor had become largely the heritage of the Greeks or Hellenes, an Aryan people who by the middle of the second millennium B.C. had won for themselves Greece and the islands of the Ægean Sea, and were settling on the coasts of Asia Minor before the end of it, and even founding dynasties in states existing inland in Asia Minor as the Dorians did in Lydia.

The Dorians were the latest comers of the three divisions of the Hellenes. The others were the Æolians and the Ionians whose settlements in Asia Minor were to the north of the Dorians. In Greece proper the Dorians secured the western half of the Peninsula, the whole of the Peloponnesus, and some of the islands. The earliest record of Greek history is found in the Homeric poems written about 800 B.C. and now no longer romantically ascribed to the blind poet Homer, but generally regarded as a cycle based on ballad poetry of a much earlier time. In them the Greeks are not spoken of as Hellenes distinguished as Dorians, Æolians, and Ionians, the names familiar in the historical period proper of Greece, but as Achæans, Argives, and Danai. In the Homeric poems Bœotia, a part of Greece not distinguished but rather discredited in the historical period, is the practical centre of Hellas, while Mycenæ is its political centre. The Homeric poems tell of the wars of the Greeks under their leader the King of Mycenæ against Troy in Asia Minor.

Excavations at Troy and Mycenæ both have gone to suggest that there is a sound historical

basis for these mythical stories of ancient heroism. Excavations at Crete and Mycenæ have revealed an advanced civilization which must go back to the third millennium B.C., and there is question as to whether the civilizations known as the Nimoan and Mycenæan were Hellenic. As yet there has been no success in deciphering the scripts found, which would seem to be a fairly easy task if the language were Hellenic. The religion, too, is singularly different from the religions of the Greeks in the historical period. On the other hand a distinctly Greek spirit is present in the art of these civilizations, which most scholars assumed to be connected with each other.

The Greek City State.—But these things were far past when Greece clashed arms with Persia. As long as anything is known of the Greeks they were a highly civilized people living in cities with kings at their heads, with a select council to advise the king, and an assembly of freemen, in fact with the germs of many forms of government.

In this did Greece differ from the empires of the East, which were all despotisms of the most uncompromising type. When the Persians, Aryans though they were, conquered Babylon, they continued inevitably this mode of government. Under it the people counted nothing at all politically.

The city state was the characteristic political development of the Greeks. It was alike their strength and their weakness, for while through it intense and vivid patriotisms and civilizations came into being, it prevented any political union or national enterprise. Thus while the Greeks could unite for worship, as when they thronged to favourite shrines like that of the Delphic Apollo, or sent representatives to compete in the Olympic games, there was never any question of a political union of all Greece. By the time that Greece had to face Persia in arms two main types of city states divided Greece, aristocracies and democracies. Both had been developed through two previous stages, when the kings were replaced by oligarchies and these again by tyrants, a name bearing no sinister taint to the Greeks but representing the Roman "Dictator."

Of the two greatest city states in Greece in the fifth century the Dorian Sparta was a typical aristocracy of the most rigid type, the Ionian Athens a democracy with all the glorious possibilities and insidious dangers which beset that form of government. In Sparta life was circumscribed by militarism. The state and the state's safety were the supreme ends. All boys were brought up by the state from the age of seven years, and Spartan discipline has become a proverb. In Athens it was the individual who mattered, and no bounds were set to the development of the democratic principle. While Sparta bred only soldiers, Athens bred artists, poets, and philosophers. But always it must be remembered that here, as in all ancient states, there was a basis of slave labour which made more easily possible alike the efficiency of Sparta and the vivid individualism of Athens. The details of later Greek history are apt to be blurred in an impression of the rivalry and clashing of the two types sublimated by these states, and the impression is accurate enough.

THE CLASSIC PERIOD

With the beginning of the fifth century B.C. the centre of the world's civilization moves westward at first to Greece, whence it was to advance still westward with the growth of Rome's power until the classic tradition embraced all the Mediterranean states. The classicism, which was of the essence of the Greek and Roman civilizations, is an individual thing, different from the colossal but crude grandeur of the eastern civilizations, different too from the romanticism of the Middle Ages and modern times, though it contributed so much to these.

The well-spring of the classic tradition is Athens, and it was that state which alike developed and defended it against the power which threatened to crush it in the buoyancy of its youth. If Persia had prevailed against Greece the whole course of the world's history would have been changed. It would have meant the stamping out of the great root ideas of western civilization, those ideas whose working out has made the wonder and perplexity of history in the West ever since, and which are, even now, leavening the immobility of the East.

In the year 500 B.C. it seemed that the Persians, having conquered all western Asia, must inevitably extend their conquests to Europe. Some of the Greek cities rose about this time in revolt against the Persian satrap, who represented the power of the "great king" in that district. They appealed to the Greeks over sea to go to their help and the Athenians sent some ships, but it was a forlorn hope, and they were recalled, and before long the rebellion was stamped out. Persia's policy of aggression now coincided with a policy of revenge. It was, however, ten years before King Darius sent a large army to attack the Greeks. The defence of Greece was left to the Athenians with the help only of the friendly little city of Platæa. The Spartans delayed because of the alleged reason of a sacred feast whose observance nothing must interrupt, but there was probably the added motive of unwillingness to co-operate with Athens. The first act in the great struggle ended with the brilliant Athenian victory on the plain of Marathon.

The Struggle between Greece and Persia.—It was again ten years before Xerxes, the son of Darius, sent a vast army for the Great Invasion

of Greece, in which no lavishness of men and money was spared. The largest army that had ever been seen crossed the Hellespont on a bridge of boats specially built for it.

It was an army garnered from the conquered peoples of Asia, and had no great heart for the fight, but the Persians ever put their trust in numbers and brute force, and those who were reluctant were spurred on by the sight of the quartered bodies of malingerers hung along the line of way.

Such was the material with which Persia proposed to crush the Greeks with their vivid individualism and love of freedom. The idea of defending Thessaly was abandoned, but the Spartans tried to hold the pass of Thermopylæ, the last defence of the Peninsula before the Isthmus of Corinth. When Leonidas, the Spartan king, found that there was another pass by which the Persians could get round to his rear, he had not sufficient men to guard it. He refused, however, to abandon the pass he was already defending, and when at last two hostile armies hemmed him in he and his little band fought their way out at the north end of the pass and there fought to the finish, suffering a defeat more glorious than any victory.

Greece now lay open to the Persians as far as the Isthmus of Corinth, but the fight at Thermopylæ had weakened the confidence of the invaders. Athens was sacked, but its people had taken refuge on the fleet. The building of a great fleet by Athens had been the policy of the Athenian Themistocles, who now vindicated it by the great victory of Salamis over the Persian fleet, which was as unwieldy and inefficient as its army.

The destruction of the Persian fleet made the commandeering of the giant army impossible. The bulk of it retreated ere it should be cut off. The remnant, three thousand of the best soldiers, were routed the next year at Platæa, and so Greece, and through her all Europe, was saved from the aggression of the East.

Curiously enough on the day of Salamis another people of eastern origin received a decisive defeat at the hands of the Sicilian Greeks, for in Sicily and South Italy by way of colonization a new Greece had grown up reproducing the society and organization of the mother country. The victory of Himera by the Sicilian Greeks over Carthage, the great maritime colony set up long ago on the north coast of Africa by Phœnicia in the days of her greatness, emphasizes the results of Marathon, Thermopylæ, Salamis, and Platæa.

The Age of Pericles.—The results to Greece of the glow of conquest may be seen in an increased ardour of patriotism everywhere which unfortunately was local rather than Greek, and, indeed, intensified rivalries rather than reconciled them. The effects of this new joy and patriotism may be seen best in the marvellous development of Athenian civilization at this period. It is famous in history as the "Age of Pericles," from the name of the great statesman who was chosen by the democracy to rule Athens in 460 B.C. and kept that rule to 429 B.C.

It was during this period that the art and literature of Athens, the standard of classic culture, arrived at their best. The age of Pericles was the age of Æschylus, Sophocles, and Euripides. Aristophanes, the first great Athenian comedian, began to write at its close. It was the age, too, of the greatest of all Greek sculptors, Phidias, who with his pupils ornamented the marvellous buildings in which the triumphant exultation of the Athenian democracy found expression.

Paradoxical at it sounds, Athens at this time was really an aristocracy drawing tribute from an Empire. This was the League of Delos, in which the maritime states of Greece bound themselves together on the defensive against Persia. At first on equal terms with Athens, and having their treasure at Delos, the island sacred to Apollo, the states soon became mere tributaries of Athens, and the treasure removed to that city was used largely for its embellishment, and for the enlargement of the lives of the Athenian citizens.

One main result of this policy was to foment the jealousy of the states outside the league and discontent within. The result of these accumulated jealousies was the Peloponnesian War in which nearly all the Greek states of the mainland joined under Sparta, the traditional rival of Athens, to attack her. For nearly thirty years, from 431 to 404 B.C., the Peloponnesian War dragged on. Athens made at first a brilliant defence. Forced though they were to abandon the open country, her citizens entrenched themselves between the famous Long Walls which joined the city to the sea at her port of the Piræus. A terrible outbreak of the plague in 430 under these conditions was a national misfortune and was soon followed by the death of Pericles.

The Athenians were impregnable behind their Long Walls, and there was a constant food supply by sea, but the fight was unequal, and when her navy failed her the struggle could only end in one way. By the famous Sicilian Expedition in 415, which the Athenians sent against Syracuse, and which ended in terrible disaster, Athens lost a large army and a flee At last in 404, after the Spartan comma Lysander had captured another large fleet, city was blockaded. Athens had to give up her fleet, ignominiously to demolish her fortifications to the sound of Spartan songs of rejoicing and accept the oligarchic government which Sparta, according to her traditional policy, forced upon her. Within a year the democracy was restored, but Athens' greatness was a thing

of the past. Only its glamour remained, a glamour which later dazzled all-conquering Rome and led her to submission in the midst of victory.

Yet the stream of culture ran still clear in Athens. Socrates, her first great philosopher, was still teaching at the end of the Peloponnesian War. Plato, his young friend and admirer, was teaching and writing all through the first half of the fourth century, and the activity of Aristotle, in his turn the pupil and friend of Plato, lasted on till nearly the end of the third quarter of that century. But politically Athens was dead.

In the full flush of conquest the Spartans had attempted to found an empire in their turn, but Sparta had no genius for sea power, and her fleet was destroyed in an expedition against Persia. Her ambitions were now limited to a supremacy in Greece itself, which was however short-lived. Her power was overthrown by Thebes, who in her turn and through the genius of one citizen, Epaminondas, established a short-lived supremacy. It died with the death of Epaminondas and the next great power in Greece came from without.

This was Macedon, a state bordering on Greece to the north. The Macedonians, though the Greeks despised them as "barbarians," were largely Hellenic in origin, and though they had not developed a culture such as Greece had known they were a people of great ability, and the "barbarism" which the Greeks despised spelt strength in conflict.

It was just after the death of Epaminondas, when the leadership in Greece was going begging, that Macedon fell under the rule of Philip, a man of great ability, a statesman and a general and, above all, a Phil-Hellene anxious to claim for Macedonia its Greek heritage. He proposed at first a union of Greek states against Persia, and was nominated general-in-chief. Athens, recovered to some degree of prosperity, opposed Philip, stung to resentment by the Philippics of the last notable statesman begot by Athens, Demosthenes.

Demosthenes saw that Philip aimed at Empire, and led a party in Greece against him. Its defeat made that empire more certain, but in the moment of victory Philip was slain by an assassin in 336 B.C.

Alexander the Great.—His son Alexander, one of the world's greatest men, inevitably seized his heritage, and his predominance in Greece became the basis for that meteoric career of conquest which makes the story of Alexander the Great read as some fairy tale, rather than sober history. Within ten years he had conquered the whole of the Persian Empire and dotted it over with outposts of Greek civilization. He had led an army into India and conquered the Punjab, whence he returned to Asia only because of the mutiny of his soldiers aghast at their distance from home. He died an untimely death at Babylon in 323 B.C., when he was only thirty-three years old.

Alexander was not only an incomparable soldier and general, but he was a great statesman too. The keynote of his policy was the fusion of East and West, and though this even to-day seems an impossible ideal it did meet with some measure of success. A leaven of Greek culture was introduced into the conquered regions, and when the empire inevitably broke up after Alexander's death the new kingdoms were for the most part ruled by his generals, and though these rulers and their successors became orientalized in time it was not before some slight savour of classicism had been imparted to their dominions.

The dynasty of the Ptolemies in Egypt was Greek, and Alexandria was long the leading centre of Greek learning. The Greek dynasty of the Seleucidæ won Syria for themselves, and it was thus that the New Testament came to be written in Syriac Greek. The greater part of Asia Minor broke up into small kingdoms. Macedonia itself was subject to a rapid succession of rulers, but each kept a tight grip on Greece through the despots set up to rule the several cities.

And now at last there appeared in Greece that ability to unite for patriotic defence which had been absent so long, but it was among the lesser states.

Various leagues or federations were sucessively formed with the object of throwing off the yoke of Macedon. They met with some measure of success. Yet again the old spirit prevailed and a rivalry broke out between the two chief leagues, the Achæan and the Ætolian, and Sparta temporarily reviving under its King Cleomenes. But all these minor ambitions were to yield before a mightier conqueror than any Macedonian. The great and growing power of Rome which was to sway the destinies of the world for centuries to come absorbed Greece in its onward march.

The Rise of Rome.—Rome was a city of Latins, one of the two Aryan branches which had pushed their way into the Italian peninsula about the same time, or perhaps rather later, than the Hellenes were taking possession of Greece. The other branch were the Oscans or Sabellians. The land west of the Tiber was occupied by the Etruscans, a pre-Aryan people probably akin to the pre-Hellenic population of Greece, but more strongly entrenched than these, so that the Latins contented themselves with the low lands to the east of the Tiber, which thus became Latium, while the Sabellians took the higher lands east and the land to the south of Latium.

The city states which grew up rather later

than in Greece were of the same type. There were always the king, an aristocracy, a free population, and a slave class. Very early too the Latins joined, like the Greeks, in some sort of loose federations for mutual defence. But what no Greek city had managed to do Rome did. Athens had never been able to impose her empire in such a way as to establish a feeling of solidarity. This was the genius of Rome, for only so and partially by this word genius can the spectacle be explained of this one city, favourably situated no doubt, extending its sway until Rome becomes coterminous with Italy and the Roman Empire coterminous with the greater part of the known world.

According to tradition Rome was founded in the year 753 B.C. by Romulus. The story is wrapped round with mythical detail, but out of it all emerges the fact that the city on the Tiber, originally a border fortress of the Latins, was a stronghold coveted by Etruscans, Latins, and Sabellians alike, and that elements of all three mingled with its population. For many years Rome was ruled by kings, at first, like all early kings, war leaders made permanent, and then finally becoming hereditary monarchs. At last, in 509 B.C., according to the tradition, kingship was abolished by the normal process in ancient city states. The last dynasty which came to an end by the expulsion of "Tarquin the Proud" was Etruscan, but the motive of the revolution was not wholly racial, for the Etruscan nobles in Rome took their part in it with the rest.

To avoid the danger of tyranny the kingly power was delegated to two "Consuls," and henceforth the republic in setting up a new office filled it always with two magistrates. For some years after this revolution Rome was under a cloud. She was threatened by a friendship between the Etruscans and Carthage, but within thirty years Carthage received a check by her defeat at Himera, and the Sicilian Greeks were successful in a struggle with the Etruscans.

From this dates the decline of this mysterious people with their language still unreadable by scholars, with their love of colour and mixture of contemptuous cruelty towards, and cynical exploitations of a conquered enemy. These qualities of the Etruscan have left their mark on the ballad literature of ancient Rome which relates to the oppression of the Tarquins. It has been supposed that they were related to the Philistines, and their spirit has in it much of what is proverbially described as Philistine, a spirit manifest too in the history of Rome and perhaps due to the Etruscan blood in its people.

The revolution which established the republic had probably for cause and certainly for effect an expansive movement in the internal and external history of Rome. It was not long before she re-established her supremacy in the Latin League which she had lost as an immediate effect of her revolution. She was constantly engaged in a struggle with the Sabellian peoples to the east and south, and soon again too with Etruria reviving after her check.

In all these contests Rome was more or less successful. It is the beginning of her heroic time and legend hangs about it. Coriolanus, who fought for and then betrayed and at last saved his country with the loss of his own life, is a typical figure, or Camillus, who took the Etruscan city of Veii after a prodigious siege. At the beginning of the fourth century a new enemy poured over the Alps into Italy, overwhelming the Etruscans irretrievably and sacking Rome in 390 B.C., putting the city to flames. These were the Galli or Gauls, a branch of that Celtic people which had long had its centre north of the Alps stretching along the Danube Valley. They did not stay in Latium, but established a "Cisalpine Gaul" in the valley of the Po.

The Etruscans were ruined, but Rome's rapid recovery gives proof of her vitality. She continued her conquering course, and in the year 381 B.C., by the admission of the citizens of the conquered Latin city of Tusculum to the full rights of Roman citizenship, she began a policy which in time as it were spread tendrils from the heart of Rome through Italy and later through the Roman Empire.

Meanwhile great changes were taking place in the constitution of the government and society of the republic. Already before the expulsion of the kings the plebeians had the right of meeting in the Comitia Centuriata, but this was chiefly for military purposes. The power of electing the magistrates was given to the Comitia Centuriata when the republic was established, but at first they could only elect patricians to the magistracies.

By degrees the social and political grievances of the plebeians led them to threaten to secede from the state altogether, and the result was a succession of laws which gradually put the wealthier plebeians on the same social footing as the patricians. For the future one consul had to be a plebeian, and at length inter-marriage between patrician and plebeian was recognized. The creation of the Tribunate of the Plebs with a power of vetoing the acts of the magistrates or senate, if these were in any way obnoxious to the Plebs, gave political power to the lesser plebeians. As time went on and the plebeians grew more numerous and powerful their officers and assembly of tribes got the right to pass laws binding on the whole state. The condition of the poorer plebeians was improved too by restrictions on the monopoly by the patricians of the common lands taken from captive states, by the insistence that great landowners should employ paid as well as slave labour, and, above all, by the planting out of yeomen as military colonists in conquered territories.

In this way this crisis in Rome's development was manipulated and she was the freer to pursue her conquests.

The Latin League, resentful of Rome's supremacy, took arms but was defeated. Its states became subject to Rome with the full rights of Roman citizenship.

Not all the conquered cities received the fulness of these privileges. The Etruscan city of Cære was the first to receive the modified rights of citizenship, the political vote being reserved. This form of citizenship, called afterwards "Italian," was largely extended. This policy was soon to justify itself in the loyalty of the Latins and Campanians when the Greek cities of South Italy, helped by the Samnites, took up arms against Rome. For some years Rome had acted as mediator between these states, but her interference was resented, and in 280 the help of Pyrrhus, King of Epirus, was enlisted, and at first Rome met defeat at his hands. But the "Pyrrhic" victories were fruitless, and were followed in the end by defeat, and the brilliant but ineffective Greek withdrew, leaving the south of Italy open for a complete conquest by Rome, who was now mistress of all Italy.

Now for the first time after the defeat of Pyrrhus at Beneventum in 275 B.C. the kingdoms of the East began to realize that a great new power had grown up in the West, and Ptolemy, King of Egypt, sent an embassy to Rome. Immediately too Rome had to measure swords with Carthage, her only possible rival in the West.

The Duel between Rome and Carthage.—The Carthaginians had had a great past and it seemed that they might yet have a great future. There seemed no reason why Rome rather than Carthage should become mistress of the West. Carthage was dowered with the Phœnician genius for seamanship; Rome as yet knew nothing of ships. But Rome was full of vitality while Carthage was really in decay. Her narrow oligarchy erred always on the side of caution, and though dying Carthage could produce great heroes and even able statesmen these were always hampered by the government.

It was by taking sides in quarrels between Sicilian cities that the two powers first came into conflict; but consciously or unconsciously the duel was fought for supremacy in Sicily and ultimately over the Mediterranean world.

During the first Punic War Rome proved the need of a navy and forthwith supplied the want, but because they knew that seamanship must be a question of years and experience they determined to make their sea fights as like as possible to land battles, and so supplied their vessels with grappling irons which held fast the enemy's ships while the soldiers fought hand to hand.

The inexperience of ships led to much wreckage and disaster, and it was impossible to storm Carthage itself, but the Romans held on, and at the end of the war Sicily at least was theirs. One brilliant general the Carthaginians had had, Hamilcar Barca by name. With the patience of fanaticism he began to build up an elaborate plan of revenge. He asked permission of his government to retire to Spain, where Carthage had many colonies, and with a sense of relief they consented. There he spent his life, extending the power of Carthage over the native tribes thus to provide a basis for his attack on Rome. He died leaving a heritage of revenge to his sons, the famous Hannibal and his brother Hasdrubal.

Hannibal, one of the most brilliant soldiers of history, made his famous passage of the Alps in mid-winter of the year 218. So began the second Punic War which ended only in 201. Hannibal won brilliant victories but got no support from home, and was thrown on the defensive, while the brilliant young Roman general Scipio by his fighting in Spain cut off the base of supplies.

When Hasdrubal at last got away to help his brother in Italy in 207 his army was defeated and he himself killed. The first intimation Hannibal received was Hasdrubal's head thrown into his camp, for the Romans were ruthless in war. His hopes were now killed, and in 202, after sixteen years on Roman soil, he was recalled to Carthage in the forlorn hope of defending the city against Scipio, now attacking the Carthaginians at home.

The war ended with the complete submission of Carthage. She became a "Socius" of Rome, like the Italian Socii managing her own affairs, but subject to Rome on questions of war and peace. Hannibal bravely tried to reorganize the internal affairs of the city, but was driven forth by jealousies within a few years.

From this date there are two currents in the history of Rome. There is a continual stream of conquest, a tale of unbroken success; and there is an internal history chequered and bloodstained, a story of experiment and readjustment.

The Roman Empire and Revolution.—After the war with Carthage Rome was really in need of rest, but no pause occurred, and this fact gives the key to this double story of success and disaster. The Roman Empire grew too fast for the government to cope adequately with the problems of its administration. There is much misery and sordidness through the need of readjustment in society and politics, yet this is but a background for a marvellous development of civilization, a cosmopolitanism whose subtlety and variety have never been surpassed.

Between 200 and 136 B.C. Rome conquered first Macedon, meaning genuinely to protect Greece, having fallen under her spell, but in the end inevitably annexing Greece too. The conquest of Italy as far as the Alps was com-

pleted. Two flourishing provinces were set up in Spain, one in the basin of the Ebro and one in the valleys of the Guadiana and the Guadalquivir, and from here Rome gradually extended her sway over the greater part of the peninsula, permanently Latinizing its language and civilization in spite of sharp struggles with its barbaric but fine population.

To maintain land communication with Spain alliance was made with the old Greek colony, Massilia (now Marseilles), and beginning by fights with the savage mountain tribes near, conquest was gradually made of the Lower Rhine Valley, a starting-point in the conquest of Gaul (now France).

Meanwhile Carthage had risen in rebellion, stung beyond endurance by Rome's refusal to allow her to defend herself against the Numidians, who were raiding her territory. The third Punic War and the famous siege of Carthage ended with the levelling of the city to the ground in 146 B.C., and her dominions became a Roman province.

In 136 B.C. Attalus, King of Pegamun, left his kingdom to Rome by will, and thus she acquired her first foothold in Asia Minor.

Meanwhile already the want of readjustment was manifest, and the year 133 B.C. began a period of revolution. The senate, which inevitably with continual warfare and need of prompt action had absorbed practically all political power in the state, was itself fast becoming degenerate. Many of the best noble houses had been wiped out in the wars and new men had taken their place.

The new provinces were taxed and their treasure poured into Rome, breeding a spirit of luxury and love of ease. The provinces were governed by pro-consuls and pro-prætors, men who had already served in office and were given this extension as a sort of prize.

The taxes were farmed out, and the "Publicani" who farmed them could grind the subject-peoples at their will, and return only a fixed sum. Corruption among all classes of officials in the provinces was the natural result of the system.

Meanwhile in Italy agriculture declined. Swarms of men who had served in the army were turned loose upon the land on their discharge, and inevitably went to swell the rabble population of Rome. The slaves everywhere were still ground down, and they and the gladiators, often captives of war made slaves, chosen for their great strength and pent up in their prison schools, formed an especially dangerous element in Roman society.

The new Greek learning imparted by slaves, and often warped to mean licentiousness, helped in the destruction of the old Roman sobriety of manners and purity of morals.

It was two noble brothers, Romans brought up by a noble mother in the old Roman discipline, who first tried to cope with all these evils and lost their lives in the attempt. Tiberius and Gaius Gracchus strove with the conviction of idealists to reform the Roman government. Tiberius, the elder by nine years, was little more than an idealist. He got a bill passed by which the monopoly by the senatorial class of public lands (largely lands taken from conquered states) was ended, and such land was let out to the people. It has been described as a small holdings bill. Tiberius was so anxious for its success that he strove to override the laws of the constitution. He was assassinated, but his brother Gaius Gracchus took up the work of reform. He was a practical man as well as an idealist, but in the end he too had himself killed by a slave to save himself from being assassinated. One good thing he had achieved—the adequate trial of provincial governors accused of extortion, and this by men of the "Equites" or rich business class. Unhappily this method made a rift between the two upper classes of Roman society. It was Gaius Gracchus who began too that policy of corn doles to the Roman populace which degenerated into a wholesale system of bribery till the mob called for free bread and free games as their right.

But above all the work of the Gracchi was to discredit the senatorial government so inadequate to its task. Its inefficiency was seen in a few years in the long struggle with Numidia, which defied Rome largely through its confidence in a system of bribing the Roman envoys.

Two great soldiers, Gaius Marius, an Italian, and a "new man," and Lucius Cornelius Sulla, a member of a Roman patrician family with all the vices of his class hardly redeemed by the brilliance of his generalship and the perfection of his culture, stand out at this time.

It was with men like these that the chance to sway Rome's fortunes now lay. At this moment a new enemy threatened Rome, the Germans, who were in the forefront of those "barbarian" nations who were already advancing from the North, and whose movements form so large a part in the later story of the Roman Empire. In Southern Gaul Marius defeated them, beating them back so decisively that some centuries passed before they attempted again to violate the Empire.

In the year 91 B.C. the "Social War" broke out, in which the Italian allies demanded, and for the most part won, the privileges of Roman citizenship. Mithridates, King of Pontus, seized the opportunity to attack Rome in Asia Minor. Sulla went to defeat him, and returned to take in hand the situation at home. Marius had created a "long service army," and so increased the power and prestige of every successful general for the future whose instrument the army naturally became. With the practical breakdown of normal government political power fell to such generals

and the military dictator becomes a familiar figure at Rome.

His transformation to "Imperator" or Emperor is easy and obvious, and so it is that the history of Rome in the last century B.C. is summed up in the story of such dictators struggling to exercise supreme power, always with a reliance on an army, until at last the genius of Cæsar was adequate to put this power on a permanent basis, for he was virtually, if not nominally, the first Roman Emperor.

Marius was elected consul five years in succession. He constituted himself the representative of the degenerate Roman populace, a veritable demagogue, using the readiest weapon to strike a blow at his hated rival Sulla. Sulla was by tradition and tastes the representative of the old aristocracy. Rome was now inevitably given over to party strife. While Sulla was away in the East, the Marians again seized the power in the state of which he had deprived them. A reign of terror ensued and there is a quality of brutality in the reprisals of this period never equalled in the most barbaric wars of the Middle Ages. Marius died, to be replaced by the demagogue Cinna, until he gave way before Sulla returned from the war and took vengeance by wholesale proscription.

This completed, he set up a new constitution under which the senate recovered all its ancient power. Then gracefully resigning the dictatorship, Sulla retired to spend a year in characteristic alternation between arduous study and the most abandoned pleasure and then died.

The Sullan constitution had no chance of permanence, and the old process went on, wars bringing great soldiers to the front, the rivalry of these for political power, the assassinations and intrigues through which Rome was to win her way to a new lease of life.

The next great soldier was Pompeius, who finally overthrew Mithridates, overran Syria, and took Jerusalem. Three new Roman provinces were set up in the midst of "a Roman sphere of influence." All this Pompeius carried through with vast labour and a wonderful mastery of detail, but going back to Rome with the knowledge that he must "work" the senatorial government to win its assent to the system. In this he was helped by the young C. Julius Cæsar, a youth of one of the highest families in Rome, but related to Pompeius by marriage. Cæsar had joined the popular party and had formed an alliance with Crassus, a soldier who had put down a great revolt of gladiators under the enlightened barbarian Spartacus. But Crassus owed his influence chiefly to his wealth. Together Cæsar and he had restored the old powers of the Tribunate, while Pompeius leaned rather to support the "Optimates."

Julius Cæsar.—Soon after the return of Pompeius Cæsar went to take up the command in Gaul which Pompeius has procured him by way of reward for his help. Crassus went to fight in the East and was killed, while Cæsar began his conquest of Gaul with the subjugation of the Helvetii, a Gallic tribe from the country which is now Switzerland, and threatening the province of Trans-Alpine Gaul. Cæsar himself has told the story of his wonderful wars. They gave him the immense prestige necessary for the part he meant to play.

The glory of Pompeius dwindled before it, and he and his party began to plot against Cæsar. Cæsar, in defiance of the law, led his army across the Rubicon. Pompeius crossed the Adriatic and Cæsar followed to defeat him at the Battle of Pharsalia in 48 B.C.

Pompeius fled to Egypt only to be struck down by an assassin as he set foot on shore. In Spain and in Africa Cæsar crushed the party of his dead rival, finding time to visit Italy and put order there between whiles.

Julius Cæsar stood apart from all successful generals before him. Having risen through a party, he ceased to be a party man, but devoted all the force of his genius to put affairs in the Roman world on a permanently reformed basis.

He was made Perpetual Dictator, and had a free hand for reform. He reorganized the whole Roman system, replacing it by an imperial government which was the only solution of the chaos into which things had fallen. All officers of state and all governors of provinces were henceforth nominated by him and responsible to him, and this was his root reform. It put the empire on a basis which gave it a new lease of life and prosperity which lasted for several centuries.

Large colonies of Roman citizens were planted out in the provinces, and the privilege of Roman citizenship was now extended to favoured ones among the provincials, so that Paul of Tarsus could defy merely local powers with a proud appeal to Rome.

Julius Cæsar had the fearlessness which has marked many of the world's greatest men and the generosity and readiness to forgive which has marked a few. He refused to stand on his guard against the jealousy of lesser men, and so was the easier victim to their malice. He was murdered in the Senate House on the 15th March in the year 44 B.C.

Yet so solid was the system he had built up that almost inevitably, though with an interval, his nephew Octavianus, his adopted heir, succeeded to Cæsar's power with the personal title of Augustus, which his successor too received, but which became a minor title. The more permanent title of Imperator, or Emperor, originally indicated that Augustus had the fullness of military power over the Roman world, which now included all Europe west of the Rhine and south of the Danube, all

Asia as far as the Euphrates with the exception of Arabia, and Egypt and North Africa between the desert and the sea.

The Imperial System.—It was in the centuries after Cæsar's great reorganization that the Roman imperial system received its greatest and best development. The empire was covered with a network of roads all leading to its heart at Rome. Roman colonies spread Roman culture over the civilized world, so that the western Mediterranean states became permanently Latinized. It was through the imperial system founded by Cæsar and sanely preserved by Augustus that Græco-Roman civilization was saved to the world, which it has since so profoundly modified.

A new era was ushered in with the Augustan age, so calm and suave in contrast to the years before, and with it the great spring of Latin literature bursts forth in the lyrics of Horace, the epic verse of Vergil, and the perfect prose of Livy.

One weak spot there was in the imperial system that it was not avowedly such. A fiction was maintained that the old constitution had not been radically changed. The emperor was but the "Principus," and there was no hereditary right of succession.

In normal periods the next of kin did actually succeed and men closed their eyes to the inconsistency between theory and practice, but there were times when there was no obvious heir, and the fight for the succession caused much bloodshed and misery in Rome. It would be impossible to do more than merely enumerate here the Roman emperors during the first three centuries of the empire, and this would not be of much advantage. The rule of the "Julian" emperors lasted till the year 70. They were so called because all had some claim of relationship or adoption on the family of Cæsar, though some of them at least owed their election to the Pretorian Guard. Nero, the cruellest and most lustful of tyrants, was the last of this group. His life gives the measure of the degree in which the empire had failed to root out the evil of luxury which had led to the ruin of the old constitution. There followed the Flavian emperors, so called from Titus Flavius Vespasianus, the first of the group, whose son Titus destroyed Jerusalem and sent the Jews forth as wanderers on the face of the earth. Then came the "good emperors" A.D. from 96 to 180, followed by the Antonines, of whom the most notable was the philosopher emperor, Marcus Aurelius, a man with all the natural virtues and with a resignation born of stoicism, a saint outside Christianity but for a morbid sadness which never co-exists with true sanctity.

The Spread of Christianity.—During these two centuries Christianity itself had, of course, been born, and was slowly but surely spreading among the populations of the empire. It represented a moral and spiritual revolution of supreme importance, but this was only realized at first by its professors.

The Roman Empire tolerated all religions so long as no refusal was given to the emperor worship, which was the guarantee of the state's security. Only the Jews had been exempted from this, for the authorities, though they themselves looked on the act of worship merely as an oath of allegiance, realized that it meant a violation of the Jewish conscience. The Christians, with their serenity and humility, were a standing reproach to the increasing sensuality which the growing prosperity of the empire begot. They often became social pariahs, and the notice of the state was attracted to them chiefly through private malice, so that the early persecutions were spasmodic and local rather than universal or systematic.

The great fire in Rome under Nero was attributed to the Christians, and the emperor, who had himself been accused of setting fire to the city, was glad to use them as scapegoats. Many Christians were burnt like living torches for the amusement of the Roman populace.

Marcus Aurelius was the first emperor who caused a persecution of the Christians by his direct authority. Yet Christianity made progress, working as a leaven quietly through all the empire, winning men to a new gentleness and a spiritualized morality. Christianity was not working wholly against alien forces. It found material ready to its hand. Besides the feverish desire for pleasure which led to the universal indulgence in the gross and brutal spectacles of the theatres, there was a world weariness morbid when without hope, but a powerful factor in the progress of Christianity when transformed by conviction.

The romantic and dramatic adoption by the Emperor Constantine of Christianity as the state religion was only possible by reason of the success already achieved. Constantine's sanction of Christianity was given in the year A.D. 313 after a great victory over a rival claimant to the empire.

There had been one great shock of persecution under Diocletian, under whom the experiment had been tried of dividing the imperial power between two emperors and two "Cæsars." Constantine was the son of Constantius, the Western Cæsar, and of Helen, a Christian. Under him the empire became united again. It might be interesting to speculate on the character which the Roman world would have now taken on had no new influence been brought to bear on it, but the world was on the eve of vast change, which heralds a new period in the history of the West.

THE MIDDLE AGES

Even in the days of Augustus it had been felt by far-seeing men that the Roman Empire

had expanded too quickly to allow of adequate defence, and for four centuries the authorities were constantly struggling with the problem of massing sufficient troops all along the frontiers to keep back the barbarians without.

It was this need which led to the partition of the empire under Diocletian, but the jealousies of rival emperors were found to be a disadvantage outweighing the advantages to frontier defence.

The "Middle Ages" began when the barbarians at last broke through and swarmed over the lands of the empire to mingle with the populations in varying proportions, and so to found the nations of modern Europe. The success of the barbarian invasions has often been ascribed to a vital decay in the empire, and it used to be the tradition to draw a vivid contrast between the decadent and luxurious provincial and his rude but virtuous conqueror. There is no truth in this view. Religion and morals within the empire were purer than among its invaders, as the wonderful spread of Christianity testifies.

Nor were the Roman soldiers deficient in either courage or fighting power. Only a great change had come over the army. Universal service had been abandoned, and professional armies wholly devoted to their generals were largely enlisted from the barbarians on the frontiers and even from the slave population. Naturally these men were not enthusiastic in the struggle with the barbarians without.

Moreover, thoughout the empire a spirit of indifference to the state had spread. The growth of class burdens and class privileges accounted for this. Vigorous political life was impossible in face of the growing bureaucratism and militarism of the empire.

The old tradition that Christianity was a hostile force working against the empire has just this much truth in it, that to those people who must have an enthusiasm Christianity furnished an object, while on its Quietist side it furnished an additional sanction of the spirit of acquiescence already abroad.

In one sense the provinces had already ceased to be Roman before the fall of the Roman Empire in that they had no part in Roman life. Even the cosmopolitanism, which such an empire might have been expected to foster, was prevented by the laws which kept the taxable population almost stationary for fear of evasion of due payment.

When the catastrophe at last came a shrunken empire extended itself in the East. Constantine had built a new Rome at the old Greek city of Byzantium on the Golden Horn, and there made his court. The city was called Constantinople after its founder, and became the political capital of the empire. The emperors became more and more eastern in their sympathies. One notable result of this policy was that a freer rein was given to the pontifical power of the Bishop of Rome or the Pope, and to the growth of a new world power in his spiritual jurisdiction.

In the year 395 A.D., on the death of the old Emperor Theodosius, the experiment of partition was revived. His son Arcadius received the East, and Honorius the West. The line of partition was drawn from the middle Danube to Durazzo on the coast of the Adriatic, and thence to the Gulf of Sidra. It was a logical division. To the east lay the lands where Greek was chiefly spoken, provinces with Alexandria and Antioch and Constantinople as their capitals. To the west lay the Latin speaking peoples.

But one great weakness in it was that the Eastern Empire did not feel that it was vital to guard the Danubian frontier to the north of the Balkan peninsula, and so left it very weak. Thus a direct passage was left for the barbarians to advance into Italy. Stilicho, the brilliant general of Honorius, and himself a barbarian, with an able man's impatience of inefficiency, took upon himself to interfere in the Balkan peninsula, and even to meddle with politics in Constantinople itself.

But Stilicho fell untimely. Honorius was persuaded unjustly that he was a traitor and he was executed. The seeds of dissension between East and West developed rapidly. Meanwhile two years after the fall of Stilicho, in the year 410, Alaric the Goth led a conquering army to Rome.

The city was sacked, but even in the midst of victory the barbarians were dazzled by the greatness of Rome. Alaric did not proclaim himself emperor or king, but was content to rule with the title of commander-in-chief of the Roman armies. Soon afterwards he died, and Athaulf, who succeeded him, led his armies out of Italy again into Gaul and thence south, driving before him the Vandals, a particularly coarse and brutal branch of these barbarians, into the north of Africa, where they spread themselves like a pest, almost stamping out the wonderful civilization which had its centre at Alexandria.

The Goths formed a vast dominion over the south-west of Gaul and the greater part of Spain. To another Teutonic group, the Franks, fell the greater part of Gaul on both sides of the Rhine, while the south-east of Gaul was won by the Burgundians.

The Fall of Rome.—The Roman Empire then had already fallen, and the acquiescence of Rome in the accomplished fact is seen when Visigoths (or western Goths), Franks, and the imperial armies joined in the overthrow of a new foe, the savage Huns, under their strange leader Attila, whose death soon after presaged the disappearance of this tribe from history.

But the traditional and dramatic fall of the empire is dated at the moment when the last decadent Roman emperor, bearing the honoured names of Romulus and Augustus, but called

in derision for his weakness Romulus Augustulus, was deposed by Odoacer the Herulian, who was content with the title of Patrician, and humbly recognized the rights of the Eastern emperor over Italy.

But these were only nominal rights, and their recognition but gave colour of legality to the new régime. The formal ending of the Western Roman Empire took place in 476 A.D.

Before many years Odoacer's power fell before that of Theodoric, the Amaling chief of the Eastern Goths or Ostrogoths. He was a man of immense ability, and, like all the better sort of barbarians, full of enthusiasm for Roman civilization.

In the thirty years during which he ruled Italy he tried to weld Roman and barbarian into one great nation. He made his capital at Ravenna, feeling no doubt that at Rome his power was overshadowed by that of the Pope. One great handicap he had. The Ostrogoths had been converted to Christianity, but to an heretical form of it.

Ever since the Egyptian priest Arius had taught in the early part of the fourth century that Christ was not perfectly equal with the Father, there had been a split among the Christians. Many had held to the teaching of Arius in spite of its condemnation by the Council of Nicæa called by Constantine in 325 A.D.

The barbarians who were converted to Arianism were never so successful in winning the good-will of the conquered populations as were orthodox conquerors like the Franks.

Then, again, the Eastern emperors yielded less reluctantly to the thought of losing Gaul or Spain than Italy, which after all was the true heart of empire.

After the death of Theodoric in 526 Italy fell to his feeble nephew, but the great Emperor Justinian determined to win it back for the empire and succeeded. One main result of his achievement was the adoption of his great *Corpus Juris*, or Code of Roman Laws, by the Italians. Roman Law was the greatest gift the Romans gave to the later world, and it was largely through its study in the Italian schools of a later day that it so profoundly influenced the laws of all European states.

The barbarians, for the most part, kept their own laws just as they imposed their Teutonic form of society on the conquered lands, but they sometimes codified the Roman laws which they found in force among the Provincials, and in time their own laws were tinged by elements of Roman Law. Only in England did Roman Law vanish altogether, which is one of the main arguments of those who hold that the Angles, Saxons, and Jutes, the Teutonic tribes who invaded this outlying province (already abandoned by the Romans in 410), destroyed entirely the conquered population.

With the death of Justinian and his great general Belisarius in 565 A.D. the power of the empire over Italy fell away and she lay open to new hordes of invaders.

The Eastern Empire.—The only effect of Justinian's efforts was to retard indefinitely the unification of Italy. Praise is due to him as one of the ablest of these Eastern emperors who, though they failed in the West, still held way against the Slavonic and Mongolian barbarians on the Danube and the Persian empire on the Euphrates.

This Eastern empire, too, after all maintained the traditions of classical civilization in a Greek rather than a Latin form. Constantinople was to withstand the shock of invasion for another thousand years, and when it fell at last before the Turk, the West, which had been laboriously building up a civilization for centuries, was intoxicated by the beauty of its culture.

Even after Justinian's death there was for long an Exarch at Ravenna, whose nominal power only served to divide North from South and further complicate the political condition of Italy. The middle district, which became afterwards the Papal States, and Venice alone owned allegiance to the empire. Into the North the Longobardians or Lombards poured to conquer. There were others in the South, where there was too a large Greek element still in nominal dependence on the empire.

The Remodelling of the West.—It is to be remarked that in all the countries round the Mediterranean the Latin element in the population triumphed over the conquerors. Often these were few in proportion to the numbers of the people they subdued, and intermarriage was inevitably followed by the adoption of the Latinized language of the conquered people.

So it happened in Spain, where the Iberian or pre-Aryan population had previously triumphed over the Celts, and the Latinized Celto-Iberian population now swamped the Gothic invaders as it was to swamp a new enemy which was shortly to threaten all these new peoples of the West.

In England, on the other hand, hardly a trace of the Roman civilization survived to leaven the Teutonic society and organization. Britain, visited twice by Julius Cæsar and conquered a century after his time, had after all received but a veneer of Roman civilization, and this only in its cities. It easily fell away.

Beyond the Rhine, where the Roman influence had never been very stable, the same thing happened, but in Gaul, which fell largely to the Franks, the Latin element prevailed.

There the Celtic element had largely predominated over the pre-Aryan, and now Celt and Teuton were to mingle to make the French people, but with a Latin language and a Latin culture.

The Franks were in many ways the greatest of these barbarian invaders. Before the end of the eighth century they had established themselves either as chief or sole power in all the provinces of the West except Britain, Spain, and Africa. It must be clearly understood that it was several centuries before national boundaries even approximating to modern divisions emerged.

The Franks possessed during many years what are modern France and Germany with immense influence in the north of Italy. For long the Franks had marauded the empire in the neighbourhood of the Rhine, and had been chastized by the emperors. They took for themselves the land round the mouths of the Scheldt and Rhine, and from those their power gradually spread.

The Frankish King Clovis, who became king at Tournai in 481, is the first great name in their history. In a struggle with the Allemanni, whose country (now Suabia) he conquered, Clovis consented to fight in the name of Christ, and, conquering, became Christian and all his nation with him.

Fortunately for himself he adopted the orthodox religion, and soon he found that it "irked" him "that Arians should rule in Gaul," and he forthwith conquered Gaul as far as the Pyrenees, and Paris became his capital. Clovis lived and prospered for many years a fervid Christian, but none the less ruthless, removing from his path all who threatened his welfare. He is a typical example of the spirit in which the barbarians received Christianity and the limitations in their observance of its precepts.

It was indeed a curious half savage material which Christianity had to mould in those days. Churchmen themselves often deteriorated in the process, but all that was saved and handed on of Roman civilization owed its preservation mainly to the Church.

The early monastic movement which spread from East to West in the fifth century had an immense refining influence on the people. In the beginning of the sixth century it received a great impulse from the spread of the rule given by St. Benedict of Nursia to his great monastery at Monte Cassino. Benedictine monasteries soon spread throughout the West and became centres of learning and industry—homes, too, of peace contrasting vividly with the turmoil without while a new world was in the making. The papacy, too, was becoming more and more a great spiritual power. Popes Innocent and Leo had awed the barbarians Alaric and Attila, and dissuaded them from their work of destruction, and the personality of Gregory the Great, pope from 590–604, made itself widely felt. It was Gregory, himself a Benedictine monk, who sent St. Augustine, another Benedictine, to convert England, although already the Gospel had been preached in the North by the less highly organized but extremely spiritual Columban monks from Iona, an offshoot of Irish monasticism. Through Gregory's efforts Latin and not Celtic Christianity prevailed in England, and English missionaries in their turn went out to convert the heathen tribes on the German side of the Rhine.

After the death of Clovis the Frankish power was extended over the Burgundians, Bavarians, Thuringians, and the Ostrogoths of Provence. Naturally the Frankish dominions then fell into three parts—Austria, or the land of the Eastern Franks, Neustria of the Western Franks, and the middle kingdom of Burgundy. The Franks clung more than the other barbarians to the Teutonic custom of partitioning a man's dominions between all his sons, and so those three kingdoms were often in separate hands, only to be reunited when the strongest prince had succeeded in slaying his relatives. The internal history of the Merovingians in the later sixth and the greater part of the seventh century is full of crime and crude passion.

For the most part the Merovingians were feeble figure heads, and in all three divisions (for each had their separate administration) it was the king's chief officer, known as the Mayor of the Palace, who was the real power behind the throne.

At last Charles Martel, the Austrasian *Major-Domi*, got the show as well as the reality of power, and founded the Carolingian dynasty. He won his greatest prestige from his epoch-making victory over the Mohammedan Arabs in 732 B.C.

The Rise of Islam.—For a century before this the great new force of Mohammedanism had been carrying all before it. The "revelation" of Mohammed, an Arabian desert dreamer, that there was but one God and Mohammed was his prophet had seized upon the imagination of the Arabians. In reality Mohammed's teaching arose from conceptions he had gleaned from Judaism and Christianity mingled with other more material elements, but after the first few years of discouragement it was received as a new gospel.

The Mohammedan era dates from Mohammed's "Flight" from Mecca in the year A.D. 622. He returned in triumph eight years later, and the worship paid to idols in the sacred city was transferred to the True God. It became characteristic of the Mohammedan faith that its followers must proselytize. With the Koran in one hand and a sword in the other the Arabians after Mohammed's death began a vast career of conquest.

Arabia had come into allegiance almost to a man, and some false prophets who arose were easily put down. The first great conquering "Kaliph" was Omar, who overcame the Persians and carried the Moslem power as far as the

Euphrates. The Eastern Empire, which had warded off the aggression of Persia, could not withstand the shock of Islam, and Syria was lost to it.

Belisarius had won back North Africa from the Vandals, but this was easily overrun by the Mohammedans. The classic city of Alexandria fell and a new Moslem capital, Cairo, took its place. There were soon internal divisions among the Mohammedans themselves, and an Eastern kaliphate at Bagdad was rivalled by another in the far West. But this hardly stayed at all the process of conquest. From Africa the Saracens crossed into Spain and overran the land. They became known here as the Moors. In Asia Minor, too, their power spread.

It seemed that the Western world might fall to the Mohammedans when almost simultaneously in East and West they received a tremendous check. Leo the Isaurian, called the Iconoclast because he sanctioned the party in the Eastern Church which protested against the use of images, by a great victory in A.D. 717 drove the Saracens back from the very gates of Constantinople, and so saved a shrunken empire from Mohammedanism for nearly 800 years. A few years later Charles Martel repulsed the Moors advancing from Spain into France at the battle of Tours in 732.

Thus bounds were set to the advance of Islam, but most of Western Asia had succumbed, and North Africa and Spain. The history of mediæval Spain is the romantic story of the steps by which the land was slowly won back by the Christians from the Moors. Yet the Mohammedans in Spain were the most civilized people in Europe in the early Middle Ages. There was much freedom of discussion among them, and they were the pioneers of the mediæval study of Greek philosophy, though naturally they gave their own colouring to its interpretation.

Charles Martel, who had saved France and presumably the greater part of Europe from the Saracens, was never king of the Franks, but his son, Pepin the Short, took the title as well as the power of king, the puppet Merovingian, with the approval of the pope, retiring into a monastery. Pepin only paid his debt to the papacy when he marched into Italy, conquered the Lombards of the North, who were threatening the secular power of the pope in Rome, and handed over the central provinces of Italy to the pope, thus laying the foundation of the "Temporal Power" of the papacy.

Charles the Great.—At Pepin's death his dominions were as usual divided, but his son Carloman soon died too, and the whole fell to his brother Charles, the Emperor Charles the Great, one of the greatest men of the Middle

dominions stretched from the Atlantic to the borders of Bohemia and from the North Sea to the Pyrenees. It was a vast empire and Charles brought a new idealism to its administration.

In spite of the prevalence of the French form of his name, Charlemagne, Charles was no Frenchman. He was a German, and had his capital at the German town of Aachen or Aix-la-Chapelle. Charles was a great soldier and general. He had little education, but he was clever and quick, a seer of visions, a reformer and administrator. He went from conquest to conquest, subduing North Italy and the remote Saxon tribes, and setting up law and order throughout his dominions.

He marched into Spain against the Kaliph of Cordova, and the death of his nephew, the brave knight Roland, forms the theme of the *Chanson de Roland*, the first of the famous cycle of epics built round the memory of Charles the Great. With the vast extension of his empire, and with Charles what he was, the dramatic revival of the Roman Empire of the West in his person seems almost an inevitable development.

On Christmas Day in the year 800 Pope Leo III crowned Charles emperor in the Church of St. Peter at Rome, and so began that institution marvellous in its success and its failure, the Holy Roman Empire.

Henceforth there were no more fictions about the supremacy of the emperor at Constantinople. Politically Europe was split into East and West, and soon the Eastern Church was also to part company from the Western in a schism which has never been healed to this day.

Charles had a peculiarly noble conception of the scope and mission of the revived empire. The emperor was to be above kings, even above popes as a moral and spiritual force in the world. The Church, under his guidance, was to educate and civilize the people, and Charles was a great founder of schools.

On the political side the revival of the empire had little influence; it affected not at all the Teutonic organization and government of Charles's empire. Charles, like all Teutonic kings, governed with the counsel of the great men of his dominions. There was the customary tradition, too, by which the assemblies of free men had a voice in questions of war and peace, and because this was little effective in such vast dominions Charles sent "missi dominici" as inspectors of the administration of the counts who held sway outside the tribal duchies and whose power tended to become hereditary.

The Growth of Feudalism.—The empire did not stop the growth of that feudalism which was to be the form of society for the next few hundred years, but Charles's government held it in check.

The essence of feudalism is that political and judicial power go hand in hand with the

possession of land. In feudal theory the king is owner of all the land, some of which he keeps as his own "demesne" land and the rest he gives out to the great men who have done him service in war—the noble class. These in return owe him homage and military service, and sometimes other payments. The great lords in their turn parcel out their land to lesser tenants who stand in relation to them as they do to the king.

A strong king can override the greater lords and prevent the allegiance of the lesser tenants ever being used against himself. He can also interfere in judicial matters, and the growth of a strong monarchy is marked by the reduction of the scope of private jurisdiction and its ultimate destruction.

But where feudalism was strong the king was weak, and countries were broken up into feudal principalities in which the great lords secular, and in the lands of the empire more often ecclesiastical, could wield the power of life and death.

At the bottom of the feudal scale was the serf, little better than the slave of Greek and Roman times.

When feudalism flourished unchecked this class and indeed all lesser men suffered horribly from the constant violence and bloodshed caused by the continual fights between the great lords. At times when the central or kingly power kept a strong hand over the great lords the condition of the serf was ameliorated by force of custom and public opinion.

The Church encouraged the manumission of serfs, and the more adventurous often escaped to the towns, where, if they went free for a year and a day, no one could reclaim them.

There had been a beginning of feudalism even before the barbarian period when, with the weakening of the central government at Rome, great provincial proprietors arrogated to themselves vast judicial powers. The germ of the tendency existed too in the Teutonic bond between the war leader and the war band, and an immense impetus was given to the system of commendation by which men acknowledged a lord for the sake of his protection when Europe in the eighth and ninth centuries was attacked by new hordes of barbarians, the fierce Northmen who came chiefly out of Scandinavia to prey upon the lands to the south.

Charles the Great had been saddened when he contemplated this danger. After his death in 814 they came in greater force. Nor was there any central power to withstand them, for with Charles's death his empire broke up more or less into its natural divisions.

The West or Latinized part became France, thus retaining the name of the Teutonic conquerors. The East became Germany, while there was a constantly diminishing "Middle Kingdom" which ultimately was divided between the two. The imperial power became but a name attached to one or other of the successors of Charles until some of its glamour was revived in the tenth century, when began that rivalry for power between pope and emperor which plays so large a part in the later Middle Ages.

The Dark Ages.—The papacy in the days after Charles the Great sank even lower than the empire. In many ways the ninth century and first half of the tenth form a true "Dark Age."

Everywhere in the ninth century Europe was fighting against fierce enemies. In the West were the Northmen. In the East the Mediterranean was infested by Saracen pirates. Germany and Italy were threatened before the end of the century by the Hungarians, supposed by contemporaries to be identical with the Huns of Attila. They were finally defeated upon the Lech in 955, and settled down in the land which was called Hungary after them. But they had contributed their share to the disorders of the period.

The Saracen power at this time was being swamped by hordes of Turks, who were pushing their way into the Moslem Empire, adopting its tenets. They became finally the dominant force in that empire, with an even fiercer zeal for conquest than their predecessors, until their challenge concentrated all the energies of the West in the vast Crusading movement at the end of the eleventh century.

The Northern pirates had begun to attack the British Isles and Frisia even before the death of Charles the Great, and immediately after it they attacked the whole coast-line from the Elbe to the Pyrenees.

At the end of the century there was a sudden break in the stream of aggression, but half England and all Normandy had been won by the Danes.

Painfully Saxon England had achieved some kind of unity under the Wessex kings when the Danes attacked it, and it was for the Wessex kings to defend England against the invader. All that the genius of Alfred the Great could do was to save England west of the great Roman road, Watling Street, for the English. The rest became the "Danelaw."

But these Northmen had a vast power of assimilation, and in time became English themselves sometimes under Danish kings, but more often under English, so that England was a united kingdom, except for a strong feudal tendency owing to the weakness of her later kings, when in 1066 she was conquered by the Northmen of Normandy, who, in their turn, had become more French than the French.

The Norman Duke William the Conqueror, when he did win England, saw to it that the feudal elements were held in check by the royal power, and England early became an outstanding example of the new strong monarchies

which were to be built up on the ruin of feudalism.

In France the same process began, when Hugh Capet, the representative of a house which had long ruled for the degenerate Carolingians, took the title of king in 987.

But in France the growth of a strong monarchy was a slower process than in England, and the Dukes of Normandy who had thus triumphed over feudalism in England were not the least troublesome of the feudal lords of France.

In Germany, too, the Saxon line beginning with Henry the Fowler (919–936) made the royal power hereditary, though his was but an ineffective kingship as far as the great Dukes were concerned. Suabia, Bavaria, and Lotharingia were dependent principalities in which Henry had hardly any power except as patron of the Church.

The Revival of the Empire.—It was Henry's son Otto who restored the empire to be something more than a name. He marched into Italy, where he was crowned king and next year emperor. He deposed the degenerate pope, and set up one of passable morality in his place, but it was left to his grandson, Otto III, to make a real effort to reform the papacy. Otto III was full of admiration for Roman tradition, and full too of reforming zeal. He practically made Rome his capital, and he placed a really spiritual man and another committed to reform, successively on the papal throne.

But Otto's neglect of Germany, in which like his father he swerved from his grandfather's policy of consolidating his power there, was a mistake, and only the Church party kept his power secure.

Otto III was a keen reformer of the Church, and in sympathy with the new spirit, which was spreading through Christendom at this time, and which has been called the Cluniac reform because it had its earliest striking manifestation in the severe reform of the monastery of Cluny in the south of France.

But the dreams of Otto III were entirely visionary. He was broken-hearted when the people of Rome, a degenerate population to which he attributed all the classic virtues, turned against him, and he wandered thenceforth in Italy, and died broken-hearted when only twenty-one years old. His successor, Henry of Bavaria, took up again a strong German policy.

For a while the papacy fell back into its former degradation, but revived again later under the Emperor Henry III. Several popes drawn from the German reforming party were successively elected. One of them, Leo IX, insisted on a clerical election in addition to the imperial nomination.

The Age of Hildebrand.—The reforming party were becoming more and more tenacious of ecclesiastical prestige, and finally the German monk Hildebrand, who became pope as Gregory VII in 1073, asserted boldly that the papacy was the supreme power in Christendom.

The emperor at this time was the child Henry IV. His minority strengthened the papal power, but when he grew to maturity the inevitable quarrel between empire and papacy broke out. It raged long over the subject of lay investitures, which was at last settled by way of compromise. Henry IV was driven to humble himself to have the sentence of excommunication removed which encouraged his subjects to rebel, but he later drove Gregory into the exile in which he died.

The Empire and the Papacy.—The struggle, or rather three separate struggles, covers a period of 200 years. The quarrel with Henry IV continued under his successor Henry V, who was emperor from 1106 to 1125. It was resumed again under the great Emperor Frederick Barbarossa (1152–1190), and yet again under his grandson, the brilliant Frederick II (1212–1250).

Always there were different causes of quarrel, but at bottom it was a duel for superiority between Church and State. The Church was fighting for its "freedom," and triumphed in each quarrel largely because it was able to enlist secular allies with various motives for enmity against the enemy of the Church, but partly too because of its moral and spiritual hold on the people.

It is to be noted that the period in which the sacerdotal claims were highest was also the period of the highest enthusiasm for the spiritual life. The Cluniac movement was followed by the rise of the great Cistercian, Carthusian, and other orders of monks. It was from Innocent III, the remarkable pope under whom papal claims were most compelling, that the new orders of Friars, the Dominicans and Franciscans, vowed to preaching and poverty, first sought approval. Those two centuries too were the age of the Crusades.

The Crusades.—This movement is one of the most remarkable in all history. Through it great masses of people from nations which had long settled down became, as it were, nomadic again. Great armies went forth from the West, and hurled themselves against the Turk with the avowed and main motive of rescuing the Sepulchre of Christ from the infidel, and making it easily accessible again for the Christian pilgrims.

But just as mediæval Christianity was always limited in its action by the passions of a people but newly redeemed from barbarism, so there were many mingled motives in the prosecution of the Crusades. Some men went for mere adventure, others for fame or profit, but always there was the colour of a religious motive, and

but for the religious element the Crusades would have been impossible. Alexius the Eastern emperor called in vain for help until Peter the Hermit, returning from the Holy Land, roused the peoples of Europe to a frenzy with his tale of the persecution of the Christian pilgrims by the Turks.

Before an organized army could be got together a great crowd of enthusiastic and ill-armed peasants and poor folk set off under the leadership of Peter himself and Walter the Penniless, and being a mere rabble committing outrages wherever they went were mostly cut to pieces long before the Holy Land was reached.

In the same year, 1096, the first real crusading army set forth. It was an army, like all the crusading armies, of volunteers officered by volunteers, and in no wise a national force.

Prominent among the leaders was Robert, the son of William the Conqueror, and brother of William Rufus, King of England, to whom he virtually resigned his Norman duchy for the expenses of his Crusade. There was, too, Godfrey de Bouillon, Duke of Lower Lorraine, the type of the perfect knight and hero of the Crusade.

The First Crusade was the only one of the Crusades which met with a real measure of success. Jerusalem was taken, and became the centre of a new Latin kingdom of Jerusalem with Godfrey as its king. There is something very romantic in this establishemnt of a feudal Latin kingdom on Eastern soil. From this time for two centuries constant streams of crusaders, knights and lesser men, flowed to and from the Holy Land.

All through the fourteenth and fifteenth centuries there was talk of a Crusade, but there the movement ended. The last Crusade, which was in any sense a real one, was the ninth in 1272, in which St. Louis, King of France, died, and whose leadership fell to Edward of England, afterwards Edward I.

The Latin kingdom had been reconquered long before this, and Jerusalem remained in the hands of the Turks, though pilgrims were allowed free access to the Holy Sepulchre. One picturesque and curious result of the Crusades was the setting up of the military orders, monks in time of peace and soldiers in time of war. The chief of these were the Knights Templars, and the Knights Hospitallers.

The Crusading movement might seem to have been somewhat fruitless, but it had indirectly brought about much change. A movement in which the virtues and vices of feudalism found full scope, its net result was to militate against the feudal form of society. Often the burghers of a town bought release from their feudal obligations from a needy crusading lord. And it was the free towns which, forming a network throughout the lands of Europe, did most to break down the fences of feudal society.

More obvious is the increasing interchange of commodities, a trade which made Venice rich, an increase too in common knowledge of men and manners, and to some extent an interchange of ideas between East and West, though it is easy to exaggerate this.

Meanwhile in France and England at least the sway of feudalism was being undermined by the growth of strongly centralized monarchies. From the time of the Conquest the Norman kings had been careful to control the feudal nobles. In the first years after the Conquest England had been obviously a conquered state. Nearly all the old English nobles were dead, and their women married with the new Norman aristocracy. The conquerors spoke a different language (Norman French), and had finer manners. But as time went on the English elements, modified in the direction of refinement, prevailed, but well into the fourteenth century the noble class was bilingual.

The Angevin dynasty which succeeded the Norman developed an elaborate centralized system of government, but between the reigns of Henry I and Henry II, England had tasted the horrors of feudalism under the weak rule of Stephen.

The Full Middle Age.—The Angevin system was a despotism, and when it fell into the hands of a tyrant like John it was no longer a means of protecting the weak against the strong, but an instrument of oppression of all classes. The *Great Charter* forced upon John by Stephen Langton and the Barons prescribed freedom for all. It was but a feudal document, and provided no adequate restraint of a determined tyrant, but it manifested a spirit which future kings must mark.

Under John's amiable but weak son, Henry III, discontent grew to rebellion because of the king's favours to foreigners, and Simon de Montfort fought for good government, and died for it at Evesham. Henry's son, the great and good King Edward I, learned from his father's experience. He determined to rule equably but strongly. He practically eliminated the feudal element from political life. He was a great conqueror, winning Wales and dreaming of uniting the British Isles under his rule. He failed with Scotland. Ireland had been annexed under Henry II, and English rule was efficient in the district round Dublin. But most of all Edward I is remembered as the "founder" of the English Parliament. He adopted as a permanent method the representation of the middle classes and towns by knights of the shire and burghers which had been first devised by the genius of Simon de Montfort.

Parliamentary government in England was to have a chequered history, but from this time the forms were always there to make English constitutional history unique among nations.

In France, too, a strong monarchy had been

built up to the weakening of feudalism, but there was no alliance between king and people.

From the first the French monarchy was a despotism, and herein lies the germs of all the difference between these two countries. The loss of Normandy to the French by John helped much towards the unification of France, but the great block of territory in the south of France which had been brought to the English crown by Henry II was always an eyesore to the French, and the true secret of the constant warfare between England and France in the later Middle Ages.

Meanwhile Germany was as much broken up as ever. The German kings, sometimes with the title of emperor, sometimes without, had little power in the greater part of Germany except over the towns which here as elsewhere shook themselves free from the trammels of feudalism.

In Italy the greater cities gradually became centres governing subject territories, so that at the end of the Middle Ages it was divided among Venice ruled by its close oligarchy, Florence, once a brilliant democracy, now controlled by the Medici family, Milan ruled by the Dukes of Milan, the Papal States under the Popes, and the kingdom of Naples and Sicily, carved out by the Normans in the thirteenth century, tossed from one dynasty to another.

The empire during the later Middle Ages had become but the shadow of a name. The papacy too, after its brilliant time under Innocent III, had fallen from its high estate. Under Pope Boniface VIII, at the end of the thirteenth century its pretensions were more magnificent than ever before. The pope forbade the secular authorities to tax the clergy without his permission. Even so good a Churchman as Edward I of England would not agree to this, and the brutal Philip IV the Fair, of France, carried his resentment so far as to declare that France was independent of the pope, and to send soldiers to attack the old pope in his palace, where he died of shock soon afterwards.

This was in 1294. The French in a few years secured the election of a Frenchman to the papal throne who in 1305, instead of going to Rome, set up his court at Avignon in the south of France, though actually belonging to the King of Naples. Here with one short interval the popes remained till 1377, and this period in its history is generally described as the Babylonian captivity, though the extent of the dependence of the popes on the French kings has been much exaggerated.

The fourteeonth century shows a somewhat gloomy phase of mediæval history all over Europe in contrast to the brilliant vivacity of the thirteenth. There has been no space to dwell on the movement in art and literature which accompanied the religious revival of the twelfth and thirteenth centuries, of the growth of the scholastic philosophy which culminated in the brilliant and subtle writings of the Dominican, St. Thomas Aquinas, in the thirteenth century, of the gay troubadour poetry of Southern France so irresponsible in spirit, of the development of the study of law, which with philosophy and theology formed the staple of education at the universities which grew out of the schools thronged with teachers and scholars in the twelfth century. Gothic architecture, that supreme art of the Middle Ages, had achieved its sanest and noblest results in the thirteenth century.

The End of the Middle Ages.—But the fourteenth century showed unrest rather than vivacity. There had been heretics with strange teachings in the twelfth and thirteenth centuries. They had been ruthlessly stamped out. The fourteenth century brought a new grimness and doggedness to bear on these questions. The teaching of the priest John Wycliff in England militated against both Church and State as then constituted. There was a new hatred between class and class, and for the first time these feelings found some form of permanent, if crude expression. In England the Peasants' Revolt, in France the Jacquerie give evidence of the widespread discontent. Three successive visitations of the Black Death, a plague sweeping over Europe from the East and decimating the population, aggravated the social and economic evils. There is something very modern in the problems at this time of the relation between labourer and employer. A brighter feature of the times is the development of a true vernacular literature with the poetry of Chaucer in England, Dante, who belongs to the later thirteenth and early fourteenth century, in Italy, and Petrarch. But Italy with its cities growing ever wealthier is an exception to the general gloom of the period.

The intermittent fighting between England and France known as the Hundred Years War did no good to either country, and is chiefly of interest to the historian of military tactics, and as a permanent object lesson of how the sturdy English bowmen overmatched time and again the proud chivalry of France. The Hundred Years War atones for itself, however, in that it gave Joan of Arc to be the saviour of France.

But this was in the fifteenth century, whose first half was but a continuation of the character of the fourteenth century.

Then midway through the century, twenty years after the burning of Joan of Arc at Rouen, the Hundred Years War came to an end. France had practically gained her natural boundaries at last, and England held only Calais of all her ancient French dominion. The French crown grew stronger, and the nation recovered quickly from the effects of the war.

In England, too, in spite of the faction fights known as the Wars of the Roses, the nation grew more prosperous, and especially was to be noted the increase of the middle class, while the old nobility was almost annihilated.

In Spain at the end of the century the marriage of Ferdinand of Aragon and Isabella of Castile united practically all Spain, though Portugal remained permanently a separate kingdom. The driving of the Moors from Granada, their last stronghold in the south of Spain, gave the country its modern boundaries.

The papacy had returned to Rome in 1377, but had to suffer the strain of the "Great Schism," which was only healed at the election of Pope Martin V in 1417. At the Council of Constance, which ended the schism, the famous John Huss, a Bohemian disciple of Wycliff, and his friend Jerome of Prague were condemned for heresy and burnt at the stake. But a long struggle with the Hussites in Bohemia was necessary before even a compromise was achieved between the heretics and the Church. It was hardly a conquest.

But conditions were preparing which were to make immense differences in the opportunity of promulgating new teaching in the future. There was little in the teaching of Luther at first to distinguish it in power from that of Wycliff or Huss, but the whole world had changed since their day, changes which may be summed up in the descriptive word "Renaissance." With the Renaissance and the Reformation modern history may be said to begin.

THE RENAISSANCE AND THE REFORMATION

At the beginning of the sixteenth century the great states of Europe had for the most part taken shape. England was united under the strong Tudor despotism built up on the ruins of the old nobility. She was soon to take her place as one of the four great states. The others were France, Spain, and Austria. The great House of Hapsburg had built up enormous power for itself centreing in its hereditary dominions of Austria. Its inheritance also included claims on the crowns of Hungary and Bohemia, and the position of emperor had become hereditary in the house. Through marriages the Emperor Charles V succeeded to these dominions and also to Spain, the Free Country of Burgundy, and the Low Countries (now Holland and Belgium). He became emperor in 1519, and naturally his succession was regarded as a menace to what afterwards came to be called the "Balance of Power" in Europe.

It seemed that Charles might dominate Europe, but he was always hampered by the divisions within the empire itself, and when at last he resigned his power his dominions were divided, the Austrian portion going to his brother Ferdinand, and the rest, still a swollen dominion, to his son the famous Philip II of Spain.

But long before this great changes had come to pass in Europe. At the end of the fifteenth century a new spirit seems to have passed over the world, an eagerness and unrest, but constructive and not merely critical like the unrest of the fourteenth century. It was this new spirit which was the chief element in the Renaissance movement.

It was once the fashion to say that the Renaissance began when in 1453 Constantinople at last fell before the Turks and Greek scholars fled West, carrying with them the manuscripts containing the treasures of ancient learning which the Eastern Empire has stored up so long. But this dispersal of the Greek scholars was only an opportune incident falling in wonderfully enough with the spirit of the age.

One strong element in the Renaissance movement was a reaction from the ascetic ideal of the Middle Ages to an enthusiasm for the worship of material beauty, which was the ideal of the Greeks and Romans. Greek, the study of which had been revived in the twelfth century but had never really spread even among scholars, was now looked upon as the key to all knowledge. Scholars everywhere, but especially in Italy, eagerly pursued the study of Greek with the aid of the exiles, and feverishly bought and copied all available manuscripts.

Statues and fragments of ancient art were eagerly collected and a new impetus was given to painting and the plastic arts. The Renaissance began early in Italy. In the latter half of the fifteenth century court rivalled court in enthusiasm for and patronage of the new scholarship. Popes and princes joined in the movement, but Florence under the Medici surpassed the rest.

The Renaissance in Italy.—The first flowering of the Renaissance in Italy, the new joy and wonder in life, was bruised when Charles VIII of France in 1494 led an expedition through the peninsula ostensibly to settle a quarrel between Italian princes, but really beginning that policy of aggression on the part of stronger states to which disunited Italy lay a natural victim for nearly four centuries longer.

Simultaneously with this reversion to classical ideals there developed a spirit of inquiry about the world and the universe. Portuguese explorers pushed their way south along the coast of Africa into unknown oceans, and finally round to India, while Columbus crossed the "Sea of Darkness" and made the discovery of the great continent of America there where the "edge of the world" had been supposed to be.

Copernicus, by his discovery that the earth is not the centre of the universe but a mere

satellite of the sun, revealed to men the first glimmering conceptions of the vastness of space. Man in relation to the universe was at once dwarfed and exalted.

At this moment then the world was teeming with new ideas. The invention of printing furthered their speedy dissemination from scholar to scholar and land to land. All this new thought and new enterprise go to make the Renaissance.

The movement began somewhat later in the other countries of Europe than in Italy, and it took on a soberer tinge. Some of the Renaissance scholars had posed as pagans, but they had not really brought their religion to the touchstone of the Renaissance. The soberer men of the North inevitably did so. The result was the Reformation.

In England, which the Renaissance in its gayer aspects reached late, a renewal of the study of Greek at the universities was followed by a movement for reform in the Church. The leaders were Sir Thomas More, who became Chancellor of England at the fall of Cardinal Wolsey, and John Colet, Dean of St. Paul's, who founded St. Paul's School for boys, where they should be taught Greek and brought up to a noble ideal of religion.

Associated with these was the world famous scholar, Erasmus of Rotterdam, who in his caustic and clever writings held up to ridicule the accretions and abuses of popular religion which these reformers denounced as mummeries. Erasmus made a new translation of the New Testament into Latin from the Greek, for a zeal for the purity of the Biblical text was one fruit of the new scholarship. But not one of these men contemplated any breach with the Church. They wanted reform from within, and they were furthered in their efforts by the far-seeing Cardinal Wolsey from motives of policy rather than spirituality.

Martin Luther and the Rise of Protestantism.—But reformation was to come by way of revolution, when the defiance flung to the pope by the German peasant friar, Martin Luther, was caught up and spread till half Europe was Protestant. Martin Luther quarrelled with the ecclesiastical authorities on the subject of indulgences, the system by which remission of punishment for sins already repented of and forgiven, could be obtained by good works which in time came to be a specified good work, such as the payment of money to charity or towards the building of a church, a development with obvious possibilities of corruption.

The papacy had fallen to its lowest depths in the last quarter of the fifteenth century, until with the Borgia Pope, Alexander VI, it touched the limits of vice and degradation. This degradation of the papacy had had its part in stimulating the movement for reform, but it was the quite respectable if worldly and unspiritual Leo X, a Medici, who was pope when Luther challenged the papacy.

Leo had granted an indulgence, the proceeds of which were to go to the completion of the great basilica of St. Peter at Rome, which was in course of building to Bramante's fine design. Tetzel, a Dominican, was selling these indulgences in Germany, and the people were flocking to buy when Luther angrily attacked the system. He was led on from a criticism of the theory of indulgences to question altogether the power of the papacy and the authority of the Catholic Church. Called to account for his opinions at the "Diet of Worms" in 1521, Luther refused to retract them, and with this Protestantism may be said to have begun. The Elector Frederick of Saxony spirited Luther away to the castle of Wartburg, fearing for him the fate of Huss. Under his patronage Luther preached, and wrote promulgating his characteristic doctrine of Justification by Faith, reducing the number of the Sacraments first to three and then to two, and whittling away the doctrine of Transubstantiation to that of Consubstantiation.

Luther would still have preserved a Church with authority to impose belief, but there was something in this new heretical attitude which appealed to the audacious spirit which the Renaissance had spread abroad, and soon in Germany there were almost as many churches as there were princes. All through his reign the Emperor Charles V strove to reconcile the Protestant attitude with Catholic authority, but failed.

From France the great reformer, John Calvin, fled to set up his church in Geneva, where he taught his rigid doctrine of Predestination and imposed his inquisitorial system of moral and spiritual discipline.

The teaching of Calvin had in it a strong germ of growth. It appealed to the fatalistic tendency in human thought, and Calvinism became the most proselytizing form of Protestantism. Scotland was early converted to it, as were some of the German states to which Lutheranism seemed but a compromise. The French Protestants, who were largely confined to the south of France, were Calvinists. The French monarchy and the bulk of the people remained consistently Catholic. In Switzerland, where each state was allowed to settle its own religion, the Protestant cantons for the most part advanced from the teaching of their own reformer Zwingli to the more ruthless doctrines of Calvin. The early Protestants in England drew their inspiration from Geneva, and were duly hunted out and burnt for their defiance by the second Tudor King, Henry VIII. It was by his zeal against Luther's teaching that Henry won for himself the title of "Defender of the Faith," and he always had an intellectual appreciation of Catholic dogma. But he

was soon to see the advantages to despotism of the new Protestantism, and more or less deliberately he gave England over to it.

The Reformation in England.—The adoption of the Protestant religion in England was a political step. There was no popular demand for it, and in fact the general feeling among the people was conservative, although, as we have seen, there was a Protestant leaven at work.

The crude story of Henry's life makes him little better than a monster, but the real key to his character, besides the strength of his lusts, is the unbounded egotism which was characteristic of the princes of the Renaissance.

To circumvent the pope's objection to his divorce from Katherine of Aragon, his wife for twenty years, Henry broke away from the papacy, and so was enabled to marry the maid of honour, Anne Boleyn.

Once committed to this course, Henry was determined to reap all its advantages. The men who stood in his way who would not take the oath of supremacy were executed, men like the inimitably witty lawyer, Sir Thomas More, and the saintly Bishop Fisher. The dissolution of all the ancient monasteries of England brought money into the royal coffers.

The confiscation of Church property had been one of the determining factors in the adoption of Protestantism by various German princes, and was the determining element in the adoption of Protestantism by Denmark and Sweden. Henry showed the utmost cynicism in this matter. He founded a new nobility with grants from the Church lands. Yet Henry's instincts were against Protestantism. He wanted a *via media*, and those who denied the doctrine of Transubstantiation or refused to believe that auricular confession was necessary, were condemned to the same horrible death as those who refused to transfer their allegiance from pope to king. So two streams of persecution flowed steadily until the reign went out in gloom.

With the accession of Henry's young son by Jane Seymour, Edward VI, in 1547, the Protestant party, whom the moderate policy of Henry had irked terribly, came into power, but Edward died in a few years, and Mary Tudor, the daughter of Katherine of Aragon, restored England with every circumstance of pageantry to the allegiance of the pope.

That she was not able to recover the monastic lands and refound the monasteries gives the measure of her failure. The mass of the English people in this period seem to have acquiesced silently in the vagaries of their rulers. But Mary's persecution of the Protestants gave a new fierceness to the Protestant propaganda. When Mary too died in a few years she was broken-hearted at her failures, and at the neglect of her husband, the great Philip of Spain, who had married her for political advantage.

Her half sister Elizabeth, the daughter of Henry and Anne Boleyn, the greatest Tudor of all and the most cynical, restored the Protestant faith. Singularly like her father in character, with a veneer of frivolity and vanity, a heritage from her mother, Elizabeth grappled with the problem of England's faith entirely in a political spirit.

She too declared for a *via media*, but the line was drawn nearer to the side of Protestantism. Avoiding the use of the title of "Head of the Church," somewhat anomalous in the case of a woman, she used all the substantial privileges of the position.

Catholics were hunted out and persecuted all through her reign, mainly because they seemed to threaten the political integrity of the realm.

Puritans, too, were persecuted for their extreme Protestant teaching. But the Elizabethan religion was accepted meekly by the bulk of Englishmen. The queen herself roused inordinate enthusiasm. She was, indeed, a consummate politician, and was determined to keep England in the forefront of the nations.

Elizabeth became queen in 1558, and for nearly thirty years, during which there was every motive for war, she kept England at peace. She dangled the prospect of her marriage as a prize or a menace before the eyes of the chief statesmen of Europe. She withstood her subjects in their insistent demand for war with Spain.

The Counter-Reformation.—From the first Spain had clung to Catholicism, and Philip II, who had succeeded to the great Spanish possessions in Europe and the New World in 1556, was the most ardent champion of that counter-Reformation within the Church which had followed hard upon the heels of the Reformation.

At first the counter-Reformation was but the reforming movement from the Catholic standpoint. Its leaders were anxious and hopeful for reconciliation with the Protestants. But the Council of Trent, which sat from 1545 to 1563, and engaged in a vast work of doctrinal definition, naturally moved no jot in the direction of Protestantism, and when the Council ended it was already realized that there could be no compromise.

But the papacy was now furnished with a vast army bent on winning back the Protestant lands to the old Faith. The Spanish nobleman, Ignatius of Loyola, had brought into being in 1540 that wonderful society known as the Jesuits; and some of the older orders too had received a new impetus to better things.

The Jesuits catered above all for the education of the young. Each member spent himself for the Society and the Church. Jesuits secretly carried consolation and religious rites to the proscribed Catholics of Elizabethan England. Ultimately they won or kept all South Germany for Catholicism.

The Struggle between England and Spain.—The battle of the two religions is the main motive in the history of the second half of the sixteenth century. It was the avowed cause of the hostility between England and Spain, but there was added to this rivalry on the sea and in the New World.

That wonderful outburst of energy which had made the Spaniards the leaders in the new exploring movement had given them possession of practically the whole of South America, and the English sailors who were waking up to adventure in the early days of Elizabeth felt that they had been taken unawares.

When the Spaniards defended their monopoly of trade to South America the English made reprisals by what was really open piracy on the high seas, and seized the treasure from Spanish ships sailing homeward from Mexico and Peru.

The Spaniards adopted the plan of assembling all such ships in the mouth of the Plata River, so that they might sail together for mutual defence. The prey was but the more tempting, and English attacks on the "Plate Fleet" became a regular feature of the period.

The tales of the sufferings at the hands of the Inquisition of English sailors who were taken prisoners served to fan resentment in England. But Elizabeth held her hand.

She would not send help to the Low Countries struggling for their liberties, but some of the bravest and best of the Elizabethan courtiers and soldiers like Sir Philip Sidney went as volunteers to fight for liberty and Protestantism in the Netherlands.

The purity, nobility, and high aims of many of the great Elizabethans have passed into a proverb, but there is a psychological incongruity between them, and an age in which Elizabeth, the astute Catherine of Medici, the Queen Regent of France, and the good-tempered but cynical Henry IV of France controlled the fate of nations. The explanation would seem to be that these others were dreamers full of the real enthusiasms which the cynical rulers manipulated to further their schemes. After all these Protestant Englishmen had more in common with their arch enemy Philip than with their own queen, whose real personality they were ill acquainted with, for to them she was the Gloriana of Spenser's poetry, the virgin queen, a centre for their loyalty and high religious aim.

The Southern Netherlands were fighting only for political liberty. They were Catholic in feeling, while the Northern provinces were Protestant. Philip had begun his reign by trying to stamp out the liberties of the Netherlands. His instrument was the Duke of Alva, whose cruelty and relentlessness were a byword in Europe. Finally these Catholic provinces remained to Spain with their liberties guaranteed, but the Northern provinces broke away and became the Dutch Republic.

The Armada.—But before this the tacit struggle between England and Spain had become open and declared, and the "Invincible Armada" of great warships fitted out by Philip had been shattered in 1588 by the superior seamanship of the lower lying vessels of the English fleet and by adverse winds in the Channel. An event which had precipitated the Armada fight was the execution in 1587 of Mary Queen of Scots, who had fled to England from her rebellious Protestant subjects nineteen years before, and been kept a prisoner ever since.

Mary was looked upon by the Catholics as the legitimate Queen of England, for they could not consistently acknowledge the right of the daughter of Anne Boleyn. In point of fact many Catholics were content to recognize the *status quo*, but the more zealous and those who were driven to desperation by the wearing persecutions of which not the least detestable were the fines for recusancy, which threatened to impoverish many of the best English families, naturally longed for a new regime, and looked to the romantic and beautiful Queen of Scots as a centre for their hopes.

The condition of the Catholics shows as a dark background against the brilliance of Elizabeth's reign. As time went on, and the counter-Reformation gathered strength, the Queen of Scots appeared a real menace, and the Babington Plot gave colour for her trial and condemnation.

The defeat of the Armada was the deathblow of Spain's greatness. Though treasure still poured into her coffers from the Indies she fell from the first rank among nations. From this time too dates England's supremacy on the seas, and simultaneously the high-water mark of Elizabethan brilliance is reached. The great plays of Shakespeare were the literature appropriate to the period.

Elizabeth refused the urging of Englishmen to pursue her victory to the complete destruction of Spain. She was anxious to balance Spain against the power of France.

The Wars of Religion in France.—France had been the prey of faction all through the century. Since the death of Henry II in 1559 Catherine de Medici, his widow, had really ruled the country for her weakly sons who succeeded each other rapidly. The eldest of them, Francis II, was the first husband of Mary Queen of Scots, and it was soon after his death in 1560 that she returned to Scotland.

The fight between the Reformation and counter-Reformation took the form of civil war in France. Although Protestantism had been severely repressed by Francis I, the contemporary and rival of Henry VIII, and by Henry II, many of the nobles were Hugue-

nots. At their head was Admiral Coligny, the chief of the Navarre branch of the French royal family, and next in succession to the throne after the sons of Henry II, who were all childless. They naturally had a strong Huguenot following. Opposed to them was the ultra-Catholic party led by the family of the Guises, always working in the interests of Spain, for the domination of French politics was one of the many dreams of Philip II to be shattered like the rest.

Catherine de Medici steered for the most part a middle course between the two. But in her foreign policy, because of her dread of Spain, Catherine leaned to the support of Protestants. For religion made very little difference in the relations between states. It was only used as a pawn in the game. The Catholic powers of France and Spain were intensely jealous of each other, and Catholic France frequently helped Protestants abroad.

The period saw two wars of religion in France ending with truces giving some measure of toleration to the Huguenots. But Catherine's passion was the maintenance of her own power, and she discovered with terror a leaning to the Protestants in her son Charles IV. She determined to aim a deadly blow at the Huguenots. The result was the Massacre of St. Bartholomew in 1572, when the thousands of Protestants in Paris for the celebration of the marriage of the Huguenot Henry of Navarre to Catherine's own daughter were struck down on all sides. Henry of Navarre was spared, but the Admiral was slain.

Massacres of Huguenots followed throughout France, but Catherine was a little cowed by the force of Protestant opinion against her, and three years after the massacre some degree of toleration was again granted to the Huguenots.

When Catherine's son, Francis of Anjou, died in 1594, Henry III alone was left, and Henry of Navarre was his obvious successor. But his religion stood in his way, and the Guises fought hard to keep him from being recognized as heir. Henry of Guise dominated the unwilling Henry III, and the War of the Three Henries was fought. Henry of Guise and the king were assassinated in turn.

The Catholic "League" tried hard to prevent the succession of Henry of Navarre, but his conversion to Catholicism, purely a matter of calculation, cleared his way to the throne. He became king as Henry IV of France in 1598, and soon after issued the Edict of Nantes, granting toleration and some measure of political independence to the Huguenots.

A genial if somewhat cynical ruler, Henry IV, always on the basis of absolutism, began many reforms in France. He strove to organize finance and stimulate commerce and adventure, but his time was short. He was struck down by the hand of a fanatic in 1609 as he was about to lead an army into Germany to interfere, always with the idea of the aggrandizement of France, in a civil war of religion which was threatening there.

The Thirty Years' War in Germany was a belated war of religion, but even in Germany the real motive was political, and for Europe at large the war became a focus for political rivalries and ambitions.

The seventeenth century has a different interest from the sixteenth. It saw less vital changes, and was rather a period of settlement and readjustment.

The change is perhaps best emphasized in England where, with the death of Elizabeth and the accession of James VI of Scotland as James I of England, the texture of English history seems to change. In England as in other countries religion and religious differences still form a powerful motive, but the constitutional problem looms larger. England was the only country which passed through a constitutional crisis at the period, but elsewhere too political activity swamped the concentration on religious problems which had marked the period of the Reformation.

THE SEVENTEENTH CENTURY

The seventeenth century reaped much of the fruition of the Renaissance movement. It is much more modern in tone than the sixteenth century, less fantastical, more sober, much further removed from the Middle Ages. Charles I of England, the century's "tyrant," is very different from Henry VIII, a typical tyrant of the sixteenth century. In England the Raleighs and Sidneys, with their peculiarly Elizabethan air of adventure and poetry, are replaced by the Cromwells, Pyms, and Hampdens, men with equally high but changed ideals, and the change is but typical of a transition which affected life in Europe generally. The Thirty Years' War, which focuses the attention and activities of the chief European nations in the first half of the century, is mediæval and lurid enough in its details, but it has a somewhat different character from the religious wars of the previous century. It becomes a centre for a larger and more cynical diplomacy.

In Germany the Emperor Charles V had spent a long life in trying to reconcile the reforming movement with the Church, but had been obliged to accept a *modus vivendi* which gave each prince substantially the power to control religion in his own state. By the Peace of Augsburg in 1555 the Lutheran princes in Germany had the possession of their states confirmed to them, but a clause provided that future converts to the reformed religion must give up their states, and no consideration of the position of Calvinists entered in.

This resignation by later converts to either branch of the reformed religion never in effect took place, and at the beginning of the seventeenth century Germany bristled with problems arising from this cause. Substantially the North of Germany was Protestant while the Southern States had retained or been won back to Catholicism.

The accession to the Empire in 1619 of Ferdinand of Styria, a pupil of the Jesuits and a typical product of the counter-Reformation, was the signal for a new trial of strength between the arrayed forces of Catholic and Protestant Germany. Previous emperors had automatically succeeded to the thrones of Hungary and Bohemia as well as their Austrian dominions, and Ferdinand had already been recognized as heir to the throne by the Bohemians. But Bohemia was Protestant, and the actual accession of so ultra-Catholic a ruler alarmed them, and, declaring that the succession to the Bohemian throne was strictly elective, they now repudiated Ferdinand, choosing in his stead Frederick the Elector Palatine. The Elector was a Protestant, and as the Crown of Bohemia carried with it a vote in the election of the Emperor, a preponderance would thus have been given to the Protestant votes. The Catholic princes ranged themselves on the side of the Emperor and the Thirty Years' War began.

The Thirty Years' War.—It lasted with intervals from 1618 to 1648. The Lutheran princes stood aside at first, because Frederick was a Calvinist and because too the Emperor rewarded them for their neutrality. But the struggle between the Emperor and the Elector ended with the complete defeat of Frederick in the Battle of the White Hill at Prague. He lost not only Bohemia but the Palatinate as well. Spanish troops had poured in to help the Catholics, and it was the fear of the undue advance of the Hapsburg power which led France to go to the help of the German Protestants. The Lutheran princes were roused too, alarmed at the repressive policy adopted by the Emperor in the conquered territories. Outside European powers were involved from various causes. Protestant Sweden was a natural partisan of the Lutherans by reason of its aggressive Protestantism and a natural enemy of Catholic Poland because Sigismund, King of Poland, had been deposed from the throne of Sweden for his Catholicism. Poland was a natural ally of the Catholic Emperor.

Protestant Denmark too was involved by reason of Holstein, which it held as a fief of the Empire.

Russia, a Slavic nation, after its long mediæval subjection to the Mongols had taken on an Asiatic character. But Russia too had had a sort of Renaissance of its own, when it threw off the Mongol domination in 1462, and from this time Russia began to look westwards. Her religion was and has remained that of the Orthodox Greek Church, but it was political and not religious considerations which involved her too in the Thirty Years' War. In the sixteenth century Russia had won her way to the Caspian Sea, and she was anxious now to win a Baltic coast. Here she was baulked by both Sweden and Poland.

The Thirty Years' War is a curious record of bloodshed and passionate strife with curiously little result.

It is divided into periods according to the predominance of some one opposing power. There was the Danish period in which Christian of Denmark was defeated by the Imperial armies under Tilly and by the brilliant Bohemian adventurer Wallenstein.

France under the great Cardinal Richelieu, the regent for the young King Louis XIII, who had succeeded Henry IV, contented itself with the weapons of diplomacy. It was Richelieu who manœuvred a peace between Sweden and Poland and so set Gustavus Adolphus, the hero of Swedish Protestantism, free to champion the Lutheran princes in what is known as the Swedish period of the war. Wallenstein, who had become the leading figure in Germany, was full of dreams of a revived and all-powerful Empire. The religious question was indifferent to him, but Ferdinand saw things quite otherwise, and in 1629 the Edict of Restitution by which all bishoprics lost to the Church in the last seventy years were to be restored, stimulated alike the wrath of the German Protestants and the zeal of Gustavus Adolphus. Wallenstein had fallen into disgrace when the Swedish king started on a victorious advance through Northern Germany, but the Empire's need brought his recall. It was a duel of giants, but it ended with the death of Gustavus Adolphus on the field of Lützen in 1633. A year later Wallenstein was murdered and the war degenerated into a confused series of struggles, with the Swedes fighting for their own hand and France ever fomenting hostilities for the weakening of the Empire.

The Peace of Westphalia, as the series of treaties which ended the war in 1648 are called, marked the death of the Empire's larger hopes. The German states had become independent with a nominal allegiance to Austria, which, with the kingdoms of Hungary and Bohemia, stands out as a great European power by reason of the extent of its territory, and not because of its claims to Empire. France had been growing steadily stronger, taking on a military character, so that it is she and not the Hapsburg power which becomes a menace to Europe in the next period.

The religious question remained much as it was before the thirty years of warfare, of which it was the ostensible motive, but the privileges given to the Lutherans by the Peace of Augs-

burg were now extended to the Calvinists, and there was a character of finality about them which the earlier settlement had not possessed. The son of Frederick the Elector Palatine got back the Lower Palatinate while the Upper Palatinate went to Bavaria. Some German princes gained, others lost, territory as the net result of the war, but to Germany it was all loss. The land had been laid waste and half the population stamped out. Other peoples, and especially France, had made capital out of her sorrow. Meanwhile England, isolated from the politics of Europe, had been passing through the sharpest crisis in its history.

The Constitutional Crisis in Seventeenth-Century England.—On the death of Queen Elizabeth in 1603 the crowns of England and Scotland were united in the person of James VI of Scotland and I of England, the only child of Mary, Queen of Scots. With his accession a new period seems to begin in English history, though the last few years of Elizabeth's reign had already taken on something of the colour of the new time. There had been in these years a kind of pause. Many classes of Englishmen desired change but had waited with a sort of courtesy until the Queen's death. Religion and politics were both ripe for readjustment. At Elizabeth's death there were roughly three phases of religious thought and feeling in England though with endless subdivision. There were the Anglicans, of whom a large class, with a rebound from the aggression of the Reformation, were looking with regret to the lost ceremonialism of mediæval times. There were the Puritans, with their passionate dislike for form and their insistence on the all importance of spirit in religion, and there were the Catholics, a persecuted and proscribed minority clinging to every detail of Catholicism. Each of these classes hoped much from the new reign. The Puritans, who had been ruthlessly persecuted in the latter part of Elizabeth's reign, dwelt on the fact that James had been brought up in Presbyterian Scotland. The Catholics remembered that he was the son of the martyred Queen of Scots, but it was in Anglicanism that James found the most congenial form of Faith. To the disappointed Puritans at the Hampton Court Conference he reiterated his clinching argument that "No Bishop" meant "No King," and in these words lay the kernel of the century's history in England. The Catholics were almost equally disappointed, and the more desperate gave expression to their chagrin in the "Gunpowder Plot" of 1605.

Fixed in his ideas about religion, James had equally unwavering notions of the functions of kingship. From the first there was friction between him and his parliaments mainly on the question of foreign policy. On this James brought to bear all the force of his subtle but unpractical mind, and only succeeded in alienating his people and depreciating England in the eyes of foreigners.

But apart from James's fatuity Parliament had been very much on the defensive from the first, and had in so many words warned the King that much that had been tolerated under Elizabeth in the relations of Crown and Parliament must now be changed.

The English Parliament.—The history of the English Parliament since its beginnings under Edward I had been very chequered. In the fourteenth century the House of Commons, consisting of the knights of the shire and burgesses chosen by the shires and towns, had secured the control of taxation and an approximation to the power of lawmaking in its "petitions" which, if they received the consent of the King and the Lords, became *Statutes* or *Acts of Parliament*. The King had to put the question of war or peace to Parliament, and even the opposition of the nobles to the King had to find expression through Parliament.

With the accession of Henry IV with a parliamentary title and through the greater part of the fifteenth century Parliament claimed to control the King's action more and more. In an age which needed, above all things, a strong executive this excessive control merely hampered the royal policy. Still the fact that the Lancastrian parliaments won for themselves the supervision of the nomination of the King's Council, the appropriation of supplies, and the audit of accounts furnished valuable precedents at a later day when Parliament was really ripe for government.

The Yorkist kings found themselves in a position almost to ignore Parliament, and with the destruction of the old nobility in the Wars of the Roses a new spirit enters in. The Tudor despotism used parliaments as a mere tool. The new nobility, lay and ecclesiastical, under Henry VIII were the creatures of the new dynasty, and this discounted the opposition of the Lords. The Commons, like the classes they represented, were consciously or unconsciously glad of peace at any price. Still the Tudors kept all the forms of parliamentary rule. There was no browbeating, and the King's will became law through Acts of Parliament. During the last few years of Elizabeth's reign there had been signs of restiveness which presaged a new time. Even from the death of Henry there had been a more critical spirit towards Government proposals, and under Elizabeth Parliament had shown sufficient initiative to introduce important bills and offer advice on subjects of public interest in spite of the Queen's assurance to them that it was their business only to say "aye" or "no." When in its last session Elizabeth's last Parliament protested against certain monopolies granted to the Queen's favourites, she immediately and gracefully bowed to their will.

The Tudors were practical, and their very coarseness of fibre procured and preserved their popularity. The Stuarts, in reality less grossly tyrannical, offended by their very idealism. Their attitude is illustrated by their constant emphasis of the "divine right" of kings, by which they meant not the Tudor theory of the divine right of the King *de facto*, but the hereditary fore-ordained right of the legitimate king. James's view that the Parliament existed by grace of the King was met by the hot retort that their rights were "of right and not of privilege." In a controversy of this kind endless precedent may be quoted to support either point of view. In the wordy war under James and the sterner struggle later Parliament continually demanded that the King should show statutory support of his claims. This was impossible in an unwritten constitution.

James had a keen eye for legal points and stretched his claims to the uttermost, as when he largely extended the customs by the "impositions" against which the Parliament protested but which the judges pronounced legal.

Charles I reaped results from his fathers' unpopularity. Parliament, now very much on the defensive, granted Charles at the beginning of his reign tonnage and poundage for one year only instead of for life, as had long been the custom. Charles declared that by non-user the right of Parliament to limit the grant thus had lapsed, and levied the ordinary customs in defiance of Parliament. Five knights were sent to prison for refusal to pay, a fact which led to the passing of the *Petition of Right* in 1628 to be followed only by a new breach in 1629, after which Charles ruled without a Parliament for eleven years.

Meanwhile the religious situation became acute. The Petition of Right had declaimed against innovations in religion, by which was meant the mediæval ceremonialism of the Arminian school of which Charles's friend, Laud, Archbishop of Canterbury, was the chief exponent. Not content with imposing his views on the English Church, Laud tried to force a new prayer book very similar to the English Prayer Book on the Scots. This was deeply resented, and the Scots took up arms against the English King.

The ordinary royal revenue, the King's "own," had never proved adequate to the royal expenses in time of war. With strict economy and straining law and precedent to the uttermost, Charles had been able during eleven years of peace to dispense with parliamentary grants, but the "Bishops' Wars" forced him at last to call a Parliament, the "Short Parliament" as it was called, for, refusing to grant supplies until grievances were redressed, it was almost immediately dissolved. But things were at a deadlock, and by the advice of his friend and chief minister Wentworth, Earl of Strafford, Charles called the famous "Long Parliament," during whose chequered sessions the duel between King and Parliament was fought out.

The Long Parliament.—The Long Parliament attacked every detail of Charles's administration. It impeached Strafford and Laud, and executed first the one and then the other. The Puritan element in the Parliament had become furiously adverse to every conservative element in religion and politics. They passed a triennial act by which Parliament was to be called at least every three years, and the existing parliament was not to be dissolved without its own consent. The Puritans designed to render the King a mere figure-head and to reform the Church in a Puritan sense.

So far they had had a free hand, but in May 1641 the *Root and Branch Bill*, which designed to abolish Episcopacy in the English Church, gave the King a party. Outraged conservatism became ostentatious loyalty. The partisans of the King were not in favour of tyranny, but they were averse from the radicalism of the Puritans. They formed a Constitutional Royalist party. On August 22, 1642, Charles set up his standard at Nottingham, and the "Great Civil War" began. It ended with the execution of the King on January 30, 1649.

At length the Puritan policy had its chance, but the difficulties of revolutionary constitution-making received piquant illustration in the career of the arch Puritan, Oliver Cromwell. He called parliament after parliament, only to dissolve them when they showed signs of that spirit of independence which had been the battle-cry of the party, with the impatience of the strong man for inefficiency he overruled opposition and governed—a completer tyrant than ever Charles had been. Like all such tyrannies, it passed with the tyrant, and but a few months after Cromwell's death England eagerly restored the son of the martyred King. Charles II entered London in triumph on May 29, 1660, and so began the period of the Restoration.

The parliaments of the Restoration were more violently Royalist than the Crown itself. The genial, cynical, and pleasure-loving Charles II was ostensibly as facile a ruler as any parliament could desire, but the parliaments of these days desired only the triumph of Church and King. The Puritans became a proscribed and peculiar people. The Puritan element was relentlessly excluded from the Church, and a strict line was henceforth drawn between Anglicans and "Non-Conformists."

Yet Charles, the most popular of all the Stuarts, was by no means in sympathy with Anglicanism. He was by conviction a Catholic, and had a real desire to see the lot of the Catholics in England improved. He had no animus against the Dissenters, and was prepared

to extend toleration to them as the price of Catholic Emancipation. To this end he plotted with the French King, Louis XIV, whose aim was to make himself arbitrator of Europe. The aggressions of Louis XIV were a menace to England as to other European countries, but Charles's policy was never one of patriotism.

Fortified by a secret treaty with Louis in 1670, Charles two years later issued a Declaration of Indulgence to Catholics and Dissenters alike. But he had to bow before the storm which met it, and it was revoked. Some inkling of the King's plans for a Catholic Restoration made possible the panic retaliations consequent on the spurious "Titus Oates" Plot. Charles spent the rest of his reign in calmly manœuvring against the angry parliaments, who would have excluded his brother and heir, James, Duke of York, from the throne. He manœuvred so well that the Whigs, as the Exclusionist opposition were called, fell entirely into disrepute, and for the last four years of his reign Charles ruled without Parliament, but with the entire sympathy of the Tories and the Church.

His reign, in spite of the furious loyalty of its commencement, shows that the relations between Crown and Parliament were in a state of tension. The struggle had yet to be settled.

The English Revolution.—The character of James, Duke of York, who ascended the throne of England on the death of Charles in February 1685, was the determining factor in the nature of that settlement. James was avowedly a rigid Catholic. During the three years of his reign in England his main object was the promotion of the welfare of his co-religionists. With this aim in view he claimed to override the accepted laws of the land by a free use of the "suspending" and "dispensing" powers. In the first year of his reign James dismissed parliament for refusing to repeal the *Test Act.* The next parliament which met was the "Convention Parliament," which met after the birth of a son to James had led representatives of almost every party in the State to invite William of Orange, the husband of James's daughter Mary, to come over from Holland and protect the liberties of England. James had fled to France, and the Convention declared that he had abdicated. William of Orange became William III and with Mary joint ruler of England.

With the accession of a ruler chosen thus, the parliamentary victory was assured. William III's chief aim, as we shall see, was the fighting out of his life duel with France. He chiefly valued England as a source from which to get money for the fight. As always, Parliament found its chief strength in its control of taxation.

The eighteenth century merely worked out in detail the parliamentary victory won by the Revolution of 1688. The weakness of Anne, the sister of Mary, who succeeded William in 1702, put no check on Parliament. The foreign character of the first two Georges, who did not even attend, for lack of English, the Cabinet meetings, gave over to Parliament control of the executive as well as the monopoly of legislation already won. The royal veto disappeared, and the party system and Cabinet government were developed. George III, "born and bred a Briton," tried once more to override Parliament, and, in the words of his mother's exhortation, "be a king," but he had to bow in the end to forces too strong for him, and his attempt is but an interlude in the steady development of parliamentary government which must, however, be distinguished from "democracy." Democratic government in England was not achieved until the nineteenth century. It has seemed well to sketch the developments ahead, which were the result of the constitutional struggle of the seventeenth century, but other aspects of that period must be briefly indicated. Intimately connected with the religious and political movements of the time, the seventeenth century saw on the part of Englishmen a vast impulse to expansion. This led to the beginnings of that stream of colonization which has since been a so romantic and significant feature of England's history.

English Colonization in the Seventeenth Century.—Elizabethan adventurers had awakened somewhat later than the Spanish and Portuguese pioneers to the marvellous possibilities of profit and adventure in the newly-discovered portions of the world. They soon outdistanced their predecessors in daring and endurance, from the brave seekers after a North-West Passage to the explorers of the Pacific Ocean and the deserts of Central Asia. But the one project of actual colonization, Raleigh's plantation of Virginia, was a failure. The difficulties seemed insurmountable, although France and Spain had both already made successful colonies overseas.

But with the beginning of the seventeenth century a determined series of efforts planted English colonies along the Eastern coast of North America. Virginia, successfully planted at last, became the home of aristocratic landowners, loyally Anglican in religion, and working their immense rice and tobacco plantations with the labour of the negro slaves, who had been imported in large numbers from Africa, since Sir John Hawkins had conceived the brilliant but brutal idea of their transportation.

The success of the Virginia plantation led to a long series of successful colonial enterprises. Far to the north of Virginia rose the group of "New England" colonies, the first of which was Plymouth, founded by the "Pilgrim Fathers" in 1620. But as Puritanism too had its shades, and these would not tolerate dissent, other groups of Puritans formed new colonies near, the greatest of which was the "Inde-

pendent" colony of Massachusetts, in which no man might stay unless he belonged to an "Independent" church. The little colony of Rhode Island alone granted toleration to all sects. These Northern colonies were different in character from Virginia. The soil was less fertile and demanded more labour, but the climate allowed of the use of white labour. At first Plymouth had declared for a socialistic arrangement, but here as elsewhere each man soon built himself a house and claimed appropriate lands, and the population consisted mainly of farmers. They were a hard-headed, thrifty, and stern people. They did not use negro labour to any great extent, because they had little use for it, but they stamped out the native Indians without pity. Their idealism showed itself in a zeal for education, which led to the early foundation of such centres of learning as the John Harvard College near Boston.

By conquest or by settlement England had won thirteen colonies on the Eastern coast of North America by the end of the seventeenth century. Lord Baltimore had founded in 1632 a proprietary colony where toleration was given to Catholics, who formed the bulk of the population. It was called Maryland. The Quakers found peace in Pennsylvania, founded by William Penn in 1682. The Carolinas had been planted out twenty years before. These Southern colonies resembled Virginia in their aristocratic character. Between them and the democratic North, and resembling the North in character, were the New Netherlands, won from the Dutch and resolved by the conquerors into New York and New East and New West Jersey. The winning of these colonies in 1667 leads us to consider what had been the relations between England and the other countries of Europe during this period.

The Struggle for Sea Power.—During the period of the Civil War in England she had very little part in European politics, but during the Commonwealth Cromwell by a vigorous foreign policy increased the nation's prestige in the eyes of Europe. He favoured France in opposition to Spain, for though Spain was rapidly on the decline the tradition that she was formidable remained, and to Cromwell she was still the symbol of Catholic aggression. By his policy Cromwell helped to increase unduly the power of France.

The little republic of Holland, formally recognized as such by the Treaty of Westphalia, looms large in this period. She had preceded the other nations in setting up trading stations on the coast of India and in the Eastern seas, but they had been speedily imitated by both France and England. There was keen rivalry in these parts, and after a fight between the English and Dutch at the "Massacre of Amboyna" in 1623, the English abandoned the East Indian islands, but soon after English settlements were made at Calcutta, Madras, and Bombay, which afterwards became the centres of the three great Presidencies of the British Empire in India. Holland took rank at this time as a first-class power, a position which she had won by way of accident and to which her size did not entitle her. She had practically secured the monopoly of the carrying trade of the world, but the *Navigation Act*, passed under Cromwell in 1651, crippled her monopoly for ever. For the future goods carried into England or any of its colonies must be brought by English ships, or ships belonging to the country from which the goods came. The Dutch fought hard against this provision. Under Cromwell, as again under Charles II, the great generals on both sides were almost equally matched (for the Commonwealth had revived the English fleet as well as the army), but in the end the Dutch had to give way on the subject of their carrying trade, and incidentally lost the New Netherlands as well.

After this France became England's chief rival in America and on the seas. Canada had long been claimed by the French, who had colonized it to the east as England had done the coast further south. France had also colonized Louisiana, and towards the end of the century a plan was formed to unite this with Canada by a chain of posts along the Mississippi. This would have meant the prevention of the expansion of England's North American colonies westwards. England had other grievances against France at this time, when France had so dominated Europe that this period of European history is generally labelled the "Age of Louis XIV."

209

The Age of Louis XIV.—Louis XIV ascended the French throne in 1643 and reigned until 1715. He was a man of some ability and vast ambition, and he had good material to build upon in the work for the strengthening of France, which had been achieved successively by the two great ministers, Cardinals Richelieu and Mazarin.

Louis' first minister was Colbert, and under him France made the only great efforts she has ever made towards colonization and development of sea power. Trading companies were formed as in England and Holland, but these were not given a free hand, having to work under State supervision. For the first time too France had a considerable navy.

But it was in Europe itself that the ambitions of Louis really lay. The army was increased and scientifically trained. For years Spain was ruled by a sickly boy without heirs, whom all expected to die at any moment. Louis, who had married a Spanish Infanta, was ever seeking gain from the arrangements about the "Spanish Succession." He saw in time that he would never secure Spain, but all through his reign he was making new claims, his object being to extend the boundary of France to the Rhine

on the east and to absorb the Spanish Netherlands.

Once established in the Netherlands, France would have been an incalculable menace to Holland, and William of Orange became the recognized champion of Europe against Louis.

Time after time Louis defeated the Dutch, but it was the genius of the stubborn stadtholder that the minimum of gain resulted to France from those victories. The story of the heroic Dutch resistance is writ large in history.

When William became King of England she was inevitably involved. Louis roused English hostility by his promise to the dying James II to push the claims of his son to the English throne. So it was that even after William's death England stood in the forefront of Europe's struggle with France; for all Europe was thoroughly alarmed by this time. The genius of the great English general, the Duke of Marlborough, wrested from France the results of half a century's battles.

Peace was at last signed in the Treaty of Utrecht in 1713, and bounds were set for nearly a century to French aggression. The danger of France and Spain being united under one ruler was averted. The Spanish Netherlands, fettered by Dutch "barrier fortresses" against France, went to Austria. England won a foothold in the Mediterranean by the acquisition of Gibraltar and Minorca, and France yielded up to her in America Newfoundland, Nova Scotia, and the Hudson Bay Territory.

In spite of his failure, France under Louis XIV had dominated Europe morally. She had set the standard in manners and literature. It was the age of France's greatest writers and most famous preachers, and the European courts, even the Russian court emerging from barbarism under Peter the Great, took the French court as its model.

Yet Louis had offended opinion everywhere by his merciless treatment of the Huguenots, the peaceful and thrifty Protestants of Southern France. After the Revocation of the Edict of Nantes many of these were killed and many more fled, so depriving France of a valuable commercial element in its population.

France was to pay later for this, and still more for the financial drain which the magnitude of the wars had made on her resources. The Treaty of Utrecht marks the real end of the seventeenth century.

THE EIGHTEENTH CENTURY

The eighteenth century has a character peculiar to itself. It was an age of classicism in literature and cynicism in politics. The religious motive sank into the background everywhere. The sects had taken final form. There was still persecution and proscription, but the grievances of proscribed sects, as of the Catholics in England, arose from penal laws already in force and not from any new initiative against them. There was indeed a new spirit of toleration growing up, arising mainly from indifference. In England as elsewhere there were classes who tended to despise all dogma and hold loosely to a vague Deism. Before the end of the century, and especially in France, a class of confessed atheists had grown up.

The mass of people in England as elsewhere, though not irreligious, were not enthusiastic. Religion ceased to be the main preoccupation of great masses of men, as it had been in the sixteenth century and remained largely in the seventeenth.

In England the frivolity among the upper classes, which had marked the rebound from Puritanism at the Restoration, became the prevalent tone of society. Even ripe scholars in eighteenth-century England were hard drinkers and keen gamblers. The periwigs and crinolines, which are distinctive features of the period, seem to symbolize aptly enough the tone of the age, its suavity and leisureliness, its unemotional preoccupation with trifles.

The cynicism of eighteenth-century politics is best seen in the motives and conduct of the successive European wars which fill the period, wars important not only from a European point of view but because they determined to England possession of India and North America.

The War of the Spanish Succession (1740-1748), in which the great European powers formed into two camps for or against the Empress Maria Theresa, the first woman to rule Austria in her own right, left the relations of the powers much as they stood at the beginning. It decided only that Maria Theresa should keep Austria, and gave the Austrian province of Silesia to the new little kingdom of Prussia, into which the Electorate of Brandenburg had been developed by a succession of able rulers. Frederick the Great of Prussia divides with Catherine of Russia the reproach of the supremest disregard for any motive but their own profit.

In the "Seven Years' War" (1756–1763) there was a remarshalling of forces. England fought on the side of Prussia against France and Austria. Maria Theresa was bent on recovering Silesia, and the colonial rivalry of England and France made them inevitable enemies. It was while the European war was taking its course in Germany that a few men of genius won Canada and India for England. But it is easy to exaggerate the part played by a Wolfe or a Clive. In point of fact, there were already more English colonists in Canada than there were French, and as India could be won only by the landing of European troops the power which had the command of the sea had an irresistible advantage. The great French-

man Dupleix, so keen to win India for France, never had the chance which came to Clive.

The Fight for India.—The Portuguese had, after their discovery of a new route to India in the fifteenth century, tried to monopolize its trade, but the Dutch soon began to trade with the towns on the east coast, and before long France and England both set up trading stations in India too. The chief English stations were Calcutta and Madras on the east coast and Bombay on the west. The chief French station was Pondicherry, south of Madras. It was Dupleix, the Governor of Madras, who first realized how easy it would be for a European power to win India for itself.

India had in it every element of disunion. The north belonged largely to the Aryan race, which had poured into India at the time that another branch was journeying to Canaan.

There were traces too of the Dravidians, a negro race which they had conquered, and these prevailed in the south over the Aryan element. After the brilliant but unsubstantial victories of Alexander the Great India suffered no invasion for many years. Then successive Mohammedan hordes poured in to conquer, so that there are more Mohammedans than there are Hindus in India to-day.

In the early part of the sixteenth century a band of Mongolians from Central Asia invaded India, and the "Great Mogul" set up his capital at Delhi. After two centuries of splendour the Mogul Empire broke up. The viceroys of the Emperor everywhere became independent princes, and there was no longer any sort of unity.

Such was the state of affairs when England and France made India a battleground in the wars of the eighteenth century.

The genius of Clive and the superiority in sea power of England over France determined the struggle, and India was won for the English.

At the end of the "Seven Years' War" France had no foothold in North America or India. The East India Company was given the practical control of British interests in India. Hardly had England won these enormous accessions to her Empire when she lost, for good and all, her original North American colonies.

The War of American Independence.—The eighteenth-century theory of colonies granted them very little independence of the mother country. In point of fact, the North American colonies had a large degree of self-government through their legislative assemblies. These were subject through their governors to the English Crown, but naturally had complete freedom in local affairs. But England had rigidly assumed from the beginning the right to regulate the trade of her colonies. Her regulations had been skilfully evaded by a vast system of smuggling, but the right had never been denied. The expenses of the European wars, which had been largely financed by England, led to an attempt in 1765 to impose a "Stamp Act" on the Americans, which was in the nature of direct taxation. Indignation led to its withdrawal, but George III and his ministers, having lost the profit, were determined to save the principle, and imposed an irritating tax on tea, which was not even a source of gain to the mother country.

The result was a complete breach. The "War of American Independence" ended in the recognition of the independence of the United States of America in 1783. The new nation was a federal republic under a president. Gradually new colonists pushed their way westward until to-day the republic stretches from sea to sea. Every year thousands of emigrants from every country in Europe pour into the "States," to become Americanized in language and mode of life in a marvellously short time.

There was really no inevitable reason why this great progressive people should not have remained in the British Empire. The breach was the result of mere blundering. England did not by any means immediately realize that eventually she would have to grant self-government to all her colonies, but there was never again such a deadlock. For over fifty years longer neither Canada nor any other British colony received any greater degree of self-government than the North American colonies had had before the War of Independence.

But in Canada the French settlers were conciliated in every possible way and the colony never swerved from its loyalty. Numbers of "Loyalists" from the "States" sought a refuge there, and so strengthened the English-speaking element in the population.

The progress of Canada, especially in the last century, has been no less wonderful than that of the United States. It too now stretches from sea to sea, and a vast number of emigrants land yearly on its shores.

In India meanwhile British rule was steadily growing. More and more of the native princes bowed to British sovereignty, while Bengal and the little districts round Madras and Bombay were directly in British hands. The rule of the East India Company, partly through the chances it gave for individual profit, partly through the peculiar difficulties of the situation, proved very oppressive to the natives. The impeachment and trial of Warren Hastings, who had succeeded Clive as Governor of Bengal, revealed a harassing state of affairs. Warren Hastings was acquitted at last, for he had ruled as justly as conditions allowed, but in 1784 a rearrangement was made giving joint control to the East India Company and to ministers of the Crown, an arrangement which lasted until 1858.

The same period which saw, as it were, the making of new nations, saw one of the nations of Europe wiped from the map.

The Partition of Poland.—The partition of Poland has a unique interest, not only by reason of its romantic and tragic appeal, but because it illustrates better than any other event the character of European politics in the eighteenth century.

Russia and Prussia were peculiarly bent at this time on territorial aggrandizement. The Polish province of West Prussia jutted out from the body of the kingdom on to the Baltic, and so divided the two portions of the Prussian kingdom, Brandenburg and Prussia proper. Frederick the Great desired West Prussia as passionately as he had desired Silesia.

The Eastern part of Poland had always been coveted by both Russia and Turkey. The Turks had been driven back from Vienna by the heroic King of Poland, John Sobieski, in 1683, and the first years of the eighteenth century saw an end of their aggression on this part of Eastern Europe. But Russia was still a danger to the Poles.

Poland's peculiar social and political character made it an obvious prey to unscrupulous politicians like Frederick the Great and Catherine of Russia. It was a kingdom, but its king had no power. For any act of government the unanimous consent of the nobles must be obtained. The noble class was exceptionally large in Poland, the only other class being the serfs. Obviously unanimous agreement on any subject occurred but seldom, and the activities of the State were paralysed.

So it was that Russia, Prussia, and Austria on various pretexts were able by successive partitions to divide the lands of Poland between them. Austria joined in the spoil, because she could not afford to allow the nicely adjusted balance in Eastern Europe to be upset as it otherwise would have been.

Individual Polish heroes led forlorn movements against the oppressors, but Poland ceased to be a nation. Polish exiles may be found in every country of Europe waiting and hoping for a day of retribution, which now at least seems at hand.

But before the third and last "partition" in 1795, the eighteenth-century system had received a startling blow in that vast upheaval of forces which have been labelled the "French Revolution."

The French Revolution and the Romantic Revival.—In spite of the eighteenth-century indifference to religion and the general lack of high ideals, the century saw a movement towards political enthusiasms which, by their very intensity, partook of the nature of a religion. These rose to fever heat in France towards the end of the century and brought about the French Revolution, which influenced conditions and events in every country of Europe. The propaganda of the Revolutionary theories and the conservative resistance to them are the dominant notes in history for at least a quarter of a century.

There were all manner of political theories and panaceas rife in the second half of the eighteenth century. The constitutional crisis in England in the seventeenth century had naturally turned the minds of thinkers there to problems connected with the nature of government and the origin of society, and the English philosophers, Hobbes and Locke, had each furnished a theory.

But the eighteenth century was concerned in these problems with a greater ethical interest. There was much speculation on ideal forms of government and discussion of the rights of man, the duties of rulers towards their subjects, and of subjects towards their rulers.

One school of philosophers inclined to hold up benevolent despotism as the ideal form of government. In point of fact, most of the governments of Europe in the eighteenth century were despotisms, benevolent or otherwise. Frederick the Great was in his way a benevolent despot, and his subjects acquiesced in his despotism. The Emperor Joseph, on the other hand, full of schemes for reform to be imposed from above, was met with distrust by his people.

But most political philosophers emphasized the fact that the origin of all government was the will of the people, and insisted on a democratic government as the ideal. It was this theory which became popular among all classes who had leisure and education enough to take any interest at all in politics. Everyone was equally vague as to the actual workings of this ideal democracy. The American revolt against England stimulated political enthusiasms.

But all this vague theorizing and speculation was to concentrate into activity in France. It was through the French Revolution that constitutionalism and democratic principles did at last win their way in Europe, though painfully and with many set-backs. The French Revolution then is the prime factor in modern history.

The French people have a high aptitude for abstract ideas. In the later eighteenth-century discussion about the "Rights of Man" was current coin in the brilliant salons of the highest French society, a society which was to be shattered when the ideas it played with were translated into fact.

The Encyclopædists.—The writers in the great *Encyclopædia*, published in the third quarter of the century, brought a supremely critical spirit to the treatment of all existing institutions. The *Encyclopædia* was edited by Diderot, and had among its contributors the sceptical d'Alembert, and Voltaire, the most iconoclastic spirit of his time. The Encyclopædists indeed were much more critical than they might show themselves in the *Encyclopædia*, and they represented a large and growing school of thought.

The critical spirit might have spent itself on abstractions but for a peculiar conjunction of circumstances which suddenly gave its expression the force and significance of a gospel.

France in the eighteenth century was woefully exhausted by the wars of Louis XIV. Already the exhaustion was felt under his great grandson and successor, the dissipated Louis XV. It was felt still more under the virtuous but mediocre Louis XVI, grandson of Louis XV, who succeeded him in 1765. The country was poor, but the Court was extravagant. The nobles were exempt from all taxation, and so the burden fell on the middle classes and the peasantry. The misery of the French peasantry in the days before the Revolution has often been the subject of exaggeration, as also the degree of their "feudal" dependence on the "seigneurs." There was little or no serfdom in France such as still existed in large tracts of Eastern Europe; still the poor were burdened while the rich went free, and France was threatened with financial ruin.

There is always a tendency in times of discontent to find a panacea for social evils in political reform, and the theorists were now convinced that only representative government could save France. So it was that the States-General, the nearest parallel which France had to the English Parliament, was called and met in May 1789.

The States-General had not met since 1614. There was now immense excitement and hope in France. This was speedily dashed when an order went forth that the three estates—the nobles, clergy, and the "third estate," roughly corresponding to the "Commons" of the English Parliament—should register their votes separately. This meant that the representatives of the privileged classes would inevitably override the third estate. A sharp struggle over this question led to the Commons declaring that they constituted a National Assembly. The members of the other two estates were invited to join them, and a few did.

A royal order to dissolve and the closing of the hall at Versailles, where the representatives had met, was followed by an adjournment to a tennis court near, where the Assembly took the famous oath on June 20 to give France a constitution. So began the French Revolution. The work of giving France a constitution occupied history for many years to come.

In the days which ensued events followed each other rapidly. The National Guard was formed. The Bastille, the frowning Paris prison which had always stood for a symbol of tyranny, was stormed. Those of the nobles who were most alive to the signs of the times hastily left France, and so began that stream of emigration of aristocrats which becomes a feature of the period.

Destructive work the Assembly found easy and performed in abundance. The privileges of clergy and nobility were swept away. But every attempt at constitution-making failed, because the Assembly confounded a strong executive with despotism.

Louis XVI at last tried to escape with his queen and his children from France, but was stopped at Varennes. He was "suspended" for a time, but at length was accepted as the figure-head of the new constitution. The National Assembly was dissolved, and a self-denying ordinance prevented any of its members sitting in the new "Legislative Assembly" which replaced it. Thus France lost the services of the only people with even a limited political experience.

The great bulk of the members of the new Assembly were republicans, and these were divided into the more moderate Girondins and the rabid Jacobins, whose real leaders, Danton, Robespierre, and Marat, were not even members of the Assembly. The republicans took as their gospel the *Contrat Social*, the tract of the famous French-Swiss Jean Jacques Rousseau, whose emotional and sentimental force distinguished him from the more purely destructive and cynical Encyclopædists. Rousseau was above all things a stylist. "Liberty" became a very passion with these men, and the story of the Revolution is witness to the crimes committed in her name.

The War against the Revolution.—Already foreign governments were alarmed at the course of events in France, and Louis XVI and still more his Queen, Marie Antoinette, "the Austrian," as the Paris mob had called her in hatred and derision, were inevitably hoping for rescue from without.

The Emperor of Austria, Leopold, brother of Marie Antoinette, and Frederick William II of Prussia had both made representations to the French Government, but it was the French themselves who finally declared war at the moment when Leopold died and was succeeded by his son Joseph, less zealous in the cause of his aunt.

Many reasons led the French leaders to desire war. The traditions of the country were military, and rulers had always found popularity in victorious warfare.

Again, too, the ancient dream appeared of giving France her "natural" boundaries at the expense of the Germans on the East and the Belgians to the North.

Lastly, there was the element of propaganda, the strong impulse to impose the Revolution and its principles on the other countries of Europe.

The anger and terror which war begets made possible deeds from which, the more rabid leaders assured themselves, there could be no looking back. Europe was aghast at the terrible "September Massacres" of the members of the French aristocracy, who by this time

crowded the prisons. In January 1793 Louis XVI, the "citizen Capet," was beheaded, and inevitably monarchs all over Europe joined the war against Revolutionary France.

France was now frankly a republic, and a new era began from the "Year I" of the Revolution. Contrary to every expectation the French were able to drive back the foreign invaders from their territories. They could not have waged war better if they had been a united nation under a strong government. The common soldiers were fired by patriotism, while the officers knew that failure might be followed by the guillotine under the new Reign of Terror which the government speedily became.

The European powers made the mistake of under-estimating the strength of France. Before long the Rhine Provinces and Belgium were taken by the French.

Meanwhile, after a struggle between the Girondins and the Jacobins, the latter won the day, only soon to become divided against themselves when the less rabid "Indulgents" protested against the measures of the Terrorists. The madman Marat was assassinated by Charlotte Corday. In the district of La Vendée the conservative peasants rose in revolt for Church and King. The revolt was stamped out with the ruthlessness characteristic of the "Terror."

Danton, indifferent to bloodshed if it served his end, but no lover of it, fell in his turn before that system of martial law which was of the essence of the "Terror."

Robespierre, who sacrificed Danton, fell too at last, and with his death the Terror ceased—chiefly because the approval of it by Robespierre, the people's idol, had alone made it possible. Robespierre fell, and the Terror ended in July 1794. The success of the French arms made government by martial law no longer necessary. In the winter of 1794 Holland was overrun and transformed into the "Batavian Republic." Its Stadtholder found a refuge in England, and gave up to her Holland's rights in the Dutch colony at the Cape of Good Hope.

England, in spite of the enthusiasm of French theorists for her constitution, was the consistent enemy of the Revolution throughout.

Napoleon.—On the ruins of Robespierre's government was set up the "Directory." At the elections which were necessary to create a new "National Convention" the services of the young Corsican officer, Napoleon Bonaparte, were enlisted to put down disorder. In the days of the Terror he had won back Toulon when seized by the Royalists. The Directory then was established by military force with the proverbial result. Napoleon Bonaparte, ostensibly but one of the generals of the Republic, was from that hour its military dictator. The struggle between Europe and the Revolution resolves itself into a duel between England and Napoleon.

A man of genius, Napoleon took little notice of orders from Paris, but worked out his campaigns in his own inimitable way. By the end of 1797 Lombardy had been won from the Austrians and part of the Papal States taken from the Pope. The "Cispadane Republic" was set up in North Italy. Austria had to give up Belgium also to France.

Spain had consented to ally herself with France, and the French, Spanish, and Dutch fleets threatened to be more than a match for the English on the sea, but successive victories over the Spanish at Cape St. Vincent and the Dutch at Camperdown guaranteed England's supremacy.

Bonaparte returned to Paris after his Italian campaign and seemed to threaten an invasion of England. But his real objective was Egypt, whose conquest he hoped to make a basis for vast aggressions in the East. He subdued Egypt but was foiled in Syria, and the brilliant victory of the English fleet under Nelson over the French fleet at the mouth of the Nile, on August 1, 1798, cut off his communications with France. Abandoning his plans, Napoleon raced back to Paris to give a garbled account of his prowess.

England was the only power actually at war with France, but a new coalition was forming, for French aggression had completely outraged opinion in Europe. The Pope had been taken prisoner and a Roman republic set up. The monarchy of Naples had been deprived and the "Parthenopean Republic" had taken its place. Switzerland, whose cantons had no desire for close political union, had to be cut to the same pattern, and became the "Helvetic Republic."

When Napoleon got back from Egypt the Abbé Sieyès, who had been now making constitutions for ten years, came forward with another. Subtly planned with a system of checks and counter-checks, it could only result in absolute inefficiency, but with one vital alteration it served perfectly Napoleon's purpose.

All the powers which were so jealously guarded were given over to a "First Consul" who could override every other element in the constitution. Bonaparte became "First Consul," to receive four years later the more accurately descriptive title of "Emperor." It seemed as though France must pass on its way to democracy through a stage of tyranny like the city states of antiquity. Meanwhile the struggle between France and Europe went on.

The Struggle between England and Napoleon.—Great Britain and Austria refused to accept the overtures for peace which Napoleon made to them, and Napoleon turned his arms against the Austrians, defeating them once more in Italy and more decisively at Hohenlinden. Austria was forced into another peace, and Great Britain was once more left alone to fight the French.

The dangerous "Armed Neutrality," which would have denied the right of British ships to search the vessels of neutral powers, was ended once for all by the Battle of the Baltic, after which the Danes, otherwise at peace with Great Britain, had to capitulate on this point. A general peace, which could but be a truce, was signed in 1802.

Meanwhile Napoleon set himself to put order into French affairs. Like many military despots before him, he ruled benevolently. The codification of the law, the reconciliation of Church and State (without the restoration of Church property), and many other measures made for stability, but Napoleon's despotism was certainly not less complete than that of Louis XIV or Louis XVI.

With all the snobbishness of a "new" man, Napoleon tried to found a dynasty with more magnificence and show than had marked the Bourbons. Exiled royalists were encouraged to return to court, and extravagant titles were showered in abundance on the complacent.

A complete reorganization of Germany in the interests of France and the increasingly direct control of the Italian, Swiss, and Dutch republics, constituted a virtual breach of the Peace of Amiens, and in 1803 war was again declared between France and Great Britain. Napoleon prepared a vast army with which he intended to invade England, but the British fleets controlled the seas, and the opportunity never came, and in 1805 a third coalition was formed in which Russia and Austria joined Great Britain.

By a series of brilliant manœuvres the British fleets prevented all chance of the invasion of England, rumours of which had caused almost panic for more than two years. Their successes culminated in the great Battle of Trafalgar, where Nelson, at the cost of his own life, practically annihilated the combined French and Spanish fleets.

Napoleon meanwhile used his army for the brilliant victory over the Austrians at Ulm, followed up by the still more brilliant victory of Austerlitz.

And now the show of republican propaganda was openly abandoned. The conquered lands everywhere were parcelled into kingdoms, and Napoleon's relations and friends set as rulers over them. Already there was a "Kingdom of Italy" which was now enlarged. The "Kingdom of Westphalia" was given to Jerome Bonaparte, and Belgium and Holland formed one kingdom under Louis Bonaparte, another of Napoleon's brothers, while Naples was given to yet a third. As though to emphasize the breach with past history the Emperor of Austria formally resigned the historic title of Holy Roman Emperor. There can be no doubt that Napoleon coveted it, but he never assumed it.

Prussia, now under Frederick William III, had been hitherto complacent towards Napoleon, but was at last alarmed. Napoleon crushed her belated resistance at Jena. The Prussian King's appeal to Russia brought war between Napoleon and the Russians, ending in Napoleon's victory at Friedland. This was followed by a complete change of policy on the part of the Tsar Alexander. Partly impressed by the personality of Napoleon, partly fired by ambition, Alexander at a meeting with Napoleon at Tilsit agreed to a project by which the two should practically divide Europe between them.

Napoleon's first act after this was to try to impose the "Continental System" to ruin British trade. No country was to import goods brought to it in English ships. As England had a practical monopoly of the carrying trade of the world, every country was dependent on the prohibited goods, and the decree was of its nature doomed to failure. But England did not wait for this to be demonstrated. She seized the Danish fleet. Russia had soon withdrawn from the system.

But now a new force enters the struggle. England, perhaps alone of the nations of Europe suffering from Napoleon's aggression, had up to now shown any sense of nationality.

Suddenly at this point a flame of national resentment broke forth, which, in spite of the stupendous efforts to beat it back, consumed in a few years the swollen conquests of France, and drove her back to her original boundaries.

Portugal's refusal to join the Continental System led to the sending of French troops to subdue her. Immediately after, Napoleon took occasion of political troubles in Spain to persuade the Spanish king to abdicate and his son to give up his claims to the succession. Spain was then to be handed over to Napoleon's brother Joseph. Popular feeling in Spain was completely outraged, and Napoleon's armies there found themselves face to face with such a force as they had never before had to reckon with.

The Peninsular War.—The Peninsular War (1808–1813) which resulted gave Great Britain a permanent basis on land against Napoleon. The Spanish officers and regular soldiers were of little use, but the English soldiers were much helped by the guerilla warfare maintained by the peasants against sufficiently small bodies of the enemy's soldiers. The heroic Sir John Moore saved Southern Spain from Napoleon in the first campaign, after which Napoleon withdrew. For five years longer the English, under Wellington, proved more than a match for the various French generals sent against him with their army of a quarter of a million.

Napoleon never realized sufficiently the significance of the Spanish resistance to concentrate on it. He occupied himself once more and successfully against Austria, and then, exasperated at Russia's refusal to maintain the Continental System against the arch-enemy England, the Emperor, whose self-confidence knew

no bounds, got together his "Grand Army" of 400,000 men and marched to subdue Russia in June 1812.

He was for once utterly out of his reckoning. The appalling severity of the Russian winter, which fell before he had crossed the country, decimated his army, and when the survivors, still a vast throng, reached Moscow they found it deserted and in flames.

There was nothing for it but retreat. The Russians would not give battle, but harassed the rear and flanks. Provisions were short, the cold intense. Only a fragment of the vast army returned to tell the tale.

The Russian disaster and the rising spirit of nationalism brought a combination of another calibre than the previous coalitions against Napoleon. His defeat at Leipsic was given the significant name of the "Battle of the Nations."

Even now the Powers, under the influence of the glamour of Napoleon's great genius, would have left him France bounded by the Rhine, the Alps, and the Pyrenees. He refused fatuously, and the allies invaded France.

Advised by his marshals that resistance was but foolishness, the great Emperor abdicated. He was banished to the island of Elba in the Mediterranean, and a Congress of European Powers met to reconstruct the map of Europe.

They quarrelled inevitably, and Napoleon, eating his heart out in Elba, hearing rumours of their dissensions, determined to pit once more his strength against their weakness.

Escaping from Elba, he gathered an immense army in a triumphal march towards Paris. Louis XVIII, the brother of Louis XVI, who had been restored to the French throne, fled. It was in the March of 1814 that Napoleon fled from Elba. By June he was ready to face a coalition, but only the Prussians under Blücher and a mixed army under Wellington were ready to resist him in Belgium. He tried his old tactics of dealing with each division separately, but Blücher came up while the struggle was still undecided between Wellington and Napoleon at Waterloo.

The Prussian reinforcement decided the day, and Napoleon rode from the field defeated.

Shortly afterwards he gave himself up to the English, and was condemned by the Powers to live out the remaining years of his life at St. Helena, from which there could be no escape.

And now the work of remaking Europe was taken up again.

The Remaking of Europe.—The powers proceeded to reconstruct Europe as though the Revolution had never been. The new spirit of nationalism was entirely ignored. Holland and Belgium, in spite of their different traditions, were united as one kingdom under the House of Orange. Prussia's Grand Duchy of Warsaw, taken by Napoleon, was given, under the name of the kingdom of Poland, to Russia. Prussia was given instead half Saxony and a group of Rhine Provinces, which made her boundaries coterminous with France, reduced to her limits of 1789. The German states were formed into a loose confederation with Austria at their head. In Italy, Lombardy and Venetia went to Austria, and Naples was restored to the Bourbons.

The reconstruction and subsequent government were in the spirit of extreme conservatism. The "Holy Alliance" between the Tsar, the Emperor, and the King of Prussia was made with the avowed purpose of resisting revolutionary principles. Reforms were allowed in most of the European states, but by the grace of the monarchs. Serfdom had received a crushing blow, and great masses of serfs were set free. Only in Russia did serfdom remain, and even there it was at last abolished in 1861. The "Charter of Liberties," which Louis XVIII had to grant in France, providing for some degree of self-government by the people, had its parallel in several lesser German states. Reform had spread quickly in Prussia, especially under the influence of the great statesman Stein, but the Prussian King regarded them still with the attitude of the benevolent despot of the eighteenth century.

Yet Revolutionary principles had been sown broadcast. The reaction was but temporary, and only possible because the Revolutionary movement had been merged in the military aggression of the Napoleonic conquests. During the half century after Waterloo nation after nation fought for and won a "charter," and the people everywhere in some sort came into their own at last.

The rise of democracy was fostered and furthered too by the new spirit of nationalism which had had its birth in Spain's resistance to Napoleon. All sorts of new forces were at work to develop the intelligence and the political self-consciousness of the people everywhere, forces which may be roughly labelled the Romantic Revival.

The Romantic Revival.—With the coming in of the nineteenth century Europe and its peoples seem to take on a more modern character. A greater variety and capacity for enthusiasm marks the nineteenth century off from the eighteenth. The new moral atmosphere was, in part at least, the result of great physical and social changes, which affected the European countries and especially Great Britain, in the second half of the eighteenth century and the beginning of the nineteenth, changes which are summed up in the term "Industrial Revolution.'

New discoveries and inventions of machinery, worked first by hand, then by water-power, and lastly by steam-power, revolutionized the conditions of labour. People thronged from the country to work in the new factories set up in the towns, which grew rapidly in size, though not

in proportion to the needs of the workers, who were often miserably housed and fed. Especially sad was the lot of little children who were employed to tend the machinery.

But the congregation in towns made for the spread of ideas, and with remedial legislation, such as the Factory Acts in Great Britain, conditions improved.

The same spirit which eventually made European countries demand a charter led to the reform of the franchise in England in 1832, when the first of several successive "Reform Bills" was passed. The early nineteenth century saw a reaction from the classicism of the eighteenth. In literature men harked back to mediæval ideals, and a new appreciation of nature marked the times.

Men grew religious again. The great Wesleyan movement had alone redeemed the character of eighteenth-century religion. The early nineteenth saw at once an Evangelical revival in the Anglican Church and the High Church revival known as the Oxford Movement. At the same time a new humanitarianism led to the repeal of the penal laws against Catholics in the British Isles. Pitt had won Irish consent to the union of the English and Irish parliaments in 1800 by the bait of complete Catholic Emancipation. The bigotry of George III had prevented the fulfilment of a virtual promise, but the position by which Irish Catholics could vote, but not for a fellow Catholic, was too anomalous to last. The emancipation of Irish Catholics involved that of English and Scottish Catholics too, and, though there was still much "nopopery" agitation, the trend of public opinion was in favour of the Catholic Emancipation Act, passed in 1829.

There was now more variety and ferment in every department of life, more courtesy and true charity in the relationship between men. England had demanded the suppression of the slave trade at the Congress of Vienna, and she led the way in its abolition. When the Civil War on this subject broke out between the North and South in 1861, the United States was alone among civilized countries in maintaining the system of slavery. The Civil War between the "North" and "South" of the United States began when the South threatened secession from the union because of federal interference with slavery. The South naturally clung to an institution with which its chief interests and traditions were identified.

On the two questions, of the abolition of slavery and the predominance of federal over state rights, the war was fought. Ultimately the North, by force of greater numbers, prevailed, and the principle of federation was established. At the same time the negro population of the States became free.

The Growth of Constitutionalism.—It is, however, in the political upheavals of the century that the fullest results of the "Romantic Revival" and the Revolution which begot it may be seen. At first the restored monarchs attempted to ignore completely the popular demand for freedom. In Spain Ferdinand VII had made generous promises to the people, but immediately on his restoration he ignored these and ruled like a despot. But in 1820 a widespread revolt won a "constitution" for Spain, the same which had been drawn up in 1812 during the Peninsular War. It came to be known as the "Constitution of 1812," and furnished a standard to which other struggling nations aspired.

In France the restored Louis XVIII maintained a constitutional policy, but under Louis' brother and successor, Charles X, an attempt at a royalist reaction led to the Revolution of July 1830, which deposed Charles and appointed Louis Philippe Duke of Orleans as a constitutional king.

Even in England, in the first few years after the end of the Napoleonic wars, the Tories, who were in power, governed in a completely conservative manner, dealing severely with the popular agitations which marked the period, and which were in great part due to the dislocation of social and economic forces consequent on the Industrial Revolution. But in England too the panic reaction could not last, and a period of reform ensued.

The movement towards constitutionalism and towards nationalism may both be seen in the Emancipation of Greece from Turkish rule, and its establishment as a constitutional kingdom in 1829 under the rule of Prince Otho of Bavaria.

In 1831 Belgium freed itself from Holland and became a separate kingdom under Prince Leopold of Saxe-Coburg. Poland made a bid for freedom too but failed, and became more closely incorporated with Russia.

The movement towards constitutional government was felt so far afield as South America, where the possessions of Spain and Portugal (itself now a constitutional kingdom) broke away from the mother country and made themselves immediately or ultimately into republics.

Just as the revolution of 1830 in France had given a great impulse to the constitutional movement, so it was with a new revolution in February 1848, which overthrew the feeble Orleanist monarchy and made France a republic a second time. The year 1848 is sometimes called the "Year of Revolutions."

Especially was the impulse felt in many German states, where there was a conscious desire for national unity. This for the moment came to nothing, for there was no agreement as to the details of such a union. Many wished to exclude Austria from the union and accept Prussia as the leading state, while others would have assigned the presidency to Austria.

In Austria, Prussia, Hanover (now no longer joined to the English Crown since that had been worn by a woman), Saxony, and Bavaria the popular demands were granted only to be revoked in the two great states within a year.

In Italy there was a general cry for liberty and a rising in those parts still under Austrian domination, but for the moment the movement was stamped out. Austria looms large in this period as the arch-enemy of nationalism. Not only did she coerce the Italians, but she crushed resistance in Hungary and Bohemia, taking from the former the degree of self-government which she had already won.

The second French republic did not last long. The middle classes were republican, but the peasantry and working people had to be reckoned with, and Louis Napoleon, a nephew of the great Napoleon, was able by a *coup d'état* to have himself proclaimed Emperor with the title of Napoleon III.

As always, such a ruler found his best justification in military glory, and in 1854 France joined England in declaring war against Russia, whose aggression towards Turkey was alarming. The Crimean War ended in 1856 by the Peace of Paris, arranged at a conference of the European Powers, a method now becoming established in the settlement of terms of peace.

Young Italy.—Napoleon III found a new field for his activities in giving help to the "Young Italy" movement in which all the more ardent spirits in Italy were involved. It was felt, even by ardent republicans in Italy, that the only chance of national independence was to aim at a monarchy. The King of Sardinia was their obvious choice, and through the genius of his chief minister Cavour and the help of the French a new kingdom of Northern Italy was formed, from which Venetia alone in the North, the Papal States, and Naples stood out.

The genius of Garibaldi won Naples for Sardinia, and the Papal States with the exception of Rome, so that by 1861 only Rome and Venetia remained outside the new Italian kingdom. Both were soon included. Venetia was assured to Italy as a prize for her alliance in the "Seven Weeks' War" between Prussia and Austria in 1863. Rome was taken from the Pope in 1870, when the outbreak of the Franco-Prussian War made impossible the traditional French policy of supporting the papacy in a crisis.

An offer was made to the Pope to pay him yearly a large sum of money. He would hold a court, but would have no territory. The papacy rejected these terms, and the attitude of protest has never been abandoned. The Pope lives in the Vatican technically a prisoner on the defensive, and the problem of the Temporal Power is still a burning question among some Catholics. It was certainly a unique problem, but any other settlement than the one achieved would have prevented the realization of the great dream of Italian unity.

Prussia and Austria.—The Seven Weeks' War between Prussia and Austria was fought for the possession of the little states of Schleswig and Holstein, which the two had previously combined to wrest from Denmark. But the war had been consciously planned, by the great Prussian minister Bismarck, with the ulterior motive of achieving German unity under the presidency of Prussia. He knew that the depreciation in public opinion which Austria would suffer through defeat would make for this.

He had calculated rightly. Prussia won Schleswig and Holstein with immensely increased power on the Baltic Coast. Austria was henceforth cut off from all direct communication with the German states. A North German Federation was formed under the hereditary presidency of the kings of Prussia, and the Southern States were associated with it in military matters.

The Making of the German Empire.—One more great war was necessary to achieve the foundation of the German Empire. Bismarck had made up his mind that the German problem could only be solved "by blood and iron." He meant to fight with France, and in 1870, over a question of a disputed succession in Spain, the Franco-Prussian War broke out. The French under-estimated the strength of the enemy, and though they fought superbly they were continually out-matched in numbers. The armies sent by the lesser German states had been trained up to the standard of the splendid Prussian army. The Germans won in battle after battle. Napoleon III, brave but incompetent, at last yielded at Sedan. Paris held out for months, but had to yield at last. Alsace and Lorraine were lost to France.

In the full flush of enthusiasm the German states decided to unite as an Empire, with the King of Prussia as hereditary emperor. Each state remained self-governing in most local matters, but the Imperial Government is supreme in questions of war, foreign policy, and commerce, and there is more of the element of benevolent despotism left in the Government of the German Empire than in any country of Europe except Russia.

France became a republic for the third time, and has remained a republic ever since, while Austria, with her sphere circumscribed and defined, felt impelled to grant Hungary that system of self-government which has made it a constituent of her Empire. So recently as 1910 Portugal cast off the monarchy and declared itself a republic, though a royalist restoration is not improbable. In Spain there is always a strong republican party. Thus even in our own day the leaven of the French Revolution is at work, and as we shall see, not only

in Europe and lands won by Europeans; it is leavening Asia too. It is with justice that the French Revolution has been described as the greatest event in modern history.

THE GROWTH OF THE BRITISH EMPIRE

The great fact in British History since Waterloo is the growth of the Empire. Before that merely the foundations had been laid. The Empire looms so large in modern life that it requires an effort to realize this fact.

An immense impetus was given to the growth of the colonies by the extensive emigration which began soon after 1820, and which was the economic solution of the problems of dislocation and surplus population caused by the Industrial Revolution. Emigrants flocked to Canada, Australia, New Zealand, and South Africa.

In Canada the process of colonizing the lands westward of the earlier settlements went on apace.

Australia.—The great continent of Australia had been annexed by Great Britain in 1788, eighteen years after Captain Cook's famous voyage of exploration to its coasts. It is strange to reflect that the first settlers in Australia were convicts sent to work out their sentences under prison supervision and perform pioneer work in this great new colony. Hitherto English convicts had been sold into the plantations of the Southern States of America, but after the Declaration of Independence this was no longer possible. But there were other settlers too, and New South Wales became a regular colony. Between 1820 and 1830 settlements were made in Western Australia, and South Australia became a colony in 1836. Victoria, Queensland, and Tasmania were later offshoots of New South Wales.

The islands of New Zealand were also colonized. In Australia the natives made little or no resistance to the settlers. They were nomads of a low type. The Maoris of New Zealand were a better type, but have also practically died out before the advance of white men.

Africa.—In yet another continent, hardly known to Europe before the nineteenth century, the British race won a great heritage. The North of Africa had had their part in the successive Mediterranean civilizations since the days of Carthage, but the rest of the Continent was unexplored until the Portuguese in the fifteenth century skirted its coasts. They made trading settlements at various points, and other nations followed suit, but only in the South was a real colony founded—the Dutch colony of the Cape. This fell to Great Britain during the Napoleonic Wars, and possession was confirmed to her for a cash payment to the King of Holland at the post-Revolutionary settlement of Europe.

The large Dutch population became very discontented as the influx of Britishers increased. The abolition of slavery was their cardinal grievance, and they resented in general the English attitude of indulgence to the natives. The centre of Africa was filled with negro tribes, often extremely savage and nearly all of a low type though often surprisingly cunning and scientific in their methods of warfare.

The great mass of the "Dark Continent" was still vague and unexplored. But on the borders of Cape Colony there were endless opportunities for strife between natives and settlers, and the "Boers," as the Dutch colonists were called, resented bitterly the restraints which British rule imposed on their hostilities towards the natives.

Twenty years after the colony passed into the hands of Great Britain the majority of the Boers withdrew from the colony, "trekking" north, where ultimately they set up two independent republics across the Orange and Vaal rivers, republics which later became the Orange Free State and the Transvaal. Natal had been similarly occupied by Boers, who, however, evacuated it when it became a British colony in 1843.

With the growth of great colonies practically monopolized by a white population the problem of reconciling self-government with home influence came up. The problem has been solved in all the great British colonies of this type in the same way. They have passed through three stages to full self-government, and Canada has led the way in each.

In the first stage the colony has representative government, generally two Houses with a monopoly of legislation, but practically no control over the executive. In the second stage the colony acquires power over the executive, which becomes responsible to the legislative instead of to the home Colonial Office. In the third and last stage a complete federal government is set up.

Canada.—Canada has had its own legislature since 1791, but no further advance was made for nearly half a century. The French and British colonists quarrelled a good deal, and two separate revolts in 1837, Papineau's in Lower Canada and Mackenzie's in Upper Canada, brought about a complete reorganization. The two divisions of Canada were made into self-governing provinces of one state, and from this time dates Great Britain's definite policy of granting self-government to each colony as soon as it becomes sufficiently populated and educated to admit of such organization.

Nova Scotia and New Brunswick were made self-governing in 1848 and Newfoundland in 1858. On July 1, 1867, the organized states,

with the exception of Newfoundland, were federally united in the "Dominion of Canada," which the other settlements in this fast-developing land have since joined.

In Australia the growth of population received an immense impetus from the discovery of gold in 1851. By 1856 all the Australian states, except Western Australia, had their own legislature and executive. By this time the other states had successfully resisted the ingress of convicts. Western Australia, the least progressive of the states, continued to receive them for some time longer. It too received full self-government in 1890. The "Commonwealth" of Australia was established in 1900. It resembles more the federal government of the United States than that of Canada, which is more pervasive. In Canada it is understood that all such powers as are not expressly assigned by the "Dominion Act" to the provinces belong to the Dominion. In the United States and in Australia the Federal Government can exercise only such powers as are expressly delegated to it.

New Zealand has become a federation in which the provincial "parliaments" exercise strictly local powers.

South Africa has worked its way to a Federal Government through a much more chequered course than the other colonies.

Cape Colony received self-government in 1892 and Natal in 1893. But many problems had meanwhile arisen in connection with the Orange River Colony and the Transvaal. They were originally independent republics, but the manner of their organization and conduct affected British interests too closely to allow their status to go unquestioned. The Orange Free State was annexed by Britain in 1848, but restored to independence in 1854. The Transvaal was similarly annexed in 1877, but its rebellion was rewarded by almost complete independence in 1881, in spite of the practical defeat of British troops at Majuba.

This indulgence gave to the Boers a false impression of British weakness. The British population of South Africa were convinced that the Boers were aiming at supremacy. Feeling was aggravated by the treatment of British immigrants into the Transvaal, drawn by the discovery of gold mines there. The result was the outbreak of war in 1899.

The Boer War broke out as a result of the refusal of Kruger, President of the Transvaal, to listen to the representations of Cecil Rhodes, the Prime Minister of the Cape, on behalf of the "Uitlanders."

Each side under-estimated the courage and resources of the other. The war lasted two and a half years, with a terrible cost of men and money, but inevitably at last the republics were beaten and absorbed into the British Empire. They were at first crown colonies with a promise of self-government later, a promise speedily fulfilled by the Liberal Government, which granted them complete self-government in 1906.

Three years later the four South African colonies were federally united under the name of the Union of South Africa.

Meanwhile the "Dark Continent" had been rapidly opening up, and elsewhere than in the South British influence had spread.

The Scramble for Africa.—Almost as intimately involved in British interests as South Africa is Egypt in the north. From 1517 until Napoleon's famous expedition in 1798 Egypt had belonged to the Turks. Afterwards it fell into the hands of the Khedive Mehemet Ali, who held it as a sort of viceroy of the Sultan. Ismail, the grandson of Mehemet Ali, had fallen under the spell of the West, and he introduced Western education and Western science into Egypt. But his finances became hopelessly involved. He owed vast sums to France and England, and these Powers claimed to appoint representatives to supervise the collection of taxes and method of their expenditure.

Ismail secretly tried to stir up rebellions in Cairo, and the Sultan of Turkey, the nominal sovereign of the Khedive, was requested to appoint a new ruler.

This he did, but Arab rebellions followed, and the English sent soldiers to Egypt to subdue them. France and Italy refused to help, and therefore have never been able to object to the British occupation of Egypt. Egypt became a British Protectorate under a new Sultan when Turkey joined in the Great War of 1914.

Egypt has prospered marvellously under British rule, and has successfully withstood enemies from without.

To the south of Egypt proper lies the Egyptian Sudan. It is a desert region, with fierce and barbaric tribes dominating the more peaceful population. The great General Gordon worked wonders there from the time of his appointment to govern it in 1894, but his resignation ten years later was followed by a rising under an Egyptian pretender, who declared himself the successor of Mohammed and was called the "Mahdi." It was a dangerous movement.

The Sudan was but thinly garrisoned by Egyptian soldiers, and the British Government judged it best to withdraw from the region altogether.

General Gordon was sent to perform the dangerous and delicate task. He was shut up in Khartum, with only one white man and the natives to help him, when the Mahdi with a fierce horde surrounded the place. An army not far off at Suakin was inexcusably withdrawn, and Gordon was left for months without relief. The expedition which went at last arrived a day too late. Thirteen years later Sir Herbert Kitchener, with a completely reorganized

Egyptian army, reconquered the Sudan and destroyed the power of the Mahdi for ever.

The Explorers.—Meanwhile Europe had wakened up to the possibilities of Africa. Brave explorers, chiefly Britishers, had for a century been striving to make the mystery of the Continent less, when in 1880 the European Powers practically agreed to divide Africa between them.

The pioneer work of the Scotsman James Bruce, who in 1770 discovered the source of the Blue Nile, was followed up by Mungo Park's exploration of the Niger almost immediately afterwards.

In 1841 David Livingstone, the heroic missionary, began his life-work of exploration and evangelization. He traversed great tracts of the Continent for nearly thirty years, dying at last alone with the natives, who loved him and bore his body many miles to the coast to give it into the keeping of white men, until it was given burial at last in Westminster Abbey.

It was the work of men like these which fired the ambition of the European Powers to have their part in Africa. In the "spheres of influence" circumscribed in 1880 no outside power may interfere unless from such motives as shall have won the approval of the European Powers in general.

Only two native states stand without these spheres, the republic of Liberia and Abyssinia. Liberia was romantically founded by the reshipping of liberated American negroes to their ancestral shores, an enterprise begun in 1821. Abyssinia was an ancient native state which by its nature commanded respect for its independence.

In the rest of Africa, Germany and Portugal each have two tracts south of the Equator, one on the East and one on the West side. Between them cuts the British sphere from the South African Union up to the great lakes, including, besides the Union, the districts of Rhodesia and Bechuanaland, both under British protection. At this point German East Africa touches the Congo Free State, which belongs to Belgium and stretches to the West Coast.

North of the Equator Great Britain has British East Africa and Uganda, stretching up to Egypt. West of this stretches a vast desert territory allotted to France, to whom Morocco, Algeria, and Tunis also, either absolutely or practically, belong.

Tripoli has been won from the Turks by Italy, and on the west coast there are strips of territory accountable to France, Great Britain, and Germany. When the railway from Cairo meets that which is being constructed northwards from the Cape, great strides will have been made in the unveiling of the mystery of Africa.

The problem of political emancipation in Egypt, and more remotely in the other parts of Africa under British rule, will have to be faced in the future. It is essentially different from that in the colonies where the mass of the population is white. Already there is agitation in Egypt, yet thinking men can hardly approve the Egyptians as ready for self-government. The whole problem is involved in the larger question of the relation between the white and black races.

The Problem of India.—Somewhat similar, and even more pressing, is the problem which Great Britain has to face in its great dominion in India.

During the nineteenth century British power has advanced steadily in India. In Central India the destruction of the power of the Mahratta princes added largely to British territory. This was followed up by the annexation of the territory round the Lower Indus, the Punjab, and the larger part of Burmah.

The widespread mutiny of 1857, which spread through nearly all the native soldiers in Northern India, illustrates some of the difficulties of governing an alien people. It was completely suppressed within a year, but at the cost of much misery and many lives.

An immediate result was the dissolution of the East India Company and the taking over of the government of India by the Crown. No war has since taken place within India, though there has been much fighting on the borders. Two-thirds of India is now directly under British rule. One-third is still ruled by native princes, but owning British sovereignty.

India has prospered mightily under British rule. Railways and canals have connected up distant parts of the Continent. A system of irrigation has done much to prevent the terrible famines which were once the scourge of India. Manufactures have been introduced, and the cotton goods of Bombay threaten to oust those of Lancashire from the markets of the world.

It seems an anomaly that a small country like England should control the destinies of India and its teeming millions; for India with its tale of ancient civilizations is very different from Africa. But it must be remembered that England's rule and policy has alone made possible, even remotely, some sort of unity for India. The civilization which England has consistently tried to introduce is breaking down the divisions of race and caste and religion. But the movement is necessarily slow. Here, as in Egypt, there is a class of political agitators, chiefly students, but no one can justly claim that India is in any way ripe to rule itself.

So on all sides there is peace and prosperity within the Empire. But thinking men can hardly contemplate the situation altogether with complacency. There is danger in too much decentralization, and it is important that, with the loosening of the material bonds which formerly tied the colony to the mother country,

the ties of sentiment and sympathy should be emphasized. With the Eastern nations waking up to Western civilisation the "yellow peril" is no mere bogey, and can only be faced by solidarity between the different parts of the Empire.

PROGRESS IN EAST AND WEST

The great fact in the modern world is democracy. Everywhere the trend is towards popular government, and its almost inevitable accompaniment, a measure of economic socialism.

In England, for instance, the democratic government is theoretically complete, short of manhood suffrage. In practice the party system acts as a check on popular despotism, the House of Lords really representing the Conservative party, and acting as a check when the Liberals are in power.

Free education, free meals, and medical inspection of school children, the taxation of the higher classes to lessen the burdens of the poorer people are all aspects of State socialism which the most pronounced Conservative tends now to accept as part of the natural economy.

A marked feature of the modern state system is the minimization of Church influence. A natural result of that system of toleration, which was initiated by the repeal of the Test and Corporation Acts in 1828 and Catholic Emancipation in 1829, is the practical equality of the sects. The mediæval function of the Church as a keeper of the public conscience has disappeared, and the State performs the function itself.

Yet there are numerous signs of discontent with English democracy as it is worked. In the vital questions connected with the relations between capital and labour, there is an increasing impatience of political methods and a tendency to appeal to economic coercion by means of strikes.

There are many who favour the Referendum as a surer means of keeping legislation in touch with popular feeling.

Others still would dispense with Parliament, and establish more completely that system of bureaucracy which Parliament has in fact, through the increasing complexity of public business, found it convenient to employ.

Thus there are many problems still to be faced in the working out of democratic principles. But the importance of these principles, whatever be their form of working, is ingrained in the minds of modern men. Even the great yellow populations of the Far East are fast adopting them.

China and Japan.—Before the nineteenth century the two great nations, China and Japan, had hardly touched the destinies of Europe. To-day they are intimately connected, for good or evil, with the Western world.

The Chinese have a civilization older than any in Europe. They belong to the Mongolian race, taking that class in its larger acceptation. By the sixth century B.C. the Chinese knew how to write, and had established records which give a fairly authentic story accounting for the previous 2000 years. In the sixth century the philosophic but materialistic teaching of Confucius was established, and in the second century B.C. Buddhism was introduced from India. In the ninth century A.D. they had already invented printing.

In the thirteenth century the Mongols proper conquered China, and it is of the splendours of the Court of Kublai Khan, a ruler of a Mongol dynasty, that the famous mediæval traveller Marco Polo tells the tale. The Chinese reasserted their independence in the next century, but in the seventeenth century a barbarian branch, called the Manchus, seized power, and it was a Manchu dynasty which was ruling when the revolution of 1913 turned China into a republic.

Previous to this the name of China had become almost symbolical of the blindest conservatism. European traders brought tea from China in the seventeenth century, but all intercourse with the West was strenuously resisted. Attempts to exclude British trade led to the "Opium War" of 1840, after which Hong Kong was given up to Great Britain and certain other ports were opened to British trade. A few years later England and France joined in reprisals against China for the imprisonment of some Englishmen, and more ports were opened. Soon after the English helped the Chinese Government to put down a semi-religious revolt, led by a mad adventurer against the Government.

Meanwhile there was no progress in China. She had early developed an exquisite taste in silk and pottery, but the arts were stereotyped, as was the system of education, which consisted of a mass of traditional facts handed on from one generation to another.

Japan, too, when it first attracted the notice of Europe, was as anxious as China to escape it. Japanese history can only be traced back as far as the seventh century A.D. The Japanese had probably taken possession of their islands about six hundred years before. They are a people of mixed race, but probably have Chinese blood in their veins, and resemble Chinese somewhat in appearance, but ethnologists are inclined to insist on an Aryan element in the race.

Their history was not unlike that of the nations of Europe in the early Middle Ages. They were ruled by an Emperor called the "Mikado," but a kind of feudalism grew up and ultimately prevailed. Portuguese traders visited Japan in the sixteenth century and Jesuit missionaries followed in their steps, but not much progress was made. The Dutch made some settlements in the islands, but the

Japanese shut themselves up in an obstinate mediævalism.

The Awakening of Japan.—At last in 1854 Japan was reluctantly persuaded to open certain ports to the United States and Great Britain; Russia and Holland soon obtained similar privileges.

In 1862 a Japanese embassy was sent to travel through Europe and America to study Western ways. Everything was new to them. In the mid-nineteenth century Japan had no idea of modern inventions. With the reports of the embassy a vast enthusiasm for progress grew up, but the progressives had to fight a rabid obstructionism. In the process the traditional feudalism was broken down, and the Mikado became the progressive head of a progressive State.

The story of Japan in the last forty years reads like a fairy tale. The Japanese became greedy of progress. A fine navy and army were soon formed. Electric light, telegraphs, and telephones were introduced into the country. Universal education became the rule. In time the land won a parliament, though the Mikado is still more powerful than most constitutional kings.

Japan, a small nation, about as big as Great Britain, first proved her new-found strength in a struggle with China.

The Chino-Japanese War broke out in 1894. The cause was the alleged intention of China to invade Korea, the peninsula lying between the two countries. Contrary to expectation, Japan won easily on land and sea.

But the Japanese had never really feared China. She anticipated a Russian domination of China, and her anticipations were justified in so much as Russia stepped in to deprive Japan of the fruits of her victory. Japan bided her time, but in 1904 she went to war with Russia. The Russo-Japanese War is the most significant war of modern times.

There had grown up a Russian tradition by which that country was believed to have vast military resources and a perfect military organisation. Great Britain had been in constant fear of Russian aggression in India. It was this fear which caused the war between England and Afghanistan in 1879.

A guarantee of help from Great Britain, if any other Power should join Russia against her, encouraged Japan to declare war. She was consistently victorious on land and sea. The fiction of Russia's efficiency was shattered. In battle after battle Russia lost more men than fell altogether in the Boer War. The Japanese more than justified the reputation for courage and efficiency which they had won in their war with China.

She won Korea, and Russia gave up all claims on Manchuria, which was restored to China, but the important result of the war was the shifting of standards. Japan sprang into place as a first-class Power, and the Russian bogey no longer caused panic fear.

There are signs too that Chinese progress may receive speedy and incalculable increase. Many reforms have been recently carried out, and on February 12, 1912, China became a republic. For the last four centuries European peoples have been exploiting the lands and riches of the East. Already the tide has turned. The islands of the Pacific and Indian Oceans are being won back by Asiatics. There is a vast influx into South Africa, Australia, and Western America. It may yet be the fate of Europe to defend itself against the power of progressive Asia.

Meanwhile a recent conflict between Western ideas of freedom and the traditional despotism of the East has been watched with breathless interest by all the world.

The Turko-Balkan War.—It was not until 1898 that the winning of Greek independence of Turkey found a sequel in the struggle for freedom by the other Balkan and Danubian provinces still in the hands of the Turks. The rule of the Sultan over Christian populations has been ever oppressive, and any effort towards freedom has been met by brutal reprisals. In 1877 and 1878 Russia fought Turkey in support of a nationalist movement among those Slavonic peoples. It began in Bosnia and Herzegovina, and was joined by Servia, Bulgaria, and Montenegro. As a result of the war Roumania, Servia, and Montenegro won their independence; Bosnia and Herzegovina were placed under Austrian administration, and became part of her Empire in 1908. Bulgaria still paid tribute, but later won her independence.

Promises of reform within the territory remaining to Turkey were made but never carried out, in spite of the efforts of European diplomacy.

At last in 1912 the Balkan States took matters into their own hands, and went to war on behalf of their co-religionists in Albania and Macedonia. Naturally in case of victory territory won from the Turk was to be divided between the allies.

The Balkan States (Bulgaria, Servia, Greece, and Montenegro) in going to war with Turkey defied a declaration of the Great Powers that they would agree to no change in the *status quo* in South-East Europe.

They were splendidly victorious. Macedonia and the whole of Thrace were taken, and when Adrianople fell the Turks agreed to terms of peace.

Unfortunately the allies could not agree on the division of the spoil, and a new war between them broke out. Bulgaria, which had been the leading spirit in the resistance to the Turk, was badly beaten by Servia and Greece, and invaded by the Roumanians, who now interfered. What-

ever be the ultimate settlement with regard to the lands conquered from the Turks, they are at least freed from the Turkish domination. Slowly but surely the Turk is being pushed out of Europe. Yet even in Turkey there is question of reform, but so far the Young Turk party has achieved but little.

The Turkish population is brave and sober enough, but the despotism of the Sultan lies heavy upon them, and inveterate Mohammedanism opposes all progress.

Turkey, like Russia in a less degree, is an anomaly in a modern world of progress.

COURSE OF READING

In general it may be taken as a good arrangement of a course of reading on any period of history to begin with something in the shape of outlines (this is the function of the article to which this course of reading is appended) and then turn to bigger books. Standard histories of the period, which, though not always to be read steadily through, may be "dipped" into where they treat of specially interesting subjects. Sometimes the bigger histories are works of literary genius, and tempt the reader to continuous reading. When this is the case so much the better. The third stage in the study of a period is to read monographs on aspects of the time which make some special appeal to the student, or others, which, less interesting in subject, have some special charm of style. The cream of all historical reading is biography, and among good biographies the student will do well to range at large. It is always valuable and fascinating to read contemporary documents, and, indeed, such reading is indispensable to the real appreciation of a period. Such documents are being increasingly printed and reprinted in easily available forms.

Anthropology, the study of man's place in the animal kingdom, constitutes an important branch of science, and may or may not be studied by the historian. The best book to commence with is *Anthropology* by E. B. Tylor, an inspiring outline. This breaks up the ground generally. The anatomical aspect may well be followed up in T. H. Huxley's *Man's Place in Nature*, but the reader is advised not to base his views of evolution upon Huxley. *Natural History of Man* by J. C. Prichard has chapters on the same aspect. (See also Zoology for Evolution and Origin of Species). An excellent popular outline of the modern knowledge of the first men is given in chapters xli., xlii. and xliii. of *Science from an Easy Chair*, by Sir Ray Lankester; follow this by *Ancient Hunters and their Modern Representatives*, by W. J. Sollas. The problem of Animism may be followed up in Prichard, and more elaborately in Tylor's *Primitive Culture* (chaps. xl.–xli.); religion and mythology in this book too, and further in J. G. Frazer's *Golden Bough*, and Andrew Lang's *Myth, Ritual and Religion.*

Ethnology, the story of man as divided into races, may well be commenced by reading *Ancient Society*, by L. H. Morgan, which deals with the evolution of man from savagery. *Totemism and Exogamy*, by J. G. Frazer, is also concerned with primitive society, but may be taken as supplementary. For ethnology proper A. C. Haddon's *Races of Men* is a suitable outline; *The Wanderings of Peoples*, by the same author, may be taken as a sequel. The classical treatise of J. F. Blumenbach, *De Generis Humani Varietate Nativa*, is in Latin. *The Races of Man*, by J. Deniker, can be read after Haddon, and also A. H. Keane's *Ethnology* and *Past and Present.*

The beginnings of *Civilizations* are treated of in Morgan's *Ancient Society* (above); further information may be had in Tylor's *Early History of Mankind*, Lord Avebury's *Prehistoric Times* and *Origin of Civilisation.*

Egypt.—The study of the foregoing books should have given a sufficient general history of the beginnings of races and racial distribution, and have prepared the way for a special study of the different early races. For those who do not wish to study ethnology, except as an introduction to the study of the early races, Haddon's *Races of Men, Wanderings of People*, and Morgan's *Ancient Society* may be selected. Maspero's *Dawn of Civilisation* (vol. i. of *History of the Ancient Peoples of the Classic East*, edited by Sayce) may then be read, and the story may be followed out in *The Struggle of the Nations* and *The Passing of the Empires*, (vols. ii. and iii. of the same work). Egypt is treated here with the other early empires, and this is probably the best way to study its history. A useful supplement is *New Light on Ancient Egypt*, also by Maspero. A fuller and more specialized treatment of Egypt will be found in *A History of Egypt* by Flinders Petrie. Useful sidelights may be had from *Records of the Past*, first and new series, from *The Tell-el-Amarna Letters*, by H. Winckler, and also J. P. A. Erman's *Life in Ancient Egypt.* For the Ptolemaic period read *The Empire of the Ptolemies*, by J. P. Mahaffy; the Roman period, J. G. Milne's *A History of Egypt under Roman Rule* (see also Rome, below); *A History of Egypt in the Middle Ages*, by S. Lane-Poole; A. A. Paton's *History of the Egyptian Revolution*, and D. A. Cameron's *Egypt in the Nineteenth Century.*

Babylonia and Assyria.—Maspero's *Dawn of Civilisation* (dealing with Chaldæa as well as Egypt) is a suitable introduction. More specialized is *A History of Summer and Akkad*, by L. W. King, which should be read for the early races of Babylonia until the foundation of the

monarchy. Maspero's *Struggle of the Nations* introduces Assyria, and this may be followed by R. W. Rogers' *History of Babylonia and Assyria.* Read, further, *A History of Art in Chaldæa and Assyria* by Perrot and Chipiez; and *Records of the Past* first series edited by S. Birch (vols. i. and alternate vols.), and new series edited by Sayce (vols. i.–vi.) give translations of ancient monuments.

Israelites.—H. Ewald's *History of Israel* is the best book to use as a foundation for the study of the history of Israel. The bulk of the book is the history of the Israelites from the Exodus to Christ. Primitive history has an introductory chapter, and later events an appendix. Sayce's *Early Israel and the Surrounding Nations* is a good corrective and supplement. *Cuneiform Inscriptions and the Old Testament* by Schrader is good for its special purpose, and there are innumerable books on special aspects of the Israelites in the Biblical period.

Hittites and Phœnicians.—Maspero's *Struggle of the Nations* (see Egypt, above) gives a good introductory sketch and can be followed by *The Passing of Empires.* More specialized are Sayce's *The Hittites* and Messerschmidt's *The Hittites.* Read G. Rawlinson's *History of Phœnicia* for the Phœnicians, and J. Garstang's *Land of the Hittites* links up Hittites and Phœnicians. For those who can read French, the geography, art, and architecture of Phœnicia are dealt with in Renan's *Mission de Phenicie;* and R. M. Burrow's *Discoveries in Crete* gives the results of research on that Phœnician site.

Persians, Medes, and Parthians.—Read *The Five Great Monarchies, The Sixth Monarchy,* and *The Seventh Monarchy* by G. W. Rawlinson. *Media* by L. A. Ragozin, and *Parthia* by G. W. Rawlinson are useful so far as they go, and Sir H. C. Rawlinson's *Cuneiform Inscriptions of Western Asia* and Kersharp's *Studies in Ancient Persian History* supplement various aspects. S. Lane-Poole's *Mohammedan Dynasties,* Sir J. Malcolm's *History of Persia,* and Sir C. R. Markham's *A General Sketch of the History of Persia* (the last two modern), bring Persian history up to the present era.

Greece.—A scholarly and interesting outline of Greek history is supplied by Professor Bury's *History of Greece to the Death of Alexander the Great.* J. P. Mahaffy's *Greek Life and Thought from Alexander to the Roman Conquest* and *The Greek World under Roman Sway* take up the tale from the point at which Bury ends, but give, of course, fuller treatment. The reader who has mastered these is prepared for fuller and more specialized treatises. Professor Ridgeway in *The Early Age of Greece* discusses the problems connected with the relations between the civilization of Mycenæ and the civilization of Greece. *New Chapters in Greek History* by Percy Gardner may be read for a clear and scholarly account of the recent excavations in the region of Greece and the conclusions to which they lead. The greatest of the larger histories of Greece is that of George Grote. The first part dealing with "legendary" Greece is now of little value; but the second part, dealing with "historical" Greece, holds its place, although even some of this is now obsolete. But the serious student who would know his Greece thoroughly had better master Grote. Its chief value is the exposition of the nature and working of the Athenian democracy (read especially chap. xxxi. vol. iv.); and the chapters on Socrates (lxvii. and lxviii. vol. viii.) and the Athenian empire (xlv. vol. v.) should be read by every student. For military history Grote is not valuable, and a better account of some of the wars may be found in G. B. Grundy's *The Great Persian War and its Preliminaries.* The first great authority on the Persian War is the Asiatic Greek Herodotus, whose *History* may be read in an English translation by G. Rawlinson, or in two volumes by G. C. Macaulay. Herodotus devotes six books to the preliminary history of the combatants. An exhaustive study of the Peloponnesian War will be found in the article under that title in the new edition of the *Encyclopædia Britannica,* and a contemporary account is furnished in the *History* of Thucydides, whose treatment in its concern with the "science of government" is almost modern in tone. The speeches can hardly be authentic, but they are its most valuable part for the light they throw on contemporary feeling and thought. Jowett's translation is supplemented by a volume of notes. Xenophon's *Memoirs* should be read for a contemporary account of Greek history after the decline of Athens. *Alexander's Empire,* by J. P. Mahaffy, supplements the outlines for that period. *Some Aspects of Greek Genius,* by S. H. Butcher, focuses attention on the Greece that lives, and Warde Fowler's *City State of the Greeks and Romans* is an eminently readable summary of the constitutional history of Greece and Early Rome; read also A. H. Greenidge, *Handbook of Greek Constitutional History.* Mahaffy's *Social Life in Greece from Homer to Menander,* and Wincklemann's *History of Ancient Art.* E. Abbott's *Pericles and the Golden Age of Athens* is an especially valuable monograph on the most brilliant period of Athenian history (compare this with the masterly picture of Pericles by Thucydides), and B. Wheeler's *Alexander the Great* should be read, and the Greek Lives in Plutarch's *Parallel Lives.* (See also Greek Language for Literature.)

The Roman period of Greece already outlined by Mahaffy's *The Greek World under Roman Sway* is also dealt with in the *History of Greece* by G. Finlay (see also Rome, below), which covers the period from 146 B.C. to A.D. 1864 (Tozer's edition, Clarendon Press). Jebb's

Modern Greece and Sergeant's *Greece in the Nineteenth Century* may be read as supplements.

Rome.—An excellent little outline of Roman history, covering the period from the origins to the Fall of Rome, is furnished by a volume of the *People's Books, A History of Rome*, by A. F. Giles. The best outline on a larger scale is Pelham, *Outlines of Roman History*, a masterly treatise published as an article in the new edition of the *Encyclopædia Britannica*, and as a separate work. Two other complementary outlines which are less emphatically constitutional are How and Leigh's *A History of Rome to the Death of Cæsar*, and Bury's scholarly and interesting volume *The Students' Roman Empire*.

After reading these, Warde Fowler's *City State of the Greeks and Romans* will be found illuminating on early Roman constitutional history, and the same writer's suggestive essay *Rome* in the *Home University Library* may be read with advantage.

At this point turn to larger books. The standard work among these is the late Theodor Mommsen's *History of Rome to the Death of Cæsar*, to which is appended for completeness, though it is hardly on the same scale, a companion volume entitled *The Provinces of the Roman Empire*. All the volumes are published, in an English translation, by Messrs. Macmillan. The work without the supplementary volume is also to be had in Dent's *Everyman's Library* (4 vols.). Mommsen, like Grote, is especially valuable, because a point of view enthusiastically held inspired his work to the level of literature. He merely touches on the vexed question of the origins of the city, and passes on to his main theme, the fall of the Republic. He found a parallel between ancient and modern conditions, and treated his characters as vividly as though they were modern. No student of Roman History can dispense with this work.

A popularly written and profusely illustrated *History of the Romans*, by Victor Duruy (Eng. trans., 6 vols.), deals with the general history of Rome to the barbarian invasions, and is a very pleasant work.

The struggle between Rome and Carthage, forms the fourth and last part of *Carthage* in the Story of the Nations series, but the whole volume may be read with profit.

Further light on the republican period may be got from a recent book by W. E. Heitland, *A Short History of the Roman Republic*. The last century of the Republic has been a favourite theme for historians, and the student attracted by this period will find ample reading. The beginnings of the Revolutionary period are treated in A. H. J. Greenidge's *History of Rome from 133 B.C. to A.D. 70*, of which only one brilliant volume was completed owing to the author's early death in 1906. The same writer's *Roman Public Life* in *Macmillan's Handbooks of Art and Archæology* is also an attractive work dealing with Roman Institutions.

Warde Fowler's *Social Life in the Age of Cicero* gives the atmosphere and local colour valuable as a setting for the political story, and should certainly be read. The same writer's *Life of Cæsar*, and the *Life of Cicero* by Strachan-Davidson, both able biographies (Heroes of the Nations series), are valuable for this period.

The little volume *Julius Cæsar* in the *People's Books* is an admirably succinct, scholarly, and living study.

Cæsar's Conquest of Gaul, by T. Rice Holmes, should be read by all interested in the military side of Cæsar's activities, and all students should read at least part of Cæsar's *Gallic War* in the original or in one of the numerous translations.

Further contemporary atmosphere may be obtained in the translation of the whole *Correspondence of Cicero with his Friends*, by E. S. Shuckburgh. Some of the best of Plutarch's *Lives* are drawn from this period. The best are those of the two Gracchi, Marius, and Sulla, Pompeius and Cæsar, Brutus and Antony.

For the history of the empire, Bury's work may be followed by H Stuart Jones's *Story of the Roman Empire* and W. T. Arnold's *Roman Provincial Administration*, and by the portion of Mommsen's work dealing with this period. The *Life of Augustus* in the Heroes of the Nations series is an appropriate biography to read at this point.

J. S. Reid's *Municipalities of the Roman Empire* deals with an important phase of imperial history. Dill's *Roman Society from Nero to Marcus Aurelius* is also valuable as a picture of the life of the times.

At this point the student would do well to turn to Gibbon's great work, *The Decline and Fall of the Roman Empire*. Edward Gibbon lived from 1737–1794, but his work is still the standard treatment of the Empire in its decline, and J. B. Bury's elaborate edition with its generous footnotes brings the work abreast of modern research. The first larger and really valuable part of Gibbon's work deals with the period from 180 to 641 A.D. The most famous portion is the fifteenth and sixteenth chapters, giving the early history of Christianity and its relation to the Roman government. There is a certain amount of historical truth in the study, but facts and proportions are distorted by the ironical attitude of Gibbon towards Christianity. Even Gibbon's first part treats of a period which has already ceased to be Roman, and is labelled for convenience the "Middle Ages." For later history of Rome, see Middle Ages and Italy.

A valuable illustrative volume for the whole course of ancient Roman History is H. Stuart Jones' *Companion to Roman History*.

The Middle Ages

The period loosely called the "Middle Ages" from the break up of the Roman Empire to the period of the Renaissance and the Reformation is so enormous and complex that it does not readily lend itself to outline treatment, and the attempt at such treatment has seldom been made. The most satisfactory text-book dealing with the whole period and a sufficiently adequate introduction is *Europe in the Middle Age*, by Thatcher & Schwill. After reading this, the beginner would do well to turn to the first three volumes of Messrs. Rivington's *Periods of European History, The Dark Ages*, by C. Oman, *The Empire and the Papacy*, by F. F. Tout, and *The Close of the Middle Ages*, by R. Lodge. The brilliant and suggestive essay, *Mediæval Europe*, by H. W. C. Davis in the Home University Library, may then be read with appreciation and profit.

After this preliminary reading the period may best be studied in sections either chronological, or according to various aspects. It would be well to concentrate first on the period of the break up of the Roman Empire and the bararian invasions. For the former subjects chaps. xxix.–xxxvi. of Gibbon's *Decline and Fall* (ed. Bury) should be read, and for the latter chaps. xxvi., xxxviii., xlv, and lii. Chapters (besides the xvth, and xvith), dealing with Christianity are xx., xxi., xxviii., xxxvii., xlvii, and xlix.

L. Duchesne's *Early History of the Christian Church* may be read in an English translation, and is a scholarly yet popular account of the origin of the Roman Church, the first heresies, &c.

A further vivid study of those branches of the barbarian peoples who successively invaded Italy in the "Dark Ages" will be found in Hodgkin's *Italy and her Invaders*. Henry Bradley's study, *The Goths*, gives a rapid survey of the history of the Goths "from the earliest times to the end of the Gothic dominion in Spain." The early part of Milman's *History of Latin Christianity*, a work of considerable literary quality, covering the whole of the Middle Ages, may be appropriately read at this point. The *Life of Constantine* in the Heroes of the Nations series gives a good picture of the beginning of the period, and of one of the characters who determined in part by his deliberate policy some main features of its history. The first two volumes of the *Cambridge Mediæval History* (a collaborative and elaborate work in course of publication) deal with the Empire after Constantine.

The early part of Lavisse and Rambaud's excellent and scholarly *Histoire Générale* is also interesting and valuable. Gregorovius' standard work, *The History of Rome in the Middle Ages* (tr. Hamilton), treats the history of the papacy from the year 400 in the form of biographies of the Popes. Bury's *Later Roman Empire* is invaluable for the story of the Eastern Empire from 395 to 800, to be read also in Finlay's *History of Greece*, and Oman's *Byzantine Empire*, a smaller book. The *Life of Theodoric the Goth* in the Heroes of the Nations series, should be read as a treatment of a character unique in its interest, and a career concentrating the main forces of the period.

J. R. Green's brilliant studies, *The Making of England* and *The Conquest of England*, should certainly be read by all interested in Early English history, though the author's conclusions are not now generally accepted. A more recent book, *England before the Norman Conquest*, by C. Oman, is admirably fresh and original, and embodies the results of much modern research. An alternative volume is *The History of England before the Norman Conquest*, by Thomas Hodgkin (the first volume of the *Political History of England* (12 vols. Longmans).

The Full Middle Ages

The irruption of the Northmen, the foundation of the Holy Roman Empire, and the development of feudalism seem to mark the beginning of a second stage in mediæval history, and the student might well end this stage with the end of the thirteenth century. The reader will naturally turn to the volumes of the *Cambridge Mediæval History* dealing with the period, when these shall have appeared. Gibbon is still valuable on this period, and his chapter on Charles the Great (chap. xlix.) and those on Mohammed (chaps. l. and li.) should be read. The *Life of Charles the Great*, by Einhard, a friend and contemporary of the Emperor, should certainly be read. Written, of course, originally in Latin it may be had in an English translation. This may be followed up by Asser's *Life of Alfred*, for though a century divides them there are many parallels between these two great sovereigns. Students especially attracted by these subjects should read also the volume on *Charlemagne* in the Heroes of the Nations series, and *Alfred the Great*, chapters by Frederic Harrison, Sir F. Pollock, and others (ed. by A. Bowker). These may be followed up by James Bryce's brilliant monograph *The Holy Roman Empire*.

Milman's *Latin Christianity* is valuable still for this period, and an excellent corrective to Gibbon. Especially good is the *General Survey*, the fourteenth book at the end of the work, which might be read with advantage at this stage. Then turn to the chapters on Charlemagne, the Ottos, St. Bernard, St. Louis, the Crusades, Hildebrand, Innocent III, and Boniface VIII. The chapter on the monastic order of St. Benedict is good, and might be read previously to the much fuller treatment in

Montalembert's *Monks of the West*, the classic work on Western monasticism previous to the eleventh century. The author's great object of enthusiasm was St. Bernard, but he died before his work reached the eleventh century. Three of his five original volumes deal with the development of monasticism in England. A sixth and seventh volume, published after his death from fragments of his writing, deal respectively with the influence of monasticism on the feudal nobility and lay society up to the eleventh century, and Gregory VII and the Investiture Contest. After reading all or parts of this work every reader should read from cover to cover J. C. Morison's perfect little study, *St. Bernard's Life and Sermons*. For the later developments of monastic life it will be well to turn again to Milman's chapters on St. Dominic and St. Francis. Two rather old-fashioned but certainly not negligible books which deal with the general aspects of the Middle Ages are Hallam's *Middle Ages* and Guizot's *Lectures on Civilisation in Europe*. In spite of the immense impetus to the study of mediæval things in recent years there has as yet been no book treating philosophically of the Middle Ages as a whole in the light of recent research. Until such a book arrives Guizot's treatment must remain the most valuable short book on the subject. Guizot is especially important to read, because he brings the insight of a practical statesman to the treatment of old problems. His book, with that of Hallam, created a revolution in historical study. Every student should read at least the last chapter in Hallam's *Middle Ages* treating of the state of society. Of the others the first four chapters on France, Italy, and Spain are the best.

Those who wish to study the history of any special country in detail will generally have to turn to works written in the language of that country, but one advantage of the study of mediæval history is that the civilization of the period is so cosmopolitan that more than at any other period the history of one European nation illustrates that of the rest.

This is illustrated by the brilliant *History of France* down to Francis I, by Jules Michelet (translated by W. Hazlitt). It is a series of brilliant studies and reflections on mediæval movements and typical mediæval characters. Every student should read the splendid chapters on the eleventh, twelfth, thirteenth, and fourteenth centuries, the studies of Charles the Great, Louis the Fat, Philip Augustus, St. Louis, Philip the Fair, the Crusades, the Albigenses, the Communes, and Gothic architecture.

After reading Michelet on these subjects it would be well to turn for contemporary reading to Suger's *Life of Louis the Fat* and Joinville's *Life of St. Louis*. Students anxious to master particularly the constitutional and political details of the history of Mediæval France should supplement the more general reading by a study of the *Histoire de l'Europe et particulièrement de la France*, by Jallifier and Vast. This has the advantage of being admirably illustrated. Special points should be further studied in the *Histoire de la France*, written on the co-operative system and edited by Lavisse. Four large volumes are devoted to mediæval history.

Those who wish to specialize on the history of Germany may read in English E. F. Henderson's *History of Germany in the Middle Ages*. Bryce's *Holy Roman Empire* is concerned largely with Germany, and should be supplemented by Fisher's *Mediæval Empire*.

For the mediæval history of Italy the student will find the following interesting and useful, Butler's *Lombard Communes*, W. C. Hazlitt's *History of Venice*, and *The Two First Centuries of Florentine History*, by Villari (translated into English).

Most readers will naturally wish to concentrate on English history. E. A. Freeman's *Norman Conquest* tells in minutest detail the story of the events leading up to the conquest of 1066, but it is exceedingly elaborate. The chief modern treatment of the political history of England in the Middle Ages is to be found in vols. ii. and iii. of *The Political History of England*, vol. ii., 1066 to 1216, by George Burton Adams, M.A., and vol. iii., 1216 to 1377, by T. F. Tont, M.A. A less severely political treatment and on a slightly smaller scale will be found in H. W. C. Davis' eminently readable volume, *England under the Normans and Angevins* (1066–1272) (vol. ii. of *A History of England* in 6 vols., edited by C. W. C. Oman). These might be followed up by Mary Bateson's *Mediæval England* in the Story of the Nations series. It is a gem in its remarkable generalization and wealth of illustration on the social life of England in the Middle Ages. *Social England*, edited by H. D. Traill (vol. i. to accession of Edward I) will also be found useful and interesting. Stubbs' *Constitutional History of England to* 1485 is indispensable for every student of English institutions in the Middle Ages. Recent research has shown some of Stubbs' conclusions on the Norman period to have been erroneous, and *Supplementary Studies*, by Petit-Dutaillis, should be read alongside to furnish the necessary modifications.

After mastering Stubbs the student should be ripe for the brilliant monographs of the late F. W. Maitland, none of whose works may be neglected by a student of mediæval history. We may mention *Domesday Book and Beyond*, *Roman Canon Law in the Church of England*, and Pollock and Maitland's *History of English Law before the time of Edward I*, which might be read successively at this point. They are all three of a specialist nature, but the distinction of style and essential lucidity of treatment make them fascinating reading. *Feudal England*, by J. H. Round, might appropriately follow, but it

is essentially stiff reading. All who wish to appreciate the exact nature of the Great Charter should read *Magna Charta* by W. S. M'Kechnie—"A Commentary on the Great Charter of King John, with an historical introduction." This too is close reading. The student who has pursued any line of reading in mediæval history, as far as the thirteenth century, when so many mediæval institutions reached their zenith, will do well to turn to various monographs tracing the history of some of these institutions through the period. Rashdall's *Universities of Europe in the Middle Ages* should be read by all. H. C. Lea's *History of the Inquisition in the Middle Ages* is a standard work on an important subject, and should also be read, but the student cannot accept all the conclusions, and should bear in mind that Lea wrote with an unconscious but real anti-Roman bias. *Roman Law in Mediæval Europe*, by Paul Vinogradoff, treats an important theme in a lucid manner. Gierke's *Political Theories of the Middle Ages* (tr. Maitland) gives an insight into one side of mediæval speculation. R. L. Poole's *Illustrations of Mediæval Thought* is a slighter but very readable work. H. O. Taylor's *The Mediæval Mind: A History of the Development of Thought and Emotion in the Middle Ages* is an admirable conspectus and very readable.

The chief thinkers of the Middle Ages belonged to one or other of the two great orders of friars. The Franciscan movement, and in a lesser degree the Dominican, has been the subject of keen interest and minute study. Everyone should read the *Life of St. Francis* by Paul Sabatier (English translation) and *The Little Flowers of St. Francis* (tr. T. W. Arnold), which work of the Saint gives the most intimate insight into his mind and character.

This should be followed up by Eccleston's charming chronicle of *The Coming of the Friars Minor into England* (translated by Father Cuthbert, O.S.F.C., and furnished with an admirable introductory essay, which is the best account in English of the early Franciscan movement). A. G. Little's *Grey Friars in Oxford* is a scholarly study of an important side of Franciscan activity in England. Eccleston's chronicle in the original Latin, with other interesting records of the English Franciscans, may be read in *Monumenta Franciscana*, edited by J. S. Brewer and R. Howlett in the *Rolls Series*. Brewer's preface to the first volume is especially interesting and valuable.

The chronicles and other documents printed in the famous *Rolls Series*, available in every public library, are of course for the most part in Latin, but for those who do not read Latin the prefaces are often suggestive and helpful.

It will be interesting, after making some study of Franciscan history, to turn to that of the Dominicans. The best early life of St. Dominic is that by the thirteenth-century Dominican Jordan of Saxony. It must be read in the original Latin, and is to be found in the Bollandist *Acta Sanctorum* (Aug. 4).

The best modern *Life* of St. Dominic is that of J. Guiraud in the series called *Les Saints* (Eng. translation, 1901). The best short account of the history of the Dominicans in England will be found prefaced to the *Life of Cardinal Howard* by C. F. Palmer.

Every student of the thirteenth century will find himself attracted by the ideal of English kingship, Edward I, and everyone should read the masterly little study *Edward I* by T. F. Tout in the Twelve English Statesmen series. Another fascinating biography, and appropriately to be read in connection with the Dominican and Franciscan movements, is that of Innocent III. Those who read French will find Luchaire's book *Innocent III* the best on the subject. For the Crusades there is an excellent article by E. J. Barker in the *Encyclopædia Britannica*, which may be followed up by H. Von Sybel's *History and Literature of the Crusades* (Eng. tr.).

Later Middle Ages

With the end of the thirteenth century a new period with a touch of modernity seems to open, and further reading on the Middle Ages may be grouped round the fourteenth and fifteenth centuries. The central fact of English and French history is the Hundred Years' War, and English and French history loom largest in this period. Vols. iii. and iv. of the *Political History of England* are valuable, and Stubbs is still the first authority on the period. The later part of his work requires less correction from modern research than the earlier. For a clear understanding of the military history of the period Oman's *History of the Art of War in the Middle Ages* must be read. A good narrative of the first part of the Hundred Years' War will be found in *The History of Edward III* by James Mackinnon. For contemporary colour every student should sample Froissart's *Chronicles*.

In the fourteenth century economic discontent becomes a marked feature of the times, and it is important to master the nature of mediæval economy. The parts dealing with the Middle Ages in *Pitman's Economic History of England* by H. O. Meredith (an excellent handbook) will make an appropriate introduction to the subject, which may be followed up in Cunningham's *Growth of English Industry and Commerce* (Early and Middle Ages). A literary treatment of the most picturesque aspect of the century's history is given in G. M. Trevelyan's *England in the Age of Wycliffe*. *The Great Revolt of* 1381, by C. W. C. Oman, is a valuable study of the Peasants' Revolt. *Social England* (vol. ii. to death of Henry VII) should be read also. Both Chaucer and *The Vision of Piers Plowman* should be read for the sake of contemporary colour.

The economic history of the time is intimately connected with the ferment in religion of which Wycliff is the fountain head. Milman's *Latin Christianity* is still excellent on this period, and may be followed up by the first volume of Creighton's *History of the Papacy*. The fascinating study of the teaching and personality of Wycliff himself may be well followed up in the introduction to the *Fasciculi Zizaniorum Magistri J. Wyclif*, ed. Shirley (*Rolls Series*) and in *Huss and Wiclif* by J. Loserth (Eng. tr.). Complementary accounts of the "Babylonian Captivity" of the Papacy, so important a feature of the period, will be found in Creighton and in Pastor's *History of the Papacy* (Eng. tr.). The history of the Hussite movement and the conciliar movement of the fifteenth century follow naturally on the fourteenth-century upheaval, and should be followed up at this point in Creighton, Milman, and Pastor.

For the progress of the second part of the Hundred Years' War, J. Gairdner's small book, *The Houses of Lancaster and York, with the Conquest and Loss of France*, should be read. Sir J. H. Ramsay's *Lancaster and York: A Century of English History*, a work of immense learning, may be consulted on points which the student may wish to have elaborated.

The most attractive figure in fifteenth-century history is Joan of Arc, and every student of the period will wish to know all that can be known about her. Michelet's vivid sketch is one of the most brilliant parts of his *History*. Her character and career have provoked much controversy, and there are many points of view. An enthusiastic modern treatment is furnished by Andrew Lang's *The Maid of France*.

The effect of the French wars in disorganizing English administration is illustrated in *The Paston Letters*, which are invaluable as contemporary documents, giving the very atmosphere of the fifteenth century. They have been edited with the closest care and scholarship by Gairdner. From their quaintness and sobriety the student will turn with a keener appreciation to the study of the Renaissance spirit.

The Renaissance and the Reformation

With the beginnings of modern times history becomes altogether more complex, and, as a natural consequence, there are fewer great books attempting to deal philosophically with great tracts of the period. But there is an increasing number of specialized standard works dealing minutely with various periods.

As a general introduction to the study of modern history nothing could be better for its clearness and general arrangement than the *Outline of Modern History* by Jules Michelet. Beginning with the fall of Constantinople in 1453, it has been translated and brought up to date by Mrs. W. Simpson. The best available summary of modern political history to the early nineteenth century is the *Manual of History of the Political System of Europe and its Colonies*. These might be followed up by Robertson's *Survey of Europe* in the *Introduction* to his *Charles V*. The formation of the European monarchies, which is partly prelude to and partly an aspect of the Renaissance, may be followed up with profit for individual countries. For England the early part of Hallam's *Constitutional History of England* should be read. For Italy there is a short English summary of Sismondi's *Italian Republics*. For Spain Prescott's *Ferdinand and Isabella* is the standard work. But Robertson's work gives better than any other a general view of forces and events at work in the Europe of the sixteenth century. *The Renaissance*, the first volume of *The Cambridge Modern History*, a work of immense specialization and research, is admirably divided up and may be read through or consulted on special points. It is almost purely political in its method and selection.

A vivid account of the geographical discoveries of the period will be found in *A Book of Discovery* by M. B. Synge.

For the Renaissance in its narrower literary and artistic aspects every student should read J. Burckhardt's *The Civilisation of the Renaissance in Italy*, and Michelet is again inspiring and illuminating. Various lectures on *The Renaissance* by J. A. Symonds should be read, and his elaborate work, *The Renaissance in Italy*, may be sampled.

Here with the vast development of personality, which is a note of the period, biography is all important. W. Roscoe's *Life of Lorenzo de Medici* is an appropriate biography to read at this point. There are numerous lives of Michael Angelo, and one of these should be read. Seebohm's charming work *The Oxford Reformers* should certainly be read. It gives an insight into English and European life as affected by the "New Learning." The *Life of More* by his son-in-law, W. Roper, should be read, and for a typical Renaissance *jeu d'esprit* More's *Utopia* (Eng. tr.) should be studied, as also should Erasmus' *Praise of Folly* (Eng. tr.).

The general history of the Reformation in Europe will be best read in Ranke's *History of the Popes*, and a further treatment of its progress in individual countries will be found in *The Reformation*, vol. ii. of the *Cambridge Modern History*, and in vol. iii., *The Wars of Religion*. The story of Holland's struggle for its liberty and religion may be read in Motley's *Rise of the Dutch Republic*. Most readers will naturally wish to read a good biography of Martin Luther. Unfortunately the subject has hardly ever been treated in an impartial spirit. Perhaps the best account is in Janssen's *History of the German People* (Eng. tr.).

The Reformation period in England may be read in vols. v. and vi. of *The Political History of England*, 1485–1547 by H. A. L. Fisher, and 1547–1603 by A. F. Pollard or alternatively in *England under the Tudors* by A. D. Innes, and *England under the Stuarts* by G. M. Trevelyan. A brilliant study on a large scale of the Reformation in England is J. A. Froude's *History of England*, 1529–1603. It is very partial and inaccurate, but the student should read it while discounting its tone and bias. Brewer's 2 vols., *The Reign of Henry VIII* (to 1530 only) give a vivid impression of their subject.

F. A. Gasquet's *Henry VIII and the English Monasteries* is a readable and scholarly account of a movement which amounted to a social revolution. The part of Cunningham's *Growth of English Industry and Commerce*, which deals with the period, should be read for an appreciation of the great economic changes passing over England at this time, and also Traill's *Social England*, vol. iii.

For a continuous history of the English Church during this period of reorganization, vol. iv. of *A History of the English Church* (ed. Stephens and Hunt) by James Gairdner is valuable and scholarly. It deals with the period from the accession of Henry VIII to the death of Mary. The tale is taken up in vol. v. *During Reigns of Elizabeth and James I*, by W. H. Frere.

Gairdner's monograph, *Lollardy and the Reformation in England*, should also be read. An elaborate study is furnished in R. W. Dixon's *History of the Church of England from the Abolition of the Roman Jurisdiction* (6 vols., 1529–1570). *Edward VI and the Book of Common Prayer*, by F. A. Gasquet and E. Bishop, is an important and illuminating study.

After the Scottish Reformation Scotland became more intimately connected with England, and it might be well to review at this point the relations between the two countries during previous periods. R. S. Rait's *Outline of the Relations between England and Scotland* (500–1709) forms an excellent popular outline, and might be followed up by P. Hume Brown's *Scotland in the Time of Queen Mary*.

The study of this period in English and Scottish history should be rounded off by a few important biographies. Gairdner's *Henry VII*, Creighton's *Wolsey* (*Twelve English Statesmen* series), *Queen Elizabeth* by the same author, A. F. Pollard's *Henry VIII* and *Cranmer*, and Julian Corbett's *Drake* may be recommended. For contemporary atmosphere Cavendish's *Life and Death of Thomas Wolsey* should be read.

Round Mary Queen of Scots a whole literature has grown, but the charming biography by Florence MacCunn may be specially recommended, and there is a study too in the *People's Books*. The study of *John Knox* by Mrs. MacCunn might be read or his *Life* by M'Crie, Knox's own *History of the Reformation in Scotland* should be sampled.

The Seventeenth Century

Two volumes of the *Cambridge Modern History* deal with the seventeenth century, vol. iv. *The Thirty Years' War*, and vol. v. *The Age of Louis XIV*. Michelet and Heeren on this period should be studied before reading up special points in these two large volumes. This would be an appropriate point to read Stubbs' *Lectures on European History*. They "form one historical drama, in which the reign of Charles V is the first, the period from his death to the beginning of the seventeenth century the second, and the Thirty Years' War is the third act." They are very illuminating in their masterly generalization. H. O. Wakeman's volume on the period from 1598–1715 in *Periods of European History* is eminently readable. Its method is selective. The development and influence of France is emphasized as of the first importance in the history of the period.

S. R. Gardiner's little volume, *The Thirty Years' War* in *Epochs of Modern History* is a fine study of the subject.

Gustavus Adolphus by C. R. L. Fletcher is a readable biography of the Protestant hero of the Thirty Years' War.

For the constitutional struggle in seventeenth-century England material abounds. The last word in research is to be found in the great works of S. R. Gardiner, *The History of England from* 1603 *to* 1642, *The History of the Great Civil War*, and *The History of the Commonwealth and Protectorate*, but to most students they will only appeal as books of reference. J. R. Green's narrative of the struggle in his *Short History of the English People* is especially vivid, and vols. vii. and viii. of the *Political History of England*, 1603–1660 by F. C. Montague, and 1660–1702 by R. Lodge give adequate narratives.

Gardiner's little volume in *Epochs of Modern History*, *The First Two Stuarts and the Puritan Revolution* (1603 to 1660) should be read by all, and no one should neglect his *Constitutional Documents of the Puritan Revolution*. The volume on *Oliver Cromwell* by H. C. Firth in the Heroes of the Nations series is especially fine both in matter and style, and should be read by all, as well as his *Cromwell's Army*. Lord Morley's biography of Cromwell is also valuable and suggestive, and there is a very complete and judicious study in the *People's Books*. Carlyle's *Letters and Speeches of Cromwell* gives contemporary colour, but has little value as history. The *Memoirs of Colonel Hutchison* and the *Diaries* of John Evelyn and Samuel Pepys should also be read, at least in part.

Pollard's *Factors in Modern History* deals suggestively with some of the constitutional problems of the period.

The real essence of the age of Louis XIV may best be found in Voltaire's *Age of Louis XIV and Louis XV*. For the history of the Revolution Macaulay's *History of England* is indispensable.

Seeley's *Growth of British Policy*, while perhaps rather over-emphasizing the part played by dynastic considerations in the relations between European states, is extremely suggestive and interesting.

The Eighteenth Century

For the general history of Europe in the eighteenth century Arthur Hassall's *The Balance of Power* (1715–1789) in *Periods of European History* is a good conspectus, and vol. vi. of the *Cambridge Modern History* also deals with the eighteenth century.

Of English history in the eighteenth century the monumental work of Lecky, *History of England in the Eighteenth Century*, gives an exhaustive analysis. Its seven volumes are made up of a series of essays rather than a continuous narrative. His treatment of the American War of Independence and of Irish history are especially good. Lecky is essentially readable, but for those who require shorter works C. Grant Robertson's excellent volume, *England under the Hanoverians*, may be recommended for its clear arrangement and grouping and its emphasis of outstanding features of the times. Vols. ix. and x. of *The Political History of England*, by J. S. Leadam and W. Hant, cover the political history of the period.

Lecky's treatment of the American War of Independence may be followed up in G. O. Trevelyan's *The American Revolution* (in progress). *The Early History of Charles James Fox* by the same writer is a gem of biography and should be read by every student of the period. Lord Rosebery's study of the younger *Pitt* should also be read. Leslie Stephen's *History of English Thought in the Eighteenth Century* gives an admirable impression of the intellectual atmosphere of the century.

The Expansion of England by Seeley treats in a clear and emphatic way of an important side of British development. Macaulay's essays on *Clive* and *Warren Hastings* should be read in connection with the history of India. Sir Alfred Lyall's *Rise and Expansion of the British Dominion in India* is a good short treatment of the subject and thoroughly up to date. For those who wish to turn back to the early history of India Elphinstone's *History of India in the Hindu and Mahometan Periods* is the best popular account. J. W. McCrindle's *Ancient India*, T. W. Rhys David's *Buddhist India*, and Stanley Lane-Poole's *Mediæval India* (Story of the Nations series) are all scholarly and readable monographs.

For the story of Canada Sir J. G. Bourinot's *Canada under British Rule*, 1760–1900, which reviews in its first chapter the colonization of the valley of the St. Lawrence by the French, may be recommended. A. G. Bradley's *The Making of Canada* is also good. It deals with the history of Canada from 1766 to 1814.

The French Revolution and the Romantic Revival

A vast literature has grown up round the various aspects of the French Revolution. The best short book to read as an introduction is Mignet's *History of the French Revolution* (1789–1814) (Eng. tr.), but Michelet's fuller treatment in the nine volumes of his *History of the French Revolution* has far greater literary charm.

Lord Acton's *Lectures on the French Revolution* are scholarly, illuminating, and original, like all he wrote. For those who care for the poetic method of history Carlyle's *French Revolution* may be recommended at this point. For the history of the Revolutionary and Napoleonic Wars the first 2 vols. of C. A. Fyffe's *History of Modern Europe* (1792–1848) is the best general account, as it is of the general history of the period. Hilaire Belloc's little volume on *The French Revolution* (Home Univ. Lib.) is useful as an analysis of character and motives, refreshing in its criticism of traditional views, and illuminating in its treatment of the military aspect of the Revolution. Vol. viii. of the *Cambridge Modern History* deals with the *French Revolution* and vol. ix. with *Napoleon*. A concise exposition of the influence of the French Revolutionary ideas on Europe is furnished by J. Holland Rose's *The Revolutionary and Napoleonic Era* (1789–1815). It should be read and followed up by the *Life of Napoleon* by the same writer, and by Lord Rosebery's *Napoleon, The Last Phase*. *Revolutionary Europe*, by H. Morse Stephens, in *Periods of European History* is a somewhat fuller treatment than that of J. H. Rose, on the same lines, emphasizing Napoleon's reforms rather than his conquests. Two out of the proposed three volumes of *A History of the French Revolution* by the same author have so far appeared. It is a detailed history (the second volume ends with the year 1793) and thoroughly scientific, correcting misstatement, and filling in gaps in the narrative of Mignet, &c. It was severely criticized by Lord Acton.

Seeley's *Life and Times of Stein* is illuminating as a study of the changes which took place in Germany in the Napoleonic era.

There is an excellent article on the Waterloo campaign in the *Encyclopædia Britannica*, and a recent small but vivid volume on the Battle of Waterloo by H. Belloc. The same writer's lives of *Danton*, *Robespierre*, and *Marie Antoinette* are all well worth reading. Mahan's *Influence of Sea Power on the French Revolution and Empire* deals with an important aspect of the period.

Oman's *History of the Peninsular War* is a masterly study.

The Romantic Revival.—For the general history of Europe in the nineteenth century, Fyffe's *History of Modern Europe* (1792 to 1878) is valuable. *Modern Europe*, by W. Alison Phillips, in *Periods of European History*, deals with the period from 1815 to 1899. *The War of Greek Independence* (1821–1833) by the same author deals with the political first fruits of the French Revolutionary movement. Vols. x., xi., and xii. of the *Cambridge Modern History* deal respectively with *The Restoration*, *Growth of Nationalities*, and *The Latest Age*.

The story of the making of Italy may be read more fully in *Modern Italy* (1748–1898) by Pietro Orsi. J. A. R. Marriott's *The Makers of Modern Italy, Mazzini, Cavour, Garibaldi*, might also be read, and Lord Acton's article of "Cavour" in *Historical Essays and Studies*.

Bismarck, A Political Biography, by Charles Lowe, should be read, both for its insight into the character of a great statesman and the history which he made. A smaller but excellent study of Bismarck by F. M. Powicke is published in the *People's Books*.

For English history in the nineteenth century there are vols. xi. and xii. of *The Political History of England*, 1801–1837 by G. C. Brodrick and J. K. Fotheringham, and 1837–1901 by Sidney Low and C. L. Sanders. Traill's *Social England*, vol. vi. (1815–1885) deals with aspects of English life of special importance in this period. Justin M'Carthy's *A History of Our Own Times* (5 vols.) but also condensed into 1 volume) is a popular and very readable account of the reign of Queen Victoria up to 1897.

Spencer Walpole's *History of England* (5 vols. deals with the period from 1815 to 1880, and *A History of Modern England*, by H. Paul (5 vols.) is a brilliant survey of the period from 1846 to the retirement of Gladstone in 1895.

The Development of Parliament during the Nineteenth Century by G. Lowes Dickinson gives in a short manner the steps by which the "democratization" of Parliament has been achieved.

Kinglake's *Invasion of the Crimea* is a standard work, and can be had in an abridged edition.

F. R. Cana's *South Africa from the Great Trek to the Union* should be read by all who wish to appreciate the problems of South African history and the events circling round the Boer War. The study of *Cecil Rhodes* in the *People's Books* may well be read in this connection.

For the general history of Africa the works of Sir H. H. Johnston are standard authorities, *A History of the Colonisation of Africa by Alien Races* and *The Opening-up of Africa*. J. S. Keltie's *Partition of Africa* may also be read, and is liberally furnished with maps.

A very readable book on a subject of compelling interest is *Great Britain in Modern Africa*, by Edgar Sanderson.

For Australia a good short and first-hand account of its development is furnished by Edward Jenks's *History of the Australasian Colonies from their Foundation to the Year* 1911.

A good manual sketching the history of China from the earliest times to the present day is that of E. H. Parker, *China: Her History, Diplomacy, and Commerce*.

The Civilisation of China, by H. A. Giles, and his *Chinese Biographical Dictionary*, contain a wealth of information on social life in China.

For Japan the best account of its modern progress is *Fifty Years of New Japan* by Count Okuma. Lafcadio Hearne's *Japan: An Interpretation* is interesting, as is also B. H. Chamberlain's *Things Japanese*.

E. O'Neill, M.A.

II. SOCIAL PHILOSOPHY

SOCIOLOGY

An outstanding characteristic of the present age is the attention given by various classes of men to social inquiries. The "social problem" every year becomes more urgent in its demands for a solution. A growing party in politics aims at the redress of social wrongs and at a higher standard of life for the workers of the nation. Social reformers and philanthropists, no longer acting on the impulse to relieve particular cases of obvious want, seek to discover the causes of distress and so attack the problem at its very foundations. Ministers of religion exhibit a growing tendency to preach Christianity not merely as a preparation for a future life, but in its relation to the difficulties by which individuals and communities are here and now beset. All classes of educated and cultured men are betraying the same increasing interest in the life and work of their fellow men.

It is from these circumstances that the study of sociology derives its interest and importance. The term is very often used in a more or less vague sense, referring to observations of particular aspects of the life of the whole nation or of parts of it. In the following article, however, we shall employ it in a narrower sense, meaning by it a scientific investigation into the origin and development of human society, ideas, and institutions. Even from this point of view there is, as we shall see, some uncertainty as to its precise meaning. Yet we shall be able to make sufficiently clear the general scope and methods of the social science. We shall first trace the historical development of the study, then give a short outline of its methods and the objects investigated by it, and conclude by indicating by what course of reading the subject may be studied in greater detail.

History of the Science.—Sociology, in the present-day acceptation of the term, is a science of quite modern creation. In Greece, it approximated to political science, which discussed the best method of securing to the citizen the greatest degree of good character; a character possible through the laws and institutions of an all-embracing State. The Roman ideas were not essentially different. The Greek influence is seen in the modern writers following the Renaissance. The doctrines of Machiavelli, Bodin, Grotius, Hobbes, and Locke, all tended to become theories of society regarded as a medium for the conscious realisation of human desires along the line of least effort. Even in so recent a thinker as Spencer a trace remains, in his view of man's submission to political subordination as due to experience of increased satisfactions through its means.

The founder of modern sociology, and the coiner of the term, was *Auguste Comte* (1798–1857). In the *Positive Philosophy* (1839), sociology is placed at the head of the sciences, as the most complex of them, dealing with the whole nature of the most fully organised being, and with the mutual relations of the social body. Human phenomena are as reducible to law as any others. The laws concerned are of two kinds—statical, the conditions of permanent existence, and dynamical, the laws of change; and, as an object must exist before it can move, the statical element in all cases takes precedence. The evolution of society depends on the development of knowledge, and this is controlled by the "Law of the Three Stages." Every society in its evolution passes through the *Theological*, *Metaphysical*, and *Positive* stages, though the evidence for this law is admittedly incomplete in any one society. The first is long and protracted. All things that affect the mind are conceived to be inhabited by spirits (*Fetichism*); a gradual reduction in the number of gods produces *Polytheism* and finally *Monotheism*. The second stage, where causes of phenomena are sought in abstract entities instead of supernatural volitions, is transitory, and passes into the final and permanent third stage, where it is seen that only phenomena and their laws can be known.

The æsthetic, moral, and religious sides of human nature are reducible to a similar order of development. In fetichism, priesthoods and

temples are absent, but arise with poetry, music, and the dance, in polytheism, where the concrete object is regarded only as the abode of the divinity. With the idea of the divinity as protector come patriotism and the military spirit, slavery, and caste. Monotheism brings a separation of spiritual and temporal power, and the surrendering of all coercion to the State; science advances and overshadows the æsthetic faculties, though these find compensation in pathetic portions of the Evangelist's narratives, traditions of saints and martyrs, erection of cathedrals, and choral music; the feudal system arises, and slavery becomes serfdom. The disappearance of the theological belief brings the decay of faith, and a free play for the spontaneous impulses of human nature. Universal selfishness is transformed into universal love, and the intellect is allied as a regulating influence with the affective functions; an aspiration after ideals taken from saintly and heroic examples leads to the religion of Positivism, the worship of Humanity.

Natural Selection.—The development of the study was after Comte profoundly influenced by the theory of natural selection. There had been long before Darwin tentative speculations on the evolutionary principle in nature. It was the *Essay on the Principles of Population* of Malthus (1798) which suggested the theory of natural selection to Darwin. The researches of Murchison, Buckland, and Lyell, among others, had familiarised the world with the idea of development in the physical and biological spheres. Buffon and Lamarck had already propounded their theories of evolution. Yet a strong opposition was offered to all attempts to apply these theories to man himself; the Old Testament teachings were influential, and the theory of evolution offered no hint of a means whereby the transmutation of species was brought about. This essential mechanism was supplied by Darwin's theory of natural selection (*Origin of Species*, 1860), that individuals perpetuated those variations which best fitted them to survive in the struggle for existence. This new theory enabled the study of man to be made a department of a higher biology, and brought all the phenomena of human development within the application of general causes, which have controlled the evolution of human life from its very beginning.

Herbert Spencer.—Darwin's theory was adopted by Herbert Spencer, who found an analogy between the social organism, *i.e.* the State, and a living body. Both increase insensibly from small aggregations, assuming a greater complexity of structure and an increasing interdependence of parts, of which the life of each is possible only through that of the rest; also, the life of a society is independent of and more prolonged than that of its individual parts, which die away while the whole body politic survives. An important difference, however, is that all members of society are endowed with feeling, and not merely a special tissue. Hence the welfare of individuals is not to be sacrificed to the supposed interests of the State, but on the contrary, the latter only exists to serve the citizens. This, however, leads to a difficulty, for, since the efficiency of a society is always greater than the sum of that of the separate parts, natural selection must act on the individual through society, *i.e.* the interests of the citizen are subordinate to those of the State. Hence it must either be the case that the individual has arrested the normal effect of natural selection—which is inconceivable—or Society must be organic in a different and wider sense than Spencer imagined, and subject to further-reaching principles than he conceived.

Spencer has thus made no advance on the English Utilitarians, Bentham and Mill, who regarded the science of society as the study of the paramount interests of the individuals within the consciousness of the political State. Accordingly, there has been a growing conviction of the impossibility of formulating the principles of human development if the "social organism" is identified with the political state. Society must be conceived as something more than political, and, in fact, social progress is shown in history to be associated with prominent types of social order organically connected with certain conceptions which have subordinated individual conception through extended periods of time. At every stage is found some dominant principle determining which among contemporary social systems will survive against the others.

Thus, in western civilisation we find, first, the principle of the greater efficiency of co-operation than of individual effort leading towards social organisation; second, the propelling force centred in the personality of some military chief; next, the subordination of the individual to military efficiency, the greatest advantage being the conception of exclusive citizenship derived from blood-relationship to a common deified ancestor. A later stage shows a sense of human responsibility outside the limits of subordination to the State. The State has still to maintain its military power against co-existing lower forms of society, yet social institutions are transformed by new ideas of freedom and tolerance. Slavery and the absolute power of the ruling classes decay, and give place to the conception of the native equality of man, to political enfranchisement, to the unlimited freedom of thought in every department of inquiry.

To sum up, while previous empirical systems have tended to construct theories of human society from introspective examinations of individual emotions, future theories must reverse this order, must regard as the controlling factor

in the evolutionary process, society considered in its more organic aspects, and must study the individual mind from this standpoint.

OUTLINE OF GENERAL THEORY

We may define modern Sociology as an interpretation of human society in terms of natural causation; as an explanation of the growth of human institutions by the operations of physical and psychical forces, working together in a process of evolution.

Nature and Scope of Sociology.—As to its exact nature and scope, varying views have been taken. Thus Comte considered that the life of society was one and indivisible, whence sociology must study it as a whole; others have relegated particular classes of social phenomena to special "social sciences," *e.g.* political economy, politics, reserving for sociology proper the study of general principles underlying the sub-sciences. Other views regard it as merely the sum of moral and political sciences, or identify it with one of the older special sciences. But since a science of sociology can be distinguished from the special social sciences, and be allotted the study of attributes common to all of these, it seems proper, as well as convenient, to regard it as the science of social elements; the common basis of the more particular subsciences, and furnishing its principles as their postulates.

Method.—Sociology is a concrete science, descriptive, historical, and explanatory. This implies that the field of observation is the whole history of mankind, that certain signs are found associated with certain phenomena, that a similar association is inferred to have existed in times past. Thus, as in all concrete sciences, the method is generalisation, verified by deduction; just as in the abstract sciences, the legitimate order is deduction, confirmed by observation. It is not meant, however, to confine these two methods, induction and deduction, to concrete and abstract sciences respectively, but just to keep description in advance of history, history in advance of explanation.

The traditional distinction (mentioned above) between social "statics" and "dynamics," and the greater importance attached by Comte to the former, seem to require that coexistences must be explained before sequences. Giddings, however, points out (*Principles of Sociology*) that these terms involve a misconception. All human phenomena are questions of dynamics, for all, coexistences and sequences, are products of social forces. Social structure results from forces in equilibrium, development and change from varying forces. The whole science is then a study of motion; the real division is of dynamics into statics and kinetics. Living organisms form a "moving equilibrium," in which an approximate equilibrium of internal forces is prevented from perfect equilibrium by external forces. It is therefore wrong to attempt sharply to divide the statical investigation of the internal equilibrium from the kinetic examination of the change.

The Fundamental Sociological Fact.—In recent years, varying theories of the characteristic marks of society have been advanced; —*Gumplowicz*, that primitive conflicts lead to amalgamations and assimilations of heterogeneous elements to form ethnical groups; *Novicow*, that conflict is progressively modified by alliance, and the physical struggle becomes an intellectual one; *De Greef*, that society progresses so far as conscious agreement displaces coercive authority; *Tarde*, that imitation is the primitive phenomenon, leading to mutual aid, division of labour, contract; *Durkheim*, that individual minds are increasingly coerced by external modes of thought and action; *Giddings*, that "consciousness of kind," which may be produced with other effects, by impression and imitation, causes alliances and contracts, and is thus the true principle to which all human development is to be referred.

Historical Evolution of Society.—We shall have to go right back to the earliest dawn of human history, when man is just emerging from the animal state. This took place, according to Darwin, in Africa, where those species of the monkey most related to man (gorilla and chimpanzee) are to-day found, and which gave the hot climate necessary when man lost his hairy covering, and adopted a frugivorous diet. An opposing doctrine places man's origin in a region extending along the north of Africa and south of Europe, as far as India; a doctrine based on such discoveries as those of the remains of anthropoid apes in France, Italy, Gibraltar, and of paleolithic implements in the valleys of the Ouse, Thames, Somme, Garonne, and Tagus. It is such discoveries as these which determine the social characteristics of the first men of whom we have any knowledge; together with the study of geological and biological facts, of a general parallel between some features of primitive society and of the lowest existing societies.

The first men lived in hordes, scattered over wide areas. Their numbers were very small, and increased from within by births and from without by the capture of women and children. The nature of the family at this stage has been the subject of much discussion and investigation. The older theory regarded the father as the head of a family of one or perhaps more wives and children; from this beginning arose, in time, a number of families all subject to the patriarch, and splitting up into separate tribes as their numbers increased. A typical example

was the case of the children of Israel. Maine, the chief exponent of this *Patriarchal Theory* in the nineteenth century, regarded the ancient Roman family as showing the true character of the primitive family—the paterfamilias possessed in the "patria potestas" unlimited power over wife, children, and slaves; women on marriage became subject to a new paterfamilias, all relationship was through males (*i.e.* was agnatic), and all clans and tribes were agnatic. But such a type was too complex to be primitive, and seems not to have occurred save with the Romans.

The patriarchal theory is not in accordance with the traditions or present institutions of civilised nations; many tribes appear to be tending towards it as a later development. Accordingly, through the researches of McLennan and others, belief in a maternal relationship has gained ground. The commonest marriage is temporary monogamy. In cases of desertion, the children remain with the mother and take her name. As the hordes become consolidated into clans, all members of the clan regard themselves as descendants of one ancestor, such as a deer, turtle, or elk. This is Totemism. Marriage is exogamous, *i.e.* between members of different totems, and descent is usually reckoned through mothers. The clan enforces rights and duties, marriage regulations, laws of property. Later arises the phratry, a brotherhood of subclans, formed from a larger clan. It develops the social and religious life of the community. The tribe is a military organisation, and develops in its council a military tradition.

At any of these stages—clan, phratry, tribe, the change from metronymic to patronymic relationship may occur. The chief factors are, marriage by capture, where the neighbouring tribes are hostile, the separation of women from their kindred by accompanying their husbands in hunting parties, the increasing value of the labour of women and children in the fields, leading to the desire for their retention, and finally, the adoption of the wife into the clan and totem of the husband. With these changes, the belief in the descent from totemic gods disappears, and is replaced by *Ancestor-Worship.* The head of the family is priest and proprietor; marriage is arranged with a view to the transmission of the priestly office; adultery is not merely an offence against the husband, but a sin; barrenness is a terrible crime; failing the birth of a son, the parental authority is transmitted to the son of a daughter "appointed" for the purpose. If a man dies childless, his widow is given in marriage to his brother, and their children regarded as his (Matt. xxii. 24). Further, clan headships tend to become hereditary, and the chief's personal possessions increase through inheritance, confiscation, conquest, and presents from the tribesmen. The Feudal System is the direct outcome of this type of society.

Hobhouse (*Morals in Evolution*) distinguishes "mother-right" from matriarchy, and with it connects his views on the position of women in early society. Under "mother-right," family relationships depend on the wife, who remains a member of her own family; the children take the mother's name and belong to her kindred, returning to them in case of desertion or divorce; the woman's brothers are her natural guardians and exercise all the rights and privileges of the position; property passes *through* the woman, if not *to* her. Yet the mother-right is compatible with the complete subjugation of women (Caribbeans, North American Indians). Woman's inferior right to protection of life and limb, her drudgery while the men fight, the prevalence of polygamy and the capture and exchange of wives all point to the inferiority of women.

This is not to say that the lower races hold their women in complete subjection. Westermarck (*Origin and Development of Moral Ideas*) rejects this as a general state of affairs. In several cases she is superior to the man. Thus, among Columbian Indians, women interfere and prevent bloodshed in drunken brawls; they are often admitted to and speak at the councils of the Navahos, and in other tribes women are always consulted before a bargain is closed in trading.

The position of women depends on their economic value, which raises their status among agricultural tribes, where the cultivation of the land is regarded as women's work; on the magical ideas connected with women, *e.g.* their uncleanness, which gives them a certain power over men; on the number of girls born, and on the prevalence of infanticide.

Consolidation into Nations.—Returning from this digression to our sketch of the historical evolution of society, we may refer briefly to the increasing consolidation of clans into tribes, and tribes into nations, and the growth of the complex civilisation of to-day. The key to this development is found by Hegel in a process of self-realisation; of intellectual progress and widening freedom. Freedom is at first considered abstract and existing only in one person, God or the king. In Greece, many could be free. Rome incorporated the substance of freedom in the formal law of personal rights. In Christianity the idea is fully matured, and all men may be free. A second doctrine is that of Comte, who, as we have seen, found the law in a merely intellectual development.

According to Spencer, who based his assertions on observation and induction, it is the military power which shapes the whole political organisation. At first, it integrates the society, but, if continued afterwards, leads to a "segmentation," a sharp division of society into castes, with a minute supervision of every department of human affairs. Industrialism is subordinate, and personal freedom disappears. If the

military power, however, becomes no longer predominant, an age of industrialism follows, which is only possible through the previous military constitution of society, and causes in its turn, freedom. Giddings, criticising Spencer, agrees that in the age of integration a society must be military. Afterwards, however, a free type is created by the energies liberated on the decline of militarism, and the next stage of progress is the organisation of free forms of society under the protection of law, which alone make industrialism possible.

A complete account of the development of human society will also trace the growth of ideas and institutions for which we have only space here for the briefest mention.

Growth of Institutions.—Thus we are led into the highly debatable question of the nature and origin of moral emotions, the notions of "ought," "good," "virtue," "merit," the altruistic sentiment. We follow the growth of modern institutions for maintaining law and order, in their various stages from direct retaliation, the blood feud, compensation for injuries, to collective responsibility, with a central authority employing the judicial duel, the oath, outlawry, the ordeal in its redress of wrongs, to the later stage of extreme rigour of the punishment of crime, which is a revolt against authority, and lastly, to the reformatory treatment of crime, which is regarded as an outcome of definite psychological or physical conditions.

Slavery is traced from its origin through economic reasons and capture in war, as an advance on slaying of captives, in its different aspects in Greece, Rome, and America, to its gradual transformation in Europe into serfdom, and its final disappearance as the greater efficiency of free labour was realised.

In the regard for human life, investigation shows how this is held cheap in various primitive societies, especially the lives of strangers; and the part played in increasing its value by religion (*e.g.* Laws of Manu, Roman Catholicism), the crusades, chivalry, and the increasing authority of rulers.

We may trace also the changes in the attitude of man towards supernatural beings; the different degrees of immortality attributed to gods, their human needs and sensitiveness to insult and worship, the practice of sacrifice, the right of sanctuary, their moral growth, and the comparative characteristics of the religions of Peru, Chaldea, Persia, India, and Europe.

The study will also find a place for such topics as hospitality, treatment of children and old persons, property, truthfulness and honour, suicide, celibacy, cannibalism.

COURSE OF READING

The study of sociology may be conveniently entered upon with *Elements of Sociology* by Giddings. Herbert Spencer's volume on *The Study of Sociology* may also be perused, as explaining the difficulties, both in the student and in the phenomena to be investigated, that must be overcome in order to make progress in the science. The relations of Sociology to the other branches of philosophy are discussed in Sidgwick's *Philosophy, its Scope and Relations.*

Larger treatises may now be attempted. These should include Kidd's *Social Evolution*, Giddings's *Principles of Sociology*, and Mackenzie's *Introduction to Social Philosophy.* Only when the student has thoroughly grasped in broad outline the nature and scope of the science should he proceed to such compendious and difficult works as Spencer's *Principles of Sociology*, and *Principles of Ethics*, Westermarck's *Origin and Development of Moral Ideas*, Frazer's *Golden Bough*, and Hobhouse's *Morals in Evolution.*

Notable books that have contributed to the historical development of the science should be studied, and some may be procured in cheap editions. Comte's *Positive Philosophy* is best read in Harriet Martineau's translation in two volumes. Mill's *Logic* discusses (Book VI) the methods appropriate to the science. Darwin's *Origin of Species* is in Cassell's "People's Library."

Primitive society may be studied in Marett's *Anthropology* (Home Univ. Library), Tylor's *Anthropology* and *Primitive Culture*, Lubbock's *Origin of Civilisation*, and Maine's works, including *Early Law and Custom*, and *Early History of Institutions.* Modern forms of civilisation are discussed in Kidd's *Principles of Western Civilisation*, and in various *Encyclopædia Britannica* articles, as well as in Sidgwick's *Development of European Polity.*

Many of the principal contributions to the science of society are not to be found in lists of sociological references, but must be sought in the periodicals in which they were first published.

POLITICAL ECONOMY

Political Economy, or Economics, is the study of man in relation to the ordinary business of life. On the one hand, it is a study of wealth, as it deals with the objects which men and nations pursue as constituting their material well-being; on the other, it is part of the study of man, for more than any other agency except his religious ideals, man's everyday work and the material resources he thereby acquires have moulded his character.

But though economics deals with questions so vital to the well-being of man, it is yet, as we shall see, a modern science, and is almost entirely the development of the last three centuries. It is still, indeed, in a transitional state, and we shall be able to trace two tendencies in it, one the more abstract and mathematical, and the other more concrete, occupied with the observation of countless phenomena, past and present.

We shall be able, however, to present certain fundamental ideas of the science, which are by no means difficult to understand, though, rejecting confused conceptions and inexact reasoning, they require a certain degree of concentration of mind.

We shall, therefore, give in brief an outline of the historical development of economic theory, and follow this with a general account of the principal topics discussed by economists. We shall conclude with a course of reading in which the study may be further pursued.

History of the Science.—Ancient and modern theories of economics owe their essential difference to the varying constitution of the State. In the ancient State, in which slavery was a permanent and integral feature, industry is held in contempt, as (with few exceptions) unworthy of the free man. The servile classes, the agents of production, are debarred from civil interests, and unfitted for combination and personal initiation. Moreover, the military habits of the nation, with their consequent insecurity of life and property, make impossible the accumulations of capital and the systems of credit of modern times. Hence, even in Greece, we find no systematic economical discussions, but only isolated, though brilliant ideas. The Greek philosophers regard the individual as entirely subordinate to the State, which controls his every activity. The citizen is regarded as the possessor, not as producer of wealth; and wealth is considered, not for itself, but as subservient to higher ends. The chief theories are those of Plato, Xenophon, and Aristotle.

Plato (*Republic*) finds in community of wives and property the most perfect means of subordinating individual interests to those of the State; the foundation of the social organisation is traced chiefly to economic causes. A self-contained State is desired, whence foreign trade is discouraged. The industrial classes are despised, and all economic dealings are subject to active State control. *Xenophon*, though preferring agriculture as a fitter preparation for military life, and as leaving leisure for political duties, lays greater stress than other writers on trade and manufactures. To promote these, he emphasizes the need of peace between the nations, and the equitable treatment of foreigners.

Aristotle does not clearly mark off economics from politics. The individual, with him, is not so subordinate to the State as with Plato, for human society is due not to economic necessity but to certain natural social impulses. Hence he allows a certain degree of personal freedom, and rejects the communityof wives and property. Slavery is approved, and cultivators of the soil, mechanics, and artificers, are debarred from all share in the government. He distinguishes between the acquisition of natural products, as in hunting, cattle-rearing, &c., and the active exchange of products, with money as its medium. The expression of his views on Capital is metaphorical rather than scientific; thus, no loans should bear interest, since money is barren, and cannot produce money.

The Romans also regarded industrial arts as contemptible. Though, in early times, paying great attention to the land, large numbers of slaves were soon introduced, the prisoners taken in the wars. Roman economic ideas are mostly copied from Greek writers. Cicero, Seneca, and Pliny urge a return to the land, as a refuge from the evils of the times, but show no clear appreciation of economic evils and their remedies. Plinyresembles the modern mercantilists in advocating the necessity of keeping money inside the country; Varro and Columella, like the eighteenth-century physiocrats, see in agriculture a cure for the social degeneracy of their age.

Nearly all the Roman jurists disapprove of loans on interest. Thus, the rate of interest was fixed by the laws of the Twelve Tables, and interest on loans was in 341 B.C. entirely prohibited by the Genucian Law.

Middle Ages (A.D. 400–1300).—The first part of this period, consisting of a long and painful

struggle towards the establishment and consolidation of ecclesiastical and civil systems, was unfavourable to any varied economical activity. Under feudalism, the wealth of the lord consisted of agricultural produce and dues paid in kind; his retainers were paid by their maintenance. Manufactures and commerce were impossible. Yet, towards the thirteenth century, factors appear making for the development of industry and trade—the Crusades, bringing different nations into contact; the rise of the burgher class, and the independence of towns; the formation of guilds, and the demand of cities for the produce of the country.

The Catholic Church was a powerful influence, in preaching industry, thrift, sanctity of promises, the dignity of labour, the claims of the poor, and fair dealing between man and man. Slavery passed into serfdom, permitting some domestic relations and religious life. Later, as the landlord recognised the superior efficiency of free labour, serfdom passed away altogether; a process hastened by the moral influence of the Church, and by the sovereign's jealousy of the great lords. Workers and contractors now became clearly separated. A capitalist class arose and developed commerce and manufactures. Trade corporations (thirteenth century) were legally regulated and recognised; these served as rallying points for the industrial workers, whose technical skill and moral habits they greatly improved.

The Modern Period.—The Middle Ages may be said to end with the thirteenth century. From this time the mediæval system rapidly and spontaneously collapsed, and a wonderful development is seen in economic activity. With the rise of paid armies, peaceful activities, to provide the necessary cost, became prominent. Manufactures and commerce were stimulated by the discoveries of the art of printing, of the mariner's compass, of America and a new route to the East, and by the establishment of public credit in the Italian cities of Genoa, Venice, and Florence. At first, there was no corresponding theoretical development. By the seventeenth century, however, as industry became an increasing concern of the Governments, as the only means, through taxation, towards military and political ends, a school of writers arose whose doctrines became known as the *Mercantile System*. The chief of these thinkers were Scaruffi, Bodin, Stafford, Copernicus, Watteville, and Child. As they observed the increasing importance of money, as a peculiar form of wealth, in a class by itself, to produce which Governments paid ever greater attention to industry, they developed a tendency to value too much the precious metals, to put too great a stress on foreign trade as against internal, on dense populations as an element of national strength, and to overestimate the capability of Governments to secure by legislation the ends they considered desirable.

In its extreme form, the Mercantile System regarded money and wealth as identical, whence it is the aim of a country to retain as much as possible of the precious metals. To this end, export of its own manufactures is to be encouraged, imports discouraged, and the difference is to be received in gold or silver. The most favourable "balance of trade" is to be secured by prohibition of, or high taxes on imported goods, by bounties on exports, and by restrictions on the export of gold and silver.

Yet in England there was at the same time growing up a body of opinion in direct opposition to the Mercantile System—that natural wealth consisted not of gold, but of the gifts of nature and the products of labour; that the true aim of national effort was the accumulation of the necessities and luxuries of life; that freedom of trade should be substituted for the system of prohibitions, duties, and bounties. Traces of such views are found in *Hobbes* (*Leviathan*) and *Sir William Petty*. *Sir Dudley North*, a convinced free-trader, held views approximating to those of Adam Smith. *Locke* strenuously opposed the debasement of the currency, but still retained some ideas derived from the mercantilists.

Physiocratic School.—These English ideas, popularised and developed in France, where Diderot was striving after a complete social reorganisation through freedom, led to the rise of the *Physiocratic School*. Originated in 1755 by Cantillon, the teachings of the school were given systematic form by *François Quesnay* (1694–1774) and *Vincent de Gournay* (1712–1759), who called themselves and their adherents the "physiocrates," or "économistes." Society, they affirmed, consists of individuals having the same natural rights; each individual best understands his own interests, and naturally pursues it. No interference by Government is just save in so far as the natural freedom of one is incompatible with the rights of others. Hence each has an absolute right to the fruits of his own labour, and property is sacred.

They insisted on freedom of exchange, unrestricted competition, and the abolition of privileges and monopoly. Further, only agricultural labour is "productive," for this alone adds to the quantity of raw material available for human needs, and to the wealth of the community. Manufactures merely give a new form to materials drawn from the earth; their increased value represents only the quantity of materials consumed in the process. Commerce only transfers wealth; the gains of the commercial classes are at the cost of the rest of the nation; they are drawn from the superfluous earnings of the agriculturists. Free-trade, and the policy of *laissez-faire*, or minimum of governmental in-

terference are advocated, and a single tax on land as the simplest means of raising the revenue. Minor writers were Mirabeau, Larivière, and Turgot. The Physiocratic system soon had its day, but lived again—as to certain of its elements—in the system of Adam Smith.

Adam Smith.—Returning to England, we find a stagnation of thought in the early eighteenth century. The first advances were made by *Berkeley* and by *Hume* (*Political Discourses*, 1752), who discussed physiocratic and mercantile views on commerce, money, and interest. Following these is *Adam Smith* (1723–1790), whose *Wealth of Nations*, in five books, was published in 1776. His general theory is explained in the first two books. Labour is emphasized as one of the sources of the necessities of life—whence his difference from mercantilists on the one hand, and physiocrats on the other. The productivity of labour increases with its division, which originates in man's propensity to exchange. Exchange implies a certain capital, and demands a market, and money, as the medium of exchange. From the exchange of goods arises the notion of value, and value in use is distinguished from value in exchange—purchasing power. The measure of value (*i.e.* in exchange) is the labour required to produce the commodity—"equal quantities of labour, at all times and places, are of equal value to the labourer."

Money is then not the real or natural price, but the nominal or market price. Price (natural) consists of three elements: Wages, the reward of labour; Profit, from the use of accumulated stock; and Rent, which arises when all the land of the country has become private. The market price fluctuates, but tends to approximate to the natural price. Wages, Profits, and Rent vary according to the circumstances of society. Wages vary with the demand for labour, but a minimum wage must suffice to maintain the labourer and his wife and family. Profits also vary with the demand for labour, but in the opposite direction. Rent is a monopoly price, the highest that a farmer can afford to give, and is thus an effect, not a cause of high prices. Capital, the accumulated material employed to produce a revenue to its owner, may be "fixed," or remaining in his own hands, or "circulating," when the goods are sold and replaced by others.

Smith distinguishes between "productive" labour, which is realised in a particular object, and the useless, "unproductive" labour of magistrates, lawyers, &c.; the first alone is employed by capital. Capital is increased through productive labour, whence the thrifty man is a friend to the State, the spendthrift a public enemy. The annual produce of the land is increased by augmenting either the number of labourers or their productive power. Either involves additional capital. As the capital of a State increases, the growing difficulty of finding new employment for it leads to competition between capitals and lowering of interest. Agriculture offers the greatest remuneration to capital, since "Nature labours along with man," and replaces both the capital and the rent of the landlord. Smith in the third book treats of the development of industries by modern European nations; in the fourth, he argues against the mercantile system, and the physiocratic doctrine of the sole productivity of agricultural labour; in the fifth he discusses methods of taxation.

Malthus.—Following Adam Smith are *Bentham* (*Political Economy*, 1843) and *Lauderdale*, in substantial agreement with him, and then *Malthus* (1766–1834), whose *Essay on the Principles of Population* appeared in 1798. The period was one of industrial unrest. The prolific inventions of the time, of cheap earthenware (Wedgwood), of the spinning-jenny (Hargreaves), the steam-engine (Watt), the looms (Cartwright and Crompton), enormously stimulated manufactures, but created hardships of their own; whence the beginnings of socialism and of the "social question." The *Essay* was a reply to William Godwin, who taught that the existing wealth was sufficient for everyone, if it were equally divided, and dreamed of an era of perfect happiness on earth when all men by moderate exertion earned a moderate sufficiency. Against this, Malthus contended that such a state of prosperity would imply an unchecked increase of population and a consequent scarcity of food, on which the former struggle would again take place. In the re-written treatise of 1803, Malthus lays down the proposition that while food can be made to increase in an arithmetical ratio, population increases in a geometrical, and therefore outstrips the food supply. He advocated marriages of prudence, and deprecated the existing poor laws, and the artificial stimulation of population.

Ricardo.—Ricardo (1772–1823) followed Smith as a rule, but treated the subject differently. He reasoned deductively from assumptions more or less arbitrary, and treated the conclusions as true; his doctrines were illustrated by reference to hypothetical cases, a practice extensively followed by his successors. His chief concern was with the distribution of the whole produce between wages, capital, and rent. The Ricardian theory of rent—the theory now generally accepted as correct—defines rent as that portion of the earth's produce which is paid to the landlord for the use of the original and indestructible powers of the soil; the rent of any land is the excess of the price of the produce over its cost of production on that land. As population increases, inferior soils are successively brought into cultivation, the cost of production on which determines the price not only of the produce of those inferior soils, but of the

whole supply (see below). The poorest land pays no rent; on any better, the rent is the difference between the cost of production on it, and the cost of that produced at the greatest expense. It follows that rent does not determine price, which is the same whether rent be paid or not.

This doctrine bears on that of wages and profits. The produce of labour is divided between labourer and capitalist, so that whatever one gains the other loses. As the price of food rises, so does the cost of the maintenance of the labourer, and therefore wages rise while profits fall. This falling is occasionally checked by new mechanical improvements, or agricultural discoveries. But though wages rise, the labourer does not gain, since the price of food-stuffs also rises; he can never for long earn more than a bare subsistence, according to the prevalent standard of comfort. For a more permanent improvement Ricardo falls back on the Malthusian device of limiting population.

After Ricardo, a number of less important writers, the *Epigoni*, including James Mill, M'Culloch, Senior, Torrens, H. Martineau, reduced the teachings of Smith and Ricardo to systematic form.

Early in the nineteenth century there was no body of settled economic doctrines; all was still a matter of opinion.

John Stuart Mill.—This state of things, so far at least as concerned the fundamental doctrines, it was expected would disappear on the publication by *John Stuart Mill* (1806–1873) of his *Principles of Political Economy* (1848). This work, which is a lucid explanation of Ricardo's economics, aimed at replacing in popular use the *Wealth of Nations*, which Mill regarded as obsolete in some parts and imperfect in all. From the important difference between production of wealth and its distribution—that while the former depends on fixed natural facts, the mode of the latter varies with the changing ordinances of society—he considers the problem of improving the existing modes of the distribution of wealth, and takes many steps in the direction of socialism. From the Ricardian enlightened selfishness, he passes gradually to an economic order founded on sympathy. As to economic "method," he is on uncertain ground, for, while in his earlier writings he affirms the à priori as the only method of investigating social sciences, he insists on the à posteriori ("inverse deductive") method in his *Logic*. Among Mill's disciples, *J. E. Cairnes* (1824–1875) was most prominent. He urged a rigorously deductive method, and left no room at all for induction. The work of these two writers made it evident that political economy, as they regarded it, was a purely hypothetical science, a long deduction from the assumption of an "economic man," who was influenced only by the desire of gaining the maximum of wealth with the minimum of exertion.

The Historical School.—The successors of Adam Smith, both in England and on the continent, followed more or less closely in his footsteps. No radical changes in economic method were made till early in the nineteenth century, when with *Comte* began the historical school which has already profoundly altered the character of the study, and will continue to exert a powerful influence on economic problems. Comte (*Positive Philosophy*, 1839) includes the study of all social phenomena, and their mutual relations in the science of "Sociology" (*q.v.*). Of this science, the laws may be statical, the laws of social existence, or dynamical, of social progress. His principal method is that of historical comparison. The fundamental principles of human nature are not to be neglected, yet from them can be foretold neither the general structure of human society nor its development. Direct observation is indispensable, especially in the case of dynamical laws on account of the accumulative influence of all former generations. The field of observation is the history of the world, including in this history contemporary facts. Applying these ideas to economics, it is seen that no true theory of the science can be formed without considering all other phases of society; economic phenomena cannot be isolated from the rest. The economic structure and development of society are ascertained not deductively from assumed premises, as the Ricardians affirm, but by direct investigation of history.

The *German* historical school (nineteenth century) applied to economics the conceptions of the historical school of jurisprudence. In the earlier period the chief exponents were Roscher, Hildebrand, and Knies. Later developments were due to Brentano, Schmoller, Held, Nasse, Rösler, Schäffle, Schönberg, and Wagner. All these insist especially on the need of a moral element in economic study, on the close relation between economics and jurisprudence, and on a conception of the State opposed to that of Smith. State interference is justifiable, not merely as a protection against violence, but wherever social ends can be most fully or solely attained through its means. Such cases, each of which is determined on its own merits, are intellectual and æsthetic culture, public health, protection of women, children, the aged and the destitute, security of labourers against accidental injury. This later German school has been powerfully influenced by the theoretic socialism of St. Simon, Fourier, Lassalle, Marx, Engels, &c. In practical economics it is midway between the *democratic socialists*, who would radically transform the whole economic structure of society through State interference, and the German *free-traders*, who, following Cobden, Say, and Bastiat, limit State action to the main-

tenance of order and the securing of individual freedom. The investigations of this historical school confirms Comte's view of the need for completely incorporating economics in a science of society.

The German influence was felt in Italy strongly and in France to a much less extent. In England the new ideas have steadily gained ground, aided by a growing dislike of the older system and a suspicion of the unsoundness of the "Manchester" policy of *laissez-faire*. The chief adherents to the new thought here were Bagehot, Leslie, and Jevons. *Bagehot* (1826–1877) declared that the system of Ricardo and J. S. Mill is true not universally, but only in those states of society where commerce is highly developed, and developed in the form taken in England; it does not explain the economic phenomena of early times or of other contemporary forms of society. The "economic man" of Mill and Cairnes is not only imaginary, as they had themselves shown, but could only act in a very limited and peculiar sphere marked by the rapid transference of capital and labour from one sphere to another. Bagehot attempted to reconcile the two opposing methods by assigning to the "abstract" method the explanation of modern advanced industrial life, and to the historical that of past economic phenomena, and of all the remaining part of present life.

Leslie (*Essays, Moral and Political*, 1879) also criticised the "abstract" school. The term "desire for wealth" is vague; as a matter of fact, men are impelled not by one, but by several economic motives, altruistic as well as egoistic. The à priori method cannot find the causes controlling the nature or the amount of wealth, or of the varieties in its distribution. Such causes are to be sought in history, and in the general laws of society. The wage fund theory of the abstract school is repudiated, as also their doctrines of the average rate of wages and of profits (save in a small and stationary world of commerce). The theory of cost of production as fixing price thus falls to the ground, and gives way to the principle that price depends on demand and supply. *W. Stanley Jevons* (1835–1882) similarly became more and more convinced that a true system could only arise through the overthrow of the Ricardian system.

The recent tendency of economics is thus to regard the science as a section of a larger science of society, with the other sections of which it is in an intimate and vital connection. Economic phenomena may be separated from the rest, but only provisionally. All primary social elements must be habitually regarded not as isolated from each other, but as in mutual interdependence. Growing in importance also are the high moral purposes to which the economic movement is subservient. The old doctrine of "right," the foundation of "natural liberty," is losing ground, and, through the pressure of practical needs, the doctrine of *laissez-faire* has lost much of its former importance. The State is more and more controlling operations making for public utility.

GENERAL THEORY OF ECONOMICS

Scope and Method.—Economics is a study of the motives which most powerfully influence man in his everyday business life. Most men are influenced there, as elsewhere, by motives other than economic, conceptions of duty, high ideals, and personal affections. The existence of these is not denied by economists; yet these are in the first instance neglected so far as they have no money measure, and a correction for the incompleteness of these premises is applied later on. The science constructed on this basis goes far beyond any other branch of the study of man, yet can by no means be compared with such exact sciences as mathematics and physics. Through the complexity and variety of economic phenomena, the conclusions of the science are true only within certain limits, which must be carefully defined. It is thus a science of tendencies resembling meteorology rather than astronomy, in the limited certainty of its predictions.

We shall therefore study the actions of men as individuals and in their relation to social life. We shall consider man not as a fictitious "economic man," but as he actually is, studying a whole class or nation, neglecting individual peculiarities, and ignoring all causes and effects not of an economic nature. If it is objected that society is an organic whole, and thus not capable of such treatment, that no set of human phenomena are wholly unconnected with, and therefore separable from any other set, it must be replied that this objection would be equally fatal to the biological sciences. But just as the brain may be studied without a physical separation of it from the rest of the body, so economic phenomena may be considered apart from religious and political motives.

The method employed will be twofold. By Induction, through observation and investigation of concrete particular facts, general laws or economic uniformities will be established.

But since this method can only state what *is*, and not *why* it is, it is to be supplemented by the more abstract, analytical method of Deduction. Starting not from particular facts but from general principles, *e.g.* that all men seek wealth, and seek it by the easiest methods, we may deduce what will happen under certain conditions from the operation of the principles assumed; the deduced results being afterwards compared with the actual facts. These two processes involve each other. The general principles from which deduction starts are themselves the result of observation. It is by induction that we ascertain how far the conclusions of the deductive method have to be modified in their application to actual facts. Further,

induction is invaluable to deduction in pointing out what needs to be explained, and in suggesting hypotheses to explain it. Induction is the more fundamental method in investigations relating to the production of wealth, to the increase of capital and population, to slave labour, and to the present proprietorship, where farmers own the land that they cultivate. The deductive method becomes the principal instrument when the facts to be investigated are complex and difficult. It is thus specially applicable to central problems of the exchange and distribution of wealth, to theories of value, wages, rent, interest, &c.

Wealth.—Wealth may be simply defined as consisting of "goods" which possess "utility," *i.e.* which satisfy some human want. Not all sources of utility are wealth, *e.g.* family affection and a good conscience. The additional quality to constitute wealth is potential exchangeability. This implies that the commodities are external to man, and that the supply is limited, so that man is prepared to give up some other thing in exchange. Wealth does not include personal qualities, nor yet, according to Marshall, service and other goods not capable of accumulation.

Demand.—We have called the power of satisfying a human want the utility of a commodity. As each particular want of man is limited, it follows that every increase to his stock lessens his desire to obtain more of it. Thus, while the Total Utility of a commodity increases with every addition to our stock of it, it does so at a decreasing rate. This is the Law of Diminishing Utility, and the Marginal Utility is the utility derived from the last small addition to the stock, the utility of that portion of a commodity which a person is just persuaded to buy. This last portion is termed the Marginal Purchase. It is evident that the marginal utility of money varies, for a sum of, say, a shilling, measures a far greater benefit to a poor man than to a rich man. When a man, to satisfy a want, offers something of value for an object, this is a Demand for the object; the price offered is the Demand Price. If the price falls, he buys more, for since the marginal utility decreases with the amount he possesses, he can be induced to purchase a greater quantity, at a lower price, though yielding less satisfaction (Law of Demand). There is no uniform relation between this fall in price and the increase in demand. And the price, we must note, measures not marginal utility *in general*, but that to each purchaser individually.

The notion of the *Elasticity of Demand* is important. Experience shows that the increased demand is not the same for all commodities for the same slight fall in price. Demand is said to be very elastic when a small fall in price causes a large additional quantity to be sold; slightly elastic for a small addition. The elasticity of demand varies with different incomes, so that each class of society should be considered separately, for the demand for a certain commodity may be very elastic for one class, and slightly so for another. When the price of a commodity is low relatively to the means of the class, the demand for it has little elasticity (*e.g.* salt, sugar), for the sale would not be much affected by a slight change in price. If the price is relatively *very* high, the demand is still only slightly elastic; thus a fall in the price of wine does not increase its consumption among the poorer people. If the price of the article is relatively moderately high, the demand for it has great elasticity; a change in the price of tobacco, meat, butter, &c., greatly affects the purchasing power of the poor. The demand for necessaries is evidently inelastic, for these must be had whatever the price. To distinguish between comparatively elastic and inelastic demands, each is measured by reference to a conventional "unity," at which point a fall in price produces such sales that the total receipts are unaltered. If the total receipts are increased, the elasticity is greater than unity; if decreased, less.

If a person has anything capable of several uses, he will so distribute it between these that the marginal utility is the same in each. For if the marginal utility were greater in one use than in another, he would gain by transferring it from the second use to the first. This is the *Law of Substitution, or Equi-marginal Returns.* These different uses may be either present or future, though, in the latter case, allowance must be made for the uncertainty of the benefit, and for the different value of benefits present and distant.

In general, a purchaser's satisfaction in the article bought exceeds that given up in paying its price. This excess, expressed in money, is called the *Consumer's Surplus;* the difference between the amount a man is willing to pay for an article rather than not have it, and the actual amount paid. We may then conceive of an aggregate surplus, with reference to a given commodity, made up of the surpluses of different individuals. Hence are suggested valuable practical ideas. Thus, in taxation, where the tax that wipes out least consumer's surplus is preferable, other things being equal, it follows that (1) things of which the demand is highly elastic should not be taxed, since a small tax largely reduces the consumption and the consumer's surplus; (2) commodities subject to increasing returns should not be taxed, for such taxation both of itself increases the price, and causes smaller consumption, which again means higher supply price.

The Agents of Production are Land, Labour, and Capital.

Land includes all utilities, whether found in land, sea, sunshine, rain, &c., over the supply of which man has no control, whose quantity is given fixed by nature.

Any increase in the capital and labour applied to land generally causes a less than proportionate increase in the produce from that land (*Law of Diminishing Returns*). This law refers to the *amount* of produce, not to the price, which may independently vary. It may, also, be kept in check by improved machinery and skill, in which case the returns may increase proportionately. Yet at length it becomes irresistible if the demand for produce increases indefinitely. Using James Mill's term, "Dose of Capital and Labour," each dose produces a less proportionate return. That dose which just repays the cultivator is called the *Marginal Dose*, and the return from it the *Marginal Return*. The marginal dose is not necessarily that last applied, but that on the margin of profitable expenditure.

On the other hand, every increase in the physical or mental vigour of a people increases man's productive power. And every increase of wealth tends to make a greater increase easier. Thus is produced a more highly developed industrial organisation, which adds much to the collective efficiency of capital and labour. Further, any increase in the aggregate of production generally lowers proportionately the cost of production. Hence while Nature's part agrees with the Law of Diminishing Returns, that played by man obeys the *Law of Increasing Returns*; an increase of capital and labour leads to an improved organisation, which increases the efficiency of the work of capital and labour.

The Balancing of Demand and Supply.—The market price of any commodity depends both on the demand price and the supply price. In every market, there is a definite demand price for each quantity of the commodity; the greater the quantity offered for sale, the lower the price purchasers will be willing to pay. Similarly, there is a supply price, that price which the holders of the commodity are willing to accept, which (in the case of decreasing returns) rises with the quantity. When, for any given quantity, the demand price exceeds the supply price, then the amount offered for sale tends to increase, since sellers are getting more than they need to induce them to manufacture that quantity. When the demand price is less than the supply price, the quantity of the commodity falls; and when both are the same, the amount produced remains also unaltered. This point is that of equilibrium; and the price is the market price.

Thus both utility fixing demand price and cost of production fixing the supply price, are factors in determining price. This doctrine, however, is quite accurate only for a stationary society; the demand and supply prices for various quantities are constantly being changed, and every change gives a new position about which the market price oscillates. As a rule, the shorter the period under consideration, the greater the influence of demand on value; the longer the period, the greater that of cost of production.

The above account makes the marginal cost of production (*i.e.* the point where a slight increase in production just repays its cost) a factor in fixing the market price, but does not explain the position of this margin, whether high or low. This depends on the causes controlling the size of businesses—the variation of the employer's expenses with increasing business. If the business grows from a very small size, marginal costs decrease at first, through division of labour and the use of machinery. But this fall is limited, as the business becomes too extensive for effective control under one employer. Marginal costs, therefore, begin to rise, and expansion of the business must cease at that point when the marginal expense equals the price, *i.e.* when the last addition no longer yields a profit on the cost of its production.

Monopolies.—The market price is, we have seen, fixed by the demand and supply prices, but in a monopoly, the quantity of the commodity offered for sale depends on the will of the monopolist. In a rigid monopoly, this control over supply is complete. The aim of the monopolist is to increase to its limit the difference between his expenses and his gross receipts; this limit, when reached, determines the output which will be aimed at.

Monopolies lead to higher prices, save in so far as they reduce the cost of production. When the demand is slightly elastic, a considerable rise in prices follows the creation of a monopoly, since in that case a small decrease in the supply raises the price considerably; with highly elastic demands, such rise in price is not so likely. Also, a great curtailment of supply will more probably be produced by the monopolist in those industries working under decreasing returns, for in the case of increasing returns, higher price would be accompanied by loss of the economies due to production on a large scale.

Monopolies may reduce prices where the cost of production largely consists of expenses of canvassing customers who would in any case purchase the commodity, though perhaps from a different firm, or where the real cost of production can be lowered by more efficient organisation.

Allied to monopolies are *discriminative* or *differential prices*, which imply some agreement between producers. Prices may vary according to the locality (through cost of carriage, or through tariffs), or the purpose for which the commodity is used (railway freights, higher for more valuable goods than for equal bulk of less valuable goods), or according to the person who buys. "Dumping" is a case of discriminative prices. This may assume several forms. It may be the export at low prices of the surplus quantity of output, which is not needed for the

home market (which is maintained at the same prices as though there had been no surplus). Or it may consist in excessive production for export to undercut competitors in a foreign market. But such substantial sales are necessary for this, and at such a cost, that this form of dumping is seldom worth while. For rather than lose all their plant by shutting down many established industries will continue to produce at a loss, provided that the price exceeds the actual cost of production apart from standing charges, and will be beaten only after a protracted and costly struggle.

In recent years, many voluntary monopolies have been created by the combination of different firms. Such agreements may leave to each firm much of its separate individuality (Kartels) or may completely destroy it (Trusts). Other forms of monopoly arise from the sole possession of certain natural products limited in quantity, from the protection of the law, as in the cases of patent and copyright, or from the peculiar nature of certain businesses which are most beneficially conducted as a social monopoly, *e.g.* lighting of a town.

Distribution.—We have now to consider the sharing out of the wealth produced by a community, and to explain the shares assigned to the labourer (wages), the employer (profits), and the capitalist (interest). We shall find that, broadly speaking, the same theory underlies all three, and that the differences are as to detail.

Assuming that all production is by groups of individuals and not by independent units, that each individual worker is equally skilful and willing, and each employer equally capable, we may imagine a certain community containing a fixed number both of employers and of labourers. Each employer endeavours so to regulate the relative amount of capital and labour he makes use of as to make his profit the greatest possible. This point is reached when an addition to either factor no longer produces more than enough to repay its cost; in other words, when the marginal worth equals what he pays for the last addition.

In the relation of demand to the wages of labour, we find that if all the available workpeople are employed at a wage previously fixed, which is below the marginal worth of labour, then the employers naturally seek more labour, in order to augment their profit. But since all workpeople are already employed, businesses cannot be extended, but wages are forced up by competition to the marginal worth. Thus the wages of labour are its marginal worth in production.

The influences on the side of supply fixing the remuneration of employed factors in production are not the same for all factors. Thus in the case of land, supposed equally fertile and well-placed throughout, the marginal worth varies according to whether it is fully occupied or not. In regard to the supply of labour, though the causes of the size of the population are obscure, we may say that the relative wages in many trades fix the supply of labour in them. Allowance, of course, must be made for differences in remuneration due to unhealthiness or unattractiveness of the calling, need of expensive training, or the risk of failure; nor do we infer that apart from these considerations, wages tend to reach the same level throughout the community, for the skill of workmen varies.

We conclude then that the wage is the amount at which equal quantities of labour will be demanded and supplied.

The actual earnings of capital are called *Net* Interest. What is commonly called "Interest" is really "Gross Interest," and includes recompense for unusual risks, or the earnings of management for a business. "Trade Risks" arise from fluctuations of the market, new inventions, or new competition. "Personal Risks" are due to the chances of unforeseen flaws in the borrower's character or capacity.

Capital may be taken as equivalent to wealth employed to bring in a profit. It is characterised by productiveness, so that the wealth consumed in production reappears in a fresh amount of wealth, and by the subordination of present desires to future enjoyment. Capital, therefore, excludes land, but includes all improvements made in it to adapt the earth to human usage.

Capital has a demand price and a supply price; these together fix the rate of interest at any time. The demand of a community for capital consists of a demand for production, and a demand for consumption, expended on goods to afford a direct sustenance to the workers. The supply of capital depends on people's power to save and their motives to save—the desire for interest, for provision against a rainy day, for a fund making possible a future advancement in life when an opportunity occurs.

The reward of the employer is his "Profits," but it must be noted that this term is ambiguous, being sometimes applied to mean gross interest, recompensing him for risks or work done.

Supposing an industry with a fixed number of employers, all working entirely on borrowed capital, and all equally capable, their businesses would be approximately the same size. Each man's remuneration would be the difference between the total receipts for output and the total outlay on rent, material, interest, and wages. This difference, of course, each employer endeavours to maximise. Now in the growth of a business from small beginnings, the increase of expenses at first falls, as we have seen, in proportion to the increase of output, through greater specialisation and use of machinery. But after a certain point, the increase of expenses rises proportionately. Hence every

employer develops his business to the point when the final addition to the expenses is equal to the price received for the additional output; in other words, when marginal expenses equal price.

But the number of employers is not, as we have just supposed, fixed. If, therefore, employers are receiving more than enough to induce them to devote themselves to the business, more people enter the industry as employers; the average size of a business is decreased, though the total output is greater, and the surplus for each employer diminishes till it is just sufficient to induce him to remain in the industry. And similarly, if the surplus is too small, employers begin to leave the industry, so that the remaining businesses expand and yield a bigger surplus. Thus the earnings of employers are fixed by demand—the surpluses of receipts over expenses, and supply—the numbers of employers willing to accept an income expected to amount to a certain sum.

The approximation of employers' earnings to a constant limit requires a much longer run than that required by interest or wages to reach their normal levels. For an industrial business is of slow growth, often enlarged under restrictions, and once established, continued till the plant is worn out.

Rent.—In ordinary use, this term stands for an annual charge made on land or buildings; in a broader sense, for the income derived from any things the supplies of which are limited and beyond human control.

If there be soils of different fertility in a country of scanty population, only the best land would be occupied at first, and no rent would be paid on it, for if rent were demanded, other plots would be cultivated instead. When the population has grown until less fertile land must be cultivated to produce the necessary amount of corn, this second land again commands no rent, and for the same reason. But since all the land of first quality is occupied, and only inferior land can be substituted for it, this land will pay rent, equal per acre to the difference between the produce per acre of the two kinds of land. Similarly for lands of still less fertility. When all the land of the country has been absorbed, and the population is still growing, even the poorest land bears a rent corresponding to the increased value of its produce.

The argument may be differently expressed, thus: The application of successive "doses" of capital and labour presently yields diminishing returns, as we have already seen. At length the return just suffices to repay the cultivator's outlay and work. This is the marginal dose, and may be applied either to rich or poor lands. On any land, the excess of the total produce of the actual dose applied over the yield of the marginal dose is the producer's surplus, and this usually becomes the rental value of the land.

Besides inequalities of fertility, inequalities of situation are a factor determining rent. In England, where the country is small and thickly populated, so that the producer is in close touch with his customers, this factor is relatively unimportant. But in new countries the richest land may lie uncultivated if not conveniently situated for markets, so that both factors may then be considered equally important.

It must be noted that rent does not enter into price, as a determining factor. High rents do not make high prices, but are the effects of them. The price is, as we have seen, determined by the cost of the marginal return. Thus the cultivators of more fertile soils are left with an extra surplus over normal profits, which, through competition, they are forced to give up to the landlord.

Quasi-Rents.—When the supply of certain appliances of production cannot be quickly enough adjusted to a changed demand for them, the net incomes from them are subject also to the foregoing theory, and may be called *Quasi-rents.* Consider a sudden demand for a certain kind of, say, textile fabrics caused by a change of fashion. The machinery employed in this manufacture yields for a time an abnormally high net income, greater than the normal profits on the capital invested in it. This income is a quasi-rent. Quasi-rents may be on appliances of many different kinds—not only on land, factories, machinery, but on business capability and manual skill; wherever, in short, there is any kind of differential advantages. Thus more efficient workmen tend to get larger wages than those whose efficiency is just sufficient to procure them employment. A quasi-rent differs from a true rent in this respect. If the latter ceased, those natural gifts which are free and imperishable would be undiminished, and produce just as before. But if quasi-rents from any class of appliances fell below normal profits on the capital and effort required for their supply, then those appliances would dwindle, and would *not* continue to produce. In long periods, however, there is time to adjust the supply to the demand. The shorter the period under consideration, and the slower the process of producing any instrument of production, the more truly is the net income from that instrument to be regarded as a quasi-rent.

Influence of Progress on Value.—The field of employment for capital and labour depends on the natural resources of the place, the social organisation and technical knowledge of the inhabitants, and the nearness to markets. The last factor is often underrated. Thus North America and Australia have become rich fields for the employment of capital and labour only since the growth of steam traffic, which brought the European markets nearer to them. New countries, however, chiefly owe their prosperity

to their power to promise to deliver goods at a later date, to their power to mortgage, in a way, their land at a high rate of interest. Hence the influx of capital, which makes the rate of wages very high. Later, the influx of capital is relatively slower, and wages tend to fall.

The influence of accessibility to distant markets on the National Dividend has been prominent in the case of England. For a hundred years, she has exported goods which are less costly the larger the scale of manufacture, in return for goods obeying the law of Diminishing Returns. But now, every improvement in manufactures spreads quickly over the Western World, so that by these improvements England gains little from exports to backward countries, and less still from those to manufacturing countries. She has gained extensively, however, from the cheapening of transport, which has replaced for the luxuries of a hundred years ago, low-priced food-stuffs, as the gains of foreign trade. Other influences tending to increase the purchasing power of the working man's wages have been the adoption of Free Trade by this country, and the development of the Mississippi Valley, and of Western America. Grain, meat, fuel, clothing, water, and light have all been cheapened by these causes or the use of machinery, in the nineteenth century.

Since the seventeenth century, the amount of accumulated wealth per head of the population has steadily increased. This has decreased the marginal utility of capital, and therefore the rate of interest. The spread of knowledge has produced a relative fall in the earnings of trained ability by increasing the numbers of "skilled" workmen. A growing need for quickness in grasping new ideas, rather than long experience in a trade, has lowered relatively the wages of elderly men, and raised those of women and young people. And on the whole, middle-class incomes are increasing faster than those of the rich; the earnings of artisans faster than those of professional men; of vigorous unskilled workmen than those of the average artisan.

A higher Standard of Life, implying increased intelligence, energy, self-respect, has increased the National Dividend and the wages of each grade. A "Standard of Comfort"—a mere increase in artificial wants—may be spoken of, which raises wages only so far as it involves a rise in the standard of life and of activity. A mere increase of wants, advocated by some as leading to an improved condition of the workers, can only raise wages through diminishing the supply of labour. This doctrine is favoured by those who believe that the pressure of population on the means of subsistence powerfully affects the rate of wages, but cannot be maintained by those who hold that improved modes of transport have minimised for the present the influence of the Law of Diminishing Returns.

Other writers have held that by reducing the hours of labour, labour is made scarcer, and therefore wages higher. In certain trades, causing excessive wear and tear on body or mind, shorter hours would lead to no permanent loss of National Dividend, since the increased efficiency of the workers would produce the same output in the lesser time. In other branches, employing expensive plant for only ten hours a day, a double shift of eight hours each would increase the National Dividend and therefore wages. In many trades, however, shorter hours would lessen the output without raising the worker's efficiency, and most of the resulting loss would fall on the workers.

The theory in question appears to assume that there is a fixed amount of work to be done, whatever the number of workers, and ignores that if work is scarce, there will be fewer new enterprises undertaken; that a decreased output leads to a decreased National Dividend and a lower wage.

Trade Unions.—A modern Trade Union, composed of workers of the same or similar trades, applies its funds, subscribed by its members to support its members who cannot obtain employment under Union conditions, to grant Provident Benefits to needy members, and to further its economic and political policy. This policy is, broadly, to secure higher wages and shorter hours, and healthy and safe conditions of work, and to provide a defence against tyrannical treatment by employers. A large Union is often composed of smaller associations, of which each manages its own affairs but is bound by the general rules of the central Executive; which strictly controls, also, the expenditure of Union funds.

Permanently to raise wages by lessening the supply of labour needs four conditions, namely: (1) there must be no easy method of production save that employed by the members of the Union; (2) the commodity must not be elastic in its demand, so that prices will rise considerably by a contraction of supply; (3) wages must be but a small proportion of the total expenses of production, so that a proportionate rise in wages will not greatly affect the price, and therefore the demand; (4) the other classes of workers, and the employers in the trade, must not be able to increase their share of the total produce by limiting the supply of their labour and capital.

The tendency of wages to approach a point of equilibrium where the amount of labour demanded equals the amount supplied, does not, in practice, always operate freely. A working man can seldom hold out long for a reserved price for his labour, and is thus compelled to accept a lower wage. In bargaining with an employer, even a combination of a thousand workers is a puny force if the employer of the thousand men be strong and resolute. Unionists contend that by organisation, workmen can

raise the current wages back to the normal level determined by demand and supply. Their chief instrument is the strike—which they admit is effective only when business is very prosperous; but even when the period of prosperity is waning, the threat of strike may succeed in preventing a fall in wages.

To this it has been objected—considering first a single trade—that constant threats of strikes lead to withdrawal of employers from the trade, in which employment declines; that though a strike at a prosperous period may increase wages, these increases would have come without it and have lasted longer. Considering next all the chief trades of the country, it is still maintained that any rise in wages at the expense of profits must promote the emigration of capital, and limit the enterprise of business men, so that a rise of wages tends towards its own destruction. Even if the National Dividend be not much lessened at once, yet the diminution is accumulative and progressive, so as sooner or later to reduce the supply of capital, and to lower wages.

The question thus becomes this, whether Trade Union action does actually lessen production, on the whole. The Unionists argue: (1) that they themselves join with the employers in making the working of the business run smoothly and certainly, that *e.g.* a fixed minimum wage is a convenience to an employer, reassuring him that no competitor is buying labour at a lower price; also, that in trades subject to severe foreign competition, employers and employed co-operate in arranging, through Boards of Conciliation, conditions of employment; (2) that their action promotes the efficiency of labour, which atones for any injury to the growth of production; they have given workers self-respect, strengthened their physique and moral character, and stopped a wastage of human lives in underpaid and "sweated" industries.

It is difficult to ascertain by direct observation from history the actual influence of Trade Unionism on wages. It appears that, other things being equal, wages are higher in trades having strong Unions than in those without. But it cannot be shown conclusively what the effect of Unions is on the aggregate of wages.

Socialism and Syndicalism.—The Socialist movement springs from a dissatisfaction with the existing structure of society, and aims at the creation of another in which will prevail a juster distribution of wealth, and more equal opportunities for the enjoyment by all classes of a rational and cultured life. The poverty problem, it is contended, cannot be solved without a radical upheaval of our economic structure. Wealth is becoming concentrated in the hands of a few, the wages of manual labourers remains stationary, the cost of living steadily rises. Thus the rich rapidly become richer, and the poor become actually as well as relatively poorer. Socialism affirms competition to be productive of untold misery and waste when applied to the production of wealth; by replacing it by co-operation, human productivity would be increased, and human existence made happier. Competition causes waste of capital and labour, and has led to the formation of Trusts and Kartels. These aim at economies in production and elimination of all competition, when prices and profits become correspondingly high. The Trust is an advance, in concentrating the control of industry, towards the stage when public ownership and control of the great industries is possible. This is the aim of Socialism; to replace the speculative, competitive method of production for the benefit of private capitalists, by a method of production by an organisation of national labour, with collective ownership of the means of production. "Capital" includes land, the instruments of production, and the floating capital necessary for production. Private landownership is condemned as economically and socially injurious; capitalism is attacked as placing the employed at the mercy of the employing class, making one man a means to another's selfish ends, and creating "the social evil of a non-labouring class."

Socialism is the economic side of a wider movement which in politics is Democracy, and in religion, the impulse to social service. It aims at realising its goal through a political democracy. In the Socialist State, such means of production as can be advantageously controlled by the community are made public property; private enterprise is encouraged if able to conduct a public service better than the State can. But there is no private capitalism, no exploitation of labour for the profit of others. The surplus value goes no longer as rent and profits, but benefits the community at large. State ownership of land and capital is the only way to bring this about, though taxation is a device which may be employed pending the full realisation of Socialist aims. Recent legislation has tended towards Socialism by a constant interference with the unrestricted private use of land and capital, by raising the standard of life through national education, old age pensions, insurance against sickness and unemployment, by the taxation of rents and profits to finance schemes of social reform, and by replacing private ownership of productive works and distributive services, *e.g.* railways and ammunition factories, more and more by State management. Beyond this, Socialist policy, pending the setting up of a Socialist State, demands an eight-hours' working day, a minimum wage for adult workers, free secondary and technical education, complete provision against sickness, the abolition of indirect taxation, and the raising of all the national revenue from unearned incomes and death duties, and State or municipal control of railways, telegraphs, water, and electricity supplies, land, mines, &c.

Socialists must be distinguished from non-socialistic Social Reformers, who believe that social evils can be abolished without altering, fundamentally, the economic structure of society. Socialism also must not be confused with Communism, Anarchism, Co-partnership, and Syndicalism, all of which aim at giving workers a greater share in the businesses at which they work, and all of which advocate the collective ownership of land and industrial capital. Of these, we give some account only of Syndicalism, through the attention it has attracted in recent years.

Syndicalism proposes that each industry shall be controlled by its own workers, that there shall be a federation of the groups, and that distribution of produce shall be regulated in the interests of all the producers by a general council of the federated trades. But this social organisation is purely industrial. The State is repudiated, and the present political methods and parties are condemned as not based on the strongest of all personal interests, *i.e.* the economic interest. There is not merely a passive indifference to the existence of the State, but an active hostility to it. The weapon of the Syndicalist is the general strike, for which it is easier to get workers to unite, and which is a great organising and educating force. Syndicalism resembles trade unionism in relying on industrial organisation, on close federation of unions, and on the strike. The latter, however, makes use of Parliamentary agitation to better social conditions, avoids strikes wherever possible, and prepares for them by amassing huge reserve funds.

International Trade.—Foreign trade is simply the working out in a larger area of the principles of division and co-operation. A more efficient employment is secured of the productive forces of the world when each of two countries produces, both for itself and for the other, the things in which its labour is relatively most efficient. The total produce is greater than if each country produced only for itself all the commodities it requires. Foreign trade also stimulates improvements in the processes of production, brings new objects to the notice of peoples, and promotes their intellectual and moral progress.

The motive of foreign trade is an increase in utility, in which both nations share. The possibility of this does not depend on the absolute cost of production of commodities in two countries, but on their comparative cost. Wherever the relative cost of production of two commodities is different in one country from that in another, it is to the advantage of each country to specialise in the commodity for which it is more specially fitted, and to import the other.

Since foreign trade is a process of barter, it follows that the total value of a country's exports is equal to that of its imports, neglecting cost of transport. That this equality is not apparent on examination of statistics, is explained in the case of Great Britain by the nation's huge carrying trade, repaid by the nations concerned in produce, by the investment of capital in foreign countries, the interest returning in imports, and by foreign travel, expenses of colonial officials, of soldiers, sailors, &c.

Free Trade and Protection.—Free-traders demand the removal of all artificial restrictions upon or encouragement to any particular industry. This implies freedom from taxation of raw materials, and of the means of subsistence, and that where foreign goods are taxed for revenue purposes, an equal tax must be levied on the home product. Protective tariffs, however, have been advocated either to bolster up some existing or newly-established branch of industry, or, on patriotic grounds, to make the nation self-supporting and independent, in case of war, of foreign countries. Home industries, it is affirmed, are supported by protective tariffs by excluding the foreign article and finding work for our own workers. Protective duties may also be imposed as a source of revenue. Through them, also, wages are kept up by excluding the products of foreign "pauper labour"; further, it is the foreign exporter who pays the duties, and a means is provided of punishing countries which decline to accept reciprocal terms.

Lesser advantages claimed for protection are that protected industries call into play the law of increasing returns, through the employment of larger capitals, and that new industries can be nourished which would otherwise be crushed by established organisations competing from abroad. Bounties are a form of protection, devised by mercantilism to encourage exportation; premiums are given to certain home industries to enable them to lower their prices abroad and thus secure foreign markets.

Money.—In early times, exchange consisted of barter, not between individuals, but between groups, the commodities being regarded rather as mutual gifts than as buying and selling. The idea of "money" began to arise when a commodity was desired as satisfying a need, and seen to be exchangeable for other things. Early forms of money were skins of animals, corn, shells, minerals, salt, and metals. To be used as money, any commodity must have a value of its own, which is high in proportion to its bulk, it must be homogeneous, so that any one unit of it has the same value, divisible without damage, durable, and its value constant and easily ascertainable. These conditions are best satisfied by the metals gold and silver. With the Hebrews and Greeks, currencies went by weight. Afterwards, their quality was indicated by a stamp.

At present the issue of coin is in the hands of the Government. In most countries, the expense of coinage has been borne by the owners of the bullion, but in England, no charge is made at the Mint, save that involved in the unavoidable delay. The charge on coinage is known as Seigniorage. As it raises the value of coins, it checks the melting of coins, which are more valuable by the amount of seigniorage than the uncoined metal.

Some economists advocate a double standard of currency (*Bimetallism*), arguing that, (1) within limits, the State can fix the value of the substances taken as money, since it is the quantity of coins and not the cost of production which fixes its value; (2) the ratio of the values of silver and gold (1 : 15½) being fixed all the world over by legal regulations, there would be no export of whichever metal lost value; (3) that a greater stability in the value of money is created; (4) and greater facilities for trade; (5) an increased quantity of money leads to an advantageous rise in prices. Most of these contentions are disputed by monometallists. In England, the sole standard is gold; silver and bronze currencies are merely token currencies, limited to small payments. Money discharges debts, facilitates exchange, through providing an easy comparison of values, necessary with increasing specialisation, and affords an approximate means of estimating the present value of future needs—a standard of deferred payments.

The value of money is often taken as the interest charged for the loan of it, but is more properly regarded as the purchasing power of money. Purchasing power, as regards money, is equivalent to price in the case of other commodities; the terms are convertible. The proximate determinant of the value of money is the equation between the amount in circulation at any given time, and the quantity of goods to be sold. But we must note that since money circulates with varying rates in different communities, we must take an average giving, in Mill's phrase, the average "efficiency of money"; also that it is the amount of sales, not of commodities, which is the determining factor, since the same article may pass through several hands before reaching the customer. We may then say that the value of money varies inversely as the product of the quantity and efficiency, the number of transactions being constant.

The ultimate regulator of the value of money is not chiefly, for short periods, the cost of production, since a change in the supply would only operate slowly on its value, but rather the relation between supply and demand. For long periods also, the cost of production has an influence difficult to measure.

The quantity of money required by a nation depends on the size of the population, the number of transactions, the efficiency of money, which varies with the habits of the people and facilities of communication, the systems of credit and banking, and the extent of hoarding, bartering, and payment of wages in kind. Thus we cannot say the absolute amount required, but, from an international point of view, the amount needed, after deducting the cost of transporting goods, is that which keeps a country's prices on the same level as those of the countries with which it trades.

Credit money consists in written or printed promises to pay actual coin—bank-notes, cheques, bills of exchange. All these rest ultimately on a gold basis. A bank-note circulates on the strength of the bank's credit, and is regulated by the Bank Charter Act, 1844. For every bank-note issued beyond a certain limit, specie must be held in reserve. This first portion of the issue, for which no gold reserve is required, is termed the "Fiduciary Issue," and it is assumed that all this proportion of the total issue will always remain with the public, and never be presented for payment. If the proportion of the fiduciary issue tends to rise beyond a point of safety, requests for loans are discouraged by the banks by raising the rate of discount (interest). Raising the bank-rate has a double effect. It makes men less willing to borrow, *i.e.* to get their bills discounted, and thus checks a tendency to overtrading. In the second place, those banks which allow interest on deposit will have larger sums tendered to them on account of the higher rate of interest. Thus less money is borrowed and more money is deposited when the bank-rate rises.

Taxation.—The subject of taxation is a department of the wider study of public finance, which deals with the revenue and expenditure of the State.

A tax may be defined as a "compulsory contribution of the wealth of a person or body of persons for the service of the public purse" (Bastable). Taxes may be direct, where the tax-bearer is the tax-payer (income tax), or indirect, when the immediate payer passes on the burden to others (production of commodities, customs, and excise duties). A revenue-tax must also be distinguished from a protective tax.

The Benefit theory of taxation affirms that the benefit of government to individuals varies with the amount of property protected, whence the tax should be imposed proportionately. The Faculty Theory advocates payment according to each man's ability as part of the organism of the State, ability to pay being measured by income. Proportional Taxation exempts a certain amount of income from taxation (in England, £160) and levies a proportional rate on the remainder. Progressive Taxation, however, favours an increasing rate with increasing incomes of those taxed; ability to pay, it is argued, increases more rapidly than incomes do.

Apparently the revenue required could best

be raised from the taxpayer in a single payment proportional to his income. This would be a *Single Tax* system, of which the best-known examples are the Physiocratic proposal of a single tax on land rent and the recently proposed tax on incomes. This system, which is never found in practice, has the merit of apparent simplicity, but, it is objected, is more easily evaded than a multiple system, irritates by its obviousness, and in practice would really be complex. The *Multiple* system, on the other hand, aims at bearing lightly at many points, heavily at none. Modern systems seek to avoid the defects of both single and multiple methods, and restrict taxation to a reasonable number of objects. The relative advantages of direct and indirect taxation must be discussed. The former is marked by facility and lower cost of collection, and affords information as to the exact amount paid by each individual (advantages also of the single tax), but the burden is obvious, the assessment of income and property is troublesome, and such a tax on the poorer members of the community is collected with difficulty and irritation. These weak points of direct taxation are the strong points of the other method; indirect taxes cause less irritation, reach all members of the society, are productive, and are collected at times convenient to the payer, *i.e.* at the times of purchase. On the other hand, consumption may be checked of taxed commodities, and injustice may be done through taxation of goods mainly consumed by the poor; the yield shrinks in times of depression, and, most important of all, serious loss may be caused by disturbance of industry.

Canons of Taxation.—Any good system of taxation must conform to certain Canons of Taxation, the most important of which were enunciated by Adam Smith. (1) All subjects of a State should contribute as nearly as possible in proportion to their ability. This, it is now coming to be held, involves progressive taxation for its realisation. (2) The form, manner, and quantity of every individual's contribution should be plain and not arbitrary. (3) Every tax should be levied at the time and in the manner most convenient to the contributor ("Convenience of Taxation"). (4) Taxes should be so contrived as to take out and keep out of the pockets of the people as little as possible above that which it brings into the public Treasury, *i.e.* its collection should cost little. Less fundamental principles are, to tax not capital but revenue, *i.e.* net revenue, and to preserve the source of the income which is taxed. Taxation should be stable; frequent changes in the system have a disturbing effect on contracts and understandings made on the supposition of a continuance of an existing system.

Local taxation provides revenue for the maintenance of local authorities. In its general characteristics, it resembles Imperial taxation.

A short account may here be introduced of the National Debt. This is the debt owing by a State to its subjects or to foreigners. In England, it began in 1692, with the borrowing of a million pounds, on the security of certain taxes, the yield of which was to pay the interest. The English national debt in 1914, before the war, amounted to about 700 millions sterling. It consists of two kinds of loans. The *Funded* debt is a permanent debt on which the State undertakes to pay interest, but which it does not promise to pay at any particular time. It is also known as *Consols*, because a number of loans raised at different times and rates were consolidated into a 3 per cent. stock. The *Unfunded* or floating debt consists of temporary loans repayable at fixed dates. These loans are raised for the convenience of the Chancellor of the Exchequer, who has often to meet payments before the taxes come in; they comprise Treasury bills, Exchequer bills, and Exchequer bonds.

The National Debt may be reduced by the Sinking Fund, or by the method of Conversion. The former in its earlier form was the surplus of certain parts of the public revenue set aside for the discharge of the public debt; but has sometimes consisted of fresh loans raised for that purpose. In the second method, a Government Stock at a given rate of interest is converted into one at a lower rate; the Government benefits by the diminution in the total amount of interest paid. In a third method, a portion of the debt is converted into a terminable annuity.

COURSE OF READING

The best introductory account of economic doctrines in accordance with Mill's treatise, is Fawcett's *Manual of Political Economy*. A more recent work, from the standpoint of the new school, is Marshall's *Economics of Industry*. A cheaper introduction to the science will be obtained through Chapman's *Elements of Political Economy*.

A useful compilation of extracts from the classical economists expounding the fundamental doctrines of the science is published in the "Scott Library" under the title *Political Economy Selections*.

Works of larger size are by Flux, *Economic Principles*, Chapman, *Outlines of Political Economy*, and Nicholson, *Elements of Political Economy*. After studying one of these, the student is ready to attempt Marshall's *Principles of Economics*, which is the standard treatise on those portions of economic theory with which it deals.

The development of economic ideas can be studied in Ingram's *History of Political Economy*, or Bonar's *Philosophy and Political Economy*.

Ashley's *English Economic History and Theory* gives a readable account, from the standpoint of the historical school, of early village communities of merchant and craft guilds, and of the development of mediæval economic theories. The *Encyclopædia Britannica* articles on "Political Economy" and "Economics" review economic thought in ancient times and in all the countries of Europe.

The classical works mentioned in the previous text may also be read, preferably in annotated editions, so that the student may see how far the views laid down are held to-day. Some of these works may be obtained in cheap editions, in some cases with introductory articles—*Wealth of Nations*, and *Leviathan*, in the World's Classics; Plato's *Republic* in Everyman's Library. A household edition of Mill's *Principles* is published by Longmans. In every case, it is advisable to have the text-book to hand.

Besides all the works on the general theory that we have mentioned, the student will find accessible a large number of volumes on separate economic topics. Many of these are of quite recent issue, concisely and attractively written, and presenting a thoroughly modern account of their subject. Among the most notable are, on Socialism, *The Socialist Movement*, by J. Ramsay MacDonald; *Socialism and Syndicalism*, by Philip Snowden; on Trade Unionism, *Trade Unions* (People's Books), and the Webbs' *History of Trade Unionism*. On Free Trade, there is an excellent volume in the Victorian Era Series by Armitage Smith, *The Free Trade Movement*; and on trusts, Longmans publish *The Trust Movement in British Industry* (Macrosty).

The student will keep abreast of modern economic thought by perusing the *Quarterly Journal of Economics*, the *Fabian Tracts*, and the special articles in the *Times*, *Daily News and Leader*, and other newspapers.

Lastly, since we have more than once emphasized the modern view that economic phenomena are but a part of a wider study of society, from which they can be only provisionally detached, it follows that the study of political economy requires a certain acquaintance with sociology, ethics, politics, and history. The student is accordingly referred to the courses of reading in these subjects in the present work. We add the following to the volumes therein mentioned: *Introduction to Social Philosophy* (J. S. Mackenzie), *Social Evolution* (Kidd), and *Social Psychology* (Baldwin).

F. W. F. Moir, B.A., B.Sc.

EUGENICS

EUGENICS was defined by its founder, Sir Francis Galton, as "the study of those agencies under social control, which may improve or impair the racial qualities of future generations." The idea of systematised and state-supervised race-regeneration is no nineteenth-century innovation. It is the master-secret of the great civilisations of olden time, and the extent of its practice is the measure of their durability and worth. Eugenics is an edifice old as the emergence of the provident mind of man, but ever gathering to itself new and wider foundations, ever rearing prouder and higher structures. It is a home of many mansions, and Modern or Galtonian Eugenics is, as it were, a vast mansion in the making, whose foundations are the modern sciences, whose corner-stone is the new science of Genetics (Breeding), and whose final altitude and dimensions no man can discern.

Francis Galton was a first cousin of Charles Darwin, and between the life-work and epoch-making discoveries of these illustrious kinsmen there is a close and instructive relationship. To Darwin we owe the scientific formularisation of the theory of Natural Selection, the theory of the differentiation of the living species by means of a selective death-rate; to Galton we owe the scientific formularisation of human or purposive selection, the doctrine of the amelioration of the human species by means of a selective birth-rate. The nucleus of both theories is Selection, for without Selection there can be no intrinsic progress.

Natural Selection is a non-moral process. Its chief weapons are privation and suffering; its victims are the superfluous products of the superabundant birth-rate which characterises life in all its manifestations. Nature never will regard the individual at the expense of the species, and weight of numbers produced was her earliest method of survival insurance. In the lower orders of life, plant and animal, the waste and destruction produced by the process of Natural Selection are enormous. For every living thing that, having attained to mature life, has facilities of propagating its kind countless millions at all stages of development are ruthlessly destroyed. A given environment is only capable of supporting a fixed amount of life, and every life that exceeds the limit is doomed to death. A life for a death is Nature's dictate. But production through reproduction is always greater than environmental demand, and the excess produced must be eliminated. According to the iron law of Natural Selection the least fit (*i.e.* the worst adapted to the particular environment) is the first to go, and this with total disregard to absolute individual worth, for fitness and worth are by no means synonymous, as the type of life that best thrives (or "fits") in a vicious environment proves. As we ascend the life-scale through the protozoa, invertebrates, vertebrates, mammals, finally to man, we notice coincident with, and in proportion to, the emergence of intelligence in the superior development the gradual lessening of the destructive processes and a stricter economy of life. The human birth-rate is lowest in Nature; the human death-rate is also lowest. How does Nature achieve this end? The economy is rendered possible by increasing parental responsibility, prolonging care of offspring, and extending the principle of social or co-operative protection. On account of such prolonged care and provision the development of a highly complex organism is rendered possible, by which the individual life is better safeguarded and equipped to face and conquer the hostile elements in his environment. It is by the extension and transmutation of these natural principles that Eugenics seeks to work. Its essence is Evolution made self-conscious.

The evolution of the mammalian order is the triumph of Natural Selection, but the order culminating in the family and social life of man has thus achieved the most effective means of restricting the powers of such selection. In man an intra-uterine period of nurture extending over three quarters of a year, a period of lactation of like duration, and parental provision and care extending over the greater part of the offspring's life, aided and abetted by social co-operation, make possible the long process of development of those phenomenal physical and mental powers which enable him not only to conquer and remould his environment, but to cope with and partially to arrest the cruel and blind destruction of Natural Selection in the human sphere.

The Arrest of Natural Selection.—Let us now consider the results of the arrest or reversal of Natural Selection which would ensue if the process continued uncounteracted in advanced human civilisation. In a highly civilised community

we notice that to a great extent the state shelters and protects not only the weak, but the worthless, the vicious, the improvident, abrogates to a considerable degree their struggle for existence; permitting them to multiply blindly, irresponsibly, to outnumber the worthy, the strong, the provident, who are themselves taxed and handicapped to support these social parasites. The unchecked prolongation of the survival preponderance of the unworthy must necessarily result in the deterioration of the race. To circumvent such deterioration and to further radical amelioration is the end and aim of Eugenics.

Ancient Eugenics essayed many remedies, conspicuous among which was infanticide. Thus in Sparta each infant born was examined by a board of authorities, who sentenced it to extinction if found to be of unsound constitution. By this means this ancient state long maintained a superlatively high physical standard of manhood and womanhood, but at the price of man's noblest endowment, the human soul humane. The protection of the weak by the strong is a ground principle of morality. The Spartan state remained barren in all the higher branches of culture, a barracks amid the beautiful homes of Greece. Not by foregoing his birthright shall man achieve his highest development.

Modern Eugenics offers a solution of the hitherto insoluble problem, by which is attained the same end in the sphere of man as the non-moral process of Natural Selection obtains elsewhere (*i.e.* the survival of the most fit). But Modern Eugenics achieves her ends by supremely moral and provident methods, and not at the price of morality and love. The solution offered is the selection of the worthy only for parenthood and the control of environment in the interests of such parenthood. The radically unfit is thus permitted to live to his fullest self-realisation; he commands our sympathy and protection, but he is denied the right to reproduce his kind. By such restraint we perform at once our duty to the individual and the race with the infringement of neither justice nor love.

Life is the product of the interaction of nature and nurture, of heredity and environment, of the inborn tendencies and the surroundings in which they operate. Both factors must be considered in any adequate and responsible system of Eugenics. For long the opinion has obtained currency that Education (Nurture) alone was sufficient. Improve the environment was the insistent nineteenth-century cry, and all else will be added unto you. But Education is literally and actually "a drawing out" of a given content, and if the content is nil, however perfect the process of Education the result is nil. No amount of Socrates' teaching could alter the innate flaws of Alcibiades' nature.

Nature and Nurture.—It is here necessary to draw a distinction between inherent, natural, or hereditary character and nurtural or acquired character. An inherent character, whether mental or physical, is an innate tendency which is the inalienable inheritance of the individual born, its existence being independent in its essence of extra-germinal condition and circumstance, and which is transmissible to the offspring by its bearer. To cite simple examples, hair, eye, and skin colour are all inherent and transmissible characters of germinal origin, while wisdom, muscular development, traumatic scars are acquired and untransmissible characters of nurtural origin. It must also be remembered that nature and environment apply also to the intra-uterine state, that all characters apparent at actual birth are not necessarily inherent; in other words, congenital does not always mean hereditary. Thus the malformation known as club-foot, though congenital, is not inherently germinal and hereditary, but is environmental, depending on local pressure in the pre-natal state, and is not therefore transmitted by the afflicted to the next generation. It will be readily seen that the correct classification of various characters as acquired or hereditary is of the utmost importance as a guide to mating and a fundamental factor in a system of Eugenics.

Eugenics and Heredity.—Eugenics is based on the scientific data of Heredity. The outstanding feature in Heredity is the fact that while like tends to beget like, each new individual exhibits a new departure which marks him as an individual entity. Thus Heredity involves two distinct tendencies—(*a*) continuity or persistence; (*b*) divergence or variation. The theory of Natural Selection involves no explanation of the phenomenon of variation; it merely observes its occurrence and registers its workings. Weismann has, however, offered us an explanation of the fact of continuity or persistence which has considerable biological evidence. He states that in embryonic development a residue of unaltered germinal substance contained in the fertilised ovum is reserved at conception to form reproductive cells for a second generation, *i.e.* simultaneously with the earliest development, the initial genesis of an individual of one generation material is set aside unused and unaltered for the development of reproductive cells to form the second generation, *i.e.* the germ-plasm (or essential reproductive matter) is continuous, and the child is contemporaneous with the sire. The individual may then be regarded as the guardian of a continuous stream of germ-plasm rather than the creator of the germ-plasm of the filial generation.

The variation tha is here discussed is a germinal modification transmissible to the second generation, and to be distinguished from

an environmental or acquired modification arising from habit or circumstance (*e.g.* muscular hypertrophy) which is not transmissible, and which we term an acquired character. Selection is the master-key to evolution, variation and continuity are its agents. The accumulation of variations through the ages, punctuated and governed by the eliminating action of natural selection, gives rise to new species, or in other words new species result from the selective action of environment l conditions upon the variations from the basal type which individuals manifest.

Natural Evolution.—In order to understand the end, aim, and scope of Eugenics some knowledge is required of the workings of natural evolution to which Eugenics is supplementary. The three factors involved in the process are Organism, Function, Environment; and the various theories are classified according to which of these factors is cited as the motive force. The earliest theories lay stress on function, and the chief exponent was Lamarck. According to Lamarck the differentiation of the species is the result of the cumulative transmission of functional modification. Changes in environment which brings about new requirements, new requirements necessitate new habits, new habits modify various organs, and continuous modification of organs transmitted from generation to generation results in the creation of new organs.

Take, for example, the time-honoured argument from the giraffe. Imagine a parental species with inconspicuous necks and inconspicuous fore-limbs depending for food on the foliage of trees. In course of time in a given area the food-supply within average reach becomes exhausted, and, argues Lamarck, hunger would cause the giraffes to stretch their necks and fore-limbs in search of the higher foliage. The next generation would profit by the exercise and consequential acquirements of the parents, and would be born with longer members. This would be repeated from generation to generation until the giraffe as we know him, with his exaggerated neck and fore-legs, was evolved. This is known as the Lamarckian theory of evolution. It is now generally discredited, as the facts of heredity give no warrant for the assumption—quite the reverse. The child does not begin where his sire left off, if he did, there would be no need for Eugenics. Heaven would long ago have come to earth.

In actual fact the child of the gymnast, unless he too is put in training, is muscularly no whit superior to the average child. The acrobat's son has to acquire co-ordination and balance like you or I. There is no royal road to the realisation of human perfection. Modern theories of evolution select environment or organism, sometimes both, as the motive force, in conjunction with the eliminating process of natural selection.

To return to the giraffe. Imagine again in a given area the parental species with moderate neck and limbs depending for food on the foliage of trees confronted with a scarcity of food within reach. The law of variation accounts for the fact that in each generation some of the animals born would have longer necks than the average, and some shorter. Obviously the animals with the longer necks would be able to reach the higher branches and survive while their short-necked brothers would be starved out. The survivors would mate with females who had also survived on account of the same variation, and thus in the filial generation the average neck would be longer. A continued food-pressure would bring about a further elimination and selection of still longer-necked abnormals. If we postulate indefinite time and a similar selection of long fore-legs on account of their survival-value we can finally credit the evolution of the giraffe as we know him. For this particular environment the chief assets of survival-value that make for fitness were length of neck and fore-limb. Similarly an environmental demand for long necks and bills among wading birds would produce, for instance, the flamingo.

This is roughly the accepted Darwinian theory. The vitalists, on the other hand, lay stress on organism, or the vital force within, urging organic change to meet environmental pressure, and ever striving after higher forms and more potent complexity.

Darwin demonstrated the amazing transformation that man had effected by applying the principle of selective breeding among domesticated animals and cultivated plants. Conspicuous are the results obtained in the stud-farm and in the case of cattle, sheep, fruit, and vegetables. In presenting his case for the evolution of the species he asks if man has been instrumental in differentiating such countless varieties in so short a time, what may not Nature have achieved with unlimited material and unlimited time at her disposal? But Eugenists ask us to draw yet another deduction from the successful production of improved varieties by man. They ask if this much has been achieved by the application of the principle of artificial selection in sub-human fields, what may not a corresponding application of artificial selection achieve in the world-wide field of the cultivation of the racial life? If Mendelian experimenters in our midst have, for example, increased the yield of certain of our cereals threefold, may not likewise the human harvest be increased ten- or a hundred-fold?

"But," object the critics, "this is a fatal and dangerous presumption on the part of man, a vaulting ambition doomed to overleap itself.

Moreover, the whole principle of artificial selection is false to nature and fact. We have at hand working before our eyes the time-honoured process of natural selection. We see its beneficent winnowing in our slums, where the unfit are cast out by the thousands. Let Nature revel in the merciful massacre of the innocents. Better let well alone." We reply that the conditions that prevail in the slums are anything but natural, and unfortunately such conditions not only destroy outright but irrevocably impair. Moreover, the awful sin of these impaired and blasted lives is visited upon the children unto the third and fourth generation.

Mendel's Discoveries.—Eugenics works upon the scientific data of heredity. Of modern discoveries in Genetics (the science of breeding) most momentous and most fruitful is the principle of gametic segregation formulated by Mendel, an Austro-Silesian abbot (1822–1884). His papers on segregation were read before the naturalists' society of Brünn in 1865, but their significance was entirely overlooked until their accidental rediscovery in 1900. De Vries in Holland, and Correns in Germany, had meantime arrived independently at somewhat similar results. The discoveries are of incalculable importance, and the principle of alternating generations when applied to problems in human breeding have already produced most encouraging results.

Mendel's research was chiefly prosecuted on pea-plants. The pea-plant (*Pisum sativum*) was selected as it has many varieties with particularly well-marked characters, and is readily cross- or self-fertilised. The experimenter crossed a tall variety of pea with a dwarf. The result of the hybridisation was a generation in which the peas were without exception tall despite the fact that one of the parents was dwarf. The character of tallness which thus prevailed Mendel called *dominant ;* the character of dwarfness in this generation latent, he called *recessive.* Self-fertilisation was allowed to occur in these tall crossed peas, and in the next generation there appeared talls and dwarfs in the proportion of three to one. The dwarfs of the generation were allowed to self-fertilise, and they bred only dwarfs. They were, therefore, pure recessives, always breeding true to the character of dwarfness. The talls of the same generation were also allowed to self-fertilise, and they bred two kinds—one-third of them (pure dominants) produced tall, but two-thirds of them (impure dominants) produced talls and dwarfs in the proportion of three to one. And so on in the next generation. The pedigree ground may be tabulated thus : Let T stand for the tall variety and D for the dwarf. Let T (D) stand for impure-tall (impure dominant). Let P stand for the parental generation (hybrid), F_1 for the first filial generation (inbred), F_2 for the second filial generation (inbred).

P				T × D			
F_1				T(D)			
F_2	25% T			50% T(D)			25% D
F_3	T	25% T		50% T(D)		25% D	D
F_4	T	T	25% T	50% T(D)	25% D	D	D

These Mendelian results are usually explained as follows : The gametes (or reproductive cells) of male and female fuse to form at conception a single union-cell called a zygote, which develops later into a new being. It is supposed that in cases of alternative or Mendelian inheritance dominance is represented in organisms which display it by a single gametic character. The corresponding recessive character is also represented by a corresponding factor in the gametes of organisms which display it. Those two factors do not blend, and when the two factors appear together in a zygote the recessive character always remains latent in the presence of the dominant. The zygotes arising from hybridisation of dominants and recessives are of three kinds :

(*a*) The dominant factor may be present in the gametes of both parents, the zygote is then called *duplex*, and always breeds pure dominant.

(*b*) The dominant factor may be carried by one gamete, the recessive by the other, in which case the zygote is called *simplex.* Such zygotes bear 25 per cent. pure dominants, 25 per cent. pure recessives, 50 per cent. impure dominants, *i.e.* bearing dominant and recessive, the latter being latent.

(*c*) Neither gamete may contain the dominant character but both the recessive, and then the zygote is called *nulliflex.* Such zygotes breed pure recessive.

Dominants and Recessive Characters.—The Mendelian law exemplified above is called the law of the segregation of pure gametes. Many human, animal, and vegetable characters have been found to conform to it, and it is therefore of incalculable importance as a guide to breeding. Thus in barley the presence of six-rowed ears as opposed to two has been found to be a Mendelian recessive character, the two-rowed type being dominant. The character has been segregated on Mendelian principles, and its uninterrupted continuance fixed. Immunity to rust in wheat has been similarly segregated as a pure recessive character, and its permanent presence guaranteed. Important as is the agri-

cultural gain of this Mendelian manipulation for cereals, vastly more important are the Eugenic predictions and interdictions regarding individual matings made possible by the discovery that certain hereditary diseases follow the Mendelian law. Thus a type of feeble-mindedness is now definitely known to be a Mendelian recessive, and when the pedigree of afflicted families for three generations is known correct prognostications can be made as to the germinal content of the members. Impure dominants in such families appear normal, but they can convey a fatal heritage to their children. In such families, therefore, those who are pure recessives and impure dominants should not marry. Pure dominants may marry, as they are absolutely free of the affliction although born of an afflicted stock. Thus Mendelism promises to furnish a guide of major Eugenic importance in problems of human crossing.

The Biometrical Method.—In hereditary cases which do not follow the Mendelian law, the biometric or statistical method is often instructive. Galton himself laid great stress on the efficacy of this method, but its results are now largely falsified by Mendelian discoveries. The relations Biometry establishes depend on the system of averages. The weakness of the method lies in the fact that from results obtained from averages no certain guidance or prediction can be furnished for individual cases, and in breeding the individual is all-important. Moreover, statistical method necessarily ignores contributory factors producing a given result, and thus often misrepresents the degree of their individual influence.

As an example of a statistical inquiry the research of Mr. Cyril Burt in the degree of hereditability of ability may be taken. The statistician selected three groups of children of the same age, the first group representing the sons of men of high intellectual attainments, the second group representing the sons of respectable middle-class tradesmen, the third group being drawn from Liverpool slums. These children were submitted to an intelligence test (a singularly unsatisfactory one at that), and the results obtained are offered us as a proof of the transmissibility of that illusive psychological quality. It is obvious that in this calculation a unilateral hereditary factor is selected and all the environmental factors ignored (*e.g.* education, feeding, clothing, sleep, &c.), although such factors have a very far-reaching influence on mental efficiency. Moreover, the statistician completely waived the maternal contribution in the boy's mentality.

Similarly, the biometricians compare the death-rate among married women between the ages of twenty-five and forty-five with the death-rate among unmarried women of like age. In the former case it is consistently lower than in the latter, and conspicuously so in the last decade. Many deductions are drawn, *e.g.* marriage makes for health; child-birth is an instrument of natural selection, weeding out the unfit in the earlier years of married life. But the point is ignored that marriage itself is an instrument of artificial selection preferring the healthier women to the unhealthy. The initial health-standard between the two classes is initially unfair. The conditions that make for a high death-rate in child-birth are not only eminently unnatural, but eminently avoidable, as Listerism proves. Moreover, when the death-rate in such cases was highest in the hospitals last century, it was quite undiscriminating in its ravages, attacking fit and unfit alike.

In our review of the evolution of the higher species we noticed four outstanding factors that made such development possible. These factors are selection, intelligence, parental care, and social care. Let these factors be continually before our eyes; they furnish a guide to procedure in Eugenic reform. It was also observed that in the sphere of human life the conditions of civilisation tend to abrogate and to a large extent reverse the process of natural selection of the fit. Without selection no progress is possible. In human states where the improvident and unworthy multiply much more rapidly than the worthy, if the conditions are such as increasingly to handicap and check the reproduction of the provident and the worthy, then not only is all racial progress paralysed, but retrogression is inevitable. It is the business of Eugenics to eliminate wherever possible all factors in the social life which contribute to reversed selection and hasten its disastrous and fatal consequences. And here we have not only the sanction of the teachings of Biology, but also the moving appeal of human history, for in every case the fall of the great nations—"Assyria, Greece, Rome, Carthage" of Byron's lament—is to be attributed to the relentless retribution of reversed selection, the dominance and the preponderance of the unworthy. The doom is sealed of states where reversed selection prevails, no matter how perfect their acquired characters—their arts, and their crafts, and their institutions. It is the inherent worth that makes for durability in all life, whether political or racial.

Warfare and Reversed Selection.—Is there palpable evidence of reversed selection in modern civilisation? Can retrogression be checked? These are questions of enormous consequence, and Eugenics furnishes an indisputable response. Modern warfare is an obvious instrument of reversed selection. In ancient times, when fighting was hand to hand and depended on individual strength and skill, war was often an effective means of selection of the fit. In modern times the recruiting officer selects the worthy in body and mind in the prime of their reproductive power to be mown down in millions,

while the unfit is left to enjoy his immunity and propagate his infirmities. The individual worth of the combatant is as naught before the diabolical powers of the gigantic ordnance on land and sea. Thus war not only affords immunity to the worst, but it destroys the best in their prime. It creates an unnatural disparity between the male and female population, fruitful of countless ills. It increases widowhood, which means unprotected motherhood and unprotected childhood with its vicious consequences in the next generation. The whole weight of the Eugenic argument is therefore in favour of peace. Again, any religion which encourages celibacy among its nobler adherents, which deprecates the divine function of physical parenthood, which accounts among the carnal lusts the sublime relation of man and wife, is an enemy to that power that maketh for good manifested in the universe, an enemy to the future and the heaven that is its promise. So in the life political any legal enactments, any taxation which embarrasses parenthood and family life among the deserving and provokes the evil of indiscriminate multiplication among the undeserving, are inimical to the racial weal. Misplaced charity, blind to the future and unsalutary in its dispensations, is an agent for the spread of social parasitism with its dysgenic consequences, and so, too, state correction, uneducative in its method, indiscriminating in its application. There is no gainsaying the Eugenic yea or the Eugenic nay. The Eugenic touch-stone is the final and infallible test of all religions, all ethics, all politics. Thus Eugenics ordains that we preserve Nature's law of evolution through selection, only we, being creatures of conscience, make our evolution conscious by selecting for birth, rather than by rejecting by death.

True Racial Betterment.—Let us now examine the auxiliary methods by which Nature has ennobled the creatures of her creation, that we, following her methods in the light of our reason and conscience, may further ennoble our natural ennoblement. As we ascend the life-scale we observe the marvellous transmutation of reaction into instinct, of instinct into intelligence, of intelligence into man's unique heritage of reason, and reason into the god-like omnipotence of genius. In mind, then, lies our superlative power; by this we are lords of earth and sea and sky; by this do we fathom the workings of Nature and offer our co-operation to further her ends. As intelligence emerges Nature denudes her creatures of weapons offensive and defensive, till the process is complete in the stark and awful nakedness of man. There are Eugenists, or rather pseudo-Eugenists, who advocate the cult of muscle for muscle's sake, who appear to envy the physical attainments of the rhinoceros, the elephant, and the mastodon, failing to see in the complete or partial extinction of these species the feebleness of muscle as an instrument of survival when confronted with the all-mastering intelligence of man. Eugenics therefore discountenances the cult of the physical except in so far as it is perfected and maintained as the servant of the mind or soul.

> "To man propose this test—
> Thy body at its best,
> How far can that project thy soul on its lone way?"

Yes, the physical is a medium, and as a medium of infinite value and worthy of meticulous care and attention; but it is not an end in itself. It is the temple of the future, to be swept and garnished against the advent of the god-in-man, that his spirit may fill it and justify and sanctify it.

Secondly, Nature has extended the principle of parental care, as a certain method of ameliorating her creatures. As we ascend the life-scale we witness the gradual apotheosis of the sacred principle of parenthood. The amœba, a unicellular organism of the simplest type, reproduces itself by fission. The parent is lost in the offspring. Reproduction is only achieved at the entire cost of individuality. In plant-life we observe the beginnings of sex, a dream-suspicion of the infinite possibilities of the urge of incompleteness, but the first-fruits of Nature's young love-dream, the seeds of strength in union, are entrusted to the unwitting wind of heaven or the careless insect in the sun, and in their millions perish, their life-cycle incomplete. The bee and the ant early learned the lesson of social co-operation, early appraised the queenly function of the mothering of their young, but cavalierly dispensed with the male's services except as a fertilising agent. Ascending the ladder of life, we arrive at the fish, exhibiting a greater physical complexity as an asset of survival value, but maternal care, observable in aquatic vertebrates, is comparatively rudimentary and the wastage of life in the making enormous. In certain piscine species there is actually an approach to combined parental provision.

So far we have been contemplating a world of life that cares at most for eggs, but when, ascending the scale of life, we reach the birds of the air we are in the midst of a world that cares also for its young. With the beginnings of co-operative parenthood the first dawning of moral life is visible, the protection of the weak by the strong even at the price of death. Such conduct makes possible a considerable diminution of the number of young produced at a birth. The fish produce their eggs in millions, and millions of children are beyond the reaches even of maternal love, but where two or three only are gathered together there is found Love in the midst of them. There is no sight more moving in its sacred beauty than the indefatig-

able sacrifice of the parent-birds for their callow young. Still higher is the mammalian order, characterised by the divine attributes of womb and breast, and culminating in man, the very son of God, whose destiny it is to transmute and spiritualise the great function of parenthood, which we see manifested in all living creation, to the end that it be to him the nurse, the guide, the guardian of his life, and soul of all his moral being. The monogamous union is the perfect instrument of race-culture, capable of ennobling and exalting the high privilege of fatherhood, protecting and safeguarding the sacred function of motherhood, and providing the precious helplessness of childhood with the best possible environment for the furtherance of its inborn heritage. The monogamous union is Nature's own institution; perfected only after æons of blind experiment and blundering failure. Any false prophets of Eugenics who advocate on any conceivable ground the adoption of human polygamy or polyandry are false to man's past, man's present, and man's future. The whole teaching of Biology is a plea for the lifelong protection of motherhood by fatherhood and the protection of childhood by both. Therefore Eugenics militates against the exploitation of child-labour and the participation of married women in industries to the detriment of their own health and their families' need. But the treatment of these ills is a social rather than a parental concern, and the bearing of Eugenics to social life is our next care.

Eugenics and Social Life.—The strength of union was an early discovery of Nature's. It was discovered in the days of the early invertebrates, and is exhibited in the extraordinary perfection of the social life of bees and ants. Eugenics claims to test finally all social institutions on the authority that society itself is but an instrument for the protection of the racial life. It is instructive to weigh and consider again the ant-heap and the hive, to consider their ways and be wise, for the anomalous aberrations perpetrated in the name of statesmanship would lead us to believe that man has forgotten the true *origo et fons* of the state, and deems it to exist for the protection of the golden calf, and not in the interests of motherhood and the life to come. The cynosure of the hive we observe is the queen, the motive of all this ecstasy of industry and activity is her protection and the protection of her young. We shall be nearer perfection when our statesmen forego their myoptic blinkings and cultivate the long vision which can focus the life to be in the life that is. It is the duty of society to protect the full cycle of life in the interests of the race, to foster expectant and nursing motherhood, infancy, childhood, adolescence, and maturity. State-appointed Listerian midwifery at every confinement is a first essential. Comfortable and sanitary homes are a second. Instruction in schools and homes in hygiene and life-principles is a third, and the creation of a universal parental conscience is a fourth. Eugenics is also uncompromising in its demands for the radical treatment of venereal diseases. Mothers and children must be safeguarded from the terrible ravages of this ghastly infection which cankers the very heart of our racial life. The conquest of Syphilis by Salvarsan is of extreme Eugenic importance. A plea is also made for the state to protect the future life from the hereditary and environmental curse of alcohol.

Elimination of the Unfit.—Eugenics, as seen, aims at the encouragement of parenthood. It also seeks to circumvent the actuality of unworthy parenthood.

Space is here too limited for a full discussion of the scope and methods of Eugenics in this eliminating process. Suffice be it to say that Eugenists urge the permanent care of the feeble-minded and insane, in order to prevent the further propagation of these calamitous infirmities. In other cases where the individual is apparently normal, but is liable to resuscitate a racial malady in his offspring, Eugenists urge the avoidance of parenthood. Such results can only be achieved by the development of a Eugenic conscience. Tuberculosis is now supposed not to be hereditary. It is, however, eminently infectious, and children of infected parents should be segregated.

Finally, Eugenics is above all a religion. It is an impassioned vision vouchsafed to the seeker after God. From his pillow, the stones of the earth, man sees again the wonderful ladder of life arise, where the angels of God ascend and descend. Above it the voice of God saying: "The land whereon thou liest to thee will I give it, and to thy seed; and thy seed shall be as the dust of the earth, and shall spread abroad to the east and to the west, and to the north and to the south, and in thee and in thy seed shall all the families of the earth be blessed. And behold I am with thee, and will keep thee in all places whither thou goest, and will bring thee again into this land, for I will not leave thee until I have done that which I have spoken of to thee." . . . And man, arising once more to labour in the waste and desert places against the advent of the fuller life to come, marvelling cries: "Surely the Lord is in this place, and I knew it not. This is none other than the house of God, and this is the Gate of Heaven."

The following Eugenic Institutions have been founded:

The Department of Eugenics, University College, London, founded by Galton. The chair is occupied by Professor Karl Pearson.

The Eugenics Education Society has its headquarters in London, but has branches throughout the Empire. Its organ is the *Eugenics Review*. Its object is the propagation of the Eugenic ideal.

A somewhat similar institution is the *Natural Council of Public Morals*, which founded the *National Birth-rate Commission* for Eugenic inquiry.

In America the *Eugenics Record Office*, under the directorship of Dr. Davenport, has made a speciality of Mendelian Research.

The French *Society of Eugenics* publishes the admirable *Eugénique*.

The corresponding society in Germany is the *Society for Race Hygiene*.

COURSE OF READING

The Methods of Race Regeneration, by C. W. Saleeby (Cassell & Co., 6*d*. net). This is a very simple and brief exposition of the aim and scope of Eugenics, popular in character but highly instructive and suggestive. It is an excellent primer of the subject.

Parenthood and Race Culture, by C. W. Saleeby (Cassell & Co., 7*s*. 6*d*. net). This admirable introduction to the study of Eugenics was supervised and appraised by Sir Francis Galton. It deals with a scientific subject in a popular and literary way, and will prove fascinating reading to the initiated and uninitiated alike.

The Progress of Eugenics, by C. W. Saleeby (Cassell & Co., 5*s*. net). This volume deals with the history and achievements of Eugenics during the last decade.

Eugenics, by Edgar Schuster (Collins, 1*s*. net). This terse and accurate little volume gives an unprejudiced review of the entire field of Eugenics. It is a scientific but highly readable treatise.

Hereditary Genius; an Inquiry into its Laws and Consequences, by Francis Galton (Macmillan and Co., 7*s*. 6*d*. net).

Natural Inheritance, by Francis Galton (Macmillan & Co., 9*s*.). These are two pioneer works on Eugenics, and should be studied by everyone aspiring to an understanding of the subject.

Heredity, by J. A. Thomson. Without a thorough knowledge of the principles of heredity, no real understanding of the Eugenic methods of race-regeneration is possible. This exposition of the subject is highly instructive and commendable.

Evolution, by J. A. Thomson and P. Geddes (Williams & Norgate, 1*s*. net). An understanding of the principles of Natural Selection is also a necessary preliminary to any serious inquiries into the principles of Eugenics.

The Scope and Importance to the State of the Science of National Eugenics, by Karl Pearson (Dulau & Co., 1*s*. net).

The Problem of Practical Eugenics, by Karl Pearson (Dulau & Co., 1*s*. net).

Nature and Nurture: The Problem of the Future, by Karl Pearson (Dulau & Co., 1*s*. net). These little volumes expound the principles of the statistical methods of inquiry into the problems of racial progress.

Man and Woman, by Havelock Ellis. This book deals with the sex problem, and throws many interesting side-lights on our study.

A. E. STIRLING, M.A.

III. LANGUAGES

PHILOLOGY

The literal meaning of the Greek word *Philology* is "love of literature and language," but except in continental universities the term is now rarely used in that comprehensive sense. Among the ancients this branch of learning was chiefly employed in interpreting texts and their meaning; and this was also considered the chief aim of philology throughout the middle ages. But since the rise and wonderfully quick growth of linguistic science in the eighteenth century, the term has been more and more narrowed, so that *Philology*, as generally understood to-day, occupies itself chiefly with the history of language, *i.e.* of its words, their forms, origin, and meaning.

This science is often called *comparative* philology, because its object is to trace the pedigree of words in the various cognate languages, and to establish by means of linguistic research the relations existing between families of speech. It is, therefore, not very different from *Etymology*, literally "the science of the true origin of words." The vague and often ludicrous notions as to the origin and ultimate connections of words entertained by the ancients and mediæval scholars was only possible because these early "philologists" lacked a proper insight into the nature of human speech and possessed no rigid scientific method. The chief reason for their failure may be discovered in the narrowness of their outlook.

To the Greeks only one language was worth studying—the Greek idiom—all other forms of speech being looked upon as barbarous and beneath notice. During the middle ages, the attention of learned men was concentrated on the three "regulated languages," Latin, Greek, and Hebrew; and the first two being closely related and the third totally different from the others, a comparison of their words and forms could not possibly lead to sound discoveries. It was not till people began to study the various branches of the Teutonic languages that progress on the right lines was made.

The Early Philologists.—The endeavours of men like Junius (d. 1671), Hickes (d. 1715), and the Dutchman, Ten Kate (d. 1731), in the field of purely Teutonic philology would most probably have resulted in the ultimate establishment of linguistic science on a firm basis, if this natural and slow process had not been accelerated by the sudden rise of the more comprehensive "comparative philology." The discovery of the relationship between the Indo-Germanic (or Aryan) languages completely revolutionised all linguistic research. Towards the end of the eighteenth century, chiefly through the works of William Jones (d. 1794), afterwards taken up and propagated by F. Schlegel, who was for a time the head of the German romantic school, European scholars became acquainted with the language of the ancient peoples of India, as contained in the venerable Vedas, and the younger Sanskrit sacred books, and the connection of most European languages with the Eastern idiom stood suddenly revealed.

This connection could only be explained by assuming that all Indo-European (or Indo-Germanic) languages—so called after their most Eastern and Western representatives—had sprung from some common source which, of course, had perished as a distinct idiom. The agreement is clearly exhibited in the inflexions and general structure of the sister languages, but it appears more striking in the vocabulary. It was impossible not to perceive that equations like the following pointed to a common origin of all the words involved:

SANSKRIT	LATIN	GOTHIC	ENGLISH
ajras (a plain)	*ager*	*akrs*	*acre*
saidim	*sedere*	*sitan*	*sit*
bhratar	*frater*	*brothar*	*brother*
yugam	*jugum*	*juk*	*yoke*
bhero	*fero*	*bairan*	*bear*
fods	*po(d)s*	*fotus*	*foot*
fitar	*pater*	*fathar*	*father*

The Original Meaning of Words.—Equations of this kind were at once discovered in great number. It was now possible to connect words

with their kindred in older and less modified languages, and in a great many cases their true and original meaning was definitely settled. Thus the English *saw*, the instrument, was connected with the root preserved in Latin *secare*, "to cut," and it was evident that the oldest saw was an instrument for cutting. This principle, however, was in the enthusiasm of the first discovery applied on too extensive a scale. Many words, it is true, may be traced back into the primitive Indo-Germanic language, but still remain isolated. This is true of most of the numbers, of many verbs expressing action, and of the names of relatives.

Many scholars were not content with this discovery, and attempts were made—and are still being made—to establish a further connection by means of some extravagant theory. The mode of reasoning adopted is well illustrated in the suggested explanation of the ultimate meaning of the words *brother* and *daughter*. The latter, for which the old Indian is *duhitar*, was connected with the root *duh*, "to milk," so that "daughter" was explained as meaning "milker," because her chief duty in the family, or tribal economy was, "to milk the cows." Similarly, *bhratar* was linked with *bher*, "to carry, bear," it being argued that the "brother" was the "supporter" of the sister in the first place. By this kind of loose reasoning the most astonishing results were obtained, and a complete idyllic picture was drawn of our primitive ancestors' mode of life.

The unsoundness of the method which leads to such results can easily be demonstrated. If it were applied to the interpretation of modern English words, one might, by disregarding the evidence of the older and cognate idioms, cheerfully connect *bard* with *bird* (from a common root ("to sing"), or *dog* with *to dig* (compare the digging habits of most dogs). If we are ever to get any further in the elucidation of the numerous isolated Indo-Germanic words, it will be through the discovery of another related language, or family of languages. It is true that attempts have been made to prove that the Semitic languages are related to the Indo-Germanic group, that both have a common origin. This theory, championed by Möller of Copenhagen and others, has, it is true, evoked considerable interest among philologists, but is still far from being generally accepted.

History through Philology.—The extravagant conclusions as to the ultimate meaning of many words were not the only excesses committed by the comparative philologists in the first flush of success. Until quite recently the idea prevailed that it might be possible to determine, by means of purely linguistic research, the geographical position of the country inhabited by the common ancestors of all Indo-Germanic peoples. A few examples may suffice to illustrate the mode of reasoning. The root contained in the English *mere*, "lake, sea" (Latin *mare*, &c.), and that of *salt* (Latin *sal*) are found in the Teutonic, Latin, Celtic, and Slavonic languages only: therefore the primitive Indo-Germanic race cannot have had a word for "sea," *i.e.* must have lived in the centre of the continent, and was, further, unacquainted with the use of salt.

But this is absurd—the roots of *mere* and *salt* may have been introduced into the languages that contain them after these had separated from the rest—or those that now lack them may have lost them before their speech was recorded in a lasting form. If that mode of reasoning were admitted, one might, with equal justice, claim that the Indo-Germanic primitive race did not know the use of "milk," for there exists no name for it that is common to all branches. Arguments of the above kind can only become valuable when supported by archæological and ethnographical evidence. It was Jakob Grimm who first uttered a warning against too hasty conclusions of over-sanguine philologists by "calling them away from the study of words to that of objects." This sounder method of connecting linguistic with archæological research has found a champion in Professor Meinger, editor of the periodical *Wörter und Sachen*, chiefly devoted to these problems.

Changes in Language.—In the foregoing paragraphs it has been tacitly assumed that language is continually changing. This fundamental fact need hardly be proved now, though it was never realised by the Greek philologists. If we try to read Chaucer in the original, we discover that his language deviates considerably from modern usage: not only is the spelling different, but the forms of words and their meanings are changed. There are many words in Chaucer completely unknown to us, while on the other hand he seems to lack expressions that we now consider indispensable parts of our vocabulary: old words are lost, and new ones take their places. And if we were to penetrate further into the past, and attempt to read King Alfred's writings, we should find that his English—though the lineal ancestor of modern speech—was altogether unintelligible. These changes—apart from the loss and gain of words—constantly at work in language may be divided into three classes according to their nature.

1. The *meanings* of words are changed because we are constantly extending or narrowing their scope. Civilisation advances and habits change, but the word very often remains although it no longer accurately describes the object or action to which it applies. Compare *pen*, originally = "feather"; *book*, now made of paper, is connected with *beech* because the

runes were carved into wood; *to write*=*to carve runes*.

Further, the number of figurative expressions is very numerous and constantly increasing, compare "to root out a habit," "the star of Rome was setting," &c. Early speech is always concrete—in subsequent stages abstract ideas are expressed in terms derived from concrete objects or physical actions: one talks of the "source of knowledge," and of a "bright" notion, or a "dark" plot. The emotions play a part in the transition from *nice*, with the original meaning of "stupid, wanton" (from Latin *nescius*, "ignorant"), to its present sense. On the other hand, a narrowing may be observed in the history of the word *fowl*, which term originally comprised all birds (which latter term was originally applied to young ones only—compare *brood*), just as *deer* was used for all wild animals in general. Changes of this kind are interesting to trace, and their history often throws light on the habits and customs of the people and the hidden workings of the human brain.

2. But not only are the meanings of words affected: the *pronunciation*, too, is changing continually. This process, though inevitable, is very gradual, and carried out by the speakers unconsciously. The reasons for this change—which is regular and uniform within definite communities of speakers—are difficult to discover. Very little can be said about this subject here. Language, as the expression of human thought, will change with the ever-developing mind of the human race; and just as the collective intellect of close communities is carried along by one uniform impulse in one and the same direction—in spite of the inevitable presence of advanced and conservative sections—so the accompanying changes of the common language must be equally uniform.

Professor Wundt, a leading authority on these matters, says, in his recent book on *Völkerpsychology*: "The question, how a nation in the course of centuries can change the sounds of a word beyond recognition (compare Anglo-Saxon *nigon*=*nine*, Latin *encaustum*=*ink*, &c., &c.), cannot possibly be answered in a thoroughly satisfactory and exhaustive manner. To do this, one would have to account for the nature and extent of all those changes which have taken place through external and internal circumstances in the entire intellectual and physical nature of the speaking community. All one can say is this: that such changes take place irresistibly, receiving little attention when they first begin to appear."

Letter or Sound Changes.—It was shown above, how, when the relationship between the Indo-Germanic languages was first discovered, lists of words were drawn up containing, for the purpose of comparison, the various forms adopted by certain "roots" in the different idioms. A close scrutiny of the corresponding forms led to the important discovery of the regularity of sound-changes. If, for example, one collects all the words that must have contained *p* in the primitive idiom, one will find that this "letter," or better "sound," is almost invariably represented by *f* in the Germanic languages: compare Latin *pater*—English *father*, *nepos*—*nephew*, *pes*—*foot*). In the same way, *b* is represented by *p*, *d*; *g* by *t*, *k*, and a similar regularity is observable among the other consonants as well as among the vowels.

Supported by these and numerous other observations of a similar nature, the philologists of the "seventies" (Leskien, Osthoff, Brugmann and others), arrived at the conclusion that "sound-laws," as they called these regular changes, were like natural laws, and did not admit of exceptions. These "sound-laws," however, are active for a certain period only, and confined to certain geographical areas; when they have run their course they disappear, their places being taken by new tendencies. Thus there was a law in primitive Germanic according to which every original *p*, if preceded by the word-accent, was changed to *f*; compare Aryan *sap-ta*, Anglo-Saxon *seofon*; later on it became the rule for *f* between vowels to turn into *v*, hence modern *seven*.

3. *Analogy* is the third factor in the constant transformation of language; it is sometimes more expressively called "group-influence," and may be described as the influence exercised by the members of one class or association-group of words upon another. The general tendency towards uniformity and the desire to simplify speech is chiefly responsible for analogical changes. Analogy affects both the sounds and the grammatical forms of words. Its most conspicuous results may be observed in the inflections. Thus there were in Old English many nouns which formed their plural in *-n*, e.g. *shoe*, *sun*, *hare*, &c., but only two of them, *oxen*, and the quite irregular *children* remain in modern English. The rest were attracted into the more numerous and powerful *s*-class. Again, *help*, *fare*, *heave*, *carve*, &c., originally formed their past tense and past participle by a change of vowel like *sing*, *sang*, *sung*, &c., but now conform with the majority of English verbs by retaining their vowels and adding *d* (or *t*). Analogical changes are constantly going on, and are particularly frequent in the language of children.

Dialects and Literary Idioms.—The old mistaken notion that dialects are merely debased forms of the standard speech has not yet died out. It is thought that the literary idiom alone can be "right," and that the dialects are "wrong" or "vulgar." However true this may be from a practical point of view, it cannot be

maintained when matters are examined historically. Each dialect is in itself as correct as the standard; it is often purer, because it does not contain so many foreign elements as a literary language is bound to absorb. Every standard idiom was at one time evolved out of a local dialect, and attained its pre-eminent position simply from political or literary, and other external reasons. When a nation achieves unity and a certain degree of civilisation, one of its dialects—often that of the capital, as in England and France—becomes the general means of communication throughout the whole state as the language of the court, the governing classes, religion, and literary endeavour. Such a form of speech, however, never completely severs its connection with the local dialects. The latter constantly exercise a strong influence upon its pronunciation in the various districts where it has penetrated, and enrich its vocabulary with new words and expressions.

Mixing, Borrowing.—Whenever two languages come into close contact, an interchange of forms and words takes place between them. The mode of contact may, of course, differ: it may be either physical or literary. If the former, it may be exercised by individuals travelling—merchants, missionaries, tourists, &c. In this manner, the earliest Latin loan-words in the Germanic languages were introduced by Roman itinerant merchants or by soldiers returning from service with the legions in various parts of the empire. Mixing on a larger scale is often effected by frequent intermarriage between neighbouring races, or between conqueror and conquered. It usually happens that the higher the culture of a people, the fewer words will be borrowed from other tongues. Thus, the Greeks rarely borrowed from Latin, whereas the educated Romans all acquired Greek, but despised all the languages of their other subject races, who in their turn, at least in the West and in Dacia, acquired the idiom of their rulers.

The Anglo-Saxons adopted hardly any words from the language of the Britons, but enriched their vocabulary on a large scale by the introduction of Latin and—after the Conquest—French words. The Normans, after settling in the North of France, speedily abandoned their native Teutonic idiom for the French tongue of their highly civilised subjects and neighbours. Similar conditions prevail in Eastern Europe, where the Slavonic races borrow from the German language, whereas the number of Russian, Polish and Czech words in standard German is extremely small.

A distinction is often made between two kinds of borrowed words: Foreign Words, which are easily recognised as such by their appearance, and Loan Words, which were introduced in earlier stages and completely assimilated. To the former class belong the numerous technical expressions in modern English derived from the Greek or Latin, as well as many words from Indian and African languages, and also names of objects recently introduced from abroad. The latter class is very numerous, and includes such common words as *plum*, *ink*, *chimney*, &c. It happens not infrequently that endings and peculiarities of syntax are borrowed and applied on a large scale. The *-er* of agent nouns, such as *baker*, *miller*, &c., was derived from Latin *-arius* at a very early stage; the diminutive suffix *-kin* is from the Dutch, whereas the use of *of* in *City of London*, *Kingdom of Scotland*, &c., is an imitation of the French usage of *de* in similar combinations.

The Origin of Language.—Speech did not come into existence like a stream rising from a source, nor was it invented like a mechanical apparatus. For it is wrong to assume that man was without language at any period, however remote and primitive. Speech must be explained as born out of man's *psyche*, by a slow and complicated, yet subconscious process. The primary cause of language-making is a desire for communication, the same that gives rise to the calls and warning signals of animals and the song of birds. Just as there are certain "natural" gestures and facial expressions common to all members of a community readily practised and understood by all, so there exist certain "natural" sounds and combinations of sounds used for the purpose of communicating one's sensations and thoughts. These man has in common with many animals. But a great step in advance, which separated human from animal speech, was made when these original and natural tones were conventionalised —when their use and application was extended to objects and actions connected though not identical with the ideas or sensations originally described.

Thus let us imagine, at the risk of being considered trivial, that the exclamation *bah* was used to express contempt. It might then be applied to a contemptible or obnoxious action or person, it might come to mean "to despise," or "to do wrong," or "bad man," "bad action," &c. &c. In short, *bah* would become a root used to form words, both verbs and nouns. Gradually it would, through inevitable phonetic change, lose its original phonetic form, and in its new shape be no longer expressive of the natural emotion of contempt. In short, the "root" would become completely conventionalised, with endless possibilities of change, both in sound and in meaning. Some philologists derive the Old English *feond*, "enemy" (modern English, *fiend*), from a root identical with the interjectional *pah* or *fie* (older *p* appears as *f* in Germanic)—but this is, of course, mere conjecture.

Imitative Words.—Another source of "roots" may be discovered in the habit of imitation: certain sounds are either produced by or regularly associated with certain objects or processes; these sounds are imitated and used to denote the objects or action in question. Words of this kind, usually called *onomatopoeic* (word-making), are constantly being formed; in the language of children they may be found in great numbers, as *bow-bow, puff-puff*, &c. To the most obvious of this class belong *cuckoo, owl* (compare Latin *ululare* "to howl"), *snigger, rustle, hiss, buzz*. Words like Latin *bibere*, which are sometimes described as "symbolical" words—the lip-consonant *b* symbolising the action of the lips when drinking—really form a subsection of the imitative element.

The above contains the present writer's own opinion on the vexed question of language-making. It may be of interest briefly to review the various theories—with their somewhat quaint names—mentioned in the discussion between Max Müller and Whitney.

1. The *bow-wow* theory, according to which the original roots were imitative sounds, so that, *e.g.*, *bow-wow* signified *to bark* or *dog*.

2. The *ding-dong* theory assumes a mysterious harmony between sound and sense. "Everything which is struck rings in a peculiar fashion, *e.g.* gold, silver, stone, &c. Man possessed a creative faculty which gave phonetic expression to each conception as it mystically thrilled through his brain." This faculty no longer exists in civilised man—it was lost when its object was fulfilled. This theory, worthy of the most mystic of German romanticists, was for a long time championed by Max Müller, who, however, abandoned it finally as untenable.

3. The *pooh-pooh* theory derives all words from interjections and ejaculations called forth by intense sensations—pain, pleasure, hunger, &c.

4. The *yo-he-ho* theory was finally adopted by Max Müller, who explained that "under any strong muscular effort—and one might add, intellectual and emotional strain—it is a relief to the system to let breath come out strongly and repeatedly. When primitive acts were performed in common, they would naturally be accompanied by the same sounds, which could easily become associated with the action performed, and serve as a 'root' to denote it." This would mean, that words like *to pull, heave*, and perhaps *swim* and *row*, were among the first to be "invented."

All this is hardly satisfactory; but before leaving this interesting subject, it might be well to quote the words of a more recent scholar, Professor Jesperson, who sums up his treatise on the origin of language as follows: "The genesis of language is not to be sought in the prosaic, but in the poetic side of life; the source of speech is not gloomy seriousness, but merry play and youthful hilarity: in primitive speech, I hear the laughing cries of exultation when lads and lasses vied with one another to attract the attention of the other sex, when everybody sang his merriest and danced his bravest to lure a pair of eyes to throw admiring glances in his direction. Language was born in the courting days of mankind: the first utterances of speech, I fancy to myself, like something between the mighty love lyrics of puss upon the tiles and the melodious songs of the nightingale. . . ."

Families of Speech.—With our present knowledge it is impossible to derive all languages from a common origin. Schleicher divided all known languages into three main classes:

1. *Isolating* languages, whose words express mere isolated ideas and not the relations existing between them. In short, there are no inflections. Chinese and other East Asiatic languages belong here. Compare Chinese *wân paó mîn*, "the king protects the people," with *mîn paó*, "the people is being protected."

2. *Agglutinative* languages, which express the relations by means of suffixes, prefixes, and infixes added to the simple roots. The Magyar, Finnish, Malay, and Bantu languages are said to belong here.

3. *Inflective* languages combine with the use of pre- and suffixes variation of the vowel of the root, for, according to Schleicher, "the essence of inflection is to be found in the differentiation of vowels." The Indo-Germanic and Semitic languages come under this heading. The change in the vowel of the root (compare *col-d-cool, sing-sang-sung*) is often called "gradation" (German *ablaut*), and must be explained not as due to a desire for a differentiation of meaning as Schleicher thought, but as the mere effect of a change of accent in the primitive language.

Schleicher's classification was generally accepted at the time, and still lingers in text-books of a semi-scientific character. But it is open to grave objections. Classes 2 and 3 do not differ in essentials, as the variation in vowels is not intentional but based on mechanical reasons of a purely phonetic kind. Further, it is wrong to say that in Class 1 the relations between the words are not expressed—because this is achieved by varying the position of words or the pitch of the vowels. The chief error committed by Schleicher and his school was that they confined their observations to the written form of language instead of investigating the living, spoken word. Had they done this, they would have discovered, for instance, that modern English exhibits characteristics belonging to all three classes: some words never change by taking endings, although they fulfil many functions, as *must, can;* others do take endings but never change the root-vowels, as

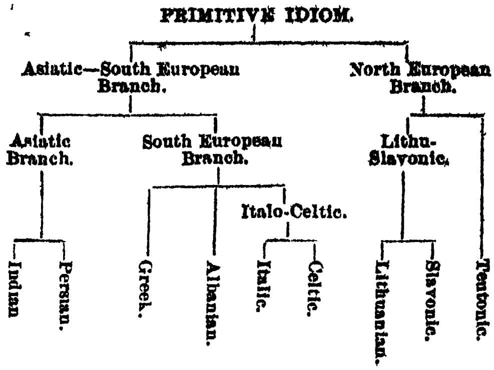
cat, plural *cats*; *ox*, *oxen*; *live*, *lived*; others both take endings and change the vowel, as *sings*, *sang*, &c.

Geographical and Ethnographical Families.—Schleicher's scheme was based on purely abstract considerations, and does not work in the application. The safest, if more elaborate method is to classify languages according to geographical and ethnographical families, by grouping together all those dialects that are demonstrably related to each other. On this basis, thirteen main types must be distinguished, each of which—so far as is known at present—may have had a separate and independent origin. Subjoined is a list of the thirteen families:

1. The Indo-European Family.
2. The Semitic Family.
3. The Hamitic Family.
4. The Monosyllabic or South-Eastern Asiatic Family.
5. The Ural-Altaic Family.
6. Dravidian or Southern Indian.
7. Malay and Polynesian.
8. Other Oceanic Families.
9. Caucasian Languages.
10. Remnants of Languages in Europe (Basque, &c.).
11. South African or Bantu.
12. Central African.
13. Native American Languages.

The Indo-European Family.—This is the most important, seeing that the chief representatives of modern civilisation are among its members. It should, however, always be borne in mind that an agreement in language does not necessarily imply a common racial origin. The Bulgarians, *e.g.* now speak a Slavonic language; but ethnologically they belong to the Ural-Altaic race—of which the Turks form part—having adopted the idiom of the Slavs, whom they conquered and absorbed at a remote period. We are here concerned with linguistic matters only.

Some of the Indo-European languages are more closely related to each other than to the rest. Thus a strong resemblance exists between the Persian (Iranian) and Old Indian (Aryan, Sanskrit) tongues; the Slavonic dialects have many peculiarities in common with the now moribund Lithuanian idiom; the Germanic branch agrees with the Slavonic in some points, with the Celtic in others, &c. &c. It would, therefore, be wrong to describe all these branches as the "daughters" of the primitive idiom. Schleicher attempted to explain the above-mentioned facts by drawing up a pedigree in which all the descendants of the primitive parent idiom are entered. He represented the latter as splitting up into two main dialects, which in turn break up again and again, a process that is still constantly going on. The subjoined table will speak for itself:



This classification was, for a long time, accepted as final. It can, however, not stand, as it fails to explain many agreements existing between remote branches of the pedigree. The Lithu-Slavonic idiom, for example, agrees with the Asiatic branch in the treatment of original *k*, which is changed to *s* or *ç* in both, whereas the other dialects retain the primitive sound in their older forms. It is wrong to imagine that languages, once they have separated from the common stock, develop, as it were, in water-tight compartments. Neighbouring idioms will always influence each other. The difficulty is overcome by rejecting the pedigree arrangement and adopting Schuchardt's and J. Schmidt's theory, according to which sound-changes travel from a certain point of inception in all directions, like a wave caused by a stone falling into the water, growing fainter and fainter in their effects until movement ceases altogether ("the Wave Theory"). The above-named scholars arrange the various branches in a "geographical" table, and thus are able to account for the agreements and differences in a more satisfactory manner. The Indo-European main idioms are distributed as follows:

Teutonic.
Celtic. Lithu-Slavonic.
Armenian. Persian.
Italic. Greek. Indian.

The most important among the Western dialects of the Indo-European languages are the Teutonic (or Germanic), the Romance (or Latin), and the Slavonic. The Celtic idioms, Irish, Welsh, and Gaelic, are leading but a precarious existence, the Lithuanian idiom is negligible, and modern Greek possesses little importance.[1] The Slavonic languages of the present day form three main groups: (1) Eastern (Russian); (2) Western (Polish, Wendish in Lusatia), Czech or Bohemian proper, Slovakish in Northern Hungary; (3) Southern (Slovenish in Western

[1] European languages that do not belong to the Indo-European group are the Magyar (or Hungarian proper), the Finnish and Turkish idioms which form part of the Ural-Altaic family, and the isolated, mysterious Basque tongue.

Hungary, Servo-Croatian, Bulgarian). The Southern Slav dialects are cut off from the main body by the Germans of Austria and the Magyars of Hungary—both occupying old Slavonic territory and largely mixed with Slavonic blood—and by the Roumanians on the Lower Danube. The latter are the descendants of the old Dacians, who accepted and modified the language of their Roman rulers. The Slavonic races are slowly emerging from a state of semi-barbarism, and the study of their languages is consequently receiving the attention of scholars and others more than has hitherto been the case. They are generally considered extremely complicated and difficult to acquire, and the most important among them (Russian) is written in a peculiar alphabet calculated to repel learners at the very outset.

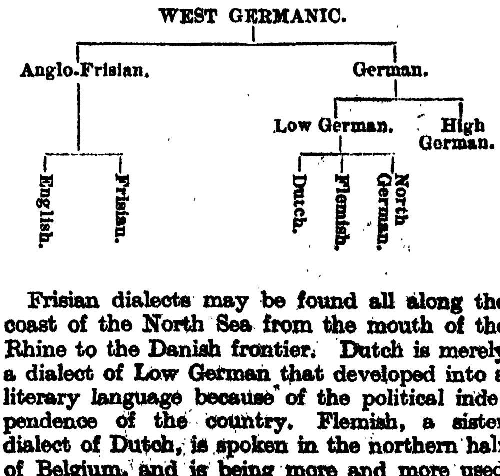
The *Romance languages* are descended from the old Roman or Latin tongue. They do not, however, spring from the highly polished and rather artificial idiom of the classic authors but from the so-called Low or Vulgar (better, Spoken) Latin of daily intercourse. There are found at the present day—proceeding from East to West—the following eight distinct idioms: (1) Roumanian, (2) Sardinian, (3) Italian, (4) Raeto-Roumanian (spoken among the mountains near the source of the Rhine in Switzerland), (5) French, (6) Provençal, (7) Spanish, (8) Portuguese. The ancestor of all these idioms—the spoken language of the Romans at the time of Augustus—was fairly uniform throughout the empire. How are we then to explain the existence of the present variety of the Romance tongues? The differences arose from two main reasons: (*a*) The Roman language was introduced into the various provinces at different periods and consequently at different stages of its development. (*b*) The pre-Roman populations modified the newly-received tongue each in a manner peculiar to its own character.

They also retained words from their old speech, though there are remarkably few of these. The sound-changes which transformed the Roman language into the various dialects were numerous and far reaching; they were carried out with complete regularity, but differed, of course, in the various provinces. In the later, or mediæval stage, most of the Romance idioms enriched their vocabularies by borrowing from other languages, notably from German. Spanish and Portuguese also introduced a considerable number of Arabic words during the Moorish occupation of the Peninsula, whereas Roumanian has absorbed numerous words derived from the surrounding Balkan languages. The Romance idioms transported across the Atlantic—American Spanish, Brazilian Portuguese, and Canadian French—bear no proved traces of influence from the native languages. All Romance dialects, and French in particular, contain a considerable amount of "learned" words borrowed at various times of the mediæval and modern periods from the classical Latin of the great writers. These learned words are distinguished by being less changed in appearance, as they were not subjected to all the numerous sound-changes which had been in operation previous to their introduction.

The Teutonic Branch is usually divided into three sub-dialects: (1) North Germanic or Scandinavian; (2) East Germanic or Gothic; (3) West Germanic. The first group split up into two sections at an early period: (*a*) West Scandinavian, comprising Icelandic and Norwegian; and (*b*) East Scandinavian, comprising Swedish and Danish. Of these four idioms, Norwegian has become almost extinct. Down to about a hundred years ago, Norway was ruled by Denmark, and the language of the dominant race was adopted by the bulk of the Norwegian people. The old native idiom is still spoken among the peasantry, and strenuous efforts are being made by a certain section of the people to restore it to its former position; but their ultimate success seems very doubtful.

East Germanic is the name given to the once powerful but now extinct races of the Austrogoths and Visigoths, the Vandals, Burgundians, and other tribes that perished in various parts of the Roman empire during the migration period.

The West Germanic branch is divided as set forth in the subjoined table:



Frisian dialects may be found all along the coast of the North Sea from the mouth of the Rhine to the Danish frontier. Dutch is merely a dialect of Low German that developed into a literary language because of the political independence of the country. Flemish, a sister dialect of Dutch, is spoken in the northern half of Belgium, and is being more and more used in literature instead of the imported French tongue. The fundamental difference between the High and Low German dialects is set forth in another section (GERMAN LANGUAGE, p. 304).

Before the primitive Germanic idiom split up into its three main dialect-groups, its con-

sonants underwent a radical change which is popularly called "Grimm's Law," but for which a much better name is "the first shifting of consonants." This shifting thoroughly differentiated the Germanic branch from the rest of the Indo-European languages. We can here furnish only a very brief outline of this important "law," formulated by Grimm in 1822 and emended by Verner in 1875.

First Series of Changes: *p, t, k* become *f, th, h*; Latin *piscis*, "fish"; *tu*, "thou"; *cor(d)*, "heart."

Second Series: *bh, dh, gh* become the corresponding voiced spirants whose subsequent history in the various dialects is too complicated to be treated here.

Third Series: *b, d, g* become *p, t, k*; Latin *labium*, "lip"; *edere*, "eat"; *genu*, "knee."

Grimm's Law describes only part of the numerous and highly complicated sound-changes that took place in the transition from Indo-European to Germanic. The number of sound-changes in the various languages and their dialects is extremely large, and can only be mastered after prolonged study.

COURSE OF READING

There exist very few books in the English language on the philology of the Indo-European languages, and the serious student of the subject will soon find that a knowledge of German is absolutely necessary for his work.

The general principles of linguistic science are admirably set forth by Jesperson in his little book called *Progress in Language*; see also the same writer's *Growth and Structure of the English Language*. Wyld's *Study of the Mother Tongue* contains chapters on general principles; the same applies to Sweet's *New English Grammar, Logical and Historical*.

The basis of all language study is Phonetics, the science of speech-sounds, for it should always be borne in mind that the spoken word matters much more than the written forms. Sweet's *Primer of Phonetics* may serve as an introduction into that science.

The best *brief* accounts of the various languages and their history will be found in the *Encyclopædia Britannica*. The Indo-European languages are exhaustively treated in Brugmann and Delbrück's *Grundriss der Vergleichenden Grammatik*; there is an English version of the first two volumes of the former edition. The Germanic languages are dealt with by various scholars in Paul's *Grundriss der germanischen Philologie*, vol. i.; the Romance languages in Meyer-Lübke's *Grammatik der romanischen Sprachen*.

A special branch of philology is the study of place-names. Most books on this subject are, however, totally untrustworthy guides. Taylor's *Words and Places* (Everyman's Library) forms interesting reading, but should be used with caution. An excellent introduction to this subject will be found in Wyld's *Place-Names of Lancashire*, and a shorter dissertation is contained in Mutschmann's *Place-Names of Nottinghamshire*. Weekley's *Romance of Names* deals with English surnames in a thoroughly sound yet entertaining manner.

H. Mutschmann, Ph.D.

THE ENGLISH LANGUAGE

HISTORY

PHILOLOGY tells us that the Indo-European or Aryan family of languages embraces Sanskrit, Persic, Greek, Latin, Teutonic, Celtic, and Slavonic. Aryan divides naturally into North Aryan (the Teutonic languages) and South Aryan (the classical languages).

Teutonic is divided into East Teutonic (Gothic and Scandian) and West Teutonic (Old Saxon, Dutch, Flemish, Frisian, English, High German). Hence we shall expect to find that English resembles German, Dutch, Old Saxon, Frisian, Flemish. And, since the common ancestor is Aryan, there may be a resemblance between English and—say—Latin. Compare Lat. *pater* with Eng. *father;* the only difference is that Lat. *p* becomes Eng. *f* and Lat. *t* Eng. *th* or *d* (O. E. *faeder*). So in Lat. *ventus* and Eng. *wind.* Lat. *v* = Eng. *w*, and, as in *faeder*, Lat. *t* = Eng. *d*, These changes of consonants are followed carefully in Grimm's Law and in Verner's Law.

English vowels also show relationship with Latin and Greek vowels. Lat *ā* (*māter*) becomes Eng. *ō* (O. E. *mōdor*): Lat. *ŏ* (*hortus, octo, nox*) becomes Eng. *ă* (*garden, ahtan* = *eight, naht* = *night*).

From these instances we can gather that North Aryan and South Aryan developed each on its own lines. Not only consonants and vowels were changed; meaning changed also. Aryan *sec* meant *follow:* from this Latin took *sequor,* I follow; but Teutonic specialised the word, and O. E. *seon* came to mean *follow with the eyes,* i.e. *see.* Thus, in *Beowulf, gang seon* means *go follow.* Again, Aryan *emuar,* to die, gave Lat. *morior,* I die; but Teutonic specialised it as *secret death by violence,* hence O. E. *morth* means *murder.* Yet the connection with Aryan *emuar* is often kept, and O. E. *morth* sometimes means *death.*

English is a descendant of Aryan, but it is a brother to other West Teutonic languages—German, Dutch, Flemish, Old Saxon, Frisian, and a cousin to the East Teutonic languages—Gothic and Scandian. The oldest piece of Teutonic prose is a version of the Scriptures in Gothic, a translation by Wulfila, who lived in the fourth century. In this we find Gothic words that differ but slightly from their equivalents in English, Old Saxon, Icelandic, German. The similarity between English and Frisian in phonology has led authorities to suppose that there was an intermediate stage of Anglo-Frisian.

Thus we see that English orignally came from a Teutonic stock. The Jutes, Angles, Saxons, and very probably the Frisians, when they invaded Britain, brought with them that part of the West Teutonic language which is termed Anglo-Saxon, or better, Old English. The language of the Britons was Celtic, but owing to the long sojourn of the Romans in Britain, the townsfolk probably spoke Latin.

Celtic Influence.—Why is it that Celtic did not influence the language of the Saxon conquerors? To-day there are only about a dozen Celtic words that were in all likelihood borrowed by the Anglo-Saxons, and the whole dozen can be challenged. The reason is that the invaders drove the Britons before them to the mountains of Wales and the Highlands and Islands of Scotland. The English word *Welsh* meant a *foreigner.* When a conquering army settles in a country the language of the conquerors is never mixed, but if the native language survives it is mixed. Englishmen had no inducement to learn the Celtic speech, but the Celts who remained as slaves or servants would gradually learn English. Words in Celtic and English may have been borrowed from Latin. Most Celtic words were borrowed late. *Pibroch* came from O. E. *pipe.* The Celts borrowed *pipe* and *piper,* and gave them a Celtic spelling; thus *piping* became *piobaireachd,* and English took the word back again with its Celtic spelling. *Brose* is simply the plural of *broth,* a Teutonic word.

The Britons were Christians, and after the English invasion we find Irish missionaries preaching to the conquerors. Any genuine early Celtic loan-words must have come through these missionaries—*e.g. dry,* a wizard; *bratt,* a cloak, then a pinafore (hence *brat,* a child); *luh,* a loch.

Early Borrowing from Latin.—It is difficult to tell what words the invaders took from the Latin spoken in the British towns. It has been said that the English borrowed the Lat. *strata* and called it *stræt* (street), but when we find Old Saxon *strāta,* Frisian *strēte,* Old High German *strāza,* we conclude that the English borrowed *strata* before they invaded Britain. Such words are known as "pre-Conquest loan-words" (note that this refers to the Anglo-Saxon Conquest of 449, not to the Norman Conquest of 1066), and among the list are *port* (Lat. *porta*), *pound* (O. E. *pund* from Lat. *pondo*), *mint* (O. E.

mynet, a coin, from Lat. *moneta*), *wine* (O. E. *win*, from Lat. *vinum*), *village* (O. E. *wic*, from Lat. *vicus*), *kitchen* (O. E. *cycen*, from Lat. *coquo*, I cook).

The Characteristics of Old English.—Old English is a simple language that gives the necessary words of life: it is easily pronounced and mostly monosyllabic. It has no abstractions, it deals with elemental concrete facts: *e.g.* relationship—*sweor*, father-in-law; *modor*, mother; *sweoster*, sister; parts of body—*eaxl*, shoulder, *fel*, skin (hence our *film*): natural history—*feoh*, cattle (cattle were used in exchange, hence our word *fee*); *sceap*, sheep; *vulf*, wolf; *boc*, beech: miscellaneous words—*etan*, to eat; *freond*, friend (from O. E. *freogan*, to love): words from Aryan gods—*Tuesday*, from the god *Tew*.

It will be seen from these examples that the O. E. vocabulary had words for obvious facts of environment; there is nothing to suggest mental or moral ideas.

Side by side with these common words we find a poetical vocabulary composed of stereotyped epic words. Teutonic poetry arose in the composition of spells, riddles, and songs. Later these were expanded into popular lays. There was no individuality in these lays: they were folklore, composed and recited by the community. We have an Old Saxon epic that uses the same phrases as the English *Beowulf*.

The old Norse sagas are lyrical; the artist procures effect by being brief and original. The Teutonic epic is entirely different. Instead of brevity, it has long tiresome descriptions; its method of emphasis is by variation. Instead of saying a thing sharply, it says it twice or thrice; in *Beowulf* we have—*They heard the sound of the horn; the horn sounded.* At one place *There they two were swimming* is repeated in different phrases five times.

The Teutonic epic came to be recited by a minstrel, and, no doubt, when he forgot a line he would mark time by repeating some tag. *Beowulf* is full of these tags or "kennings." They are generally alliterative, and mean nothing. When in *Beowulf* we read "I know not," it means nothing. Indeed many kennings, if taken as part of the story, would reduce the context to absurdity. King Hrothgar can do nothing to ward off the monster Grendel, yet he is called "the protector of Danes." Hrothgar, after visiting Grendel's den, says, "I know not where it is."

The wealth of variation in Teutonic epic is seen in many words for one object. For *sea*, we find *waeter*, *flôd*, *lagu*, *stream*, *sæ*, *geofon* (ocean), *waeter-stream*, *sæ-flod*, *swan-rad* (swan's path), *fisces bæth* (fish's bath), and many others. A civilisation that could describe the sea as "the swan's path" had some glimmerings of the picturesque.

Latin Influence.—We have seen that the English had Latin words before they left their continental home. The Romans left a few place-names, *e.g.* *-caster*, *-chester*, *-colonia* (the *coln* in *Lincoln*), and the English allowed these to stand. It was Christianity that brought Latin to England. Christianity came with the prestige of Roman greatness, and as a part of Roman culture. What appealed to the English was the tradition of a secular empire that the Roman missionaries brought with them. Religion to Teutonic civilisation meant politics. There was no spiritual conversion: the English simply added God to their other deities. They thought of God as a Teutonic chief, Christ as a great warrior; the Twelve Apostles as thegns; and Satan was the greatest warrior of all. We must not therefore expect to find words with any spiritual meaning.

The real influence of Christianity dates from 800, when the Church took education into its hands. The actual number of Latin words borrowed at this time was not large; the English preferred to find native equivalents for Latin religious terms. The word *archangel* means "high angel": the English had *heah* (high), and they invented the word *heahengel*. A *disciple* was a *leorning-cniht*, *Exodus* was *ût-færeld* (the out journey), a *centurion* was a *hundred man*, a *miracle* was a *wunder*, a *hermit* was a *wēsten-setla* (a dweller in the desert, *westen*), a *Pharisee* was a *sundor-halga* (a separate holy man), *music* was *swinsung-cræft* (song craft), *medicine* was *læce-cræft* (leech craft). These examples show that the English were timid of foreign words.

Scandinavian Influence.—About the end of the eighth century the Northmen began to raid the coasts of Britain. Gradually marauding bands began to settle in the North-East, and this settlement is known as the Danish Invasion. English at this time had various dialects, and naturally these of the North and East were most influenced by the Danish tongue.

The dialect of Wessex (King Alfred's dialect) remained unchanged: the dialects of Mercia and Northumbria became Anglo-Danish. The important thing to notice is that the literary language—the Wessex dialect—was outside the area of Danish influence. It must also be remembered that the language of the Northmen was a Teutonic language, and it had much in common with English. It is very probable that a Northman and an Englishman were mutually intelligible in conversation.

The Northmen were heathens; their civilisation was at a stage similar to that of the English when they invaded Britain in 449. Hence we do not expect words denoting culture; any Danish words introduced were democratic.

The Danes came as a hostile army, burning churches and books; wherever they settled, literature died. Consequently O. E. borrowings are few in number. It was only after slow

amalgamation that Danish appeared in any force. Scandian terms in Old English are different from those after 1200. Early loan-words were connected with the invaders' life, *e.g. cnearr* and *scegth* (names for ship), *hūs-carl* (a body guard). Most of the early borrowings died; English had quite enough terms for *ship* already.

The rule of the Danish kings brought new terms in law, &c. Law terms are *lagu* (law), *sacleas* (innocent), *hūsting* (meeting), *bryd-lōp* (marriage); war gave us *fylcian* (to arrange troops), *orrest* (battle); social caste introduced *eorl* (earl), *hus-bonda* (householder). Other words are *thriding* (third part: *cf.* the Yorkshire *Ridings*), *ceallian* (to call: O. E. word was *clipian*), *fellow* (O. E. *feoh*, cattle, and then money, and Scandian *lagu*, law). We have verbs like *hit, take, scream, skulk, scrub.* From Scandian come *they, their, them, hence, thence, whence.*

In many cases the O. E. form is retained in the literary language, and the Danish form survives in dialect. We have *true* and *trigg* (tidy), *church* and *kirk*, *chest* and *cist*, *leap* and *loup*. *Till*, instead of the preposition *to*, is a Danish survival in Scotland, and the termination *by*, seen in Whitby, is Danish also.

It is sometimes held that Danish was the cause of the Northern English dialects dropping their inflexions or terminations. No doubt the invaders, when they used an English word, would seize the stem and ignore the inflection. But the English dialects were shedding their inflexions long before the Danish Invasion. All we can say is that the Danish helped the process of dissolution.

There are certain tests for Danish words in English. In East Teutonic (Gothic and Scandian) these combinations of vowels *iew, aew, uw* are represented with hard *g*, while West Teutonic has *w*. Hence if we find a word like *trigg* in Middle English, where Old English has *treowe* (true), we conclude *trigg* is a Danish borrowing. In Scotland we have *big* (to *build* a house; the O. E. word was *buan*, to dwell). Other tests are the change of *ea* into *ou* (*leap* and *loup*); the Danish *sk* (*skill, bask, skulk*); the Danish ending *le* (*dazzle*).

It will be seen that the language of the Northmen had comparatively little effect on English. The law terms fell into disuse when the Normans brought over new law terms; the naval and military words already had English equivalents which they did not supersede. English did with Danish what it did with Latin—it translated it into English.

Middle English.—Middle English is the name given to the language of the twelfth to the fifteenth century. By the year 1500 modern English was in use. From 1100 to 1200 MSS. were written by scribes from many districts, and there is therefore much variation of dialect. After 1200 one dialect—Middle English—is the standard literary language. Between 1300 and 1500 the Northern dialect develops in its own way, and becomes Middle Scots. The southern dialects fall into decay and become non-literary. Language before 1100 is practically stationary so far as internal development is concerned; it is almost insusceptible to foreign influence. Latin words were translated into English; the Danes brought a few technical terms, and later influenced the literature of the north. In 1100 the language was but little in advance of the language of 500: it still depended on Teutonic material; it had the old grammar and structure.

Evolution of English did not begin until Norman influence was introduced; the Normans brought European culture to a race that had been cut off from intercourse with the Continent.

French Influence.—The Normans brought with them the Norman-French language. Although the Normans were Teutons, their tongue was a Romance tongue; it was a derivative of Latin. At the beginning of the tenth century Rollo, a Northman, settled on the coast of France and received territory from the French king. But in a hundred years the Northmen or Normans had adopted the language of the conquered Franks. This circumstance enables us to understand why Norman-French did not kill English as English had killed Celtic.

The Normans brought feudalism to England; before their coming, the idea of a vassal holding land in exchange for service to a lord was unknown. The Norman knight continued to speak Norman-French, which became the language of the court. In the course of time, Normans and English intermarried, and the distinction of race was lost, but the distinction of class survived. French thus became the mark of an aristocrat. Thus we find that Romance words introduced refer to the court, the military, the chase, and other aristocratic institutions. Thus we find the following Romance words introduced. From government: *crown, state, govern, government, sovereign, reign, chancellor, exchequer, people, nation.* From feudalism: *baron, duchess, vassal, peer, prince, heraldry, honour, glory, court.* From law: *judge, justice, jury, cause, summon, plea, defendant, crime, accuse, traitor, injury, penalty, property, heritage, damage, privilege, tenure.* From war: *army* (which did not displace O. E. *fyrd* and *here* for centuries), *war, battle, arms, armour, assault, banner, lance, officer, colonel, captain, lieutenant, sergeant, soldier, navy, admiral* (from Arabic *amiral*), *vessel, enemy, company, guard* (French had no *w*, hence English *w* became *gu*; Eng. *ward*=Fr. *guard*). From the Church: *clergy, sacrifice, pray, preach, sermon, service, trinity* (O. E. had *thrines*), *angel, virgin, saviour, saint, parish, miracle, feast, lesson, rule, tempt.* The Church also introduced words denoting moral

idea: *charity, chaste, grace, duty, pity, discipline, mercy.*

Norman-French.—The Normans brought in many words that pertained to their superior social status, *e.g. master, mistress, sir, madam, obey, command, rich, riches, poor, rent, money.* Their table habits are shown in *dinner, supper, toast, roast, jelly, dainty, soup, sausage, pastry.* The chase brought *scent, falcon, warren, quarry, leash, brace;* dress accounted for words like *costume, garment, apparel, tailor;* card-games gave *ace, trump, partner, cards, dice.* In French also were such words as *painter, carpenter, joiner, butcher, mason, table, chair, ornament, palace, manor, castle, mansion, choir, aisle, image, pillar, arch, colour, art, beauty.*

All these words suggest a culture superior to English culture. Many English words began to find French equivalents, but the foreign word did not mean quite the same as the native word. The native word is always more homely: *love* is nearer the human heart than *charity, amity* is colder than *friendship, lonely* is infinitely more expressive than *solitary.*

Normandy was lost to England in 1204, and after that date Englishmen began to study Parisian French. Norman-French was harder than Parisian French; the hard *c* in *carrion* or *caitiff* is Norman, but the *ch* in *church* and *chance* is Parisian.

We have thus two stages of French influence. Norman-French came first; it was the language of the court and the law; it was taught in schools. Then Parisian French became a cult in England; it was the language of French literature and the French court.

Speaking generally, French words were naturalised or rather Anglicised. The English had no compunction in taking a French word and tacking an English prefix or affix on to it. English were the terminations *-ly -ful, -less, -ness, -dom, -ship; court, beauty, art, dainty, duke, court* were French, but the English genius at once combined French and English and wrote *courtly, beautiful, artless, daintiness, dukedom, courtship.*

The terminations *-ry, -age, -ess, -ment* are French: the words *bake, mile, shepherd, endear* are English, but English stem was combined with French suffix to give *bakery, mileage, shepherdess, endearment.*

Many of the above are early formations, and the system of forming hybrids has obtained down to the present day. A familiar hybrid is the ending *ee* (from French *-é*); to-day we write *nominee, employee, trustee, devotee.*

The coming of French destroyed the ascendancy of the West Saxon dialect, and Middle English (the language of Chaucer) became the standard literary language.

Old and Middle English: *the Transition.*—From 1100 to 1250 the language is irregular in dialect and rate of change. The irregularity is partly due to the different degrees of emancipation from Old English. The North experiments more than the South; the Danish influence was felt most in the North, while the later French influence affected the South and Midlands most.

Middle English is the transition period between Old English and Modern English, and to understand it we must realise wherein Old differs from Modern English. Old English is a language of inflexions or case terminations. Latin is a language of inflexions. The Latin word *amabo* means *I will love:* thus where the Romans used one word we used three. When the Romans wanted to say *They will love,* they kept the stem *amab-* but changed the termination *-o* into *-unt,*—*amabunt.* Old English, like Latin, changed its endings to express different cases; *e.g.* O. E. *scop,* a poet (literally a *shaper* of verses) had genitive *scopes,* of a poet. *The song of the poet* or the *poet's song* was *scopes sang.* Where we say *of the poet* (three words), Old English said *scopes* (one word). But we retain this old genitive as a possessive case; when we write *the poet's song,* the apostrophe before the *s* shows that a letter has been omitted; this letter is the *e* of the old genitive *-es.*

We see that Modern English has lost its inflections. Dr. Sweet recognises three periods: the Old English period of full inflexions down to 1200; the Middle English period of levelled inflexions, from 1200 to 1500; Modern English period of lost inflexions, 1500 onwards.

Auxiliary words like *am, is, be, will, shall, would, do, can, must,* took the place of inflexions. The history of English is one of the widest freedom. We have forgotten origins: the *'s* is used where it cannot possibly have any direct relationship to the O. E. genitive *-es.* Thus we speak of *Alexander the Great's wars,* or even *the man that broke the bank's flight.*

The transition from Old to Middle English is evident by 1100: by that time the noun had a single form for all plural cases, and only two forms for singular cases; the verb also had reduced the number of its personal endings. By the fourteenth century the present plural of the verb *hope* was:—

Northern	*Midland*	*Southern*
We hopës	We hopen	We hopeth
You hopës	You hopen	You hopeth
They hopës	They hopen	They hopeth

We find a change in vowel notation. The O. E. *u* sometimes becomes *o* (O. E. *sunne*=M. E. *sonne*); O. E. *y* becomes *u* (O. E. *wyrcen*=M. E. *wurchan*); O. E. *u* becomes *ou* or *ow* (O. E. *scuras*=M. E. *schowres*=Mod. E. *showers*); O. E. hard *c* becomes *ch* (O. E. *circe*=Mod. E. *church*); O. E. *cg* becomes *gg* (O. E. *brycg*=M. E. *brygge*); O. E. *g* is softened into *y* (O. E. *geonge*=M. E. *yonge*=Mod. E. *young*); *a* becomes *e* (O. E. *beran*=M. E. *beren*=Mod. E.

to bear). The letter *e* began to be used for *u* and even for *an*; O. E. *nama* becomes *name*, *sunu* becomes *sune* (son), *withutan* becomes *withute*. Long *ā* in O. E. *stan* became *o*, *e.g.* *stone*, but was preserved in the North, *e.g.* Scot. *stane*.

The O. E. plural *-en* began to be superseded by *-es*; thus *housen* became *houses*. The old plural still exists in the Scottish *e'en*=*eyen* (the O. E. plural of *eye*), in *oxen*, and in *children*, *brethren*, &c.

A peculiar result of the Norman-French influence was the treatment of the guttural *gh*. *Night* in the Old English was *niht*, pronounced like the Scottish *nicht*. The *g* was introduced, no doubt to help the Normans to pronounce the *h*, for no Frenchman can pronounce a guttural. The *gh* was and is ignored by the Englishman; it is physically impossible for him to pronounce it. Hence we find English tourists in Scotland calling *Brechin*, *Breckin*, or *Auchtermuchty*, *Awtermawty*. The avoidance of the guttural *gh* is seen in the English pronunciation of *cough* ("coff"), *trough* ("troff," but Scot. "troch"), *enough* ("enuff," but Scot. "eneuh"), *rough* ("ruff," but Scot. "roch"), *dough* ("doe"), *sought* ("sot," but Scot. "soht"). Compare also Eng. *daughter* and Scot. *dochter*; Eng. *laugh* ("laff") and Scot. *leuch*; Eng. *night* and Scot. *nicht*. English has always avoided hard *g*; O. E. *fugol* became *fowl*, O. E. *dæg* became *day*, O. E. *hagol* became *hail*.

The Order of Words or Syntax.—If we translate word for word a passage of Old English, we find that the order of words is strange to us. The first lines of the *Beowulf* translated word by word runs thus: *Lo! we of the Danish kings in former days the glory have heard, how these æthelings valour showed.* We observe that the verb is placed at the end of a sentence, as it is in German. An inflected language does not depend on position; *Cæsar vidit legionem* means the same as *Cæsar legionem vidit*. We know that *legionem* (legion) is the object of the sentence, because it is in the accusative case. The order does not affect the meaning. Now take an English sentence; *James struck the horse*, and change the order to *The horse struck James*. Obviously in English a change of order involves a change of meaning. Old English itself kept a more or less fixed order, and the decay of inflexions in Middle English made a fixed order essential.

Chaucer.—A study of Chaucer's vocabulary will show all the changes noted above. Take the prologue to the *Canterbury Tales*.

Whan that | April | le with | his schow | res
swoote
The droght | of Marche | hath per | ced to | the
roote
And bath | ed ev | ery veyne | in swich | licour,
Of which | vertu | engen | dred is | the flour;
Whan Ze | phirus | eek with | his swe | te
breethe
Enspir | ed hath | in ev | ery holte | and heethe
The ten | dre crop | pes, and | the yon | ge
sonne
Hath in | the Ram | his half | e cours | i-
ronne, &c.

The most noticeable feature here is the prevalence of the final *-e*, but it is not always sounded. For example, if *Marche* (line two) is pronounced *March* the line scans well, but unless *swete* (line five) is pronounced in two syllables the line is not scanable. The loss of final *-e* in English may be partly due to the English habit of throwing the accent of a word back to the first syllable. In Aryan the accent was free, and it changed with each inflexion moving one step further down the road. Greek and Latin kept the Aryan system, and in our classical borrowings we find the moving accent, *e.g.*

fámily, famíliar, familiárity.
phótograph, photógraphy, photográphic.

English words did not move the accent, *e.g.*

lóve, lóving, lóvingly.
kínd, kíndness, kíndliness.

Naturally when the stem part of a word was accented in conversation, the ending would tend to tail off in a slovenly fashion.

Chaucer uses both methods; he will give to *Náture* the accent *Natúre* after the Latin-French manner. We have divided the above passage into feet in order to show how many words, now of one syllable, were dissyllabic then—*crop-pes*, *yon-ge*, *Ap-ril-le* (three syllables), *schow-res*.

In the sounds of words we notice a change. The *sc* of O. E. *scūras* has become the softened *sch* of M. E. *schowres*; O. E. *swōte* has become M. E. *swoote*; M. E. *drough* has lost the hard *g* sound of O. E. *drugoth*; O. E. *rote* has become M. E. *roote*; M. E. *swich* and *which* replace O. E. *swilc* and *whilc*; O. E. *geong* is M. E. *yonge*, another instance of softened *g*; M. E. *sonne* replaces O. E. *sunne*.

The French influence is clearly shown in the word *perced* (O. E. was *thyrlian*, to pierce, hence *nostril*=*nose thyrl*=*nose hole*), *veyne*, *licour*, *flour*, *engendred*, *enspired*, *tender*, *vertu*, *cours*.

The order of words cannot be accurately judged by reference to poetry; Chaucer (in line 8) puts *i-ronne* (run) at the end, but the position is surely selected to meet the exigencies of rhyme.

A quotation from Sir John Maundeville (1322–1388) will show the new order of words.

And some men clepen it Ganges; for a Kyng that was in Ynde, that highte Gangeres, and that it ran thorge out his Lond. And that Water is in sum place clere, and in sum place trouble; in sum place hoot, and in sum place cole. The seconde Ryvere is clept Nilus or Gyson: for it is

alle weye trouble: and Gyson, in the langage of Ethiope, is to seye trouble; and in the langage of Egipt also. The thridde Ryvere, that is clept Tigris, is as moche for to saye as faste rennynge; for he rennethe more faste than ony of the tother (from Galton's *English Prose*).

Here we are far from modern idiom, but we are also far from O. E. arrangement. This passage shows wonderfully little French influence; *clepen* (O. E. *clipian*, to call), *highte* (=called) *Kyng*, *hat* (O. E. *hat*) *water*, *cole* (cool), *faste*, *rennynge* (=running), *thridde* (=third), are all native words. *Clere* is from Old Fr. *cler*, from Lat. *clarus*; *trouble* is from Fr. *troubler*, from Lat. *turba*, a crowd; *second* is from Fr. *seconder*, from Lat. *secundus*; *ryvere* is from Fr. *riviere*, from Lat. *riparius*; *langage* is a French word from Lat. *lingua*. The *u* of *language* was inserted later, no doubt, to connect *langage* with *lingua*. In the Middle English period *u* was often inserted in imitation of French spelling; thus we find *kingue*, *finguer*, *guest*, *tongue*, and the *u* has survived in *guest* and *tongue*.

The last word of the quotation—*tother*—is interesting. In Scotland we still hear *the teen and the tother* for *that one and that other*. We have reverted to the O. E. *other*, but some words remain corrupted. *Apron* was originally *napron*; the confusion grew out of the phrase *a napron*.

Nickname was *an ekename* in Middle English; *adder* was *nædre* in Old English; *umpire* was originally *numpire*, from Fr. *nonper*, not equal.

Thridde is from O. E. *thridda*, three; in words of this kind *r* and *i* were easily interchangeable; thus we have *wright* from O. E. *wyrcan*, to work.

The Invention of Printing.—In the fifteenth century printing was invented. We shall examine a passage from Malory's *Morte d'Arthur*, which was printed in 1485.

Anone Sir Launcelot herd a voyce that sayd Launcelot goo oute of this ship, and entre into the Castel, where thou shalt see a grete parte of thy desyre. Thenne he ran to his armes and soo armed hym, and soo wente to the gate and sawe the lyons. Thenne sette he hand to his suerd & drew hit.

Here we find that many inflexions have disappeared, and that the grammar is almost modern. *And soo armed hym* is the only archaic idiom.

The establishment of the printing-press in England settled the supremacy of the Midland dialect as the literary language. Printing created a standard, and writers of different localities conformed to the standard, just as rustics who talk dialect to-day try to write idiomatic English in their correspondence.

Distrust of the Vernacular.—By the sixth century A.D., Latin had ceased to live, but it continued as the language of the Church, diplomacy, and the cultured classes. The great Italian poet Dante struck the death-blow. Before his time the writers of the earlier Renaissance despised the vernaculars as vulgar and corrupt mediums. Dante defended the vulgar tongue, but he used it because he was writing what he called comedy; he purposed writing a tragedy in Latin, thus showing that he did not trust the vernacular entirely. At the end of the sixteenth century, Italy had academies—the Florentine and Dellacruscan—which existed to champion the vernacular.

In France we see a similar movement to make the vernacular the literary speech, but there the desire to use Latin was never so strong as it was in Italy.

In England, as we have seen, the vernacular underwent a long period of influence from French and Latin. Old English compounded easily, but Middle English lost the power to compound, and borrowed ready-made words. Caxton attacks Latinising, and says that the standard of ordinary speech must be taken from ordinary people. And by controlling printing, Caxton had a wide effect. In the sixteenth century, English began to borrow from every language it came in contact with, and Latin became the medium of the Universities only.

Naturally we find distrust of the native speech in scholars. Ascham in 1545 states that it is easier to write *Toxophilus* in Latin or Greek than in English. Thomas More writes his *Utopia* in Latin; Bacon puts his *Essays* into Latin so that they may survive; Hobbes, when eighty-five, writes his autobiography in Latin verse. The Latin inscriptions on tombs, church windows, and other objects meant to last, show the old fear of the native language's being but an ephemeral thing.

At the Reformation Old English began to be studied. Old English literature was essentially democratic; it was written for the people. And as the object of the Reformation was to take education from the few and give it to the many, Old English works were respected. In the destruction of the monasteries, the Old English manuscripts were preserved. The services of the Church were changed from Latin into English, and the Bible was printed in the vernacular.

Thus until the seventeenth century we have a vernacular impulse and a classical impulse side by side. Every writer was experimenting with words; the scholars used what Wilson in his *Arte of Rhetorike* called "ink-horn terms," *i.e.* strange foreign words fished up from the bottom of the inkhorn; the popular preachers introduced many colloquial expressions into their sermons; a poet used so many archaic words that Ben Jonson remarked that "Spenser in imitating the ancients writ no language." There was absolute freedom; Shakespeare uses adjectives for verbs, nouns for verbs, nouns for adjectives, double negative and comparatives.

Between 1530 and 1560, roughly, most writers condemn English as a literary medium, but between 1560 and 1600 there is a strong reaction. Writers all regret that English borrows so much from other tongues, but admit that it must do so. The translators, Florio, Golding, and Stanyhurst admit no inferiority of English, and Sidney says it is equal to any other tongue in the world.

At the end of the sixteenth century, then, the vernacular was an established institution. Writers accepted it, but they were afraid of its becoming corrupt by over-borrowing. We find modern English words condemned by purists of the late sixteenth century, *e.g. ponderous, antique, despicable, homicide, prodigious, retrograde, clumsy, strenuous, conscious*. Other words objected to at that time have not survived, *e.g. ventosity, obstupifact, dominators* (lords).

The seventeenth century, the period of dictionaries, believed in frank borrowing, and most writers on the subject boast that English is better than any other tongue. But the idea that English was being corrupted still held ground, and we find Dryden and others advocating the institution of an Academy of Latin scholars to fix the language.

Fresh French Incursions.—The Restoration of 1660 brought French influence back to English language. French helped to break down the involved sentences of Milton and Browne. Many French words were borrowed, but were not naturalised. We saw that French words borrowed from the Norman-French and Parisian French took English accents and pronunciations; the French was hard in Middle English, *e.g. church, chance, charge*. Modern French words beginning with *ch* take the soft French sound; hence we can tell that *chef, champagne, chic, chaperon*, are modern loan-words. *Chivalry* is an old borrowing, and according to age the *ch* should be pronounced as in *church* or *chair*. But since popular usage favours the pronunciation *shivalry*, it is pedantic to insist on hard *ch*. Many other words came in with the Frenchified court plays; *e.g.* Dryden uses *chagrin, levee, foible, penchant, apropos, ballet, maladroit*.

The eighteenth century was a time of longing regret for a Golden Age in the past. Writers of 1700 looked back to works of 1650 and said "English was pure then"; but in 1750 writers looked back to 1700 and said the same thing. Landor pitched on 1780 as the "Golden Age" of English language; Matthew Arnold looked back to Landor's age; and to-day some of us look back to Arnold's time and say "Language was fine then."

Swift, Bentley, Johnson, Hume, Beattie, Landor, Arnold, and Churton Collins all believed that language could be made stationary—that a standard could be fixed. Johnson wrote his *Dictionary* in order to fix the language, but before the work was finished he saw that the language could not be fixed. What these men did not understand was that to be fixed a language must die. Latin is a dead language; it can never change.

In 1710 Swift urged the editor of the *Tatler* to circulate a list of bad words. He condemns abbreviations like *phiz* for *physiognomy*, or *mob* for *mobile vulgus*, on the plea that there are too many monosyllables in the language already; he objects to invented words like *kidney* or *bamboozle*, and to polysyllables like *ambassadors, preliminary, speculation, operations, communication*—all words introduced from the War of the Spanish Succession. It is obvious that Swift's opinion counted for nothing.

In 1712 Swift sent a letter to the Earl of Oxford proposing to found an Academy. He states that English was perfect until the Great Rebellion corrupted it. Oxford did not take the matter up.

In 1773 we find Beattie arranging to interview George III on the subject of corruption in language. Beattie proposed to edit Addison as a model, to note vulgar words, and to issue an edition of Scotticisms. Among his Scotticisms are *restrict, narrate, notice, I reckon, in place of*.

Landor thinks that a word should be used in one sense only: if *to execute* means *to finish*, he objects to its meaning *to hang* also. He believes that a word's meaning should show its derivation. In our own time very few of us believe in the derivation fallacy; if we do believe in it, we must reject such words as *matinee* (*not* a morning performance), *manufactured* (*not* made by hand). Landor also condemns a phrase like *examine into* on the ground that *ex* means *out* in Latin, or *averse to*, since *a* in Latin is *away from*. To-day good writers ignore the derivation: they write *averse from* and *averse to, different from* and *differ with*.

Modern English.—The lesson we learn from the attempts of writers like Johnson, Swift, and Landor to give language a definite standard is that the history of a language is the history of its corruption. Strictly speaking, there is no corruption; evolution is a better term.

The present age is heretical in many things—morality, religion, politics; it is heretical in language also. It has no respect for words as words; it prefers *wire* to *telegram*, *bus* to *omnibus*, *taxi* to *taxicab*, *bike* to *bicycle*. The most daring, and incidentally the most inartistic, heretics say *under the circs* for *under the circumstances*, and if *under the circs* should become idiomatic English the efforts of every professor and schoolmaster in Britain would not prevail against it.

Let us examine the following quotation from a 1914 short story:

A member once talked about Milton, but the prompt action of the secretary, in pointing out the rule that forbade conversation on modern topics, brought the erring member up sharply.

Member came from Lat. *membrum*, a limb;

talk from O. E. *talian*, to speak; *prompt* from Lat. *promptus*, through French; *action* from Lat. *actum*, to do; *secretary* from Lat. *secretus*; *pointing* from Lat. *punctum*, to prick; *rule* from Lat. *rego*, I rule, which gave Lat. *regulus*; *forbade* from O. E. *forbeodan*=*for*+*beodan*, to bid; *conversation* from Lat. *conversatio*; *modern* from French *moderne*, from Lat. *modus*, treasure; *topics* from French *topique*, from Greek *topikos*; *brought* from O. E. *bringan*, to bring; *erring* from Old French *errer*, from Lat. *erro*, I wander; *sharply* from O. E. *scearp*. Prepositions and conjunctions are usually Old English.

The above passage shows how much of our vocabulary we owe to Latin and French. But it includes only one Greek word, *topics*, and that was borrowed through Latin and then French. And there is not a single word borrowed from modern foreign languages. Yet modern English has taken loan-words from practically every known language.

Modern French Words.—We saw that early French loan-words took on an English habit and pronunciation. At the Restoration (1660) a system of giving French words their French pronunciation grew up, and since then the custom has obtained. English throws back the accent; thus *géntle* from French *gentil* is an early borrowing, but *gentéel* from the same source is late.

The tendency to give the French pronunciation is primarily a snobbish one; the speaker does not want to be accused of ignorance of French. There is no real reason why we should pronounce *trait* "tray," or *envelope* "ongvelope," or *valet* as "valley." In some words the French pronunciation is almost necessary for euphony. *Espionage* is better as "es′pionaj" than "espiónage"; *Chopin* would sound barbarously as "Choppin." And the French soft *g* is sweeter than English hard *g*; "mas-saj′" is probably better than "mássage," "pres-tij′" than "préstige." Yet if these words had been early borrowings we should have had the accent thrown back as in *savage* or *cabbage*. The modern *garage* is not yet fixed; it is pronounced "gar-aj′," and gárage. The latter is becoming popular.

Slang.—Slang words are like the members of the lower middle class of society; they are outsiders who are allowed into the best circles on occasion only. A favoured few are permitted to stay there, and their lowly origin is forgotten in a generation or two. A Cabinet Minister's "salary" is derived from Latin *salarium*, "salt-money," which soldiers received. Originally *salary* was slang, but to-day the word is as respectable a member of society as a Cabinet Minister.

Speaking generally, any word having force and personality will make its way to the front. When Kipling speaks about a steamer "waddling in from the sea he is using a slang word, but *waddling* is the one word for the ship's motion, and anyone who objects to it is merely a pedantic snob. Again, to speak of a drunk man *barging* into a room is to raise a slang word to the level of the best literary language. Words should either suggest a good sound or a fine picture. Anyone who has seen a barge making its way through Thames shipping will appreciate the comparison with a tipsy man.

The chapter on slang in that delightful book *Words and Their Ways in English Speech*, by Greenough and Kittredge, will cure anyone of linguistic snobbery. One finds there that many aristocratic words have plebeian origins.

Modern Word-Making.—The process of change in language never ceases. Every new invention requires a name. We have *telegraph* (Gr. *tele*, far off, and *grapho*, I write), *phonograph* (Gr. *phone*, sound, and *grapho*), and so on. Scientists choose Greek compounds because the Greek language is known to scientists of all countries.

Writers often invent words. Milton invented *gloom*, *moon-struck*, *Satanic*. Newton gave us *centrifugal* and *centripetal* while Huxley invented *agnostic*. Modern prose writers do little in the way of making new words, but the press is always experimenting. In this year 1914, the London papers are using the word "pogrom" as a schoolboy uses a new knife. What the word is supposed to mean is difficult to know It sounds as ill as the ugliest word in London, the word *Goodge* in Goodge Street.

The press is more given to changing the meaning of words than to inventing new ones, and we really need someone to make new terms for old ideas. If the press calls a sordid crime a tragedy, we must use some other word for *Œdipus*; if it speaks about the dramatic statement made by Mr. Asquith when he says "The answer is in the negative," we require a new word for Othello's "I took by the throat the circumcised dog, and smote him—thus." If in the account of a society gathering one lady is described as "charming," another as "beautiful," a third as "sweet," and a thirtieth as "lovely," we really do require a few new epithets for describing lilies, sunsets, and Helen of Troy.

It isn't that language is becoming corrupt; it is merely evolving. If the British public agrees with its society journals in calling the honourable Sylvia de Montmorency Blank "the beautiful daughter of a lovely mother," the British public attaches to the word "beautiful" a meaning that it did not always have. It used to mean "perfect in form"; and the honourable lady would be the last to claim perfection. Clearly we need a new word for "perfect in form." "Perfect" itself would meet the case, but the society papers would quickly welcome it as a fresh adjective.

It is well to attach to a word a definite shade of meaning, but we should beware of snobbery.

Coleridge once heard a lady use some slangy adjective to describe the Falls of the Clyde, and he was annoyed. Of course it is well to say that falls are magnificent, or awful, but if a young lady says they are ripping we should not think ourselves very superior. After all, she means the same as we do. Words like "ripping" are popular because they have no definite meaning attached to them; a revue may be ripping, also the poems of Keats may be ripping. We once heard the latter described as "scrumptious."

Etymology.—This subject is too vast to treat thoroughly in the space permitted by this book, and we can only hint at the delights of the study of words and their history. Any grammar will afford a list of Greek and Latin prefixes and affixes; most of us learned them at school. There is little pleasure in learning that the word "interrupt" is derived from the Latin *inter*, between, and *ruptum*, to break. But consider a word like "rival." This word comes from the Latin *rivus*, a stream. What is the connection between a stream and a rival? Latin had an adjective *rivalis* meaning "pertaining to a stream," and *rivales* was the name given to neighbours who got water from the same stream. We can imagine a breezy encounter between two *rivales* at the river bank, and we can quite easily see how the modern meaning of rival came about.

This instance shows how delightful the science of Etymology can be.

Let us take another example, the word "treacle." At first sight it is difficult to trace any connection between this word and the Greek *thēr*, a wild beast. The Greeks had an adjective *thēriakón* meaning "pertaining to a wild beast." A wild beast bites, hence the word *thēr* became associated with "a remedy for a bite." Greek remedies were often in the form of a syrup, hence *thēr* became associated with a thick syrup, and the original idea of a cure was lost. The same process is seen at work in the history of the word "villain," which is derived from Latin *villa*, a farmhouse. A villain was originally a farm-servant, and in the days of feudalism the labourer was looked upon as a low fellow. Most of Shakespeare's servants are knaves or fools. The word has lost its association with the farm labourer, and a villain is *any* low fellow.

The word "knave" we have just used has a similar history. Its original meaning was "boy.' Servants were often called "boys," and a *knave* acquired the meaning of *servant*. And as the gentry considered servants thieves, the word *knave* came to have its sinister significance.

The student of Etymology must beware of jumping to the obvious conclusion. For instance, the word "belfry" suggests derivation from "bell," but its history shows no connection with "bell." It comes from Middle High German *berovrit*, a place of safety, through Old French *berfroi*. If we go farther back, we find that it is connected with *bergen*, to conceal, and *vride*, protection.

Of less interest are the words derived from the names of people and places. Words like "machiavellian" or "quixotic" explain themselves, but the connection between a sandwich-man and the Earl of Sandwich is not so apparent.

One Earl of Sandwich was a notorious gambler, and to save time he had his food brought to the table in the form of the modern sandwich, hence the name. A sandwich is essentially two pieces of bread with meat or jam or cress between. The man who first likened a sandwichman to a meat sandwich must have been inspired.

The derivation of a word from a place-name is of common occurrence. We have *sherry* from the Spanish town *Xeres*, *china* from *China*, and so on. In our own day we have seen how such words are derived. When Mafeking was relieved, London went into jingoistic hysterics, and now we call any kind of extreme jubilation *mafficking*.

The Bibliography at the end of these articles names the books that the interested student should read. But the science of Etymology should be considered a delicious luxury. It is good to know the history of the words you use, but words change so much that etymology is not a safe guide. It is possible to write good English without a knowledge of the history of words. Nevertheless such a knowledge is well worth having for the reason that the writer feels that he is working with old friends.

GRAMMAR

Books on English grammar lay down the laws of good speaking and writing, and the thinking student is naturally curious to know who made these laws.

The old grammars were the result of classical study; the old grammarians laboured under the false impression that the grammar of Latin was suited to the English language, or they based their grammars on the periodic style of the eighteenth century. They claimed that grammar was a matter of Logic and Reason, but they could not explain, for example, why some classical words formed an English plural, while others took the Latin plural.

The truth is that grammar should not be based on any rules of the past. The only criterion is the usage of the present day; consequently a grammar book is out-of-date by the time it is published. Rules are dangerous; if grammar is to prevent a man from expressing himself spontaneously and easily, then the sooner we drop grammar the better. All progress is realised by the breaking of rules, and since Chaucer's day English has been lawless. Suppose someone had written a Grammar at the time of the authorised translation of the Bible. He might have quoted "What came you out *for to* see?"

or "Our Father, *which* art in Heaven" as examples of correct idiom. No one to-day would think of using *for to* on the plea that a noted grammarian of the seventeenth century had stamped it as a correct phrase.

How, then, are we to know what is grammatical and what is not? There is only one answer worth considering: we must be guided by the practice of the best modern writers. Freedom must be fully allowed. Someone may ask: "Are we then to tolerate that barbarous usage of the split infinitive?" Nearly every teacher condemns it; it is held to be vulgar, corrupt, ugly, what you will. The truth of the matter is that you cannot split an infinitive; our infinitive is itself a corruption. "To" has nothing to do with the infinitive. The split infinitive is slightly specialised and expresses a fine shade of meaning; it is found in the works of nearly all great writers.

What are we to do when there is an option in usage? "Averse to" is used by good writers quite as often as "averse from"; "we had rather" is as good as "we would rather." The only way is to take full use of the option; time will probably eliminate one phrase. The same method may be applied to slang. Many of our words to-day were slang terms once, and by a gradual process they were raised to the level of the literary language. Our *mob* was originally a slang-corruption of *mobile vulgus*; *bounder*, once a slang term, can now be used without quotation marks.

No writer can raise a slang word to the literary level. If a modern writer—for example, H. G. Wells—were to use the verb *biff* for *hit violently*, he could not raise *biff* above slang. But if twenty good writers were to use it, the chances are that others would follow them and raise *biff* as they raised *bounder*. Hence originality in language is like originality in social behaviour—it is liable to be misunderstood. If you wear a cap with a frock coat, and if you are a brilliant talker, you will find that people are staring at—not listening to you. So if you think that good taste requires your writing a sentence like "Socialism is out to knock spots off the blokes that sneak the tin from the poor," you will find that your readers do not think of Socialism because they are shocked by your language.

In politics, in science, in philosophy, the great men are ahead of the rank and file. But in idiom and language there should be no conscious effort to seek originality. After all, language is merely a means, not an end.

Grammar, therefore, will mean to us the usage of the present day. It will guide us in following the conventional language and idiom of the best writers. We shall not concern ourselves with intricacies like parsing, breaking up of elaborate sentences into their subordinate clauses, and other terrors of the Victorian schoolboy.

The subject is so vast that we cannot treat one tenth of it in these pages. Hence we shall assume that the ordinary definition of noun, verb, gender, case, &c., are known to the reader. We shall deal with *bad* English, and try to show why it is bad.

Bad English.—"Bad" English may have been good English at one time; it is bad to-day because it does not conform to the speech of the cultured classes of society. The majority, says Ibsen, is always wrong. In all probability the number of British voters who say "I seen a man" or "I seed a man" is greater than the number of voters who say "I saw a man." It is certain that the majority of voters say "Who did you see?" instead of "Whom did you see?" The standard of usage is the speech of the educated classes. Nevertheless there is always a tendency for speech to sink to the lower level. A bishop will reply to the query "Who's there?" the vernacular "It's me." A learned professor will say to his wife "Who did you see at the Joneses?" But the Bishop when writing his sermon writes "It is I," and the professor in his *History of Rome* writes "Whom did they applaud?"

THE NOUN

Number.—There is no confusion of number when a sentence is perfectly simple. In the sentence "A certain amount of excitement was natural," *amount* is the subject, and *was* the predicate. But in the sentence "A certain amount of excitement and riot were natural," a mistake has been made. The subject is not *excitement and riot*; it was the *amount* that was natural. Hence *were* is wrong in the above sentence.

Collective nouns form a difficulty. Should we say "The audience *was* appreciative," or "The audience *were* appreciative." There we may take advantage of the option; either is right.

Either .. Neither, Or .. Nor.—When a simple conjunction like *and* links two nouns together the two take a plural verb. Thus: "Tom and Willie are foolish." But "Either Tom or Willie are foolish" is wrong; write it out fully as "Either Tom is foolish or Willie is foolish," and you at once see that *are* must not be used. The following verbs are wrong in number:

Neither of the boys were at home (was)
Either he or I are at fault (is)

Most of us know the plurals that are not formed by adding *s* or *es*—*child*, *children*; *sheep*, *sheep*, *trout*, *trout*, *man*, *men*, etc. The only difficulty is one that arises from a confusion of plurals; we have *penny*, *pennies*, *pence*; *brother*, *brothers*, *brethren*. In all cases one plural form has a specialised meaning. I give a boy two *pennies*, but he pays two *pence* for a toy; I catch five *fishes*, but I buy *fish*; I ask my tailor to show me different *cloths*, but I order a suit of *clothes*; I fire *shots*, but I buy *shot*; I lived

with my *brothers*, but when I preach to a congregation I say "Dearly beloved brethren"; I shell *peas*, but I buy *pease*-meal.

The following appear to be plural, but are really singular :—news, riches, alms. We write "My news is scarce," but most of us write "Riches are desired by many."

Smallpox (small pocks) is really plural, yet we say "smallpox is a dangerous disease." "Measles have broken out."

There is no rule for foreign plurals, but the tendency is to Anglicise foreign words. No one speaks of *banditti* or *formulæ* nowadays; we say *bandits*, *formulas*. The foreign plural is retained in *stratum*, *strata*; *analysis*, *analyses*, *tableau*, *tableaux*.

Compound words follow no special habit in forming plurals. We say *commanders-in-chief*, *mothers-in-law*, *lookers-on*, but *pailfuls*, *major-generals*, *sergeant-majors*; sometimes both nouns take the plural form, *e.g.* *men-servants*, *knights-templars*.

Gender.—A thorough knowledge of the gender of nouns is not necessary in English. In Latin gender is all-important, because an adjective qualifying a noun must have the same gender as the noun. We cannot say *bonus mensa* (a good table): we must say *bona mensa*. *Mensa* is feminine, *bonus* is masculine. In English gender has come to denote sex only, although it is usual to refer to a ship as "she" or the sun as "he."

A list of words having unusual genders is of little use. We have one before us as we write. *Spinster*, we notice, is the feminine of *bachelor*, but one never hears the word *spinster* outside of law courts and churches; *bachelor-girl* is now generally accepted. *Drone* is given as the masculine of *bee*; but the bee in a hive is a neuter. If *drone* has a feminine, it is *queen-bee*. *Man-servant* and *maid-servant* have been contracted to *man* and *maid* or *servant*.

Before we leave the subject of gender let us give a topical warning: *suffragette* is not the feminine of *suffragist*.

The Possessive Case.—This case is denoted by the apostrophe *s* ('s). It has often been erroneously supposed that *'s* is a relict of *his*, and our grandfathers wrote on their books "John Smith his book." The *'s* is a relict of the O. E. possessive *es*; the apostrophe denotes the missing *e*.

In ordinary cases the apostrophe is placed before the *s* in the singular, and after the *s* in the plural. Thus we say "The cat's dish" when we refer to one cat, but "The cats' dish" when we refer to more than one cat. In the case of collective nouns we follow the rule for singular nouns. Thus we say "The People's Books," "The children's games."

The apostrophe *s* has lost its old position; we now speak of "Smith the blacksmith's house," "Charles the First's head," or even "Charles I's head," It is usual to write "James's book" or "Guinness's stout." Perhaps the ear is the best guide. "H. G. Wells' novels" sounds better than "H. G. Wells's novels." Euphony makes us write "For conscience' sake," but we write "For Thomas's sake."

When two nouns are connected by *and*, care must be taken. If we write "Smith and Thomson's *History of Greece*," we convey the idea that Mr. Smith and Mr. Thomson collaborated in writing the *History of Greece*. But if we write "Smith's and Thomson's *History of Greece*," we show that Mr. Smith and Mr. Thomson each wrote a *History of Greece*.

Grammars usually object to the use of apostrophe *s* with inanimate objects, *e.g.* "The piano's legs," "The book's appeal." Current usage accepts these possessives, but in good prose "The legs of the piano" is still preferred.

The Pronoun.—A pronoun is a word that stands for a noun. The importance of pronouns is not realised unless one tries to write a sentence without them:

"Tom put on Tom's hat, and, whistling on Tom's dog, left Tom's house."

This sentence shows the danger of ignoring pronouns.

The following sentence shows the danger of using too many pronouns:

"John told James that Charles told him that he was going to Birmingham if he asked him to go." It is impossible to tell whom *he* and *him* refer to.

Personal Pronouns.—The only difficulty about the first personal pronoun is the use of *me*. You knock at a door. Someone within asks "Who's that?" You answer "It's me." Should you answer "It is I"? There is no occasion to say "It is I"; usage has accepted "It's me," and all the pedantic correctness in the world will not oust the phrase.

The second personal pronouns *thou*, *thee*, *ye*, *thine*, *thy*, are obsolete, and should not be used, unless in a novel dealing with a past age.

The third personal pronouns *they* and *their* are often misused in a sentence like the following:

"Each boy and girl will receive their prize when they come forward." The correct sentence is "Each boy and girl will receive his or her prize when he or she comes forward," but even then the sentence is not good. It is better to say "Boys and girls will receive their prizes when they come forward," although there still exists a doubt whether *they* refers to the children or the prizes. "Each boy or girl, on coming forward, will receive a prize" leaves no ambiguity.

Who, which, what.—These are interrogative pronouns when they ask a question: *e.g.* "Who did this?" "Which will you have?" "What did she say?" Confusion between *who* and *whom* often

arises. In conversation most of us say "Who did you see?" Write this: "You did see—who?" and the incorrect grammar is at once evident. "Whom did you see?" is correct.

The Relative Pronoun.—The relative pronoun always "relates" to some noun already used: *e.g.* in "This is the *house that* Jack built" the relative *that* relates or refers back to *house*. *House*, in this case, is called the antecedent of *that* (Lat. *ante*, before; *cedo*, I go). The relative is sometimes omitted when it is the object of a verb: *e.g.* "I appreciate the gift (that) you gave me," "He barks at every tramp (that) he meets."

There is one mannerism in which the antecedent is omitted—"There are who say." The antecedent *people* is understood. This Latinism is better left alone; it sounds pedantic and stilted.

The relative phrase *in which* is sometimes omitted. "The way the Boers acted was annoying" is often written for "The way in which the Boers acted," etc.

In all cases of the relative the elementary principle of subject, predicate, and object must guide. Every schoolmaster knows this type of sentence:—"A farmer who lived in Scotland. He went out to the field," etc. In the sentence "who lived in Scotland" *who* is the subject, *lived* the predicate. Now *farmer* is evidently a subject: where is its predicate? *Went* cannot be the predicate of *farmer*, for it is the predicate of *he*. Cut out the full stop and *He*, and you have good English, for then the relative clause "who lived in Scotland," if cut out, leaves an orderly sentence, "a farmer went out to the field."

A common error is the insertion of *and* before a relative: *e.g.* "He had a cycle with a high gear, and which he pedalled with difficulty." This sentence suggests another error—the separation of the antecedent and the relative. In this case a person who did not know anything about cycles might wonder whether *which* referred to *cycle* or to *gear*. Consider the sentence:—"James Green, the son of George P. Green, who is a well-known pig-dealer, fell from his horse yesterday." Does *who* refer to James or to George? If to James, the sentence should run: "The well-known pig-dealer James Green, who is the son of George" etc.; if to George it should run "James Green, son of the well-known pig-dealer George P. Green," etc.

When there is no ambiguity the relative may be some distance from its antecedent.

Adjectives and Articles.—The indefinite articles *a* and *an* confuse many writers, but if you write as you speak you should have no difficulty. If you pronounce the *h* in "hotel" write "a hotel"; if you drop the *h* write "an hotel." Personally we write "a hotel," "a hospital," "a heroic deed."

Usually *an* is used before a word beginning with a vowel, but here again sound must guide. We write "an uncle," but we write "a unique play."

Repetition of the article often makes confusion. "A poet and critic" may refer to one man, but "a poet and a critic" suggests two men. What can we make of the following? "The secretary and treasurer, along with the chairman, went out to meet the delegate, who is secretary of the Leeds branch, and vice-president."

Was "the secretary and treasurer" one man or two? Was the delegate not only secretary of the Leeds branch, but vice-president also? or were the delegate and the vice-president different men?

If the secretaryship and the treasurership were held by one man, and if the delegate was not only secretary of the Leeds branch, but vice-president also, the sentence should read: "The chairman, along with the secretary, who also holds the position of treasurer, went out to meet the delegate, who is secretary and vice-president of the Leeds branch."

If the secretary and the treasurer are two men, the sentence should run: "The secretary and the treasurer, along with the chairman," etc.

The ordinary adjective presents no difficulty to the young writer. The difficulty appears when the comparative degree of an adjective is used.

Adjectives are "compared" as follows:

Positive	*Comparative*	*Superlative*
quick	quicker	quickest
good	better	best
beautiful	more beautiful	most beautiful

Some adjectives cannot be compared. Queen Anne is dead; we cannot say that Charles I is "deader," because he has been longer dead. If we believe in the derivation of words, we cannot say that one thing is "more unique" than another; *unique* means "being the only one of its kind." But if we accept the modern journalistic meaning of *unique*—"uncommon," we may use the phrase "more unique."

Adverbs are compared like adjectives, thus:

Positive	*Comparative*	*Superlative*
quickly	more quickly	most quickly
well	better	best
beautifully	more beautifully	most beautifully

Now, the young student usually mixes up comparatives of adjectives with those of adverbs.

"John is a quick runner." Here *quick* is an adjective.

"John runs *quickly*." Here *quickly* is an adverb.

We say "John is a quicker runner than Willie," but we cannot say "John runs quicker

than Willie"; we must say "John runs more quickly than Willie."

A good old-fashioned tag to remember is: An adverb tells how, when, or where anything is done.

Any noun can be used as an adjective. We speak of "The *London* Girl," "the *Press* club," "the *farmer* class," etc. But in phrases like "biscuit box," "cab rank" "paper chase," is the first noun being used as an adjective or not?

In writing, the way to obviate any difficulty is to join the two with a hyphen if the first is to remain as a noun. It is better to write *biscuit-box, paper-chase, walking-stick*. In the last named, if *walking* were an adjective, a "walk ing stick" would literally be a stick that walks.

In a sentence like "Labour and religious troubles held the attention of the government," there is ambiguity. It might mean "Labour held the attention of the government, and so did religious troubles."

Labour is a noun used as an adjective qualifying troubles. To prevent ambiguity write the sentence thus: "Religious and labour troubles held," etc.

The Verb.—The most common mistake made by uneducated speakers is the confusion of the verb's tenses. *Tense* means "time"; present tense refers to present time, past tense to past time, and so on.

The past participle is the great stumbling-block. Note the following:

Present Tense	*Past Tense*	*Past Participle*
eat	ate	eaten
grow	grew	grown
see	saw	seen
write	wrote	written

To find the past participle of a verb, add *was* or *have*.

I *eat* a pie (Present)
I *ate* a pie (Past).
The pie was *eaten* (Past Part.).
I have *eaten* the pie.

Similarly:

I *see* him.
I *saw* him.
He was *seen* by me.
I have *seen* him.

Now, when a man says "I seen a dog-fight last night" he is using the past participle *seen* instead of the simple past tense *saw*.

Observe that the past participle is often used as an adjective: *e.g. chosen* ("the chosen people") *forgotten, grown* ("a grown youth"), *risen* ("the risen sun"), *stolen, worn, written* ("the written letter").

Do not conclude that all past participles end in -en or -n. Note the following:

Present Tense	*Past Tense*	*Past Participle.*
swing	swung	swung
sing	sang	sung
hit	hit	hit
sweat	sweat or sweated	sweat or sweated
tell	told	told

Verbs in -ing.—1. *The Present Participle.*—The present participle always ends in *-ing*, and it is always used as an adjective as well as a participle.

"Thinking that his father had come home, James left the house." *Thinking* is a present participle; it is also an adjective qualifying *James*.

Consider the following sentence: "Entering the ballroom, a brilliant spectacle met our eyes." Here *entering* is a present participle; it is also an adjective. What noun or pronoun does it qualify as an adjective? *Ballroom?* No, it wasn't the ballroom that was entering? Spectacle? No; the spectacle was not entering. The sentence is an ungrammatical one. Write it: "Entering the ballroom, Mary beheld a brilliant spectacle," and it is correct. Mary was entering; hence *entering* is an adjective qualifying *Mary*.

2. *The Gerund.*—A verb in *-ing* may either be a participle or a gerund. If it is a participle, it is an adjective; if a gerund, it is a noun. In "Do you object to me *smoking*," *smoking* is a present participle and an adjective qualifying *me*. But in "Do you object to my *smoking?*" *smoking* is a gerund and a noun, qualified by the possessive adjective *my*. Observe closely the following sentence:—

"By constant *drinking*, he became insane" (gerund).

"Drinking constantly, he became insane" (pres. part.).

"She prevented his *going* out" (gerund).

"She prevented him *going* out (pres. part.).

Personally we prefer the gerund in prose style. In our opinion "Sammy believes in Parliament giving Home Rule to Ireland" is not so good as "Sammy believes in Parliament's giving Home Rule to Ireland." "I do not like him associating with bad boys" is not so good as "I do not like his associating" etc. The gerund is nearer the correct meaning in all cases. In "Excuse me smoking," you are asking a lady to excuse *you;* whereas what you really want her to excuse is your *smoking*. Hence "Excuse my smoking" (gerund) is better.

The gerund can be used instead of the infinitive.

"Skating is pleasant" can be written "To skate is pleasant."

The verbal noun, which is really a gerund, is always preceded by the definite article, and followed by the preposition "of": *e.g.* "He set himself to the *mastering* of Latin." (verbal

noun). The gerund proper is seen in "He set himself to mastering Latin."

The Shall and Will Difficulty.—Natives of southern England use *shall* and *will* correctly; the words have for them a certain shade of meaning that the northerner can with difficulty understand. A Scot never gets over the "shall and will" difficulty; he usually adopts *shall* for the first person, *e.g. I shall*, and will for the second and third persons, *e.g.* you *will*, they *will*.

Without entering into the intricacies of the question, we give a general rule that covers most cases.

In the first person use *shall* for the simple future, *e.g.* "I shall call to-night." But if there is any emphasis use *will*, *e.g.* "I *will* do it; you have no right to prevent me."

In the second and third persons use *will* for the simple future, *e.g.* "You will be there at seven?" "He will come." But when emphasis is required use *shall*, *e.g.* "You *shall* be there at seven"; "He *shall* come" (I command him to come).

Should and *would* are used in a similar way. "I should think so," "You would like to go, wouldn't you?" "He would do it if he could." "I would," is used in "I would that she were here."

The "shall and will" difficulty need not trouble the northern writer; if he uses them wrongly, he is in the company of Stevenson, Oscar Wilde, Gladstone, W. B. Yeats, and many other well-known writers (see *The King's English*, pp. 134–156).

The Preposition.—A preposition always governs a noun or pronoun: *e.g.* "*to* the fire," "*in* London," "*through* the village," "the Prince *of* Wales," "*between* two fires."

The preposition *between* should be used when only two things are referred to; we divide an apple *between* John and Tommy, but we divide it *among* John, Tommy, and Bill.

A common mistake is to use the conjunction *unless* instead of the preposition *except*. It is wrong to say "I like everyone *unless* that one"; *except* is the word.

A vexed question is the one dealing with prepositions and their relationship with words that have Latin or Greek prepositions in their composition. *Averse* is from Latin *a*, from, and *versum*, to turn; should we follow the Latin preposition, and write *Averse from?* To do so always is mere pedantry; the derivation really does not matter, and the average speaker does not know any Latin at all. The following are all usual:

"I am averse *to* (or *from*) your going." "He was oblivious *of* his surroundings." "I differ *from* you in appearance, but I differ *with* you on the subject of politics." "Your politics are different *to* mine." "I disagree *with* you (not *from* you)." "The company consists *of* half a dozen members, and its one merit consists *in* its system of quarterly payments." "I am chary *of* doing what you ask."

The older grammar warned its readers against the placing of a preposition at the end of a sentence. They insisted on the changing of "Whom are you waiting for?" into "For whom are you waiting?" Nowadays the sentence may have the preposition at the end; the old joke of the village schoolmaster, "Never use a preposition to end a sentence *with*," was prophetic.

The Conjunction.—*And* is the commonest conjunction. It can be used at the beginning of a sentence (see STYLE, p. 108), and it can be omitted in a list of nouns. Our fathers always wrote "He owns lands, houses, factories and ships." We are beginning to write "He owns lands, houses, factories, ships."

Beware of the phrases *and which*, *and who*. This is wrong: "Mary, the parson's daughter, *and who* is home for the holidays, is to be Queen of the May."

This is right: "The farm which stands near the river, *and which* is the largest farm in the shire, is to be sold"

Certain verbs take special conjunctions after them: I fear *that* (or *lest*), I hope *that*, I doubt *whether* he will come, or I doubt if he will come. "I prefer Mary *than* Lizzie," is wrong; *prefer* takes *to*—*e.g.* "I prefer this *to* that."

SPELLING

Spelling is mainly a matter of eye-training, and it is questionable whether the method of oral repetition obtaining in so many schools is of any value. The only sure way to learn spelling is to read, and we suggest that, if the spelling lesson were abolished in a school, the scholars would spell as correctly as these who "learn" spelling. Four words might be "learned"—*siege* and *seize*, *receive* and *believe*; a rule might be formulated, "after a *c* comes an *e*, after an *l* comes an *i*"; hence *deceive*, *relief*.

Latin roots will guide the student in the spelling of words like *innocent* and *colloquial*. *Innocent* comes from Latin *in*, not, and *nocens*, harmful, hence there are two *n*'s at the beginning. *Colloquial* comes from Latin *con*, together, and *loquor*, I speak. *Conloquial* would not sound well, hence the *con* is changed into *col*. Thus we have two *l*'s at the beginning of *colloquial*.

The other words in the English language we should not "teach."

Spelling Reform.—The great difficulty a child experiences in spelling correctly is that we allow two standards in modern English—a spoken word and the written word. In practice we obey the spoken standard only, but in writing we conform to another standard. Writing stereotypes words; hence the written word is

always lagging behind the spoken word, which is always changing. This stereotyping of words is merely an accidental result of the invention of printing, and our written standard practically stops short at the Middle English stage.

As a result of this dual standard, education is held back. Tell a child that cough is pronounced *coff*, and he will naturally conclude that rough is pronounced *roff*, and plough, *ploff*. Our present system makes a child distrust reasoning, and the whole idea of education is to make children think rationally. Existing spelling hides all knowledge of phonetics.

Language is continually changing. Our modern pronunciation is quite different from the pronunciation of Chaucer or of Shakespeare.

Let us consider the long *a*. This letter is on the way to extinction; you will hardly ever hear long *a* in England, except in the word *father*. It is kept in the Anglican service, *e.g.* in *command*, but long *e* has usurped its functions in most cases. In Scotland the long *a* persists; a Scot orders a bottle of *Bāss*, a Londoner orders a bottle of *Băss*. The difficulty is that we have fifteen vowel sounds, and only five characters to represent them. The only remedy is to combine vowel with vowel, vowel with consonant. This has been done in *ee* and *aw*.

Most consonants remain faithful to their original sounds.

The objector to spelling reform generally bases his argument on association; his defence of the existing order is based on sentiment. "Why change the time-honoured spelling of our forefathers?" he cries. Let us see what "the time-honoured spelling of our forefathers" amounts to. In the sixteenth century *hot* was spelled *hot* and *whot*, the latter spelling being used by Spenser. *Hole* was changed to *whole* in the same century. What would the critic say if *whot* were used to-day by a writer who pleaded that he was following "the time-honoured spelling of our forefathers"?

The plea of association is a poor one; the spelling of classical authors is altered every two generations. It has been said that the spelling of Shakespeare is good enough for the twentieth century; but no one knows what the spelling of Shakespeare was like. For he was not consistent; the spelling in the Folio is not the usual Elizabethan spelling. This suggests that Shakespeare was a reformer of spelling. There was no definite standard in Elizabethan times; Spenser will spell a word in two different ways in the same stanza.

Some defenders of the present system hold that if spelling be changed the idea of a word's derivation will be lost, and thus the tie that binds present and past language will be severed. Suppose the argument were a sound one. The aim of language is the expression of ideas. When a man writes the word *rival* he does not need to know that the word is derived from the Latin *rivus*, a stream. It is no doubt interesting to know that the etymology suggests two neighbours who were always quarrelling about the use of the stream that separated their gardens, but the information has no bearing on the present use of the word *rival*. If, therefore, the argument were sound, it could not be defended.

Now it can easily be proved that the "etymology" defence is a sham. For if the defenders are consistent they will drop the *c* in *scent*; they will spell *fancy*, *phansy*; they will explain why *matinee*, from the French *matin*, morning, means "an afternoon performance," or why manufactured goods are not made by hand (Lat. *manu*, by hand; *factum*, to make).

Some critics say that if we tamper with spelling we obscure meaning, for if *son* is spelled as it is pronounced, *sun*, there will be confusion between *son* and *sun*. But to-day we have thousands of such words. Ask a schoolboy if the word *piece* means part, chessman, bread, coin, painting, play, firearm, music, or opera and he will easily be able to tell by the context what *piece* means.

Spelling reform will come when the general public has lost its superstitious reverence for existing spelling. America will lead the way; the American *favor* is being imitated in business correspondence in Britain, and soon we shall have *honor*, *humor*, *program*, and similar words in our daily newspapers.

All that reformers suggest is that phonetics should guide spelling so that when a word is written its pronunciation is obvious. A revolution cannot take place; all we can hope for is a reform *within* spelling—that is a reform which will reduce existing anomalies by discarding unpronounced letters and letters that mislead one in pronunciation.

PUNCTUATION

The only guide to good punctuation is one's common sense. The purpose of stops is twofolds; they act as signals to mark breathing spaces, and they preserve the correct sense.

Consider the following sentence:

"Cæsar came in; on his head a helmet; on his feet sandals; on his brow a manly frown."

Change the punctuation, and it reads:

"Cæsar came in on his head, a helmet on his feet, sandals on his brow; a manly frown."

It is improbable that any young writer will allow the sense of a passage to be perverted by bad stopping. The difficulty is to know what stops to use.

The stops in general use are the comma (,), the semi-colon (;), the colon (:), the period (.).

The Period.—The period is the strongest of all the stops. It marks a division between one complete sentence and another.

Note the following sentence:—"Margaret walked along the road, the nightingale sang."

Here we have two statements with no definite connection between them. The reader is asked to think about Margaret; then suddenly he is hurried off to the subject of nightingales. Obviously a strong stop must separate the statements; the comma is too weak. This is correct: "Margaret walked along the road. The nightingale sang."

Take another sentence: "He died at the age of fifteen, Death the Reaper does not always wait until the corn is yellow." Here there is a connection between the two statements, but the comma is too weak to join them. A full stop would do, but a semi-colon would meet the case better.

In good writing, a period ends a sentence containing a predicate. Some modern writers ignore the predicate, and in fiction we sometimes find sentences like these :—Day broke. Glorious day. The sun rose. A purple and gold sunrise," etc.

There is no real reason why we should condemn verbless sentences; if they convey a meaning they are justified. But something—it may be tradition and convention, or it may be an innate objection to backboneless things—prevents a writer who believes in style from using such sentences.

A full stop marks the end of a speech, unless "he said" or a similar phrase follows the speech. He said: "Go away"; but "Go away," said he.

It is almost unnecessary to add that the period is the only stop followed by a capital letter.

The full stop is always used after a contraction. We write "George Brown, M.A." The stops after M and A show that M is a contraction of Master, and A of Arts; *cf.* Jones and Co., Esq., James K. J. Smith.

The Comma.—Never use a comma unless the sense of a passage requires one. Read this passage aloud:

"In spite of all their efforts the crew failed to reach the shore. Shivering with cold they clung to the masts and hope left them." A pause is made at *efforts*, at *cold*, at *masts*. Should we place commas after these words? The sense of the passage does not require commas after *efforts* and *cold*, but the average printer would insert them. The case of *masts* is different. At first glance we imagine that the crew were clinging to the masts and to hope. A stop is evidently required. The comma is not strong enough; the semi-colon is scarcely strong enough. The full stop will meet the case, for there is a wide gulf between the two statements. The first tells of the material fact that some men were clinging to the masts; the second is concerned with a spiritual conception.

The passage when punctuated reads:

"In spite of all their efforts, the crew failed to reach the shore. Shivering with cold, they clung to the masts. And hope left them."

There is always a danger of over-stopping. The following sentence is over-stopped. "This, however, the secretary, wisely, refused to allow; indeed, he announced his decision, forcibly, in a full house." This sentence might well be written thus: "This, however, the secretary wisely refused to allow, indeed he announced his decision forcibly in a full house."

The Semi-colon.—As stated above, the semi-colon is stronger than a comma, but weaker than a full stop. It is a stop dear to the stylist; the reader should study the use Stevenson makes of it. The sentence just written affords a typical example of its use. The first part of the sentence refers to the stylist; the second part refers to Stevenson. And, since Stevenson is recognised as a good stylist, there is obviously a connection between the two statements. A full stop after *stylist* would do, but a comma would be too weak.

The semi-colon is useful where the comma might confuse.

"Among those present were the Prime Minister, Mr. Balfour, Mr. Lloyd George, the Chancellor of the Exchequer, the Secretary to the Admiralty, Mr. Churchill." This sentence leaves us with a few doubts. Is Mr Balfour the Prime Minister? Is Mr. Lloyd George Chancellor of the Exchequer or not? Are the Secretary to the Admiralty and Mr. Churchill two different men? If Mr. Asquith is Prime Minister, Mr. Lloyd George Chancellor of the Exchequer, and Mr. Churchill Secretary to the Admiralty, the sentence, to be absolutely clear, requires semicolons.

"Among those present were the Prime Minister; Mr. Balfour; Mr. Lloyd George, the Chancellor of the Exchequer; the Secretary of the Admiralty, Mr. Churchill."

In an ordinary newspaper report clearness would be sought by separating each person by a comma.

"Among those present were the Prime Minister, Mr. Balfour, Mr. Lloyd George the Chancellor of the Exchequer, the Secretary to the Admiralty Mr. Churchill."

The Colon.—The colon in strength lies midway between the full stop and the semi-colon. In the old periodic prose it had a definite value, but in modern prose it is used sparingly. The colon may be used in a proverb where sharp antithesis is required, *e.g.* "Man proposes: God disposes." Some writers use it before a quotation, thus—"He said: 'A stitch in time saves nine,' and sat down."

The colon is often combined with the dash, especially before a list, *e.g.* "The chief towns are :—Leeds, Bradford, Halifax," etc.

The Mark of Interrogation.—Everyone knows that a question must be followed by a question mark (?), but everyone does not know the difference between a direct question and an indirect question.

If I say "Is this your book, Mary?" I am asking a direct question, and the mark of interrogation is necessary. But if I write "John asked Mary if the book belonged to her," I am writing an indirect question, and no mark of interrogation is required.

The Mark of Exclamation.—This is one of the most abused stops we have. We all know the schoolgirl's letter that is full of them. The exclamation should never be used unless something is *exclaimed.* The following are justifiable :—

"Alas!" he exclaimed.
"How I long for the sun!"
"Ah! I understand," he cried.

The chief abuser of this useful stop is the man who uses it to show that he has made a joke. Here is a quotation from *Punch* :—"'This machine,' says an advertisement of a motor cycle, 'Gets You Out of Doors—and Keeps You There.' Frankly, we prefer the sort that Gets You Home Again."

If *Punch* had put an exclamation mark at the end, the mark would have been a notice which read "This is a joke. Laugh, please." Our point is that an exclamation mark, when it means "This is a joke," is an insult to our intelligence. It is a good sign that most of our comic papers have discarded the exclamation mark, although quite a number of them may have ceased to use it because of a natural timidity in using the claim "This is a joke."

The Dash.—The dash usually denotes a sudden break, *e.g.*

"I have come," he said, "to tell you that I—well, why should I force my opinions on you?"

In dialogue the dash is used when one speaker interrupts another.

"I have seen the——"
"I don't care what you have seen," cried the lawyer impatiently.

The dash is also used to denote the omission of letters, especially in what are called unprintable words. In the twentieth century it is the height of stupidity and hypocrisy to write D—n for damn; the word has now no connection with the Latin *damno,* when it is used as an exclamation of annoyance. Literary historians often speak of a work's being damned by the critics, and they simply mean that it is condemned.

Brackets.—Brackets should be used sparingly; they never improve the appearance of a printed page. They are used to denote a parenthesis—that is, a sentence standing apart from the sentence in which it is contained.

"Jones bought a motor car (he always said he would buy one), and when he attempted to drive it, he drove it into the river (he always said he *would* drive it into the river)." This sentence shows that the bracketed clause is thrown in as a kind of comment. Dashes may be used instead of brackets. "Jones bought a motor car—he always said he would buy one—and when," etc.

Quotation Marks.—As the names implies, quotation marks are used when words are quoted. In the sentence "Enough!" he cried, we place inverted commas round the word used by the man who spoke. In the sentence: Mr. Asquith said he could not introduce the bill, no quotation marks are needed, for we are not quoting the actual words Mr. Asquith used. Here is the *direct* speech: Mr. Asquith said "I cannot introduce the bill."

When a quotation comes within a quotation, single inverted commas are used:

Mr. Brown said: "Smith said to me 'You are no gentleman, Brown,' and I threw a brick at him."

Quotation marks are the joy of the literary coward. A man will write: Mr. Brown had just risen to address the meeting when a volley of potatoes came from the rural audience. One "spud" made its mark on Mr. Brown's immaculate shirt-front.

The quotation marks round the word *spud* mean "Forgive me for using this vulgar word; I am trying to explain that these vulgar rustics say *spud* instead of *potato.* The quotation marks show that I am quoting; I should never think of using the word myself."

The man is not only a coward; he is also an intellectual snob. If he has not the pluck to use the word *spud,* he ought not to place the responsibility for it on the shoulders of a long-suffering working-class.

When a word is used with a new meaning, inverted commas are generally placed round it. Newspapers used to write about someone's being sentenced to receive so many strokes with the "cat." The quotation marks meant "We do not mean the common domestic pet, you know. We refer to the instrument of torture." Nowadays, thanks to popular education, there is little chance of the public's mistaking one kind of cat for another, and the press has discarded the quotation marks.

Possibly most people would write "Do you 'rag'?" meaning "Do you dance rag-time?" Here there is some justification for the quotation marks. *Rag* has another meaning, *annoy,* as in the phase "The army ragging case," and confusion might arise. In America, where a student's rag is called a *haze,* the word *rag* might be used without quotation marks for "dance in rag-time."

The Hyphen.—Certain words are usually joined by a hyphen. Thus we always write *walking-stick, Anglo-Saxon, Franco-Prussian,*

rowing-boat, boxing-gloves. Boxing gloves would be gloves that box: a walking stick would be a stick that walks.

It is extremely difficult to lay down definite laws for the hyphen. Obviously a *bookcase* is better than a book-case; but is *Indian-ink* better than *Indian ink?* It is; *Indian ink* is ink made in India, but *Indian-ink* is a special drawing ink that has no connection with India or the Indians. Common sense must be the writer's guide. He will not write *paper weight* because that means a weight made of paper; he will write *paper-weight* or *paperweight.*

The present writer finds it most natural to write *prayer-book, boot-tree, inkbottle, rainproof-coat, window-blind, tobacco-jar, tobacco heart, toothbrush, tooth-powder, gum-arabic, blotting-paper, notepaper, pen-holder, motor-car, a street crossing* (but *street-crossing is dangerous*), *black-and-white drawing* (but a *black and white dress*), *gaslight, daylight, electric light.*

No one can say with authority that the above list is wrong; if a youth says "I prefer *motor car* to *motor-car,*" the present writer says "Good! use *motor car* if you prefer it."

Some writers write sentences like this:—"He owns dwelling- and lodging-houses," but the majority of writers say "dwelling-houses and lodging-houses."

The Apostrophe.—The apostrophe always denotes a letter or letters left out. Thus *can't* has the letters *n o* omitted; *don't* is short for *do not,* and the apostrophe shows that an *o* has been cut out. Only one writer, Mr. Bernard Shaw, has the temerity to reject the apostrophe; in his plays he writes *cant, wont, shouldnt.*

Young writers often ask this question: Shall I use words like *don't* in my writings? To such we answer: It all depends upon what you are writing. If you are writing a letter to a friend use *don'ts* and *won'ts* as often as you like. But if you are writing a formal article or book, you will be wise to avoid contractions. Personally we like them; they help forward a familiarity between the writer and the reader. Most important of all, they help to kill dignity in prose; dignified prose is like a dignified person—remote and austere. If you are a Shaw, or a Chesterton, or a Belloc, you can use contractions with impunity, but if you are sending in essays to English Masters or to University Professors, you will be wise to eschew all contractions.

Naturally much depends on the subject. An article for the *Quarterly Review* will avoid contractions, but an article in *London Opinion* will require them.

STYLE

When we say that a cricketer has a style we mean that he has a cultivated manner of batting. We apply the word "style" to artists, writers, boxers, jumpers, and many others, but we do not say that the coalman has a style of his own in shovelling coals, or that the cook has a style of her own in stirring a pot. Style, therefore, is associated with some art, and it is acquired by patient practice. The style of a Jessop is the result of long practice at the nets; the style of a Paderewski is the result of long practice of scales. But practice alone will not produce style; many cricketers never develop an individual style; many pianists remain mediocre technicians.

Clearly style depends upon the man; he must have a special aptitude—call it talent, genius, what you will—for his art, if practice is to make him a good stylist.

As it is in sport and music so is it in writing. Prose style is an art that can be cultivated. Style in cricket depends upon a natural aptitude for games, but style in writing depends upon something bigger than an aptitude; a man's prose style is the expression of his individuality.

Now a man may have a strong personality and yet lack the means of expressing it. The poet Burns has a good style when he expresses himself in Scots dialect, but his letters, written in English prose, appear to be the efforts of one trying to express his thoughts in a language that is strange to him. Gray speaks about a "mute inglorious Milton"; and no doubt in our villages to-day we have men who are stirred as deeply by a sunset as a Shelley might be, but who, for want of training, cannot express their feelings in words.

There is a tendency to attach too much importance to words. The coster who says to his sweetheart "I siy, 'Arriet, ain't that a stunnin' sunset?" possibly experiences as much elemental delight in beauty as the cultured lady who says "How glorious is this purple and gold!"

The language of prose differs from the language of conversation. Mr. Brown, a suburban gentleman, will remark to his wife "I'm tired of these confounded piano-organs, Mary. That's the fourth that's been here to-day. I'm sick of them, and I'm going to write to the papers about them." But when Mr. Brown sits down to write to the editor of the local paper, he pens a letter something like this:—

"SIR,—I hope that you will pardon my trespassing on your valuable space when I write to protest against the too frequent visits of piano-organs to our neighbourhood. As I write these words, the strains of a music-hall song, played on a piano-organ—the fourth since 10 A.M.—reach my ears, and I think I am justified," etc.

Note that Mr. Brown is not using the language of conversation. Now this letter suggests the individuality of the writer. Mr. Brown is a plain man who does not believe in airs and graces. He tells his story in plain language. He is not anxious about his style; his aim is to stop the visits of itinerant organ-grinders. He is no

great stylist; the hackneyed phrase "trespassing on your valuable space" damns the writing as prose at once.

Mr. Brown has a neighbour, Mr. White, who also writes a letter to the editor. His effort runs thus:

"DEAR Sir,—I beg to associate myself with the spirit of Mr. Brown's letter in last week's issue. It is a distressing circumstance that our secluded corner of the great Metropolis should suffer from a superfluity of raucous sounds which emanate from sundry meretriciously decorated instruments yclept piano-organs," etc.

Evidently, Mr. White is a pompous old gentleman who believes in big words and fancy phrasing. He no doubt speaks of Mr. Brown as "a man who can't write the King's English." Yet Mr. Brown is the better stylist. Mr. White's letter conveys the impression that he is trying to show off his knowledge of big words. His style is stilted, pretentious, foolish. Introducing an obsolete poetic word like "yclept," which means "called," into a letter on piano-organs is like wearing morning-coat, brown boots, and a straw hat.

The young writer is inclined to follow the style of Mr. White. He writes "the Metropolis" instead of "London;" "the Emerald Isle" instead of "Ireland"; "automobile" for "motor-car"; and so on. He thinks that there are common words and special words, just as these are everyday clothes and Sunday clothes. But he does not realise that a fishwife in her working garb is infinitely superior, artistically, to a fishwife in her Sunday best.

Many writers of short stories in our magazines betray their horror of the common word. Where a simple "he said" would be appropriate, they write "he asseverated," "ventured he," "he vouchsafed," or some other stilted expression.

Fear of Common Words.—Daily Journalism has to some extent been responsible for the erroneous idea that the simple word is undesirable. A reporter, when writing up a football match, gives us something like the following:—"After the kick-off, the ball was carried down the field by the Wanderers' forwards. Dickson passed the sphere to Wilson, and the latter, navigating the leather past several opponents, crashed the cowhide far up among the meshes of the enemy's citadel." "Ball," he thinks, is good enough to begin with, but on no account must it be repeated; besides, in his opinion, the report is made picturesque by the words "sphere," "leather," "cowhide."

The frequent repetition of a word gives a sentence monotony, but our reporter forgets there are such things as pronouns. Let us take a simple statement and rewrite it in bad journalese:—

"The King will go to Balmoral next Saturday. It is believed that the Prime Minister will travel north with him and be his guest for a few days. The Queen will remain at Buckingham Palace."

Translated into the language of the second-rate press, this statement reads:

"The King will journey to his Highland home Balmoral, on Saturday. His Majesty will, we believe, be accompanied by the Premier, who will remain in the north for a few days as the guest of Royalty. Our Sovereign will not have the pleasure of his Royal Consort's company on this occasion, as Her Majesty will remain at Buckingham Palace." Fear of repetition seems to obsess all Fleet Street.

Yet repetition of a word will sometimes give a piece of prose emphasis.

"Napoleon might well have been afraid, but Napoleon did not know what fear was," is more forcible, more arresting than "Napoleon might well have been afraid, but he did not know what fear was." Write this sentence in bad journalese: "Napoleon might well have been afraid, but the famous Corsican did not know what fear was"—and you merely make it ambiguous to the young reader. Every reader is not aware of the fact that Napoleon was born in Corsica (*see* REPETITION, *infra*).

We do not contend that big words should never be used, nor do we condemn fine phrasing. The style should be suited to the subject. If I write a note to the gardener telling him to cut the grass on the back-green I do not write

"DEAR MR. JONES,—Please bring your keen blade and see to it that the sward is shorn of its luxuriance."

But if I write a romantic tale of chivalry, I may, with perfect propriety, refer to King Arthur's sword as his blade, and to the grass, where the knight lies mortally wounded, as the sward. Few would suggest that the poetical prose of Francis Thompson, in his monograph on Shelley, is aureate, and therefore bad.

There is a difference between poetical prose and flowery prose. A St. Andrews student—R. L. Mackie—in a description of St. Andrews, the city of his dreams, wrote these words:

"Sometimes I am a grey friar, who has renounced the world, with love and music and all its vanities, till one day a scent of roses is blown into my face, and I find myself weeping."

That is poetical prose, because the thought is a poetical one. Compare it with the following:—

"Lucy in vain sought the dreamy realms of Morpheus, but the dismal wail of feline wanderers kept recalling her to the stern realities of a grim world."

This is merely a flowery way of writing "Lucy could not sleep because of a cat's concert on the tiles."

The thought is commonplace; the cat's concert is a stock joke of the comic papers, and to call it "the dismal wail of feline wanderers"

is ludicrous. The above phrase at first appears to be a humorous exaggeration. Every schoolmaster and every editor knows that such phrases are dear to young writers. Floweriness of diction is often the result of lack of knowledge; the young writer is always ready to pad.

Perhaps we are not far from the truth if we say that most of the faults in prose style arise from poverty of thought and the resulting confusion of mind. One should not write unless one has something important to say. Schoolboys show much confusion of mind in their essays. A boy will write: "George Washington said, 'Father, I cannot tell a lie,' and he was the first president of America." He does not realise that the two statements cannot be connected in one sentence, unless humour is intended. When you read the sentence you think of the legend of the cherry tree and the little hatchet, then suddenly, your mind is carried over many years, and you try to think of a dignified gentleman of fifty-seven. You are invited to leap over a space of time that saw the turmoil of a great civil war, and the leap is too great. If there were any obvious connection between the two statements the sentence might be excused.

If a boy writes:—"Wellington, as a child, spent many hours playing with toy soldiers; and Wellington won the battle of Waterloo," he is not writing great prose. Yet he might contend that the two statements are related, for the whole sentence suggests that Wellington's early pastimes showed his bent for soldiering. But if the boy writes:—"Wellington, as a child, kept white mice; and Wellington won the battle of Waterloo," he will have considerable difficulty in producing a defence of his joining together two ludicrously incongruous assertions.

Confusion of thought is responsible for the type of sentence found under the heading "Correct the following sentences" in examination papers. Everyone knows the familiar "Piano for sale by a gentleman with carved legs." Correction of sentences like this should be done in the nursery, not in the examination room.

Prose Rhythm.—Good prose is always musical. Read aloud this passage from the Authorised Version of the Bible, a book full of great prose:—"How beautiful upon the mountains are the feet of him that bringeth good tidings, that publisheth peace, that bringeth good tidings of good, that publisheth salvation." In these words there are perfect rhythm and harmony.

Consider the following sentence:—

"He came upon the dark red sand, and gazed far out upon the sea." This can be scanned as two lines of verse:

He came | upon | the dark | red sand.

And gazed | far out | upon | the sea.

Any prose that scans like verse is bad; prose should have rhythm, not metre. Ruskin often falls from rhythm to metre. One of his sentences reads:—"And the gathering orange stain upon the edge of yonder western peak, reflects the sunsets of a thousand years." Observe the blank verse lines:

Upon | the edge | of yon | der west | ern peak,

Reflects | the sun | sets of | a thou | sand years.

No one should set out to write musical prose; the music should come of its own accord. Alliteration gives musical effect, but alliteration should never be used consciously. Here is a conscious and incidentally a poor attempt:

"With *h*ounds and *h*orn the *h*unters *m*ade for the *m*arshy *m*oor, whence the *f*rightened *f*ox had *f*led."

Assonance contributes music to prose, but it should come unbidden. Many proverbs rely on assonance for their rhythm, *e.g.* "A stitch in *time* saves *nine*." "Every *little* makes a *mickle*."

Tricks and Mannerisms: *Inversion.*—Words in an unusual order are sometimes used as a trick in style. Modern novelists are writing sentences like this:—"Came a day when I realised," etc. This kind of inversion is not yet accepted as current coin; possibly it will never be accepted, for writing "Came a day" instead of "A day came" appears to be an idle mannerism with no definite merit.

Inversion often has a set purpose. A newspaper report of a social function will run thus: "Among those present were Mr. and Mrs. Brown, Mr. White, Miss Thomson, etc." If the account ran: "Mr. and Mrs. Brown, Mr. White, Miss Thomson, Mrs. Green, etc., were among those present," the reader would have to read a column of names before he discovered the reason of their publication.

Metaphor.—Young writers like to use metaphors. The undergraduate is very proud of himself when he commences an essay on Edward III's Wars, thus:—

"'Mighty events turn on a straw,' says Carlyle, 'the crossing of a brook decides the conquest of the world.' Can we apply Carlyle's dictum to the Wars of Edward III? We cannot. We cannot glean any straw from the field of circumstance; we cannot point to any river in Edward III's path and say "This is the Rubicon.'" This is no exaggeration of stilted rhetoric; the present writer wrote these very words when an undergraduate.

Metaphors are dangerous to handle, especially when used by inexperienced writers. It is easy to speak of a statesman as a pilot steering the ship of State through a troubled sea, or of a clergyman as a shepherd leading his flock; but these are hackneyed metaphors.

The young writer should not strive to make elaborate metaphors; if he does, he will surely fall. Many a student has invented metaphors that raise laughter. Examples of mixed metaphors are :—

"He sowed his wild oats, but they came home to roost"; "To take arms against a sea of troubles" (Shakespeare); "I refuse to be saddled with a sinking ship."

An essayist recently wrote this sentence :—"The idle rich are parasites preying on the carcase of a dead civilisation." Now, to call the idle rich parasites is good, but to speak of parasites as *preying* is not so good. We speak of an eagle's prey or a tiger's prey, but we do not as a rule speak of insects' prey. Again, a carcase is a dead body, hence the adjective *dead* before *civilisation* is superfluous. Moreover, our modern civilisation is not dead; it is merely asleep. If the essayist felt that he *had* to use a metaphor he might have written: "The idle rich are the drones of the hive; they eat the honey that the workers have gathered and give no labour in return." Both *parasites* and *drones* are common expressions for "the idle rich," but they are too apposite to merit the epithet "hackneyed."

Repetition.—Repetition may be used for clearness, but as a rule it is an orator's trick for procuring emphasis. We have all heard this sort of speech: "The Liberal Party, gentlemen, stands for liberty; the Liberal Party stands for equality; the Liberal Party stands for fraternity." In writing, repetition like this should be avoided. Pronouns usually do away with the necessity to repeat, but pronouns do not always avail. In the sentence: "Thomson asked Jones about Smith. He said he was going to Brighton for a month," there is a want of clearness. Does the first *He* refer to Thomson, Jones, or Smith? Write the sentence: "Thomson asked Jones about Smith. Jones said that Smith was going to Brighton for a month," and you have clearness.

Repetition for emphasis is a common device in prose style. A simple statement, "The nation made him a hero and then a god," is more emphatic if written "The nation made him a hero, and then it made him a god."

Balance.—Let us study the following sentence: "Among those present were M. Paderewski, the celebrated pianist, Mr. George Bernard Shaw, the brilliant wit and dramatist, Mr. David Devant, the great illusionist, and Mr. John Smith." Evidently Mr. Smith is not famous at all, or is so well known that description is needless. Whatever the reason for omitting any distinguishing characteristic of Mr. Smith may be, the whole sentence is inartistic. Something is lacking; if it had ended "and Mr. John Smith the local butcher" the rhythm of the whole sentence had been complete, although the matter of the sentence had been puzzling.

Take another instance: "In the Middle Ages men believed in kingship with all its pomp and pageantry; in modern times men believe in democracy." There is a lack of balance here; we have added a descriptive phrase to *kingship*, but not to *democracy*. And the force of the sentence lies in the antithesis of *kingship* and *democracy*. Rewrite thus:—"In the Middle Ages men believed in kingship with all its pomp and pageantry; in modern times men believe in democracy with all its sham and shoddy," and the two halves are balanced.

Mechanics of Style.—A sentence beginning with "And" will often lend grace to style, especially when "and" is equivalent to "Moreover," *e.g.* "The Elizabethan playwrights gave to the drama an extravagance it had never known before. And extravagance was the one thing the drama required."

A series of "ands" gives a sweet simplicity to a romantic narrative. This might be the conclusion of a romantic tale :—

"And hand in hand the lovers wandered by the quiet stream. Joy was in their hearts, and laughter on their lips. And for them time stood still. Love had come to them, and Love recks not of time. Love is for all eternity."

The repetition of "and" lends a quietness to prose of this kind. The student should read in Malory's *Morte d'Arthur* or in Maundeville's book of travels. These writers use "and" as a child uses it in telling a story; and the result is a delightful simplicity and charm. One modern writer, Mary Johnson, the writer of tales of Virginia, is an artist in the use of "and." Read *By Order of the Company*, and you will find that much of its charm depends on the archaic arrangement of sentences.

Study the writings of authors like Stevenson and Shelley if you want to discover great style. The former almost always uses the correct word; the latter in his letters shows what rhythmical prose should be.

The prefaces of Bernard Shaw are good as a specimen of modern prose. Compare his style with that of any noted writer of the nineteenth century, and you will find that style is a mere incident with him. He has no airs and graces; he has something to say, and he says it forcibly and well. In his case the style is the man; his prose betrays his personality.

HISTORY OF ENGLISH POETRY

Early English Period.—The Anglo-Saxon invaders of Britain were of various races. It is known that Jutes were among the number, and philologists think that Frisians came over also. These invaders brought with them the stories extant in West Teutonic civilisation. Their stories were not written: they were handed on orally, and they were sung by minstrels or

scops. There must have been hundreds of these poems, but only a few are preserved.

Widsith, the first English poem, is an account of a minstrel's wanderings. But the most valuable Old English poem is *Beowulf*, an epic. This poem tells of the exploits of a hero Beowulf. and the scene is laid probably in Denmark. It is clearly the product of a civilisation that liked hard fighting and bloodshed. Beowulf does some marvellous feats, and he tells delightfully tall stories about his previous deeds of prowess. Read the poem—good translations are numerous—and you will learn much about the customs of our forefathers. The tale is well told: you actually see the mead-benches and the hard-drinking warriors; you see the monster Grendel stalking through the banqueting hall; you hear the clash of arms. There is no personal note, no lyric in *Beowulf*. The early Saxons were not introspective; they liked a rattling tale of doughty deeds.

The only approach to lyric, that is expression of passionate personal feeling, in Old English is the *Complaint of Deor*. Deor is a minstrel whose rival has been preferred before him, and his "Complaint" is evidently heart-felt.

These three poems are *pre-conquest* poems; they were known to the Anglo-Saxons before they invaded Britain.

A glance at an Old English (O. E.) poem will show that it differs greatly from a modern poem. The O. E. language is unreadable to anyone save a specialist. It is not commonplace or prosaic; in *Beowulf* we find the sea called the "'whale's path," the "swan's road," the "seal's bath," etc. And the arrangement of the language is quite different from the arrangement of modern poetry. There is no rhyme, nor are the verse lines of any definite length. The chief characteristic of O. E. verse is its alliteration; generally two words in the first half of the line, and one in the second half begin with the same consonant, and these alliterated syllables are emphasized in reading the poetry. There is no idea of compression. The poets practised extended narrative, long-winded parallel phrases, circumlocution and repetition. Many phrases are part of the stock-in-trade of the minstrel, and are used without meaning. In *Beowulf*, for instance, Hrothgar knows where Grendel's den is, yet he says "I know not whither she has gone." Emphasis is gained by repetition; in *Beowulf*, line 1431, we have "they heard the sound of a horn. The horn sounded." Sometimes the same idea is repeated in different words four or five times. All these stock phrases are known as *Kennings*, and as a rule they are mere padding.

Beowulf gives us much information about the minstrel. Possibly in the earliest times there was no profession of minstrels. Kings often were minstrels; King Hrothgar takes the harp twice; later we find King Alfred disguising himself as a minstrel and entering the Danish camp; in Norse Sagas kings often act as minstrels.

The main duty of the minstrel was to transmit news; *Beowulf* hears of Grendel in song. He had also to celebrate any deed of valour done by his chief, and we generally find him flattering his lord. He was always of noble descent, but towards the end of the O. E. period he degenerated. The minstrel of the Middle Ages was the descendant of the Roman actors, and was a kind of acrobat or a pantomimist.

Widsith, *Deor*, and *Beowulf* are heathen in origin, but most O. E. poetry is Christian in subject. To appreciate the O. E. religious poems we must understand what Christianity meant to the Anglo-Saxons. The Teutonic warrior did not understand theology; what appealed to him was the pomp and circumstance of Christianity. The Roman bishop had an imposing retinue; he càme to Britain under Imperial authority. For centuries paganism and Christianity existed side by side; the warrior took the simple plan of adding God to his other deities. The Twelve Apostles were described as "Nobles round a ring-giver"; later, in Middle English romances, the Twelve are gallants. The Devil was the greatest warrior of all. The Anglo-Saxons borrowed the language of Christianity, but the meaning to them remained pagan. For example, "Providence" was used with the O. E. meaning *wyrd*, "relentless fate."

The names associated with the post-conquest religious poems are those of Caedmon and Cynewulf, but nothing definite is known about the authorship of the poems. There are many lives of saints, full of miraculous happenings. *Juliana*, of which there are translations, is a typical "Life"; it shows how credulous and elemental the early Teutonic Christians were.

To this time belong a few secular poems—the *Wanderer*, the *Ruin*, the *Seafarer*. These three poems are full of fine description.

The invasion of the Northmen practically killed O. E. poetry. After Alfred the Great's time we have very few poems. The best known are the *Song of Brunanburgh* (937), which tells of Athelstan's victory over the Northmen, and the *Battle of Maldon*.

Norman Conquest to Chaucer (1066–1400).—In the English language section we have seen how the coming of the Normans influenced our language. Many people vaguely imagine that the Normans brought French poetry with them. There was little or no French poetry to bring. Long before 1066 the O. E. verse was breaking down, and the new poetry was taking its place. The Latin hymns of the Church were familiarising people's ears with definite metre and rhyme. French had followed the Latin style, and when Provençal lyric arose it greatly influenced the prosody of English poetry.

Between 1066 and 1200 we have no poetry at

all, but soon after 1200 we have Layamon's famous poem, the *Brut* or British History, in reality a romance. This poem is of the highest importance prosodically, for it shows clearly the transition from O. E. prosody to metre and rhyme. The poet often forgets his O. E. alliteration and its accents, and uses rhyme. The *Ormulum*, the *Proverbs of Alfred*, the *Proverbs of Hendyng*, *The Fowl and the Nightingale*, *Genesis and Exodus* all show the transition between the O. E. verse and the modern metre.

The O. E. alliterative verse did not die without a struggle. The *Pearl*, *Patience*, *Cleanness*, *Gawain and the Green Knight*, and lastly Langland's *Piers Plowman* all belong to the alliterative camp.

Before Chaucer's time there was a period of romance writing, but nearly every romance was a translation or adaptation from the French. When the Roman theatres were destroyed, the *mimus* became a travelling "turn." From the eleventh to the fourteenth century the *mimi* were welcomed everywhere, although most of them were poor and thriftless. In late fourteenth century they formed guilds, and the Church patronised them.

The Romance.—Medieval Romance arose in France. Verse romance dealt with all subjects—classical subjects, folk-lore, etc.—and each romance was invented by various authors. The chief subjects were love and chivalry, and they usually ran in cycles. Thus we have the Round Table or Arthurian Cycle and the Charlemagne Cycle. Now these romances differ fundamentally from the *Beowulf* type of epic. There is no love in *Beowulf*; the hero's strength does not come from love for a cause, but from brute force, elemental thirst for slaughter. *Beowulf* does not fight for God or for woman. Yet in the O. E. epic, although we find stiff court etiquette, the poor are not despised.

In the romance proper we at once meet with chivalry and its concomitant snobbery. The hero is inspired by a lady-love, and, like a true aristocrat, he believes in the importance of social status.

The *chansons de geste* and the *Song of Roland* mark a transition stage between the *Beowulf* and the *Arthurian Cycle*. In *Roland* woman plays a small part, and courtesy is not mentioned. The *chansons* differ from *Beowulf* in that their warriors do not fight for fighting's sake; Christianity is fought for, and faith gives the warrior superiority. It is curious that a "hero" in those days had no definite nationality. Roland's story was handled in Germany and Italy, and a group of Norse sagas grew up round the story.

Whenever we come to Arthurian romance we are in romance proper. Pageantry, sumptuousness, and colour are dwelt upon. In *Beowulf* the emphasis was on war, in the *chansons de geste* on war for a cause; in the Arthurian Cycle all the emphasis is on love. *Beowulf* and *Roland* were both founded on history; Arthur's story was founded on a general legend of a hero. This late romance was idealistic; Arthur's knights all represent Virtue.

We may appreciate Chaucer if we do not know romances like *Havelok the Dane*, *King Horn*, *Guy of Warwick*, *Bevis of Hampton*, but we cannot understand him unless we realise the great importance of the *Roman de la Rose* and its influence on English poetry. The *Roman de la Rose* is an allegory which coloured English poetry for about three hundred years. It is the work of two French poets. The first part, by Guillaume de Lorris (*d.* 1260) is a poem of love and chivalry. It tells of a dream—a garden on a May morning, a company of fair folk, a carol, and is full of gorgeous colour. The second part, by Jean de Meung (*d.* 1320), is in violent contrast to the romantic Lorris's work. It is full of satire on politics and morals. We shall see that most English poets followed the "dream" tradition, but we shall find bold spirits who followed Jean de Meung's realistic method.

Lyrics.—As the Romance followed French models so did the English Lyric follow the troubadours of Provence and the trouvères of Northern France. It is significant that some of our earlier lyrics show the English and the French versions side by side. Perhaps the earliest English lyric is the *Cuckoo Song* beginning "Sumer is icumen in." The musical importance of the canon in form is a striking parallel. See MUSIC (pp. 383–414). At the same time another kind of lyric throve—the lyric of satire. Lawrence Minot, a poet with a marvellous command of verse forms, shows this kind of lyric at its best. The importance of Minot is that he explains Chaucer; he shows what kinds of verse Chaucer had before him.

Chaucer (1340–1400).—The poetry we have been discussing was for the most part second-rate work. It was struggling to find good metres, and the changing of language forms resulted in poets not knowing where they were. English poetry needed a poet who would reduce its warring elements to harmony, and it found that poet in Chaucer. He used many different stanzas, the heroic couplet and other measures, and in each his words flow smoothly and perfectly.

Although printing was unknown in his time, Chaucer knew much of the literature before him. He makes fun of the more foolish romances in his *Rime of Sir Thopas*; he refers to alliterative poems as *rum ram ruf*.

In subject matter and style he began by following the *Romance of the Rose* tradition, and it should be noted that the *Rose* was a hundred years old when Chaucer translated it.

Chaucer's work is sometimes divided into three periods: I. Period of French Influence;

II. Period of Italian Influence; III. Period when he becomes wholly English. The division is only roughly true. He visited Italy often, and was much influenced by the works of Petrarch and Boccaccio. Probably Boccaccio's narratives led Chaucer to break away from the *Rose* tradition. At any rate he did break with the *Rose* tradition. His *Book of the Duchess, Parliament of Fowls, House of Fame* all follow the manner of Guillaume de Lorris; all have the artificial "dream" allegory. But in *Troilus and Cressida* Chaucer has caught the manner of Jean de Meung; he ceases to idealise woman, and represents her as fickle, sensuous, and dangerous. Queen Anne of Bohemia remonstrated with him about his realistic treatment of woman, and Chaucer wrote, as penance, *The Legend of Good Women*, a poem in the old de Lorris manner. *Troilus* belongs to his Italian Period, the *Legend* was written just before the *Canterbury Tales*. We may conclude therefore that Chaucer never got away from French influence.

His greatest work is the *Canterbury Tales*. A band of pilgrims sets out for Canterbury, and on the way each one tells a tale. Possibly Chaucer got the idea from Boccaccio's *Decameron*. The great importance of the *Canterbury Tales* lies in the fact that they form an excellent gallery of portraits. Previous poetry practically ignored "drawing from life"; poets wrote paraphrases of Scripture like *Genesis and Exodus*, romances like *King Horn*, allegories of the *Rose* variety, but all these were divorced from real life. You read a medieval romance, and the hero does not *live;* but in the *Canterbury Tales* each character is real, you feel that you could talk to the Miller or the Monk.

Chaucer had no definite message. He did not set out to preach a gospel; all he cared for was the *Art* of story-telling, the *Art* of poetry.

For many years English and especially Scottish poets copied Chaucer, but there are two poets of the period who cannot be classed as Chaucerians; these were Langland and Gower.

Langland.—*The Vision of Piers Plowman* is, as we noted above, a continuance of the O. E. alliterative poetry. It is a long confused allegory, and its importance lies not so much in its poetry, for Langland was no great poet, as in its matter. Langland was a reformer. Chaucer satirised society in a genial way, but in the main he thought society good. Langland satirised society because he saw its rottenness. He thinks that the evils of society will be redeemed if squire and vassal, clerk and layman understand their proper duty. He is no socialist; the existing form of government is good enough for him if its abuses are abolished.

Gower.—Chaucer was a man of genius: Gower was a man of talent. He began by writing French, then Latin, and finally English verse. He stuck to his French models, and used the octosyllabic line with the French lack of freedom, thus gaining the title of "Correct" poet. His *Confessio Amantis* begins in the *Rose* manner, and rambles into various classical and medieval tales. But the book lacks enthusiasm and humour; even its love scene leaves one cold.

From Chaucer to Spenser: *The English Chaucerians.*—The poets who followed Chaucer and avowed themselves imitators of the "Master" were at best mediocre poets, at worst atrocious versifiers. The poets from Lydgate to Hawes seem to lack a sense of music and rhythm. Lydgate, Occleve, and Hawes are the worst offenders. The most interesting of the lot is Skelton, who wrote frank "doggerel." He tried all forms of verse, but, without genius, could not keep his "free" verse from clumsiness.

Early Scottish Poetry and the Scottish Chaucerians.—Scottish poetry was late in being born. The only poetry that could have arisen would have sprung from the Lowlands, where a Northern English dialect was spoken, but the fury of the Danish invasion prevented any poetic outburst. Then in the stress of the War of Scottish Independence literature had no chance to flourish. The first Scottish poem is Barbour's *Brus*, a rhyming chronicle rather than a poem. Blind Harry's long poem *Sir William Wallace* is a kind of *chanson de geste*, full of improbable incidents. Barbour shows no hatred to England in his patriotism; Blind Harry's patriotism is coloured by hot hate of the Southerner.

In the Golden Age of Scottish poetry patriotism is seldom seen in poems. Henryson, Dunbar, Douglas, and other Scottish Chaucerians, set out to follow the *Rose* tradition in subject, and Chaucer, Lydgate, and Gower in manner. It is a strange circumstance that they admired Lydgate and Gower equally with Chaucer.

It should be remembered that Middle Scots was an artificial, literary language which was never spoken, and that the Scottish poets always called their language "Inglis." Dunbar sneers at the poet Kennedy for using Gaelic or "Erse."

Roughly, the difference between the English and the Scottish Chaucerians is that the former follow the de Lorris—*i.e.* the chivalrous, idealistic part of the *Rose*—while the latter write in the satiric style of Jean de Meung's part of the *Rose*.

James I.—It is doubtful if the *King's Quair* was written by James I of Scotland, but modern criticism is inclined to consider his claim valid. It is an allegory of the *Rose* variety, with its dream and garden and its fair lady. The poem has much of Chaucer's cheerfulness, and not a little of Gower's didactic moralising.

Henryson.—Henryson (*b.* 1425) is the best of Chaucer's disciples. Like James I, he uses the allegory, but his poems show a desire for something freer. In the *Garment of Good Ladies* he

uses allegory combined with ballad form, and is evidently more concerned with art than moralising. In the *Bluidy Sark*, in ballad stanzas, he drops allegory altogether. His best known work is the *Testament of Cresseide*, which undertakes to complete Chaucer's *Troilus*. Henryson makes Cresseide a leper; Troilus passes and gives her alms, neither recognising the other. When she discovers his identity she dies. Here we have a grim realism greater than Chaucer's; a stern sense of justice and of doom not found in Chaucer.

The *Fables* are Henryson's best work. In them he tells in his own way some of Æsop's fables. To each he adds a *moralitas*, for he could hardly get away from the idea that art should teach as well as delight. Of great importance are his descriptive touches. Chaucer's described *man:* he was not a nature poet. The *Rose* followers described conventional, artificial landscapes and animals. Henryson breaks away from this: he describes scenes and animals known to him.

Robyn and Makyne, a pastoral, is great. A pastoral to Vergil and Petrarch was a poem in which shepherds and shepherdesses were used to satirise town life, the clergy, etc., and in Milton's *Lycidas* we find the ancient idea of satire and invective. Henryson breaks away from this tradition, and writes a real pastoral.

Dunbar.—Some people contend that Dunbar (*b.* 1460) is the greatest Scottish poet. Like the others, he is affected by the *Rose* tradition; his *Golden Targe* and the *Thistle and the Rose* have the "May morning" business, but, in both, Dunbar uses the allegory as a background for painting on. In short, he drops spiritual allegory for art.

As a grim humorist he is great. *The Twa Maryit Wemen and the Wedo* is coarse; it has not the subtle humour nor the acuteness of perception of Chaucer, but it has passion and breadth.

The Ballad of Kind Kyttok, the tale of an old wife's amusing adventures at Heaven's gate, gives us a good idea of Dunbar's "modernism"; it has a demonic humour found only in Dunbar, Burns, and Byron (in his *Vision of Judgment*).

Dunbar is a master of verse forms; he uses "aureate," *i.e.* coloured diction, and develops a rich pictorial style. He is a great satirist, but he never writes to reform abuses. In short, he is an artist, not a moralist.

Douglas.—The last of the four great Scottish poets is Douglas (*b.* 1474), best known for his *Æneid*. He wrote the *Palice of Honour*, a *Rose* allegory, but he innovated by mixing classical mythology with religion. *King Hart* is a moral allegory of the *Piers Plowman* type. His best work is his *Prologues* in his translation of Vergil. In the main he is of the old school; he looks back to Chaucer rather than forward to Spenser, and the Renaissance.

Lindsay.—The poet Lindsay was born in 1490. He was a reformer, the poor man's friend; he hated hypocrisy and satirised it fiercely. His allegory is a thin cloak that hides satire on medievalism. His poetry is founded on the misgovernance of Scotland. His greatest work is *The Satire of the Three Estates*. His art is uncouth; he is a politician and preacher rather than a poet.

Nature in Scottish Poetry.—We have seen a gradual breaking away from the sentimental idealism of the *Rose* allegory. In allegory nature was purely conventional; the sun always shone; there were no clouds. The *King's Quair* is nearly all sun and convention. Henryson in his *Fables* gives a vivid picture of autumn and winter and cloud—the first example of realism. Douglas in his seventh prologue paints a nature-picture of dread and awe. In the main the Scottish poets make for realism in nature studies; they paint nature as it is, not as they want it to be.

English Ballads, Carols, and Lyrics.—A ballad is usually a tale told in verse, *e.g.* Henryson's *Bluidy Sark*. All ballads are probably broken down epics and romances; many of them are for certain. And they are seldom earlier than the fifteenth century. Scottish ballads are better than English ones. The reason for this is that in England printing was established, and the ballads were stereotyped. In Scotland they were collected late, after long years of polish in being handed down orally. They dealt with all stories—romances, love stories, local tragedies, etc.

These ballads familiarised the people with ballad measure, and at the time when Lydgate and Occleve were stumbling in bad verse, people must have known the rattling rhythm of good ballads.

In the fifteenth century too carols were popular. Ballads were recited; carols were sung to music. The ballad had many subjects and few metres, but the carol, limited to a religious subject, sought variety in form.

In the Mystery Plays, Moralities, and Interludes (*see* DRAMA, p. 134) snatches of lyric appeared, and as drama was popular, the lyrics of these plays must have assisted ballads and carols to rescue poetry from the hopeless verse of the Chaucerians.

Italian Influence.—Wyatt and Surrey are usually coupled together as the poets who introduced Italian influence. But the credit belongs to Wyatt. He introduced from Italy the sonnet and various lyric measures. He tried hard to perfect the loose verse left as legacy by the Chaucerians, but his success was not complete. Surrey completed his work. Wyatt would pronounce "suffer" as "suffér" if rhyme required it, thereby following Chaucer; Surrey

insisted on each word's having its proper standard. His verse is a great advance on Wyatt's. Moreover, he is famous as the introducer of blank verse.

Wyatt and Surrey gave English verse strictness, and this strictness obtained until Spenser's time. Gascoigne used blank verse in the *Steel Glass*, but his chief title to notice is his being the author of *Instructions*, a book telling poets to "keep the measure" in writing verse.

Sackville shows the result of Wyatt and Surrey's teaching; in his poetry is the new music and freedom of the Renaissance. And Sir Philip Sidney in his *Stella* sonnets is far beyond the rude attempts of the reformers.

Spenser.—As Chaucer perfected the mediocre verse of his predecessors, so Spenser took up the verse of the reformers, Wyatt, Surrey, Sackville, and perfected it. In the *Shepherd's Calendar* you find him experimenting with diction and metre. He uses archaic and dialect words, hence we find Ben Jonson saying that Spenser "in imitating the ancients writ no language." In his masterpiece the *Faërie Queene* he shows the results of his experiments—perfect music and diction. Many of the passages are full of purple and gold.

In subject the *Faërie Queene* is an allegory—to many readers, it must be admitted, a tiresome allegory. It is full of knights-errant and villains, chaste women and bad women. And like a true romance it shows that good always triumphs; Spenser is no realist. He idealises Queen Elizabeth, possibly the least ideal women in history. He had no definite message as Langland had: allegory was to him a mere framework for his glorious word-pictures. In Spenser's work subject is of no account; the treatment is everything. Hence his greatness lies in his pictures and music. He is the forerunner of poets like Keats who love beauty for its own sake, rather than of poets like Blake and Shelley who have beauty and a vision.

From Spenser to Milton.—The poets immediately following Spenser are usually called the Spenserians, but the appellation is misleading, for two other poets influenced the poetry of the seventeenth century. They were Donne and Ben Jonson.

Donne.—Most writers call Donne the head of the "Metaphysical School of Poetry." "Metaphysical" here means "beyond the physical." Hence Metaphysical poetry strove to give words and phrases a meaning beyond their obvious meaning. Donne's own poetry is full of passion and fine music, but his imitators carried the Metaphysical poetry to ludicrous extremes.

Donne is a good example of the intellectual Renaissance wit, as shown by his mathematical analogies and classical phraseology. Spenser shows Gothic art; his is beautiful. Donne on the other hand is clever; he looks on verse as a task, but he performs his task excellently. The reader should turn to the articles on ART for a full discussion of the Renaissance, and all that it meant.

Ben Jonson.—Jonson is usually spoken of as a classical poet, "classical" referring to Greek and Latin. The main characteristic of Greek literature is its moderation; it has no excess, no ornament for ornament's sake. Romantic literature is very different; think of the French romances with their jumble of incident, their lack of unity. Spenser's *Faërie Queene* is unclassical; it has all the exuberance of romance. So when we call Ben a classical poet we mean that he eschewed excess of ornament. He copied the balance and "correctness" of the classics, and hated extravagance. His well-known song "Drink to me only" has nothing far-fetched about it; it is simple.

The Influence of the Great Three.—We may say with some truth that Spenser followed Italian, Ben followed the classics, and Donne followed neither. The Fletchers—Giles and Phineas, Browne and Wither show the influence of all three. Carew, Suckling, Lovelace, and Herrick are disciples of Ben. They retained his classical form but they introduced sentimentalism and "conceits" (*i.e.* extravagant fancies) of the Metaphysical school of Donne.

Compare Suckling's "I prithee send me back my heart" with Ben's "Drink to me only," and you will find Suckling's poem rather trite and "conceited." But Herrick beats Ben in grace and compression.

Donne's followers included Herbert, Vaughan, and Crashaw, but these poets also owe something to Spenser's music and Ben's simplicity. The Metaphysical school was in the main bad. When Crashaw writes of a lady's eyes as "walking baths, compendious oceans," poetry is evidently in a bad way.

Euphuism.—In Elizabethan times there was a great vogue of extravagant language and thought. Other countries suffered from the same trouble. In Italy Marini popularised extravagant writing. Euphuism in England was the equivalent of Marinism in Italy. The name arose from John Lyly's *Euphues*, a novel full of excessive alliteration, far-fetched "conceits," and extraordinary similes. Euphuism became fashionable, and, as we shall see under DRAMA, Shakespeare and others came under its influence. Euphuism in prose and the Metaphysical in poetry are the main features of the period.

Shakespeare.—It seems foolish to place Shakespeare after Herrick in a discussion of poetry. Our reason for doing so is that Shakespeare stands apart from any school.

Shakespeare the dramatist we discuss elsewhere; here we are concerned with the poet. No one denies that he is of the highest rank poet. The blank verse of his plays is magni-

ficent; his lyrics and sonnets are unsurpassable in their music and painting; his poetical imagination, at least in his later works, is unlimited. Under DRAMA we discuss Shakespeare's philosophy and message (p. 136). His importance in the history of poesy lies in the fact that he perfected the form of poetry, having for one thing absolute confidence in his language. He has more freedom than Spenser. He follows no rules as Gascoigne did; his guide is his ear. Hence we find his lyrics tripping along in all kinds of measures, his blank verse ignoring all conventional pauses and running on in paragraphs. Before him Marlowe, Peele, Greene, and other dramatists used blank verse; but, on the whole, without freedom. They were apt to stop at the end of each line, to bring the pause (cæsura) in at a fixed point in the line, to use ordinary feet like the iamb and the trochee and to ignore feet of three syllables (trisyllabic feet). Shakespeare when he began was conventional too, but he soon sought freedom in his blank verse.

The Decline of Blank Verse.—In his late plays, *e.g. The Tempest,* Shakespeare's blank verse becomes too free; it uses much redundance, *i.e.* an extra syllable at the end of each line. Beaumont and Fletcher show the same fault, only more so. The later poets Davenant and Suckling exaggerate this freedom until their blank becomes a kind of prose.

Elizabethan Lyric.—In the late years of the sixteenth century a great lyric outburst occurred. At this time many wrote verse for private circulation, and these verses sometimes found their way into miscellanies. An early Miscellany is the *Paradise of Dainty Devices* (1576), but in it is very little lyric. The *Gorgeous Gallery of Gallant Inventions* contains much rubbish, as its euphuistic title might suggest.

About 1588 three musicians, Byrd, Tallis, and Dowland wrote songs, and these men, along with musicians like Morley, Jones, and Orlando Gibbons, lent to lyric the charm of music. Sidney, Lyly, and Peele had written delightful lyrics before this, but until the musicians came lyric was not always musical. Campion, the great lyrist, was a skilled musician. Students should read Mr. Bullen's edition of the late miscellanies, *England's Helicon* (1601) and Davison's *Poetical Rhapsody* (1602), but the ordinary reader will find the *Golden Treasury of Songs and Lyrics* a most companionable volume.

Summary.—Between Spenser and Milton we find lyric thriving and blank verse decaying. The character of the Elizabethan Age is better discussed under DRAMA, but we may learn something from the poetry of the period. Elizabethan poetry is not didactic; the poet has no message to teach, no "reform" to preach. He is content with life and society, and does not concern himself with prophesying. Realism is conquered by romance. Idealisation of woman and the search for euphuistic conceits go hand in hand. The glory of the period is its song; sometimes it is extravagant, often it is simple in its beauty. England under the Tudors was no Paradise, but Elizabethan song makes it one. The robbing of the peasants under the system of "enclosures" does not seem to have inspired any one to voice their wrongs in song. The poets have eyes only for their lady-loves; their poems are individual, not communistic. Patriotism was not often expressed. Daniel wrote historical poems. Drayton wrote *The Ballad of Agincourt,* a fine war song, but Drayton is at his best in his great sonnet "Since there's no help, come, let us kiss and part"—an expression of personal, not national emotion.

Milton.—We have seen that Chaucer, Spenser, and Shakespeare came to redeem the comparatively bad verse of their predecessors. Milton is the fourth great redeemer of English verse. The blank verse of Shakespeare's successors was weak stuff; lyric alone was good. Milton practically ignored the lighter lyric, but he made of blank verse something grand and noble. Hitherto blank had been dramatic only; Milton used it for epic. He gave to poetry a glorious poetic diction and the great Miltonic organ-music.

In his early poems we see the influence of Spenser and Donne, but he soon leaves behind the exuberant style of the romantic and becomes Vergilian. In nature he was austere and religious in a Puritan sense, and the sumptuous excess of Romanticism was foreign to his nature. He is not medieval; the mere fact that he contemns the Church—a medieval institution—shows that he is a heretic. His "modernism" is treated under PROSE (p. 127).

Milton is a poet of manner rather than of matter. In *L'Allegro* or *Il Penseroso* the subject does not matter; the beauty lies in the treatment. So in *Lycidas,* an elegy on the death of his friend King, he chooses the conventional pastoral, and uses it to attack the Church. Pastorals originally were poems contrasting the free life of shepherds with the meretricious joys of the town-dweller. Poets began to put critical remarks in the shepherd's mouths, so that the pastoral became a kind of satire.

Again, in the great epic *Paradise Lost* and in *Paradise Regained,* the story is of less importance than the manner of its telling. The majesty of the theme, the music of the verses with their euphonious proper names, the thunder of the mighty battles—these give the epic its grandeur. One feature of the story is of high importance—the character of Satan, the real hero of the epic.

Milton's sonnets are important historically. Before his time sonnets usually treated of Love, and were, as a rule, written in sequences. Milton used the sonnet for any subject that occurred

to him. Some of his sonnets are poor; others, *e.g. On his Blindness*, and *On the Massacre in Piemont*, are of the highest rank.

From Milton to Pope.—It should be remembered that the metaphysical poets, Crashaw, Herbert, and Vaughan and the Caroline lyrists Lovelace, Herrick, Carew, and Suckling flourished during Milton's lifetime. Practically all poetry was tinged with metaphysical "conceits." The lyrists kept Ben's classical form, but added fantastic "conceits." One feels that they do not feel deeply; when Carew writes about a fly that blew into the eye of his mistress, and suggests that Love attracted the fly, we know that simple sentiment has been superseded by fanciful sentimentalism. Marvel, who lived a little later, could play the Miltonic trumpet and Caroline flute with equal mastery. In Herrick and Suckling we find a departure from the romantic influence of Provençal love-lyrics. Herrick has no suggestion of the service to woman found in chivalry; and Suckling rejects the chivalric respect for women. It may be said generally that from Ben's time the influence of Anacreon, Catullus, and Horace superseded Petrarchian romanticism in lyric.

Of high importance is the change in the form of verse. The Elizabethan poets were primarily free and exuberant in style; in other words, they followed the excess of Romanticism, not the Hellenism of Classicism. Their followers chose the "correctness" of the classical style; from Cowley and Waller to Pope we find that freedom is eschewed; the heroic couplet becomes more and more strictly moulded, until in Pope we find it a two-lined stanza containing a thought of its own. This change is a direct outcome of the spirit of the new age. The Elizabethans were primarily in love with imagination; then imagination grew weak and poetry became strained with "conceits." The Restoration period was critical, not imaginative; it called itself the age of "good sense."

Under Elizabeth England was a united nation: Englishmen took things for granted; they believed in monarchy, the church, the state. Under the Stewarts and during the Commonwealth England was disunited; the nationalist had become a party politician. People found themselves forced to take sides, hence we find the battles between Anglican and Puritan, King and Parliament, the "Correct" school of poetry and the Romantic school. And we find that poets are now partisans. Waller, Cowley, and Dryden eulogise Charles II; Andrew Marvel satirises Clarendon, and chooses the dangerous subject of the slitting of Coventry's nose. Butler's *Hudibras* satirises the Parliamentarians, and Oldham satirises the Jesuits. Satire was no new thing in England. Jean de Meung's part of the *Romaunt of the Rose* satirised women and the religious orders; Skelton attacked Cardinal Wolsey; Langland satirised Church abuses, as did also the Scottish Chaucerians. Donne wrote satirical poems.

In Butler's *Hudibras* we find the *Rose* elements, the satire on woman and the religious orders—nonconformists.

The age of "good sense" was not inspiring. A poet may find inspiration in Macbeth or King Lear or Satan; he will hardly be inspired by Coventry's ear. The romantic idealisation of a lady-love had degenerated into servile flattery of the Stewart kings. Spenser's flattery of Elizabeth was idealisation; Waller's flattery of Charles II was something less pardonable.

Dryden (1631–1700).—Dryden began by writing poetry after the metaphysical manner, then he took to writing plays (see DRAMA). His third period is the period of his satire, theological poems, and translations. He is a greater satirist than Marvel or Oldham; his *Absalom and Achitophel*, *The Medal*, and *MacFlecknoe* are masterpieces. His great theological poems are *Religio Laici*, and *The Hind and the Panther.*

His importance in the history of poetry lies in his perfecting the satire and in his mastery of nearly all kinds of verse as distinguished from poetry. His heroic couplets are the best of their kind; they are not so rigidly "correct" as Pope's, and consequently have not the same monotony.

If felicity of expression and absence of irregularity in verse make our greatest poets, Dryden stands beside Shakespeare and Milton. But if we require from our poets ideas, imagination, or, combined with complex harmonious metre, passion, Dryden is not of the first rank. In truth the form of his and his successors' art was conventional and fixed; it could be manufactured. The matter only was of value in this Age of Reason.

Pope (1688–1744).—Although "correctness" flourished during the later seventeenth and earlier eighteenth centuries, the couplet was not accepted by all poets. The Restoration lyrists—Dorset, Sedley, Rochester, and Mrs. Behn were writing songs sweet but decadent. Historically, however, the coupleteers are of most importance, and of these Dryden and Pope are the recognised masters. Pope began his career with pastoral poetry, and described the country in the artificial terms of town life. Then in the *Essay on Criticism* he laid down his "correct" views on poetry. *The Rape of the Lock* is truly representative of an age that had eyes for trifling matters only, an age of stupid town gaiety and puerile partisanship and rivalry. After this was written, Pope took to translating Homer, but his famous work belongs to his last period, the period of his *Essay on Man, Dunciad, Satires, and Epistles.*

His couplet is a marvel of neatness and compression; his satire is scathing. So far as form

is concerned, Pope is a great poet. As a philosopher he is "the apostle of the commonplace"; his imagination is negligible; his passion is ruled out by "common sense." He was the conventional poet of a conventional period. "Follow nature," he cries, but he means "For any sake don't do anything original. Nature was fully treated by the ancient Greeks and Latins; their rules were 'Nature methodised'; don't depart from these rules."

Dr. Johnson and Goldsmith were poets of the Popian School, the latter being the last great poet of that school. In Goldsmith we find the Popian couplet, but he has got away from conventional "poetic diction" and describes scenery with freshness and truth. Yet in *The Deserted Village* he is "correct" enough to prevent the poem's being of the first rank.

The Romantic Revival.—The "correctness" of the age of "good sense" could not last. Domination of poetry by the couplet and conventional diction led to a revolt. During Pope's life-time, Thomson's *Seasons* appeared. Though not poetry of the highest kind, the *Seasons* are of the greatest importance historically. They are written in blank verse, and go straight to Nature for their illustrations. In *The Castle of Indolence* Thomson uses the Spenserian stanza. Others were protesting against the "correct" school couplet. Young's *Night Thoughts* was in blank verse; Collins and Gray practised many kinds of irregular measures in pseudo-classical forms, but often with much effect.

We saw how the Elizabethan romanticism degenerated into cheap, meaningless "conceits." The "correct" school of Dryden and Pope came as a rescue. The Elizabethan poets were imaginative dreamers who idealised continually, but at worst they were great artists technically. In the "correct" period idealisation has gone; the poets are realists, although, it must be confessed, poor ones. There is much realism in the satire of the period, but in description realism is lacking and the form of their expression has become standardised. Poets described nature in stock-phrases. "Poetic diction" made poetry ludicrous. "Poetic diction" originally came from Milton.

The rebels who revolted from this arbitrary tradition did not foolishly invent a method of their own. In looking back on their country's poetry they found ready to hand forms of expression which satisfied all their ideals. It was not easy to imitate the form of an Elizabethan lyric. These and other great poems showed few tricks for the pupils to imitate, but they held out countless goals for inspired appreciation.

During the eighteenth century poets shrank from calling a spade a spade; a wood is a "grove," a man is a "swain," the moon is "Diana." Milton's Adam in *Paradise Lost* was the culprit; he called the sun "this diurnal star," and in Pope and Thomson and Gray we find Adam's successors.

The chief feature in the Romantic Revival was the looking back to ancient poetry. In 1765 Percy's *Reliques of Ancient English Poetry* was published, and the eighteenth century made the acquaintance of fine old ballads and lyrics. In 1774 Warton's *History of English Poetry* disillusioned the many Englishmen who believed that the poets before Dryden were worthless.

The Revival is by some dated from Chatterton, who in 1764 began to produce the *Rowley Poems*, which he alleged were the work of a fifteenth century poet. These poems are of the new romantic poetry. In Cowper we see the transition poet; he writes stiff couplets after Pope, and shows the bad poetic diction of the period, but like Thomson he goes straight to Nature for his colours. Crabbe also goes to Nature, and though he uses the couplet he belongs to the new rather than to the old order.

Blake.—When we come to Blake we are beyond the reach of the Popian school. In form alone his poems are as free as Shakespeare's. But Blake's claim to greatness does not rest on his verse forms alone. The twentieth century, the period of realism and naturalism, has discovered in Blake a forerunner of Nietzsche. Blake, sometimes spoken of as "the English Nietzsche," forestalled Nietzsche in declaring that the world should get rid of the idea of sin and punishment. When Blake says "Put off holiness, and put on intellect," "Be yourself," "Energy is the only life," we might be excused for thinking that a Nietzschian is speaking.

Burns.—Almost contemporary with Blake, Robert Burns was writing poems that had no resemblance to the "correct" school work. The Scottish Chaucerians used an artificial literary language, Middle Scots. By the time of Montgomerie, Middle Scots was almost dead. And when Drummond writes he is an English Elizabethan in language and thought. But before Burns wrote, we find Allan Ramsay and Ferguson using dialect in poetry, but it was Burns who raised dialect to a good literary medium. Burns owed much to these two pioneers; Ramsay wrote true pastorals filled with first-hand description of rural life (the Popian school's pastorals were conventional and second-hand); Ferguson, the delicate youth lionised by the Edinburgh smart set, gave vivid poems of Edinburgh life.

Burns's fame rests on his lyrics, but he is not one of the greatest of lyric writers. There is hardly one of his poems which is at once simple without being commonplace, and whose every word or syllable is inevitable, as is the case with the great artists. Our chief thanks are due to him for turning the thoughts of literary people of his time against the Popian couplet.

His execution is not to be compared with that of Blake.

Like Shakespeare he often took old works and rewrote and nearly always bettered them. His poems in English are inferior to his dialect poems, being very stilted in their language.

Blake was a philosopher with ideas ahead of his time; consequently he was known to a coterie only. Burns, as a man of his time, a keen observer, a graphic describer, a malignant laugher, a sweet singer, was lionised in Edinburgh. His idea of freedom is platitudinous; a man who prided himself on being a Jacobite was not a democrat. He was not a deep thinker; he was ruled by heart, not by intellect. Scotland has made Burns a god, just as Britain has made Shakespeare a god. People quote tags like "A man's a man for a' that," and imagine they are quoting great thoughts. Let us grant that he was a genius, though artistically hardly more than inarticulate. He was at his best when he felt most keenly, as in his satirical poems like *Tam o' Shanter*—perhaps his greatest work. Let us love him for his humanity, but let us realise that Robert Burns was no great philosopher, that he wrote poems of democracy without the true democrat's "vision."

Wordsworth and Coleridge.—In 1798 the *Lyrical Ballads*, a book of poems by Wordsworth and Coleridge, was published, and the appearance of this book is generally considered the most important event in the Romantic Revival. The poets explained that Wordsworth's aim was to make the common uncommon, while the aim of Coleridge was to make the uncommon acceptable. Wordsworth chose ordinary subjects, *e.g. We are Seven, The Idiot Boy:* Coleridge chose a supernatural tale, *The Ancient Mariner*, and made it credible and acceptable.

Wordsworth had theories about poetry. He held that poets should use the language of rustics, and when he carries out his own theory he writes drivel like *The Idiot Boy*. He was the enemy of eighteenth century "poetic diction" and all the conventional "town poetry" of the Popians. His attitude to Nature was new. Milton saw Nature through books; Thomson and Crabbe described Nature at first hand. He was a creative poet; he refused to accept other men's subjects and philosophy as Shakespeare and Burns did. Wordsworth described Nature, but to him, pantheist as he was, it was a great spiritual power. Sometimes he would appear to mean "God" when he writes "Nature." He has no passion and no dramatic instinct, but he has profound religious feeling. Much of his poetry is poor stuff, but in *The Prelude, Tintern Abbey*, the *Ode on Intimations of Immortality*, and some of his sonnets, he rises to the highest poetical excellence. The thought is original and profound; the form completely satisfying; the execution inevitable. The result is a complete artistic whole.

Coleridge's fame as a poet rests upon his three dream pieces, *The Ancient Mariner, Christabel*, and *Kubla Khan*. These are unsurpassable for glorious imagery, music, mystery, and suggestion. In his work is that element of strangeness observable in all great poems. Every vowel and consonant in his poems has a value.

Southey (1774–1843).—Nowadays Southey is praised as a prose writer and adversely criticised as a poet. He was not of the first rank, although in *The Curse of Kehama* and *Thalaba* he sometimes glimpses the heights. His popular pieces, *The Inchcape Bell*, the *Battle of Blenheim*, the *Well of St. Keyne*, are commonplace in sentiment and execution.

Scott (1771–1832).—Mere story-telling is not the highest poetry, and, because Scott wrote long narrative poems like *The Lay of the Last Minstrel, The Lady of the Lake, Marmion*, he has been belittled by many critics. But his poetry is not often poor; it has music of a kind, and has done more to tune the ear of the people to riding rhythm than all the works of Wordsworth, Coleridge, Shelley, and Keats. But his music is to theirs as that of Rossini is to Beethoven.

Scott was a sort of Socialist-Tory with aristocratic theories and a democratic practice. He had no class-prejudice; he was at home with all social grades. His chief characteristic was his love for the romantic past; while Byron and Shelley were working themselves into a passion of excitement over the French Revolution, Scott was unmoved. His "heaven on earth" was a dream of the past; Shelley's "heaven on earth" was a dream of the future.

Byron (1788–1824).—Byron, according to foreign critics, is our greatest poet, but this is probably due to ignorance of the beautiful intricacies of the English language. There is too much rhetoric about his poems; he seems to be continually obsessed by a pose. His technique is hardly better than that of the men who write for *Punch*. But his thought gives him a place in the history of poetry, for he is a master of invective and curious satire. His "indignation nearly made him a poet," but he had no restraint, nor had he the inspiration that redeems lack of restraint. His fame among his contemporaries rested partly on his social rank, partly on his egoistical personality, partly on his somewhat shallow philosophy.

Shelley (1792–1822).—Shelley, along with Blake, Wordsworth, and Browning, belongs to that class of artists which is not content to accept current views on morality, religion, economics, and other ideas. Shakespeare, Burns, and Tennyson are of the opposite camp.

Shelley was inspired by the doctrines that produced the French Revolution; the doctrines that have moved all reformers from Prometheus

to Larkin. The poet is the man who cuts keenly, as with a blade of clean steel into the heart of things, and can express his thoughts in great language. That is what we call inspiration. He believed that all men are born free and equal, and that by reasoning and love all inequalities of rank could be abolished. He was a rebel against authority of any kind; he wanted to abolish priests, marriage, and war. His anger against what was established was a vague anger; he saw the rottenness of a social order that was worse than that of our own time. He had no plan for abolishing the evils except a firm conviction that all would be righted by love. But that is of minor importance; poets are not concerned with the details of their Utopias. He had a vision of a better civilisation; he lived for freedom of soul and body. In other words he was ahead of his times.

But great vision and a passionate love for freedom do not make a poet. To these Shelley added a marvellous lyrical power that has never been equalled. His verse is full of word music. Each vowel and consonant does its part like each note of a piano. In the end nothing is forced; all wears the inevitableness of genius. It is impossible to imitate him. His thought is profound, and often difficult to seize because of its delicateness. His descriptions of natural scenery are like a Turner landscape.

Keats (1795–1821).—Keats is one of our greatest poets, but he has not Shelley's keenness of vision; he is concerned with beauty only. In his early work he is over-luscious; he drowns his poetry in sensuous imagery, and not seldom becomes mawkishly sentimental. But in pieces like *La Belle Dame sans Merci, The Ode on a Grecian Urn, Ode to a Nightingale, Ode to Autumn, Isabella, Hyperion, The Eve of St. Agnes,* his odes and sonnets, we find poetry full of gorgeous imagery and haunting music.

Words are often used for the mere sound, and archaisms are not scorned. If you read Keats aloud, mouthing every syllable, you will be rewarded by a great sensuous pleasure. And if you compare his work with that of the pre-Raphaelite painters, who tried to do on canvas what he did in verse, you will realise that Keats was on surer ground.

It is impossible here to consider fully the minor poets of the so-called Romantic School. Some of them are possibly better known to the people than either Shelley or Keats.

Perhaps the most popular poet of the first half of the nineteenth century is Mrs. Hemans, author of *The Better Land, The Graves of a Household,* and many other poems of sentiment or, rather, sentimentalism. The student should read *The Graves of a Household* ("They grew in beauty, side by side," etc.) and then read Shelley's *Ode to the West Wind.* If he cannot see that the former is commonplace in thought and excessive in emotion he should eschew poetry altogether.

Other popular minor poets of the period are Moore, the composer of so many Irish songs; Campbell, the author of *Ye Mariners of England, Hohenlinden,* and other patriotic poems; Thomas Hood, author of *The Song of the Shirt, The Bridge of Sighs, The Dream of Eugene Aram;* Macaulay, the essayist and historian, who wrote *Lays of Ancient Rome.* Less well known are James Hogg (1770–1835) and Leigh Hunt (1784–1859). Hogg, "The Ettrick Shepherd," has a few pieces of real poetry in his voluminous verse; and Hunt is remembered chiefly because his florid style influenced Keats.

The Victorian Poets.—The poets we have been studying all belong to the Romantic Revival. We saw that this Romantic Revival broke the classical correctness and conventionality of the Popian school. The Victorian Age does not break with the Romantic Revival, it is a continuation. The poetry we have been considering is not strictly democratic. Wordsworth in his early work is inspired by the French Revolution; Shelley is the apostle of the idea that led to the French Revolution; Byron seeks after freedom of a kind. But Coleridge and Keats follow mystery and beauty: of the minor poets only one is a true democrat—Thomas Hood.

The Victorian Age is at once democratic and scientific. And science brings scepticism in its train. Darwin's theory of Evolution shook traditional belief in the Creation; Sir Charles Lyell's geological discoveries shook traditional belief in the Flood. Doubt became general, and doubt always involves questioning.

Tennyson.—The spirit of the Victorian period is best reflected in the poetry of Tennyson. He writes poetry around the new ideas introduced by the conflict between science and religion and by the rise of democracy. But he merely puts into poetical language the thoughts of the average man; he has not the vision of a Blake, a Shelley, or a Browning. He suggests what in journalism is called the Nonconformist Conscience.

As a musician and painter in words he is of all but the highest rank. He resembles Keats in his love for beauty and harmony, but it is the love of the beautiful which it was the correct thing for a Victorian man of culture to acquire, and he adds a sympathetic understanding of humanity, that finds its counterpart in the Charity Organisation Society.

His greatest poems are short, *e.g. The Lady of Shallot, Œnone, Morte d'Arthur, The Lotus-Eaters, The Palace of Art, A Dream of Fair Women.* These are full of sensuous colour and sound, but even in these we have the smell of the lamp. In his long poems he is far from successful. *In Memoriam* is a collection of

cairngorms rather than a single large brilliant. *Maud* is marred by its combining good lyric with pseudo-socialistic satire. *The Princess*, though full of songs, is bad as a whole; it tries to combine a Victorian essay on the woman's movement with a frank burlesque. In the *Idylls of the King* Tennyson is out of his element. He did not understand the mystery and morality of the Arthurian Legend. He gives to the legend the Victorian Protestant morality, thereby ruining the story. In Arthur's time there was no duty required of women; the relation between the sexes was governed by Love, not by a conventional moral code. Guinevere was not an adulteress. Tennyson turns a beautiful story into a lesson on morality.

Browning.—In these pages we have continually spoken of the two kinds of artist—the artist who accepts, and the artist who refuses to accept, current thought and morals.

Browning belongs to the latter—the greater class; Tennyson, with Shakespeare and Burns, belongs to the former. While Tennyson was accepting the popular views on religion, science, and economics, Browning was thinking out new views for himself. Tennyson is primarily a painter and musician; the merit of his poetry lies in form rather than matter. With Browning the form is subsidiary; he has something new to say and he says it in an almost spontaneous way. He ignores the reader; his intellect is keen and his pen always lags behind his thoughts. He jumps from one idea to another so rapidly that dull readers cannot follow him; hence the hackneyed talk of Browning's obscurity.

He is not subjective, unless in his dramatic lyrics; his poems are not expressions of personal experience. He is a great novelist in verse. The State does not interest him; he is an individualist; he seeks to discover the secret of the individual's psychology. Love and effort are necessary for living a full and free life; Browning looks for spiritual, not material reforms.

Browning's word-music was at one time condemned as discordant. The present age has advanced beyond the older opinion and recognises music in Browning as it now recognises music in Wagner. The next generation will no doubt smile at the early twentieth century contempt for the "discordant music" of the Futurists.

Browning's wife, Elizabeth Barrett Browning, is known chiefly by two works, *Aurora Leigh* and *Sonnets from the Portuguese*. She has some passion and sensibility, but her poems are marred by her lack of an ear for music.

Arnold and Clough.—These poets are true Victorians in their scepticism. Arnold's *Empedocles on Etna* is a fine example of Victorian questioning; the poet sees faith being destroyed by science and intellectualism, and he takes refuge in an almost indifferent resignation. His *Scholar Gipsy*, *Thyrsis*, and *The Forsaken Merman* are much above the others in poetical form. Arnold's thought makes him a most companionable author. Clough felt more deeply, but could not express himself so poetically. Both are fascinating writers.

The Pre-Raphaelites.—Pre-Raphaelitism, as applied to painting, was a movement to improve the conventional art of the day by a return to the art of painters before Raphael. Applied to poetry, Pre-Raphaelitism is a harking back to medievalism and romance as an escape from the intellectualism and scepticism of the age. The eldest poet of the school was Dante Gabriel Rossetti. He was a painter, and his poems, like his pictures, are mystical and sensuous and peculiarly satisfying. He gave a new turn to the ballad form; he added to its power, but he decreased its naivety. He continues Keats' search for beautiful strange words, and, like Swinburne, he brings out undreamt of values of English sounds. His sister Christina has not his paganism, and she has greater simplicity. She is a great artist in words.

William Morris was primarily an artist. He was a Socialist, but his greatest objection to poverty was that it prevented people from seeing beautiful works of art; he might be called an æsthetic economist.

Like Rossetti, he seeks romance in the medieval past. Rossetti went to Italy for inspiration; Morris turned to the Norsemen's sagas, and he is perhaps unsurpassed as a story-teller. His verse goes with a swing; it is musical and varied, but it never reaches the supreme heights of poetry.

Swinburne, the youngest of the pre-Raphaelite poets, is often called a decadent because he found despair, death, pain, unfulfilled nature, unsatisfied love companionable. It is typical of the man that he has the deepest love of the sea, and of all men he knew its cruelty. Swinburne is one of the lesser rebels; he is anti-Christian and pro-Revolutionary. He is a heretic in his wonderful transformation of ugliness into beauty, and he is always seeking after strange gods. But his vision was besmirched by his education and surroundings. He is classical (*Atalanta in Calydon* is the only English drama in the real Greek manner). He is constantly tending to the pre-Raphaelite notion of painting; he was on the side of Rossetti and Burne-Jones, not Whistler and Manet. As a metrist he is wonderful; he gave poetry a new orchestral music, a new variety in consonantal and vowel sounds.

George Meredith is a greater rebel. Like Browning, his matter is usually greater than his manner, yet his *Love in a Valley* is purely lyrical.

Edward Fitzgerald in *The Rubaiyát of Omar Khayyám* voices Victorian scepticism, and Coventry Patmore ignores both pre-Raphaelitism and intellectualism and writes homely verse. Francis Thompson riots in colour and sound;

The Hound of Heaven is full of purple and gold.

The era of invention and science brings out the verse of Rudyard Kipling. He is the minstrel of Imperialism and strenuousness. His verse has much force and energy, but he is more interesting philologically as a coiner of words than as a poet. He has founded Colonial poetry whose chief factors are unreal, "romantic" subjects, strong language, swinging music.

At the opposite pole to Kipling is Edmund Dowson, chief of the decadents. His *Cynara* and "Exceeding sorrow consumeth my sad heart" are technically most beautiful. The thought is unconventional even to morbidity, but the harmony of their music will never fail to evoke the admiration of literary folk.

William Watson is a true follower of Wordsworth and Arnold, with a slight personal note of his own. Some of his poems are sure of immortality.

W. B. Yeats has added real romance—the element of strangeness—to beautiful though intricate beauty of form. He is a religious poet, as distinguished from one dealing with moral or social aspects. Yeats is the founder of a school of poetry and drama, the chief of whom are Lionel Johnson and Synge respectively. They have drawn no nearer to the real Celtic spirit than O'Shaughnessy and his contemporaries did. "A. E.," another follower, is still alive. Hardy, with a technique not always of the highest, carries into poetry his rebellious pessimism. Robert Bridges, the Poet Laureate, has continued the Miltonic tradition to good purpose, and as a lyric writer ranks in his best moods with the highest. Most of his work, however, is in the nature of poetical exercise.

Masefield's poetry is too often sententious, but his poems have done much good in popularising poetry.

W. W. Gibson and Lascelles Abercrombie are possibly our best modern poets. Gibson sees the world that the man in the street sees; but he throws undreamt of lights on it. Some of his lyrics are the most beautiful things in present day art. His restraint is admirable, his feeling profound, his wisdom simple in its sureness, his use of words inevitable. He does not confuse art with nature. He describes the thoughts and feelings of his characters as Synge does in his plays, not as they would speak in ordinary conversation, but in the words they use in everyday life placed in an order of simplicity they would employ if they were poets.

Abercrombie connects more easily with his predecessors than Gibson does; you often catch a note of Milton in his work. His thought is always very subtle and his psychology difficult. As a metrist he is probably the greatest living.

The best modern poets, Gibson, Abercrombie, John Drinkwater, W. H. Davies, James Stephens, Walter de la Mare, and Rupert Brooke, are not imitators, and are seldom hampered by traditional prejudices about subject or form. They are alive to the world around them; they despise nothing real, but they are not content to state what they see in an inartistic way.

PROSODY

Prosody is the study of the constitution of verse. It is really a breaking up of lines into syllables, and when we break up a line into syllables we are said to scan it. Note the following line:

The | boy | stood | on | the | burn | ing | deck.

This line contains eight syllables, and is said to be an octosyllabic line (Lat. *octo*, eight).

Now each syllable has a quantity; we either lay stress on it when we pronounce it, or we do not. In scansion it is wise to place the symbol ◡, which means "short," above an unstressed syllable, and the symbol –, which means "long," over a stressed syllable. Read the above line aloud and you will find that you emphasize the syllables *boy, on, burn, deck.* The line is therefore scanned:

The boy | stood on | the burn | ing deck.

This brings us to the consideration of "feet." A foot may be monosyllabic (consisting of one syllable), disyllabic (two syllables), trisyllabic (three feet.) Feet of more than three syllables are not often required in English prosody.

Disyllabic feet are of three kinds. An *iamb* consists of a short and a long, *e.g.*

delay, invite, to see, to you.

A *trochee* is a foot having the first syllable long and the second short, *e.g.*

injure, artful, call for.

A *spondee* is a disyllabic foot having both syllables long, *e.g.*

flowed forth, there lies.

Note that the long and short symbols have nothing to do with long and short vowels. The *i* of *in* is short, but if you say "he is in" you can lay stress on the *in*, and in scanning you may write

he is in.

We can now scan verses:

The boy | stood on | the burn | ing deck.

The shades | of night | were fall | ing fast.

Make weep | the eyes | of day

Tempt not | the tyr | ant sea.

Of that | waste place | with joy.

The student need not attempt to memorise the words *iamb*, *trochee*, *spondee*. All he should remember is that disyllabic feet are the commonest in English prosody. But there are other feet—feet with three syllables. The trisyllabic feet in English prosody are the *anapæst* (◡ ◡ –) *e.g.* interfere, and the *dactyl* (– ◡ ◡) *e.g.* cinema.

In scanning it is sometimes better to change a dactyl into an anapæst. Note the following :

Terror | and mys | tery, guard | her shrine, | I

The Assyr | ian came down | like a wolf | on
the fold.

I bring | fresh showers | for the thirst | ing
flowers.

'Tis the mid | dle of night | by the cas | tle
clock.

Merrily | merrily | shall I live | now.

The following line might be scanned in dactyls:

Four for the | quarters and | twelve for the |
hours.

but it is better to start with a monosyllabic foot (*i.e.* a foot of one syllable), and scan in anapæsts.

Four | for the quar | ters and twelve | for the
hour.

Try the same experiment with the previous line,

Merr | ily, merr | ily shall | I live now,

and you spoil the rhythm.

We shall now try to scan a stanza from Stevenson's "Shadow March."

All | round the house | is the yet | black night,
It stares | through the win | dow pane,
It crawls | in the cor | ner,[1] hiding | from the
light,
And it moves | with the mov | ing flame.

Verse lines receive their names from the number of syllables or of feet they contain. We speak of a ten-syllable line as a decasyllabic line (Greek, *deca*, ten), or an eight-syllable line as an octosyllabic line (Lat. *octo*, eight). Again, we can call a five-feet line a pentameter (Greek, *pente*, five, *metron*, a measure). Here is a typical iambic pentameter.

The vill | age mast | er taught | his lit | tle
school.

It should be noted that an octosyllabic line may contain more than eight syllables. We call Coleridge's *Christabel* an octosyllabic poem, because there are four feet in most of the lines, and in ordinary circumstances we count a foot as two syllables.

'Tis the mid | dle of night | by the cas | tle
clock
And the owls | have awa | kened the crow | ing
cock
Tu | whit | tu | whoo !

The first lines have eleven syllables each; the third one only four. In it each foot is monosyllabic. It may be asked, why not scan this line in two feet, thus :

Tu whit—tu whoo !

There is only one reason against doing so: you make the poem irregular.

Blank Verse.—It is scarcely necessary to explain what rhymed verse is. Verse that does not rhyme is known as blank verse, but when we speak of blank we mean unrhymed decasyllables. Knowing this we divide Shakespeare's lines into five foot-spaces when scanning. Take the first lines of *Cymbeline*.

First Gent. You do | not meet | a man |
but frowns : | our bloods

[1] How are we to scan the third line? Suppose we use a foot ◡ – ◡ for ner hid ing.

It crawls | in the cor | ner, hid ing | from the light.

This will not do : there is a distinct pause after *corner*. This pause is called the *cæsura*, and nearly every verse line has a cæsura. Very often at the cæsura and at the end of a line there is an extra syllable, usually called a redundant syllable. You find it in Shakespeare's later plays. Here is a line from *The Tempest*.

And like | this in | substan | tial pa | geant fad | ed.

The *-ed* at the end is an extra syllable. We should look upon the *-ner* of *corner* as an extra syllable, and scan thus :—

It crawls | in the cor | ner ‖ hiding | from the light.

Remember that rules do not matter; let your guide you.

Not more | obey | the heav | ens than | our
court | iers

Still seem | as does | the king |

SECOND GENT. But what's | the
mat | ter ?

Notice that two speakers often contribute to one blank line. The last two lines have an extra-metrical syllable at the end.

Prosody is a subject that we advise the student to wander into without much guiding. Its charm lies in its discoveries. Scan a piece of blank verse from one of the early Elizabethan plays; then scan a part of *Hamlet*. You will conclude that the main difference between Shakespeare and the author of *Gorboduc* is a difference of ear. Again, compare the jog-trot rhythm of Pope's couplets with the freedom of Shelley's lyrics. In general the history of prosody is, like that of nations, a history of freedom's breaking with convention.

But remember that prosody is not the whole of poetry. Any Limerick in a prize competition will scan easily and well, but a Limerick is not poetry. It is possible to be a Keats or a Shelley without knowing the meaning of the word "cæsura."

PROSE

Under the heading STYLE we have explained the difference between plain and ornate prose. In the history of prose style we shall find the two varieties alternating fairly regularly. The weakness of English prose for many centuries lay in the fact that writers modelled the structure of their sentences on Latin. They thought that English would die. Ascham in his *Schoolmaster* writes; "All men covet to have children speak Latin; so do I because there is no other way to bring English to perfection." More wrote his *Utopia* in Latin, and Bacon rewrote his essays in Latin so that they might survive. Hobbes, at the age of eighty-five, wrote his autobiography in Latin verse. In the late sixteenth century we find Harvey, Wilson, Cheke, Sidney, and others defending English and prophesying a future for it, but they are thinking of words, not of structure.

Early Prose.—If we except the *Anglo-Saxon Chronicle*, the earliest O. E. prose of importance is King Alfred's translation. Alfred set out to educate his people, and in translating *Boethius* and *Orosius* he introduced vernacular phrases of his own. The greatest O. E. prose writer was Elfric, who flourished in the tenth century. His work consists of sermons and Lives of the Saints.

O. E. prose could have no future, as the language was slowly dying.

English prose proper began in the late fourteenth century. Chaucer's prose is not of any great merit; it is interesting mainly because blank verse lines appear in it occasionally. Wyclif's prose is important. He was appealing to a lowly audience, and was trying to translate scholarship into the vernacular.

But the greatest prose writer of the period is Sir John Mandeville. His *Voyage and Travaile* shows the first prose style. The author has got away from translation; he leaves religion, philosophy, and history, and wanders into the fields of imagination. The simplicity of the book is delightful; he tells his story as a child would, breathlessly running on in a series of "ands."

The following sentence illustrates Mandeville's simple ease:—"And when she saw that he turned not again, she began to cry, as a thing that had much sorrow."

The next great prose writer is Malory, the author of *Morte d'Arthur*, one of the greatest romances ever written. The music of Malory's prose is wonderful, and the simplicity of the telling is sweet. Here is the conclusion of the farewell scene between Guinevere and Lancelot:

"And the ladies bare the queen to the chamber, and Sir Lancelot awoke, and went and took his horse, and rode all that day and all that night in a forest, weeping."

Another writer of romance was Lord Berners, a master of style. Parts of his *Froissart* remind us of the Book of Common Prayer in their combining Saxon and classical words, *e.g.* "Uphold and sustain." In him we find what is known as "aureate" diction, *i.e.* the use of flowery language, and one of his works, a translation of Guevara's *Dial for Princes*, is believed to have introduced a kind of "Euphuism" before Lyly wrote *Euphues*.

At this time Caxton was printing many romances, and his influence on prose was considerable. He wrote for his own press, and advocated the French style.

A curious writer of the fifteenth century is Pecock. He distrusts classical words, and attempts to find native equivalents; hence we find him using "endly" for "finally," "undeadly" for "immortal."

In Fisher's sermons we find the first deliberate attempt to form a literary style. Like Berners, he uses "tricks" such as the combining of Saxon and classical words, and the use of the triplet (*e.g.* "worldly honours, worldly riches, and fleshly pleasures"). The interest of the prose we have been considering lies in its form, not in its matter. The time of Caxton was one of translation and sermonising; thought was of little importance, for the scholar thought and wrote Latin.

When we come to Sir Thomas More we are in a different atmosphere. In him we see the first sign of the modern spirit—a new indivi-

dualism. He was the first to tackle social inequality. After the Peasants' Revolt in the time of Richard II, labour throve, but in Tudor times sheep-farming drove the rustics into the towns. This event synchronised with the Renaissance of Learning which rediscovered the art and letters of the Greeks and Romans, and opened up new avenues for thought. More is a true product of the Renaissance. He wrote his *Utopia*, a book picturing an ideal state where the inequalities of Elizabethan civilisation were unheard of. He is quite modern; he anticipates Old Age Pensions and the Insurance Bill; he advocates religious toleration; he affirms that punishment should act as a preventative; he wants a six hours' day; he desires to eliminate the idle rich. Yet More is no Socialist. He believes in social ranks; he applies his idea of equality to religion only. He does not do anything to work out his theories in practice. In the main he thinks of morals, not economics. He is a theoretical rebel: he denounces war as being ugly and commercial; he contemns hunting and hawking as being butchery. He has got rid of the foolishness that was named Chivalry.

More was the first to see the utility of Greek thought: his *Utopia* was inspired by Plato's *Republic*. It is noteworthy that Greek inspired many lovers of freedom—Bacon, Milton, Shelley, Byron, Ruskin, and in our own day, H. G. Wells, Gilbert Murray.

As a stylist More is not of high rank. Three other writers of his time are more interesting for manner, if less interesting for matter. They are Latimer, Coverdale, and Cranmer. Latimer was a popular preacher, and he ranks with Bunyan and Cobbett as the chief practitioner of the homely style. Coverdale's *Bible* lent to the subsequent Authorised Version many of its most graceful and musical phrases, while Cranmer is believed to be the author of all that is best in the Anglican Collects and Prayers.

At this period a reaction against ornate Latin diction took place. Cheke imitated Pocock, and tried to coin words. For "parables" he writes "biwords"; for "lunatic," "mooned"; for "alien," "outborn." Yet he liked the Latin construction of sentences, and perhaps taught Ascham to like them also. Ascham was the first to write a definitely plain style.

His prose was excellent for many purposes, but it lacked raciness. The spirit of the times was against sanity of expression; the Elizabethans were all for the exuberance of Romance instead of the quiet order of the Greeks. Lyly came to give the Elizabethans the style they required. He wrote a book called *Euphues*, and his prose style became known as Euphuism. Euphuism was simply a name for the new ornate prose; Euphuistic prose was full of excessive alliteration, impossible images from an imaginary natural history, frequent use of homely phrases and illustrations. It became the fashion. Sidney's *Arcadia* and Shakespeare's earlier plays are full of it.

At the time when Lyly was writing ornate prose, Hooker was writing his *Ecclesiastical Polity* in plain prose. Hooker's prose is almost faultless in balance and harmony, but the writers of his time for the most part followed Lyly. Many translations were made, the most famous being Florio's *Montaigne* and North's *Plutarch;* pamphlets and lampoons became common; Greene, Nash, Lodge, and other dramatists wrote short stories. Euphuism colours all these.

Seventeenth Century Prose.—The age we have just passed was the age of chivalry; the Elizabethan courtier was the true successor to medieval knight. In the seventeenth century the courtier is superseded by the citizen. The imagination of the Romantics was replaced by a modern democratic spirit which was essentially critical. This spirit analysed religious faith and judged time-honoured institutions frankly and fearlessly. In short, literature began to convey facts. Walton and Fuller wrote biographies; the Duchess of Newcastle wrote an autobiography; Pepys and Evelyn wrote diaries; satire, always vague during the Renaissance, became definite.

Bacon.—The new spirit is recognised in Bacon. His "modernism" is seen in a comparison between his *History of Henry VII* and Raleigh's *History of the World.* Raleigh is medieval and monkish, he devotes three chapters to the locality of the Garden of Eden. Bacon is beyond that stage; he is a Romantic, but his Romanticism is intellectual, while Raleigh's is emotional. Bacon's examination of Henry VII's character is unmerciful; it is the first piece of scientific history in English. Bacon as a stylist is great; he is a master of rhetoric, and, like all rhetoricians, he dazzles but does not convince his audience. He is no democrat. He wrote for princes, as his exemplar Machiavelli did. His greatest gift was his desire for inquiry; he was no scientist, yet he popularised science. More in his Utopia pictured a state ideal for living in; Bacon in his *New Atlantis* depicts a state ideal for scientific research.

Jonson.—Ben Jonson, like Hooker before and Dryden after him, is a master of plain prose. In his matter he is mostly concerned with literary criticism, and is on the side of classical order. He distrusts the vernacular as a literary vehicle; he has no sympathy with prose romance. His conservative taste foreshadows the "correctness" of Dryden and Pope and Johnson.

Burton.—The author of the *Anatomy of Melancholy* is typically Jacobean in style like Bacon. He loves long quotations from the classics, and, like Milton, he uses sentences of enormous length. His matter is of little importance to us; it is a dissertation on human melancholy, but its real interest lies in its quiet humour, its profound learning, and its quaint digressions.

Sir Thomas Browne.—Browne, the author of *Religio Medici*, and *Urn Burial*, is one of our greatest stylists. His sentences are full of magnificent music and gorgeous colour. He is a great artist, but is no great thinker. Paraphrase his sentences and, their beauty and sound gone, they are commonplace.

Preachers. — In the history of seventeenth century prose the great preachers play an important part. Usher, Hall, and Donne, Jeremy Taylor, Barrow, Fuller, South, Baxter, and others were famous preachers. From them we expect no great originality; they spent their time expounding texts. Donne and Taylor gave fine music and colour; Fuller a quaint jocular style; South a fine masculine prose.

Character-writers.—A fashion of writing essay-like "characters" grew up in the seventeenth century; the character-writers fixed on a type of person—a braggart, a lover, a pedant, etc.—and wrote a short description of the type. Sir Thomas Overbury's *Characters* are fairly typical. He is no genius; he sees the surface of things. Hall goes deeper, and where Overbury used a hard cynical wit, Hall used genuine humour. Earle is perhaps the wittiest of them all. When he tells us that "a young preacher preaches but once a year, though twice every Sunday," or that "a coward is a Christian merely for fear of Hell fire," he is the Bernard Shaw of the seventeenth century.

Milton.—Technically Milton's prose is poor when compared with his verse. He has long sentences, Latin construction, a laboured vocabulary, and only here and there splendid passages. He writes much controversial prose, and often sinks into scurrility. In poetry he is a conscious artist; in prose he is a pamphleteer. His marriages were unhappy, and he wrote on Divorce; his views on marriage brought him into collision with the censorship of the Press, and he wrote against Censorship; he tutored his nephew, and he wrote on Education. His prose is an expression of his personality.

Milton was original; indeed in some ways he was in advance not only of his time but our own time. He advocated abolition of bishops, the public schools and the universities; he was willing to tolerate polygamy; he wanted to see a republic established. But he was not thinking of democracy; he was thinking of Puritanism. Milton the Puritan saw in public schools and universities hotbeds of Royalism; Milton the genius saw in marriage laws imprisonment of soul. Democracy to him was what it is to the modern party politician—a thing to be led by powerful men.

Hobbes.—The author of the *Leviathan* writes a lucid, ordered style, without any ornaments. His theories about democracy are worth studying; he stumbles upon the great truth that the chief power in a democracy, whatever that power be, is practically irresponsible. This truth constitutes democracy's big problem to-day.

Clarendon.—Clarendon's fame rests on his *History of the Great Rebellion.* His style is bad; he ignores punctuation, and he runs sentences together in batches. His point of view is onesided, but that is no demerit; the historian who thinks he is impartial has no genuine enthusiasm. Truth is best revealed by a fiery fight between two rabid partisans. The merit of the book is vivid portrait painting; he is one of the greatest depicters of character.

Biography.—We have seen that the seventeenth century was much concerned with the character. Ben Jonson wrote on Shakespeare and Bacon; Hobbes wrote an autiobiography in Latin verse; Isaac Walton wrote biographies of Donne, Hooker, and others.

Walton's fame rests on *The Complete Angler,* nominally a treatise on angling, but really a character-sketch.

The chief fault of seventeenth century prose is its lack of directness. Gorgeous imagery, profound learning, musical phrasing we have in plenty, but there is hardly any plain direct lucid writing. When we come to the prose of Dryden, Temple, and Halifax we have arrived at modern prose.

The Age of Dryden and Pope.—This period is sometimes called the *Augustan Era*, because writers imitated the classical writers of the Golden Age of Latin poetry, a time when Augustus was Emperor. From Dryden to Pope writers followed "the ancients"; Aristotle had laid down laws for tragedy and epic, and the English writers thought that these laws were to hold good for ever. Pope says that following the ancients is the same as following Nature. Prose writers, no less than poets, aimed at "good sense," *i.e.* simplicity and conventionality.

The Royal Society was founded to encourage the use of common language, instead of the elaborate Latinisms of previous prose. And no one will deny that English prose required to break away from the Latinised periodic prose of Browne and Taylor.

Modern prose begins with Dryden. There were three editions of his *Essay of Dramatic Poesy* published during his lifetime, and in these we see the changing of idiom. In the first edition he puts a preposition at the end of a sentence; in the third it has disappeared. In the third he writes *written* for *writ*, and where, in the first edition he uses the same word twice in one sentence, he changes one word for another in the third edition.

His prose flows with ease; it is essentially plain and to the point, and it was one of the best models for subsequent writers who wanted to write without wordy rhetoric.

As a literary critic Dryden is ranked high.

When he forgets his "rules" he praises Chaucer; when he remembers his rules he condemns Milton's *Comus* and *Lycidas*. He was no heretic; he preferred to conform to the current mode. As a thinker he was not great.

Bunyan.—John Bunyan is one of our greatest writers. His fame rests upon his *Pilgrim's Progress.* This story is nominally an allegory, but in reality it is a piece of great fiction. The characters are real characters; the psychology is founded on life and experience. Bunyan is a great realist. He has none of the previous period's rhetorical rant; he tells his story in simple manner, but he paints a more vivid picture than the Elizabethans paint.

He is great because he is elemental; he is the great artist who never heard of art.

The Life and Death of Mr. Badman is treated under THE NOVEL (p. 131). *Grace Abounding* is a masterpiece in pessimistic autobiography.

The Diarists.—Evelyn and Samuel Pepys stand apart from the prose writers of Dryden's age. Evelyn's *Diary* is simply a record of events without any accomplished style. Pepys' *Diary* is world-famous, and its fame rests, not on its style, but on its delightful candour and unconscious humour.

Journalese.—About the end of the seventeenth century prose style begins to lose dignity. The philosopher Locke, the pioneer of eighteenth century rationalism, shows signs of colloquial language, but Roger L'Estrange is the recognised scapegoat of the period. L'Estrange, along with Jeremy Collier, the stern critic of an immoral drama, and Tom Brown, wrote in a vernacular manner; they clipped words; they used vulgar phrases; they wrote in the language of the ale-house. The newspaper came on the scene, and in it slipshod language found a refuge.

Defoe.—Daniel Defoe is one of the greatest journalists of all time. He "wrote up" everything that was topical. His fame rests upon his *Robinson Crusoe* (see p. 131). As a thinker Defoe was almost modern. He anticipated modern poor laws, agricultural credit banks, registration of seamen; he sees the cause of bad environment and the fact that there is a law for the rich and one for the poor. As a stylist he ranks with Bunyan as a great master of simple descriptive prose.

Swift.—Jonathan Swift is usually called our greatest satirist. His satire is demoniacally bitter and merciless; his hand is against every man. For him the world was out of joint, but he was not born to set it right. He has no alternative to an evil social system; his genius was that of a destroyer, not a builder.

Steele and Addison.—Steele began the *Tatler* and the *Spectator*, but Addison generally receives most of the praise for the series of essays published in the papers. Steele had much humour and pathos, but he was no genius. Addison was no genius either. He wrote urbane, gentle, manly prose, and he tried to improve the morals of his generation, but he was superficial.

He was too polite to be really important, too conventional to break new ground.

Mandeville.—The author of *The Fable of the Bee* is interesting from a scientific and sociological point of view. In paradox he is the Chesterton of the eighteenth century. He holds that selfishness is at the root of virtue, that social laws are the result of alliances for protection among the weak. He states that "private vices are public benefits," for he believes that the vicious luxury of the rich, by giving employment, benefits the state; a doctrine that no thinking modern would recognise. His writing was an attack on Shaftesbury's idealism.

Berkeley.—To the general reader Berkeley's philosophic works are uninteresting. In the history and prose style he figures as the writer of excellent argumentative prose. His *Essay towards Preventing the Ruin of Great Britain* is easily readable; it is intended to remedy the materialism and secularism of the age.

The Age of Johnson.—*Johnson.*—Dr. Samuel Johnson was a man with a great personality. Consequently we usually think of the subject of Boswell's *Life* rather than of the author of the *Dictionary*, *Rasselas*, or *The Lives of the Poets*. He was the literary dictator of the time; he was the centre of a group that eagerly swallowed his opinions. These opinions were "classical"; the Romantic Revival was alien to Johnson's spirit, although he ultimately came very near to appreciating it.

He was a great literary critic, although hampered by a preoccupation—his belief in Popian "correctness." He fails to see the beauty of Milton's license in *Lycidas*; he contemns the poets who number the "streaks of the tulip." He had no eye for beauty ("one blade of grass is like another" to him); he had no ear for music. But his criticism is always suggestive. He anticipates in a hint what Tolstoy says about Shakespeare—that his popularity is largely due to "custom and veneration."

Goldsmith.—Johnson's prose style is Latinised and pompous. Goldsmith's is its antithesis; it is light and graceful. Goldsmith is a typical Irishman; he has wit, humour, heart, and an indulgent view of Englishmen.

Burke.—Edmund Burke is one of the chief members of the Johnson circle. His prose is oratorical, and for imagery, music, and architecture is unsurpassable. As a politician he was opposed to democrary; he believed that the aristocratic few must govern the vulgar many. He believed in a gradual evolution of nations, and naturally was appalled by the French Revolution. He had vision; he foresaw the loss of the American Colonies; but his failure to grasp the significance of the French Revolution shows that his vision was limited.

The Historians.—History in England had not been of much literary importance previous to the eighteenth century. Raleigh had written his *History of the World* in a medieval manner; Clarendon had produced his *History of the Great Rebellion*, a biassed and consequently important work.

The historians of the eighteenth century are Hume, Robertson, and Gibbon.

Gibbon.—The greatest of the three is Gibbon, the author of *The Decline and Fall of the Roman Empire*. Like Johnson and Burke, Gibbon writes plain prose with ornament superadded. As a historian he paints great pictures, and like Clarendon he has a bias. Clarendon hates republicanism; Gibbon hates Christianity and the enthusiasm of any religion.

Adam Smith.—The most important among the other prose writers of the Johnsonian period is Adam Smith, author of the *Wealth of Nations*. His prose style is not specially distinguished. The *Wealth of Nations* is one of the great works on political economy. It came as a heretical treatise; it attacked the economical theories of the past. To many students of the present day it is unsatisfactory; it does not reach towards the ideal state, where there are no landlords or idle rich. But Smith's theories have had an enormous influence in the evolution of the science of economics.

The Rise of the Periodical.—From the time of the character-writers the essay had flourished in one form or another. In the hands of Jonson, Bacon, Dryden, Addison, and Steele, it had treated most subjects. At the beginning of the nineteenth century the essay was given a new vogue by the inauguration of the *Edinburgh Review*, the journal of Jeffrey, whose criticisms of the Lake poets made him notorious as a bad critic. "Christopher North" (Professor Wilson of Edinburgh University), the author of *Noctes Ambrosianæ*, wrote for *Blackwood's Magazine*. Lockhart, Sir Walter Scott's biographer, was editor of the *Quarterly*. Thomas Hood was sub-editor of the *London;* Lamb, Leigh Hunt, and De Quincey all contributed to periodicals.

Lamb.—Charles Lamb is one of the most lovable personalities in literature. A mild, nervous, whimsical man, he wrote mild, nervous, whimsical essays. He gossiped in print. As a critic he has been much lauded. His appreciation of Shakespeare was great, but unfortunately Lamb's example, together with that of Coleridge and Hazlitt, has led to Shakespeare's being judged by his single passages rather than by his plays as a whole.

Hazlitt.—William Hazlitt ranks with Coleridge and Lamb as a great literary critic. All three had an enthusiasm and egotism that is absent from Steele and Addison. Lamb was an amiable man; Hazlitt had a vile temper. In his criticism one finds judgments that are warped by personal whim, but he was a fine critic of passages. His *The English Poets* is full of suggestion, although marred by his contempt for history.

De Quincey.—The author of the *Confessions of an English Opium-Eater* lives chiefly as a stylist. His manner is more important than his matter. He revolts from the plain prose, and writes poetical prose, full of imagination and sound.

Cobbett.—Cobbett's one claim to figure in a history of English prose lies in his carrying on the tradition of Latimer and Bunyan in using a vernacular style.

Southey.—Southey's prose looks back to Addison; it is fine but correct after an eighteenth century fashion.

Macaulay.—Macaulay is one of the student's early loves. His graphic short sentences and his forcible exaggeration appeal to the young. As a historian he is good, because biassed; as a thinker he is narrow; as a journalist he is excellent.

The Victorians.—*Carlyle.*—Carlyle's imagination was deeper than Macaulay's. His style is proverbial; it ignores parts of speech, it uses inventions like "beautifuller," it uses nouns as verbs, verbs as nouns. Carlyle is no constructive thinker; he is emotional, not intellectual. His red-hot vehemence of expression is subjective, not objective. He glorifies work and duty. Nevertheless he is a great writer.

Macaulay and Carlyle were the first of a group of historians—Buckle, Freeman, Green, and Froude. Buckle held that environment made the man (Carlyle held that the great man made the age); Freeman was polemical and bitter; J. R. Green was picturesque and imaginative; Froude was inaccurate, but a great painter in words.

Arnold.—Matthew Arnold is generally lauded as a great literary critic. His merit is his suggestiveness; he uses the comparative method, *i.e.* he ranges through ancient and modern literature, and judges English work in relationship to Greek, Latin, French, German works.

Ruskin.—Ruskin's work is primarily concerned with art, and art to him means Turner. Undoubtedly he had a great vision; that the Futurists in art and economics are beyond him does not alter that fact. His style is ornate (sometimes metrical) and very musical. Latterly he believed in a kind of aristocratic Socialism.

Pater is a notable stylist in the pictorial manner. His merit as a critic lies in his frank search for beauty.

From Pater's time onwards, style in itself is not specially considered. The writings of Darwin, J. S. Mill, Huxley, Hugh Miller are, for the most part, specialists' treatises. Newman alone stands out as a master of prose style.

It is impossible to mention many of the recent

writers of English prose. One of the most individual was Oscar Wilde, who wrote brilliantly witty and paradoxical plays and essays (*e.g. Intentions*).

THE NOVEL

A novel is a story in which the characters are fictitious; even if a historical personage is introduced, he or she is made to develop a character of his or her own.

As we have action plays and psychological plays, narrative poetry and philosophical poetry, so we have story novels and psychological novels. H. G. Wells's *Marriage* is a novel; so is his *The Invisible Man*. But the two are miles apart in style and motive. *The Invisible Man* is a story; its interest lies in its adventure and surprise; we are interested in the plot—how the story will end. In *Marriage* the plot is of minor importance. There is no stirring adventure; the development of the characters is our main interest. *Marriage* deals with souls; *The Invisible Man* deals with incidents. The best novels are of the *Marriage* order. Readers of Meredith, Hardy, Wells' (in his later works), Bennett, and Locke are bored to death by the tales of absurd adventure that pour from the libraries and run as serials in the commercial press.

A taste in fiction comes after much reading only. The schoolboy who commences his reading with "Penny Dreadfuls" will not be long before he desires something better. The wise parent will not forbid his boy from reading "Dreadfuls"; he will be glad to see a desire for reading manifesting itself, and, when the time comes, will gently lead the young reader to a better pasture.

It is a mistake to read good fiction when you are very young. Give a schoolboy one of Meredith's novels, and ten years later he will in all likelihood say "Meredith? I can't stand him. I once read *The Egoist*, and I thought it a poor story." The present writer read Sarah Grand's *The Heavenly Twins* when he was very young, and all he saw in it was an idyll of a sweet girl and a beautiful-natured Tenor. Years afterwards he re-read the story, and was surprised (and delighted) to find that the book was a great argument and plea for woman's freedom.

The average youth begins with "Penny Dreadfuls," but he soon goes on to Ballantyne and Kingston. Ballantyne is moral and religious, and because of this most schoolboys prefer Kingston. Tales of schools also belong to an early phase; most boys enjoy the stories of Ascot R. Hope and Talbot Baines Reed, author of *The Fifth Form of St. Dominic's*. Kipling's *Stalky and Co.* is too realistic for most boys, and it is best read when a boy is seventeen at least. The next period is one of romantic tales of adventure. Guy Boothby is a general favourite with youth; his delightful method of beginning a story with a "Hands up, or I fire!" kind of sentence wins a boy's heart at once. During this period a youth reads Stevenson's *Treasure Island*, Anthony Hope's *The Prisoner of Zenda*, and its sequel *Rupert of Hentzau*. Stanley Weyman's *A Gentleman of France*; Rider Haggard's *Montezuma's Daughter* (and Kingsley's *Westward Ho*, which tells a similar story), *King Solomon's Mines*, *She*; Cutcliffe Hyne's *Captain Kettle*; Conan Doyle's *Adventures of Sherlock Holmes*; Kipling's *Kim*.

The transition from the adventure tale to Hardy or Meredith is difficult to follow. Possibly Marie Corelli's books, by their constant criticism of society, give many young people a taste for deeper criticism and thought, just as Ella Wheeler Wilcox's poems lead people to the study of good poetry. We have suggested that the psychological novel is greater than the adventure tale, but we do not intend to give the impression that we despise adventure tales. A romantic story like Mary Johnson's *By Order of The Company* makes excellent reading. Unfortunately, however, many readers never get past the romantic novel; their one desire is for thrills. That this class of reader is a large one is shown by the cinema-houses' offering of large doses of sentimental pathos and absurd heroic adventures, in which, of course, the ending is happy.

It will be noted that the classics are not mentioned in the above list. The classics either enter into a boy's reading incidentally, or they never enter at all. Occasionally a boy will take a fancy to Scott (many boys are repelled by his dry introductions), or to Dickens or Thackeray. The works of the Brontës, Sterne, Richardson, Fielding, George Eliot do not belong to any special phase. In general the modern reader does not want to read the classics; there is in this age a desire for the new books and the new theory. Professor Sir Walter Raleigh's opinions of Shakespeare are of more interest to the present writer than Hazlitt's are. This modern desire for the "latest" is inimical to education, and our universities, by ignoring Arnold Bennett and dwelling on Lyly and Fielding, play a necessary part as correctives. Where our university professors fail is in their forgetting that modern known writers should be constantly compared with ancient unknown writers. A professor of English Literature will discuss More's *Utopia* and hark back to Plato's *Republic*, but he will not compare More's work with Wells' *A Modern Utopia* or Morris's *News from Nowhere*.

The same objection may be taken to the teaching of History in schools. History, for most children, stops at the Revolution of 1688; after that History means Marlborough's wars, the "'Forty-five," the Crimean War, and the Indian Mutiny. Few teachers would think of mentioning Larkin in a lesson on the Peasants' Revolt of Richard II's reign.

To sum up, study of modern men and books only is bad; study of dead men and books only is bad. Education requires a blending of ancient and modern.

History of the Novel.—The word "Novel" proper came from Italy. Boccaccio in 1350 wrote *The Decameron*, a collection of prose tales ("Novella Storia") of adventure.

Italian fashions soon become popular in England, and Italian stories were translated (*cf.* Painter's *Palace of Pleasure*). The novel must not be confused with the verse romance; the romance dealt with legendary figures, the novel dealt with real figures.

The first novelist was John Lyly, who wrote a novel called *Euphues, The Anatomy of Wit* (see p. 126). Nowadays *Euphues* would not be classed under fiction in a public library, for it is really a book of moral aphorisms with the flimsiest of plots. The dramatists Greene, Nash and Lodge wrote Euphuistic stories dealing with the London low life of the day. Nash points the way to Fielding; his *Jack Milton* has characteristics in *Tom Jones*.

Sidney's *Arcadia* is a pastoral romance, with less realism than the tales of Greene and Nash, but it is an advance on *Euphues* in characterisation.

During the dramatic outburst the novel was moribund. Dekker wrote stories with lively pictures of types, but he wrote better plays. It would appear that the novel and the drama cannot flourish side by side on equal terms. The nineteenth century was the period of the novel, but nineteenth century drama in England was wretched stuff. The twentieth century promises to be a great dramatic period in England. We find that the novel did not become important until drama was decadent. But the Elizabethan paved the way for the psychological novel—that is, the novel where character, not incident, is predominant. Men became introspective; the lyrics of the dramatists are personal expressions. And a strong desire to study men's "humours" and "characters" led to Ben's humour comedies and the characters of Overbury, Hall, and Earle.

Bunyan.—*The Pilgrim's Progress* is a novel of adventure, but it is also an introspective study of the writer's soul. Christian is Bunyan. It is a great story, full of great passages. Think of the simplicity and force of the following passage:—

"Then Apollyon straddled quite over the whole breadth of the way and said, 'I am void of fear in this matter. Prepare thyself to die, for I swear by my Infernal Den that thou shalt go no further. Here will I spill thy soul!'" There is no trace of the dramatists' bombast and rhetoric here. *The Life and Death of Mr. Badman* is more modern than *The Pilgrim's Progress*: it foreshadows the novels of Richardson, Fielding, and Thackeray.

Defoe.—Daniel Defoe was a born storyteller. His imagination always runs away with him, and, when he writes his *Journal of the Plague Year*, he is inventing quite as much as he does when writing *Robinson Crusoe.* He anticipates moderns like Reade, Dickens, H. G. Wells in using fiction as a means of satirising social evils. *Robinson Crusoe*, it must be remembered, came at a time when the French "heroic romance" was popular, and its naturalism did much to kill the impossible adventure stories that led Dryden to write his "heroic" ranting play *The Conquest of Granada.* Defoe's novels had two faults, they lacked humour and sentiment.

Swift's *Tale of a Tub* and *Gulliver's Travels* are satires with just enough story to make them novels. And Johnson's *Rasselas*, though nominally a novel, is simply literary criticism put into the mouths of characters who do not really live.

Richardson.—Richardson's novels are written in the form of letters. *Pamela* is full of mawkish sentimentality. *Clarissa Harlowe* is one of the great studies of feminine psychology. *Sir Charles Grandison* is a prolix study of a prig. Richardson is always trying to be moral in a conventional sense; he is far too long-winded; he is devoid of humour. His great merit is his knowledge of feminine nature and human motive.

Fielding.—Fielding had a strong sense of humour. He began by parodying *Pamela* in *Joseph Andrewes.* He is superior to Richardson in character-drawing and in construction. In *Jonathan Wild* he showed himself a fine satirist, but he is at his best in *Tom Jones.* This work is not immoral: it is merely coarse. There is a healthiness about Fielding's obscenity that Richardson's moralising does not possess. But Fielding is a painter rather than a prophet. He accepts current ideas of morality; he is on the side of the man, and does not foresee a time when the woman will demand from men the same standards of morality that men apply to woman. He owed much to the Spanish picaresque novel, or rather that great parody of the picaresque novel, *Don Quixote.*

Smollett.—Smollett also was influenced by the Spanish novel. He is not one of the greatest novelists; he excels in animal spirits and sailor portraits. *Humphrey Clinker* is his best work.

Sterne.—The author of *Tristram Shandy* is one of the great humorists of English literature. He has not the broad humour of Fielding or Smollett; his is the rapier thrust, not the broad-stroke blow.

Goldsmith.—*The Vicar of Wakefield* is an idyll; it is a simple sentimental story told in a charming way.

The Women Novelists.—The first woman novelist of note is Frances Burney; her *Evelina* (1778) gives a lively picture of eighteenth century

society. Mrs. Radcliffe wrote of secret passages, mysteries, and the supernatural, and brought the Romantic love for Nature into English fiction, but had no claim to genius.

Jane Austen.—Jane Austen lived all her life in a sleepy country town. Her work is an advance on what was a conventionalised fiction; she has no melodramatic titled villains nor abductions. Her women characters are better psychological studies than Richardson's; her sentiment is saved by her sense of humour from becoming sentimentalism. She is always mildly satirical and impersonal.

Maria Edgeworth and Miss Ferrier are of no great importance; the former could paint Irish life and manners well, and the latter is sarcastically delightful in depicting the Scotch gentry.

Scott.—Sir Walter Scott's general outlook on life is discussed on p. 120. Here we are concerned with the novelist. Scott came at the time of the Romantic Revival, but this circumstance does not account for his romantic stories of the past. It was his temperament to dwell in the past, just as it was Shelley's temperament to dwell in the future.

Scott practically created the historical novel; previous writers had used history without truth or accuracy of detail. He admitted that Miss Porter's *Scottish Chiefs* (1810) and Maria Edgeworth's studies of Irish life led him to combine history with national (Scottish) character. Scott can tell a story excellently; he can paint lively characters, and describe nature realistically. He has no bias, and in consequence he has no propaganda; he accepts current views on morality and behaviour. He is on the side of Romance. The French Revolution inspired Wordsworth and Shelley; it made Scott tired, and he sought refuge in the romantic past.

Contemporary with Scott was another Scottish novelist—John Galt, who lives because of *The Annals of the Parish.* Galt is no genius like Scott, yet he was nearer to the life of his time than Scott was. While Scott was telling tales of Ivanhoe and Robin Hood, Galt was depicting the industrialism of his own town.

Among Scott's successors in romantic fiction were James Grant, author of a *Romance of War*, and Bulwer Lytton, famous as the author of *The Last Days of Pompeii.*

Charles Lever lives by reason of his rollicking extravagant military tales *Charles O'Malley* and *Harry Lorrequer*, and Captain Marryat's *Peter Simple* and *Mr. Midshipman Easy* are immortal as boy's stories.

Thomas Love Peacock wrote the novels *Headlong Hall, Nightmare Abbey, Melincourt*, and others. He lives in the period of the Romantic Revival, but he always looks back to the cheaply ironic eighteenth century period.

The Victorian Novel.—*Dickens.*—Charles Dickens is one of our greatest novelists. He can tell a story, or draw a character excellently. He has a great gift of humour, but his pathos is too often sentimentality; some of his pathetic scenes are as mawkish as any cinema "moving drama full of human interest."

Dickens was essentially plebeian; he was a true son of the working-class, and never became a snob. But, democrat as he was, he lacked vision. One feels, in reading his novels, that he accepted Victorian current views on morals and politics. His attitude to social abuses was that of the Liberal rather than that of the Socialist. He had definite ideas of good and evil. He was a romancist in his general outlook, and a realist only in details. Consider *David Copperfield.* In drawing Steerforth, Dickens is following the time-honoured prescription that a seducer of a woman is a bad man who deserves punishment—poetic justice. Again, think of Dora Copperfield. Think of the manner in which a modern—say, H. G. Wells—would have treated her. Probably he would have had hundreds of pages giving David's introspective musings on his marriage to a woman whose temperament was incompatible with his own. Possibly he would have made David run away with Isabel.

We are not trying to hint that Wells is greater than Dickens as a novelist. He isn't; but he is a greater thinker. His characters try to find out what is good and what is evil in an environment that is compounded of convention and law. Dickens accepts the convention and law; he accepts what the man in the street thinks good or evil.

Thackeray.—Thackeray resembles Dickens in this, that he accepts the current code of ethics. He differs from him in nearly every other respect. His sense of humour is different; he is a wit rather than a humorist. You smile with Thackeray, but you guffaw with Dickens. His outlook is different; to him Society means the upper and middle classes. Dickens had too much humanity to be a good satirist; Thackeray had too little. He has often been praised for his satire. Personally we fail to discover on what his fame is founded. He was a Victorian W. S. Gilbert—only much greater. His *Vanity Fair* is scarcely a more cogent criticism of society than *Vanity Fair* the popular weekly is. Thackeray did not look deep; any satire he has is surface satire. But he is a great novelist and stylist, although he falls below Dickens in wide humanity.

The Brontës.—Charlotte Brontë, the authoress of *Jane Eyre*, has one great merit; she gives us an introspective study of herself. True, she almost fails when she invents other characters, but we do not mind that. She belongs to no school; she blends romance and realism, sentimentalism and domesticity. Her sister Emily is much greater in imagination; as a piece of

"fiction," *Wuthering Heights* is greater than *Jane Eyre*. Mrs. Gaskell, who wrote the life of the Brontës, is for the most part an inferior novelist; she sees the obvious and little more.

George Eliot.—There are many modern people who find George Eliot's books dull, and you will probably find that *Adam Bede* and *The Mill on the Floss* are seldom asked for at Mudie's. Her present unpopularity may be due to the undoubted fact that she is at best a second-rate novelist. She has plenty of humour; she is "advanced" in a Victorian sense; she is always a critic; she is a fine painter of rural scenery; she subordinates more incident to character. But she fails to arrest the twentieth century, possibly because hers is the talent of experience and observation, not the genius of creation.

There is nothing very arresting to be said about Charles Reade, Anthony Trollope and Charles Kingsley. Each could tell a story very well, and the former had a didactic purpose.

Modern Fiction.—The works of Dickens mark the transition stage between the Victorian and twentieth-century novel. Thackeray's tales afford shallow moralising, but Thackeray was not frankly didactic. Dickens was.

Again Dickens is a half-century ahead of Thackeray in his choice of atmosphere. Thackeray followed the Aristotelian tradition of making his characters people of birth; Dickens pointed the way to the fiction that was to produce *Kipps* and *The House with the Green Shutters*.

In general it will be found that the best modern fiction has no special predilection in its choice of atmosphere; it is frankly eclectic.

George Meredith stands out as the first master of the new fiction. He has no mission; the only social questions that attract him are Home Rule and the emancipation of women. He loves humanity, and has Browning's passion for studying types. He owes something to Carlyle in style, and something to Thackeray in treatment of character, but he is mostly original.

Thomas Hardy is possibly as brilliant an analyst of character, but his art is less perfect. Meredith's characters work out their own salvation; Hardy's are the victims of simple chance. Tess and Jude the Obscure never get a chance. Again there is an elementariness about Hardy sometimes. *Two in a Tower* shows this, both in style and treatment of character. Another strange circumstance is that books like *Far from the Madding Crowd* and *Jude the Obscure* appear to be romances that have lost their way. When you read them you think them grim pieces of realism; a month later you think them romances.

George Moore is frankly realistic. His *Mummer's Wife* is one of the greatest novels ever written. Moore eschews all sentimentalism and make-believe; he seeks truth, not at the bottom of the well, but at the bottom of the cess-pool. He finds it, and the wonderful thing is that it is often beautiful.

One should compare Moore with George Douglas, the brilliant young Scot, who wrote *The House with the Green Shutters*, in our opinion the greatest novel Scotland has produced.

There is very little beauty in this book. The only touch of humanity in it is where the baker cries: "Damn it, man, leave folk alane," when the rotten-hearted Deacon is baiting Gourlay in the Skeighan brake. All else is ugly spite and hate.

The main characteristic of the novel is power. Douglas is a master of words; with one word he will paint a canvas.

It is impossible to mention more than a very small fraction of present-day novelists. George Gissing has often been praised for his realism and thought, but he is not at all profound. His novels are full of moralisings about social grades, but one cannot help feeling that Gissing's ideal is a life of respectability in a London suburb.

H. G. Wells began as a writer of imaginative novels dealing with science. Then he added humour of the most delightful kind, and gave us books like *The Invisible Man*. Later he took up the novel of sex psychology. . . . *The New Machiavelli*, *Marriage*, *The Passionate Friends*, *Tono-Bungay*, *Ann Veronica*, *Love and Mr. Lewisham*, and others. The interest of these is sociological in the main; Wells places his lovers in a garden-party where futility reigns, instead of in an Arcadia. In the end, however, they generally have the moral courage to fly to Arcadia in spite of Mr. Wells. Every one of his later works is a gold mine of suggestion and thought.

Conrad belongs to the class of novelists who write narratives. He deals with what he has seen in his travels. He is a master of the telling word and the illuminating phrase.

Another word master is Rudyard Kipling. He is a man with a mission; he advocates an Imperialism that, to many, means an aggressive forcing of British Commercialism and Toryism upon other races. He is the apostle of efficiency and discipline. As a short-story writer he is great.

It has been said again and again that Kipling's Muse is dead. The truth is possibly this:—He has outlived his time. The present age is the age of the democrat. Kipling is essentially aristocratic and oligarchic; his works do not hint that he believes in democracy.

Arnold Bennett, one of our most prolific writers, has published some very companionable novels. He favours the narrative type of story. His characters are more or less conventional; they adapt themselves to the universe, while Wells' characters are always trying to adapt the universe to themselves.

Perhaps Bennett's fame will rest on *The Card* and its sequel *The Regent*, two of the funniest books of the century.

W. J. Locke is another novelist without a mission. His characters are mostly realists who move in a romantic atmosphere; Marcus Ordeyne is a man with a wing collar and coloured socks, walking abroad in the Forest of Arden.

We must make some reference to what is known as the Kailyard School. Some have placed Stevenson in this school, but he is a long way from men like Ian MacLaren and Crockett.

Stevenson began as a romancist, and he discovered romance in everything. Yet, had he lived, he might have been a great realist. The unfinished *Weir of Hermiston*, his greatest work, has nothing of the *Treasure Island* manner about it; it is a fine study in psychology.

The novels of the Kailyarders are mostly novels of sentimentality. Barrie is undoubtedly the greatest of the group, but he does not always reach the heights. *When a Man's Single* is weak stuff. *Sentimental Tommy* and the sequel *Tommy and Grizel* form a great work which is marred by the absurdity of Tommy's death. Possibly Barrie killed Tommy because he didn't know what to do with him.

One work of Barrie's is a perfect whole—*A Beautiful White Bird*, one of the sweetest stories ever written.

A special word must be said about the humorists in English fiction. Dickens stands at the head of modern humorists, and it can be seen that W. W. Jacobs has many of Dickens' tricks and mannerisms. Jacobs is a fine humorist, but his humour lies in the manner of telling. Stage a Jacobs story and its humour is gone. Barrie on the other hand is a humorist because he picks out the scenes from life that one would laugh at. Hence his humour stages well.

Jerome K. Jerome's humour is out of date; it is too far-fetched.

George A. Birmingham is delightful, and Stephen Leacock is great at times. Three novels full of exquisite humour are *Kipps*, by H. G. Wells, *Septimus*, by W. J. Locke, and *The Card*, by Arnold Bennett.

DRAMA

In drama there are two main divisions, tragedy and comedy.

Tragedy.—The word tragedy, thanks to the newspaper reporter, has become the accepted term for a murder. Newspaper headlines blare forth such words as "Awful tragedy in Poplar; man shoots wife and four children," and the average playgoer naturally thinks that a tragedy is a play with a death at the end. The use of the word "tragedy" for a crime is misleading; indeed in Tragedy a murder is always something greater than a vulgar crime.

Aristotle the Greek philosopher and critic said that in tragedy the chief character, owing to some human frailty, meets with disaster. He is neither a very good nor a very bad man; if he were very good his disasters would horrify us; if he were very bad we should say "serve him right." But when he is a man of normal qualities his troubles rouse our pity and awe.

Tragedians since Aristotle's time have put his theory into practice, although many of them never heard of Aristotle. The heroes of Shakespeare's tragedies are neither saints nor sinners; they fall because of human frailty. Hamlet's tragedy is his failure to rise to an occasion; Macbeth is a fairly good man, and his tragedy is his being led into a situation he cannot fill; Othello's tragedy is his fancied discovery that purity is non-existent.

Yet perhaps the idea of circumstances, of Fate, is of greater importance in tragedy than human frailty. Macbeth's weakness would not have led him into trouble if Lady Macbeth had not been ambitious. And Lady Macbeth was a potentially good woman overpowered by Fate. Fate, in the person of Iago, overpowers Othello. In Ibsen's *Ghosts* human frailty accounts for Mrs. Alving's tragedy, but her son's awful end is the work of Fate in the form of Heredity. So in Masefield's *Nan* the heroine is a good girl with no special frailty; her tragedy depends on the weakness of others—the hate of a she-devil and the treachery of a youth—and on the circumstances of her parentage.

Aristotle held that the chief character in a tragedy must be of exalted rank, because the higher a man's rank the more appalling his fall. Shakespeare makes his tragic heroes men of high rank, but modern tragedy counts on human life, not on social standing. Nan is of the common people.

Comedy.—The generally accepted definition of a comedy is "a play that makes you laugh." This definition is inadequate. *Charley's Aunt* and *When Knights were Bold* make you laugh uproariously, but they are not comedies: they are Farces. A Farce is "a play that makes you laugh"; it is full of ludicrous situations entirely divorced from any situations of real life.

A comedy is, strictly speaking, a light, tolerant satire on current manners, customs, morals, politics, &c. It is essentially a criticism of contemporary life. It depends upon its wit rather than on its humour; we smile at comedy, but we roar at farce.

It is necessary to distinguish between wit and humour. When a low comedian tumbles into the orchestra we laugh: the incident tickles our sense of humour. But when a character in an Oscar Wilde or a Shaw play says brilliant things we smile: the sparkling dialogue appeals to our sense of wit. Humour belongs to the heart; wit is an intellectual exercise. The rustic whose intellect is not developed will see

no point in Shaw's dialogue, but he will thoroughly appreciate an old man's slipping on a banana skin.

Comedy therefore is the product of a more or less cultured society. It usually deals with town life and dwells upon social amenities.

Plays cannot be definitely classified as Tragedy or Comedy. Various hybrids have grown up. We have Shakespeare's Historical Play and Romantic Comedy, Dryden's Heroic Play, the modern Melodrama (a play depending upon exciting incident and romantic plot), the Psychological Play (*e.g.* Ibsen's *The Doll's House*, which is neither Comedy nor Tragedy), the Opera, and the Comic Opera. Musical Comedies and Revues are not drama : they belong to the order of music-hall entertainments.

Early-English Drama—*Miracles and Mysteries.*—English drama, like Greek drama, was religious in origin. The destruction of the Roman Theatres resulted in the *mimis* becoming travelling "turns." The ill-favour of the Church followed them, but in spite of opposition they throve. Gradually they organised themselves into guilds, and civic corporations took them over. The Church at length saw that the *mimi* could not be ignored, and it issued edicts telling the people what shows to attend and what ones to eschew.

Possibly the Church began to see that the play might be used as an educative force. At any rate we find that by the twelfth century the clergy had begun to give dramatic performances on special feast days. They acted stories from the lives of the Saints and from the Bible ; the former are known as Miracles, the latter as Mysteries. Gradually the Miracles passed out of the Church into the street ; the priest was superseded by the layman—the member of the guild.

The Miracle plays were written in cycles, and four cycles have come down to us—the York, Wakefield, Coventry, and Chester plays. None is earlier than the fourteenth century. The plays in these collections show how drama develops from a Church spectacle to something related to the life of the time. Secular incidents are introduced into sacred story and these are generally humorous.

A typical play is *Noah and the Flood*, which was played by the guild of Fishermen and Mariners. Noah tells his wife to come aboard for he is about to set sail. She refuses and the two begin an argument that leads to blows. In the *Second Shepherd's Play* a sheep-stealer Max is introduced as a clown. The clown was a development of the Devil of the Church Miracles.

The Morality.—The Morality was a play with allegorical characters (*e.g.* Experience, Studious Desire), and its aim was to teach. The Morality did not supersede the Miracle : the two continued to exist side by side. The characters of the Morality were not interesting, but gradually real human characters with allegorical names were invented.

The Interlude.—The Morality was intended to teach ; the Interlude was a mere piece of farce. A typical example of the Interlude is Heywood's *The Four P.'s*. In this a Palmer, a Pardoner, a Pedlar, and a Poticary have a competition to decide which is the greatest liar. The fact that the Palmer wins is merely a mild instance of early satire against the Church.

Tragedy and Comedy.—The Miracle, Mystery, Morality, and Interlude were entirely native products, but about the middle of the sixteenth century, Englishmen began to study the Latin plays of Seneca. The Senecan type of play did not represent action on the stage ; action took place "off," and a Messenger rushed on to tell the tale. The Classical Messenger had appeared in *The Four Elements*, an Interlude, and this is perhaps the earliest sign of classical influence we have.

The first English Tragedy is *Gorboduc*, a Senecan play by Sackville and Norton. It was an appeal in drama to Elizabeth, begging her to marry so that there should be no dispute about the succession. The Senecan tragedies could not appeal to the English masses, for the English playgoer demanded (and still demands) action, not narration. Yet the Senecan manner influenced English drama. It gave it the long introspective soliloquy (*cf.* Shakespeare everywhere) ; it gave it a love for the supernatural (*cf.* Hamlet's Ghost), and a taste for revenge (*cf.* the bloodthirsty plays of the Elizabethan dramatists generally), and a desire for exclamation that led to the cheap rhetoric of the Elizabethans.

A few years after the production of *Gorboduc* two typically English plays appeared, *Ralph Roister Doister* and *Gammer Gurton's Needle.* The former is the better of the two. Although classical in plot construction and in its division into five acts, it is English in its characters and story. It is an Interlude in a classical dress. The clown of the piece, Matthew Merygreek, is the old "Vice" of the Moralities in a more human form. He induces Roister Doister, a braggart and simpleton, to court the widow Christian Custance in the absence of her betrothed the merchant Gawin Goodluck. The rest is simple farce. The important feature of the play is the combination of the Morality "Vice" with the gull of Plautus.

The Stage.—When the guilds took the Miracles out of the hands of the clergy, they travelled around the country side. Their stage was a movable platform. The players dressed in the lower and played on the upper part which was open. Many guild actors became professionals or "stroller-players," and played in booths, market-places, and the courtyards of inns. The Elizabethan inn-yard had seats round the boundaries, but the common people

stood in the centre, the "pit." The stage was a platform that jutted out into the pit.

The inn-yard came to be looked upon as the best theatre, and playhouses were modelled on it. The Globe was of this pattern. The performance took place in the afternoon.

The Elizabethan audience was far from being refined. Men argued and quarrelled in the pit while the play was going on; cards and dice were played. The playgoer was out for the day and he wanted his money's worth. Hence we find Elizabethan plays full of fights and bloodshed. The stage fight was a real fight; the audience took sides, and a duel in—say—*Macbeth* sometimes developed into a general battle between the sections in the pit. The Elizabethan theatre was the equivalent of our music hall; the audience took a frank delight in horseplay, coarse wit, and blood and thunder. Shakespeare wrote for his audience.

But there was another kind of audience, the audience of the Court, the Inns of Court, and the Universities. This audience wanted something higher than music-hall "turns." We saw that *Gorboduc*, the first English tragedy, was performed at Court; the inn-yards would not have tolerated a Senecan tragedy with its lack of action. The Court drama took Seneca as a model for tragedy, Plautus or Terence for Comedy. It delighted in pageantry and music, and the Masque was very popular in exalted circles. The Masque was a kind of forerunner of grand opera; it depended upon music and pageantry. Ben Jonson wrote over forty Masques.

The University Wits.—Marlowe, Nash, Lyly, Peele, Lodge, and Greene are known as the University Wits. We shall expect to find that in their plays they show the influence of classical learning. They do; but they do not forget the Elizabethan audience and its love for the farce of the interlude and for blood. Marlowe is the greatest of them all. He is famous as the creator of the "mighty line." Blank verse in earlier drama had been a poor thing; the blank of *Gorboduc* is frankly bad. Marlowe's blank verse has majesty and great music. The other "wits" had a share in the reforming of blank verse; Peele gave it sweetness, Lyly lent it grace.

The plays of the "wits" all mirror the energy and fullness of the age. The people wanted blood and horrors; Marlowe gave them *Tamburlaine* with its score of murders, Shakespeare gave them *Hamlet*, and Kyd gave them the *Spanish Tragedy*.

Thought was not welcomed by the Elizabethans; psychology to them was of less importance than childish stage fights and trumpet blares. The childishness of the age is seen in Marlowe and the other "wits"; they mistake bombastic soliloquy for introspection. The drama of the period is often merely silly in its extravagance. Characters in Marlowe and Shakespeare rant in the manner of the villain in a modern tenth-rate melodrama. Only Marlowe and Shakespeare make them rant poetically.

Shakespeare.—We have suggested more than once in these pages that Shakespeare belongs to the class of artists who accept the ideas of their time. He is no innovator. He is quite content to take old plays and rewrite them, as Burns rewrites old songs; and he has no objection to lifting scraps of philosophy from these old plays. He is a conventional citizen, with a conventional citizen's innate snobbery; his great ambition is to be a country squire at Stratford-on-Avon. Democracy he has no sympathy with; he ridicules popular leaders like Jack Cade; he almost invariably makes his working-class characters rogues or fools; he bows the knee to pomp and rank. Like Kipling he is on the side of the Conservatives.

It has been said that Shakespeare was ahead of his times, seeing that he ridiculed popular fashions. Now there are two kinds of social critic; the one sees the foibles of society and rather likes them, the other sees the foibles and hates them intensely. W. S. Gilbert is of the former, Shaw is of the latter type. Shakespeare, like Gilbert, saw the follies of society, but he thought the follies worth having, even if it were only for the fun of laughing at them. He pokes fun at Lyly's Euphuism and Marlowe's rhetoric, but he rather fancies rhetoric and Euphuism.

As a technician he accepts the drama of the time with its extravagant make-believe. Girls disguise themselves as men, and are not discovered; bad men are paired off with virtuous maidens at the end of the fifth act, merely to give the play a happy ending; the obscenities dear to the Elizabethan pit are given with a liberal hand; clowns, the descendants of the Morality Vice, juggle with bad puns and worse innuendoes; characters do things without any rational motive (*cf.* Lear's division of his kingdom), and they believe tales that a self-respecting schoolboy would laugh to scorn (*cf.* Othello's belief in Iago's story or Claudio's belief in Hero's guilt in *Much Ado*).

If our criterion is a modern realistic dramatist like Ibsen, Shakespeare must be considered a bad dramatist; for, according to twentieth-century ideas, drama ought to be realistic—that is, a play should present no incident that is obviously divorced from real life.

Clearly Shakespeare's plays are different from Ibsen's or Strindberg's. No one in real life would break the news of Ophelia's suicide as the Queen in *Hamlet* breaks it to Laertes:

There is a willow grows aslant a brook
That shows his hoar leaves in the glassy stream, &c.

But it may not be just to say that Ibsen's plays

are better than Shakespeare's: you cannot say that claret is better than cheese. According to the realists Ibsen is the greater; according to the romancists Shakespeare is the greater.

It is as a romancist that Shakespeare must be judged; his greatness is best seen when he is compared with his contemporaries. Shakespeare's greatness lies in his poetry and music. He should be judged as a poet and musician rather than as a dramatist. He takes the plays of his predecessors and invariably he makes them beautiful works by adding music and colour. He does not invariably improve the plot; the older play *King Leir* is much more natural and simple than *King Lear* with its shallow tricks of disguise and credulity.

Shakespeare appears to have no definite criterion for life; his usual test is happiness.

Macbeth says:

Out, out, brief candle!
Life's but a walking shadow; a poor player,
That struts and frets his hour upon the stage,
And then is heard no more; it is a tale
Told by an idiot, full of sound and fury,
Signifying nothing.

Compare this with Jaques' *All the world's a stage*, and Prospero's *We are such stuff as dreams are made on, and our little life is rounded with a sleep.*

In those sayings there is no hope, no vision of a fuller life. His outlook is frankly that of a hedonist.

That Shakespeare is great no one can deny. He can draw a character brilliantly; his Falstaff is glorious. He was an excellent humorist and a passable wit. His poetry is of the highest kind. In his lyrical plays *A Midsummer Night's Dream* and *Romeo and Juliet* he is unapproachable.

The lesson we are trying to teach is this: Shakespeare is not always excellent; hero-worship too often makes students ignore his shortcomings. Our objection to him is the frankly biased one that he was neither prophet nor democrat. His consummate art we admit and appreciate.

Ben Jonson.—Ben was on the side of classical correctness in his plays as in his lyrics and prose. He hated the rhetoric and extravagance of the Romantics, and he refused to "write down" to the Globe type of audience. He calls comedy "a thing throughout pleasant and ridiculous and accommodated to the correction of manners." Oscar Wilde might have subscribed to the same definition. Shakespeare is not a comedy writer; what is called his comedy is really farce.

Ben, then, set out to tell the Londoner what he thought of him, but he did not carry out his intention well. He began to create characters with "humours" (*i.e.* eccentricities); he tried to fit character sketches from contemporary life into the classical frame of drama with its stock Roman comedy figures—the gull, the cunning servant, the braggart, the young wife and her jealous husband. As a result his characters lose reality. Ben's plays might be called Moralities with the dialogue of Plautus and Terence added.

The other dramatists.—The plays of Shakespeare's contemporaries and immediate successors belong roughly to two groups—those that followed the horrors of Kyd's *Spanish Tragedy*, and those that treated of the town manners of the day. The former type of play is generally disgusting. A good example is Marston's *Antonio and Mellida* which is full of blood and bombast. Chapman's *Bussy d'Ambois* shows similar horrors, and Webster's *Duchess of Malfi*, though a great play in the romantic manner, is full of crime and revenge, lust and hate.

The play of town manners is a better product. Dekker's *The Shoemaker's Holiday* is one of the best examples. Dekker is the J. M. Barrie of Elizabethan times; he has a strong sense of human qualities, and his women, like Barrie's, are sweet. Middleton also sticks closely to civic manners, and Jonson, Marston, and Dekker collaborate in an excellent play *Eastward Ho!*

Beaumont and Fletcher write for the court. Their plays show the decadence of the romantic play. In them we find empty bombastic speeches, which do not suit the characters who make them; sentiment posing as passion; mere coarseness pretending to be wit. The decadence of Elizabethan drama reaches its depth in Massinger, Ford, and Shirley. Massinger wrote a famous comedy, *A New Way to Pay Old Debts*, but his work as a whole shows smartness rather than genuis. Ford revels in lust and blood.

The blank verse of the drama gradually became decadent also. Shakespeare's blank verse is perfect in music; only, in his latest work, *The Tempest*, he favours the redundant syllable (see p. 117). Beaumont and Fletcher follow this license, and when Shirley and Davenant and Suckling take it up their blank verse becomes a kind of prose.

The decadence of drama has some connection with the change of power in England. Under Elizabeth England was optimistic; her sailors had sunk the Armada and founded new colonies over the Atlantic; everyone was wondering what new wonder would appear next. With the accession of James I the old spirit died. He truckled to Spain; he toyed with worthless favourites (Elizabeth's favourites were capable men). The new spirit is illustrated by the imprisonment and death of Raleigh. The optimism of a genuine patriotism gave place to the pessimism of sectarianism and partisanship. Puritanism grew apace, and in 1642 the theatres were closed. The romantic drama died out then.

Restoration Drama.—When the English drama reappears again in the age of Dryden it is a new product altogether, although Massinger's *A New Way to Pay Old Debts* foreshadows it.

Elizabethan drama was an expression of the national life: the drama of the Restoration was an expression of town life. It was an amusement for the Court and the smart set. Comedy mirrored the profligate society of the time. Anything suggesting Puritanism was burlesqued and satirised; chastity was jeered at. The playwrights had no motive beyond giving a cheap entertainment. If they condemned current morality on the ground that it was hypocritical and smug, they might be excused or praised. But they condemned morality because they were writing for the bloods who wanted license.

Restoration tragedy added English freedom of action to Spanish bombast and the extravagance of the French heroic romances of Madeleine de Scudéry. Dryden and Shadwell wrote "heroic plays." They are full of impossible feats, ranting speeches, and other absurdities. Dryden's *Conquest of Granada* is a typical "heroic play."

Dryden, Etheredge, Shadwell, Sedley, and Mrs. Behn practised comedy, but without any distinct merit. They had been trying to imitate the racy dialogue of Molière, but they never quite succeeded. Wycherley almost succeeded. His plays are not specially well constructed; he depends mostly on intrigue and coincidence. His characters are little more than types, yet such plays as *The Country Wife* and *The Plain Dealer* are good to read.

Congrève.—The name of Congrève is the greatest in Restoration comedy. Like the others he is a writer of artificial comedy with its conventional construction and its disregard for probability. His characters are stagey, but they are perfect stage folk. They talk wittily, sometimes brilliantly. But behind their talk there is no real criticism of life. Congrève's best comedies are *The Double Dealer, The Way of the World, Love for Love.*

Vanbrugh, like Congrève, is a wit. *The Confederacy,* his best play, is original in one way; it leaves the exalted lords and ladies of Restoration drama and portrays old-clothes dealers and money-lenders.

Farquhar, the third of the great artificial comedians, if less brilliant as a wit, is more modern than Congrève and Vanbrugh. His plays *The Recruiting Officer* and *The Beaux Stratagem* anticipate the eighteenth-century novel in atmosphere.

The Restoration dramatists are always being blamed, by writers who ought to know better, for their coarseness of language, yet these writers never think of condemning the innuendoes of Shakespeare which are worse because innuendo. The genuine artist believes that to appreciate the quintessence of roses one must first walk by the dung heaps. When one sees things in their true perspective one realises that coarseness of language is a minor matter. The critics who magnify the indecencies of the Restoration dramatists are on a level with the man who refuses to bathe in the sea because of the fact that people drown cats and dogs in the sea.

About the year 1700 comedy loses most of its coarseness, but it becomes a worse product than the comedy of 1660–1700. The plays of Colley Cibber and Mrs. Centlivre are poor stuff as literature. Sentimentality began to creep into comedy. This is seen in the comedies of Steele. His *Conscious Lovers,* evidently founded on Terence's *Andrea,* is classical in its stock characters and incidents. Steele's humour depends much upon his pathos for a foil; he is definitely moral in purpose, but artificial and non-dramatic.

Restoration Tragedy.—We have seen how Dryden, following Davenant, took up the heroic play with all its rant and rhetoric. Buckingham's *The Rehearsal* is an excellent burlesque of the heroic play. In *All for Love (Antony and Cleopatra)* Dryden comes nearer the tragedy of Shakespeare. Otway, the author of *Venice Preserved,* has pathos and tenderness, yet he shows the rant and staginess of the age. His verse is unmusical. He could construct a plot. Lee on the other hand was very musical in his verse, but he could not construct a plot. He has all the bombast and artificiality of the time. Southerne and Rowe are tragedians who do not rise very high. Addison's *Cato* is the last word in bad tragedy: its characters do not live, its plot is bad.

Eighteenth-century Drama.—A new fashion of writing literary plays sprang up in the eighteenth century. Thomson wrote literary plays that are forgotten. Johnson wrote a play, *Irene,* which is forgotten.

Between Steele, Cibber, and Mrs. Centlivre and Goldsmith many minor dramatists wrote farces and sentimental plays. O'Keefe's *Agreeable Surprise,* Cumberland's *The West Indian,* and Holcroft's *Road to Ruin* give a fair idea of the drama before Goldsmith and Sheridan.

Goldsmith's fame as a dramatist rests on *She Stoops to Conquer,* a fresh delightful comedy of incident and manners.

Sheridan is the author of three noted comedies. *The Rivals, The School for Scandal,* and *The Critic.* The dialogue is brilliant, the construction is good. *The School for Scandal* is not artificial like *The Rivals:* its characters live. But Sheridan, although he satirises current manners, does not go deep. He has not got away from the hollow morality of his time.

Nineteenth-century Drama.—Between Sheridan and the modern dramatists there is a time of

non-dramatic activity. The nineteenth century is the century of the novel. Any drama written was divorced from the stage. Byron wrote *Cain* and *Manfred*, Shelley wrote *The Cenci*, Tennyson wrote *Beckett*, Browning and Swinburne wrote plays. These plays are literary; they are better read than acted.

An important date in the history of English drama is 1843, when the law that gave Drury Lane and Covent Garden the monopoly of legitimate plays was abolished. Immediately theatres sprang up all over London, and competition became keen. But there were no plays of merit to put before the public.

In the early century Sheridan Knowles' tragedy *Virginius* was popular. Then in the 'forties Bulwer Lytton produced *Richelieu* and *The Lady of Lyons*, plays full of bad sentimentality and stilted expression. But the popular plays were adaptations of French farce and comedy. Then Tom Taylor came with his Frenchified machine-made plays in the 'fifties. Dion Boucicault wrote a poor if popular play *London Assurance*, and Irish melodramas, *Colleen Bawn*, *Shaughraun*, *Arrah-na-Pogue*.

During the years 1865–1870 the Bancrofts set themselves to produce something better than French farces and bad melodramas. They introduced more natural acting and staging, and greatly improved the auditorium of the Prince of Wales' Theatre. Their most important work was the production of T. W. Robertson's plays, *Caste*, *Society*, *Ours*, *School*. Robertson was no genius; he had no vision. But his plays were an antidote to the rubbish that passed for drama at the time. His follower H. J. Byron, author of *Our Boys*, a play often revived, was frankly bad as a dramatist.

English drama was not redeemed by Robertson. During the 'seventies the Bancrofts revived plays like *The School for Scandal* and introduced adaptations of Sardou's French plays. Sardou was a bad influence. His *Dora* was adapted as *Diplomacy*, and in 1913–14 this play had a great success at Wyndham's Theatre. Now *Diplomacy* is third-rate drama; it deals with a trifling incident; it pictures a conventionally jealous woman in contrast with a simpering empty girl; it is full of stupid rant. The psychology is bad, the humour feeble, and—worst of all—it depends for climax on a silly trick—the detection of a criminal by a perfume. It is a play for children.

In the 'seventies Henry Irving became popular by his performance as Mathias in *The Bells*. Irving was a fine actor, but his influence on English drama was evil. By giving the public plays like *The Bells*, *The Lyons Mail*, *Charles I*, Conan Doyle's *Waterloo*, he was popularising drama that depended on its sentimentalism or its melodrama. It led nowhere; it did not touch the intellect. It was purely emotional. Irving put the actor above the dramatist; instead of adapting himself to Shakespeare, he tried to make Shakespeare's plays adapt themselves to his own histrionic art. He introduced the elaborate staging familiar in theatres to-day (*e.g.* His Majesty's Theatre). Sumptuous scenery is a doubtful benefit to the theatre; it appeals to the eye. The beauty of Shakespeare's plays is their scenery painted in words; the Elizabethans had no scenery but the Elizabethan pit had imagination. When Don Pedro in *Much Ado* said,

> "Good morrow, masters; put your torches out:
> The wolves have prey'd; and look, the gentle day
> Dapples the drowsy East with spots of grey,"

the inn-yard audience *saw* the dawn. In a modern theatre that passage would be accompanied by flashing limelights, and in consequence the force of the lines would be lost.

During the 'eighties many of A. W. Pinero's plays were produced, but adaptations from the French still held the field—melodramas and operettas. A native melodrama grew up (*cf.* Henry Arthur Jones' *The Silver King*, 1882), and Gilbert and Sullivan's comic operas almost killed the French operetta.

Ibsen's Influence.—Pinero, Jones, Sidney Grundy, Carton, Haddon Chambers and others rescued English drama from French influence. But the chief factor in late nineteenth-century drama was the discovery of Ibsen.

In 1889, Ibsen's *The Doll's House* and *Pillars of Society* were produced in London. The Independent Theatre performed *Ghosts* in 1891, and the Press screamed forth stupid anathemas against Ibsen's alleged filth and immorality. Bernard Shaw's *Quintessence of Ibsenism* gives an excellent account of Ibsen's reception in England.

Ibsen was a dramatist with great stage technique and a great vision. He was ahead of his time. He saw the hypocrisies and the criminality of nineteenth-century morality, and he tore them aside. The greatness of Ibsen is at once realised when one compares one of his plays with—say—one of Sardou's. The play we mentioned above—*Diplomacy*—will do. In *Diplomacy* there is a story, a trifling pseudo-detective story of a bad woman's treachery. The characters are purely conventional; they say nothing of importance; they talk cheap platitudes; they do not think any more deeply than the average fashionable person in real life. The whole play is unreal, and, to an intelligent spectator very boring.

In *The Doll's House* we have a trifling incident—her forgery and financial dealings—that leads to Nora's finding her soul. The play is a study of a human soul, not a tale of a silly treachery. The interest is in Nora's gradual realisation of her cramped un-individual life with a fond

uxorious husband. The play goes straight to a great fundamental—the right of a woman to live her own life. It is a grim challenge to smug conventional morality and habit.

Pinero, Grundy, and others wrote good stage plays; but they had not the vision of Ibsen. There is a "popular" strain in their view of established things: they are not rebels.

Bernard Shaw, on the other hand, is a rebel against most established institutions. His plays are dramatically inferior to Ibsen's, but he has the Ibsen genius for seeing beyond the horizon of the man in the street. His plays sparkle with witty dialogue and humorous incident, but his wit and humour are only the sugar coating of the pill. Society, according to Shaw, is suffering from a dreadful disease—a sluggish intellect. It won't *think;* it accepts without questioning its laws, morality, religion, philosophy—everything; it is the slave of prejudice and hypocrisy. Shaw believes that Society requires a drastic remedy, and he offers it his pill. His plays are stern sermons on social and moral texts; he is one of the greatest preachers of Britain. His importance as a thinker lies in his power of suggestion; he is the best schoolmaster known since Greek civilisation. His importance in the history of English drama lies in his theory rather than his practice. His *Dramatic Essays and Opinions*, a collection of his critiques when a dramatic critic, are full of excellent comments on bad drama. He is on the side of the Naturalists, or as they are sometimes called, the Realists. He contemns sentimentalism, the exaggeration of love and its powers, jingoistic heroics and most things that a theatre-going public appreciate.

Galsworthy, the late St. John Hankin, Granville Barker all belong to the Naturalist school, and the late Stanley Houghton's *Hindle Wakes* was of the new order of drama.

Drama of Sentiment.—Outside the Realist drama there flourishes a drama that might be called the drama of sentiment. Barrie is its best exponent. Barrie's plays are full of sweetness and whimsicality; he is no stern critic of morals or customs. He has what Richard Le Gallienne describes in another context as "that sort of humour which comes of the resigned perception that the world is out of joint, and that you were not born to set it right." His romance is seen in the beautiful fantasy *Peter Pan*, a fantasy that Maeterlinck almost equals in *The Blue Bird*.

The probability is that the Naturalist play will never become popular in Britain. To-day Ibsen is played to empty benches in the Provinces, and, with the exception of an occasional Repertory production, Ibsen's plays are not staged in London. The public wants what intellectual people consider rubbish. It wants dramatisations of ranting romantic tales of adventure, farcical plays adapted from the French, and melodrama. The theatre is regarded as a playhouse, not a pulpit.

The Repertory Theatre.—Commercialism prevents the growth of a real drama. Managers look upon the "long run" play as the best; they give the public what it wants just as the average newspaper does. People still go to see a star actor rather than a play. Nevertheless there is a growing tendency to look upon the play as the thing. The Repertory Theatre movement is against the "star supported by a company." To understand the Repertory movement we must know something about the provincial theatre of the late nineteenth and early twentieth centuries. From Restoration days until the middle of the nineteenth century every large provincial town had its "stock company," which had an ever-changing repertory. The stock company was an excellent training-school for actors, and the best players drifted to the centre London. The coming of the railway ended the stock company system, and the modern touring company system took its place. By the new system all plays on tour are replicas of plays produced in London.

Now this system is unsatisfactory. The Provinces have not the same tastes as London, yet they meekly allow the London favourite plays to be thrust upon them. Moreover the touring system is generally commercial; the art-loving companies that tour with Ibsen's plays and play to a few intellectuals in the pit are heroic exceptions.

The Repertory Theatre movement came as an antidote to the commercialism of the "long run," and to the unintellectual drama. The movement, begun in London by the Independent Theatre Society and the Stage Society, was furthered by Mr. Charles Frohman and the Vedrenne-Barker management. The earliest to be founded outside London was the Irish National Theatre. The company went on tour, and gave to other towns excellent productions of plays by Synge, W. B. Yeats, and Lady Gregory. Miss Horniman founded the Manchester Repertory Theatre in 1901, and Glasgow, Liverpool, Birmingham, and Croydon followed her lead. The Repertory company gives local authors their chance; a well-known instance is that of the late Stanley Houghton, whose *Hindle Wakes*, produced by Miss Horniman in Manchester, was taken to London and there was received with enthusiasm.

Musical Plays.—The musical play hardly comes into the history of drama: it is nearer the music hall. The comic opera of Gilbert and Sullivan has gone out of fashion, and its place has been taken by the musical comedy and the revue. The charm of Gilbert and Sullivan's operas is due to the fact that Sullivan gave to Gilbert's jingling polysyllables the melody that suited them. Many praise Gilbert for his

wit, but to-day there is a growing feeling that his wit is based on a superficial view of Society. Gilbert thought Society good in the main, and he laughed tolerantly at its foibles. Shaw, on the other hand, thinks Society rotten at the core; he says extremely witty things about it, but behind his wit is a stern realisation that Society is founded on many shams and stupidities. Gilbert's forte was his genius for absurd situations; the adjective "Gilbertian" will possibly live when his wit is forgotten.

The musical comedy of the *Merry Widow* or the *Quaker Girl* type depends upon its pretty girls and their beautiful dresses, its light lyrics, and its comedians. The story is of minor importance. The revue goes a step farther and drops the story; it is simply a jumble of music-hall "turns" with the "beauty chorus" superadded. The invasion of the theatre by these diverting—and occasionally amusing—numbers has seriously hampered the growth of good drama. Managers are spending huge sums in their production; touring companies almost monopolise the provincial theatres. The musical play fosters the idea that a theatre is a place of amusement only. But the musical comedy and the revue have one great merit: they are quite frank in their aim. They do not serve up the stupid rant that passes for melodrama in many "legitimate" theatres; they do not deal in conventional characters like villains and heroes.

The music hall is not the rival of the legitimate theatre. It is a necessity. The man who can appreciate Masefield's great tragedy *Nan* or Shaw's delightful comedy *Man and Superman* can also appreciate Little Tich and Marie Lloyd. There may be competition between a musical comedy and a music hall; there is no competition between a music hall and a repertory theatre.

Anyone interested in drama must take note of the cinema vogue of the present day. As it exists the cinema is inimical to good drama. It delights in mawkishly sentimental stories of death and poverty. However, the filming of Forbes Robertson in *Hamlet* points to a higher aim. Perhaps the filming of Shakespeare will make people realise how much of his glory lies in his word-music, and colour. The cinema is excellent for farcical incident and educative pictures of bird and animal life. But it will compete with and, let it be hoped, kill the French farce, not the intellectual drama.

It is fatuous to preach against any popular movement; a nation has the plays it deserves. The present age is one of transition. People are altering their values of morality, religion, and philosophy; the worker is awakening to the fact that he slaves while rich people, through no merit of their own, live in luxury. There is a general movement to share the pleasant luxuries of the wealthy, and the result is an increased desire for light amusement. Life is not joyful to the majority of toilers, and the revue or the cinema house affords a means of forgetting life's greyness. To the poor man the cheap entertainment is a means to an end; to the Piccadilly nut it is an end in itself.

The Drama like the Press nearly always caters for the majority. The minority, hopeless of the commercial play, stays away from the theatre and reads its play at home. Most admirers of Ibsen, Strindberg, Shaw, Galsworthy, and Barker know their plays from the printed copy only.

WRITING AS A PROFESSION

Most people go through a certain stage during which they are ambitious to write novels or plays. This stage usually follows the one in which a young man is convinced that he is a born actor—this conviction usually follows a visit to one of Martin Harvey's romantic plays—and in which a young woman feels sure that all her talent is directed towards the footlights. The literary ambition seldom lasts longer than the theatrical ambition. Thus the market is never overstocked with actors and writers.

The present writer has a theory that most youths are probable geniuses; but the great majority lose self-confidence and cease from striving. After all, there is more than a little truth in the saying, "Genius is the art of taking pains." Without much labour no one ever succeeds in any art.

In the art of writing, hard study and hard thinking are essential. And the first requirement demanded of a writer is that he has something to say. The young artist does not realise this; he thinks that the art lies in the words, not in the thought. A few years ago the man that believed in words had a public; to-day, readers want a truth or a theory, and they take little interest in the way the truth is expressed. As we have pointed out in the article on Style (p. 100), the novice will persist in seeking the far-fetched word. If a young writer feels that he must write "Braid seized the iron. There was a sharp metallic click, and the rubber-core went sailing through the serene air; while the spectators, in amazed ecstasy, followed with eager eyes the rapidly moving ball," he should leave literature and take to ploughing.

Let us look into this puerile style. "There was a metallic click"; does the writer think that we expect to hear a wooden crack from a driving-iron? And why tell us that the eyes of the spectators followed the flight of the ball? The average intelligence should guess that the crowd, which follows a professional golfer, is not looking for daisies.

We shall take it for granted that the reader has got over the desire for flowery language. Does the ability to express one's thoughts

simply and directly qualify one as a writer of books ? It does, if the thoughts are worth expressing.

The Writing of Fiction.—One cannot be a great novelist until one has had much experience of life. The youth may write a great novel about his own life, if he is gifted with a wonderful power of introspection, but the only character in the work will be the portrait of the author.

Still, the young writer has a wide province that does not demand great knowledge of psychology, although it requires much imagination. This province is that of the Adventure story. No one but a very clever writer can write a book like *The Egoist,* or *The New Machiavelli;* but a tale of romantic adventure like *The Prisoner of Zenda* or *Treasure Island* can be written by a writer of imagination.

The British public does not want novels of thought; it wants tall stories with happy endings; it demands plenty of blood and villainy, or pailfuls of sloppy sentiment. The serials in the popular weeklies show what kind of stuff the non-intellectual public is reading. Most of them are childish, and unreadable if one has any taste in fiction. This type of story is purely commercial; the proprietors of those papers give the public what it wants, not what it ought to want.

The young writer who has no principles in art may become rich by writing serials and short stories for popular journals. But the young writer who sets out with the primary idea of making money is not the one we are addressing. Many a youth has said, "I can't make enough out of my art to pay for bed and breakfast. I shall stoop to write highly paid piffle; then, when I have made some money, I shall settle down to write the matter I want to write." And many a poor youth has found that after a year or two at the pot-boiling work his senses have become deadened, and he has become unable to write good work. The most dangerous thing in any art is to sell your soul for a living.

The reason why there are so many tenth-rate books on the market is that so many people are writing commercially. But there is a public for higher art; there are writers who are not out for gain alone; there are publishers who give the public what it ought to want. This is the only public worth catering for.

The Short Story.—The short story is the most difficult of all to write. In it there is no room for elaborate description, no room for verbosity. The best training for a short-story writer is the constant telling of stories to friends; if the friends object, write a story about their objecting. The telling of stories orally teaches one to select the salient features.

Consider the following story:

A professor was lecturing on astronomy to an audience in a Fife village. He told of the gradual cooling of the sun.

"Gentlemen," he said solemnly, "in seven hundred million years the sun will be a cold body like the moon. There will be no light, no heat, and consequently no life on the earth."

A farmer at the back of the hall rose to his feet.

"How—how l-long did you say that would be, Mister ?" he asked excitedly.

"Seven hundred million years, my friend."

The farmer sank into his chair with a sigh of relief.

"Thank heaven," he said huskily; "I thought you said seven million."

Compare the above simple tale with the version told by the inartistic person. Here it is:

A professor—I am not exactly sure which one, but I think it was Oliver Lodge—anyway, he was a professor of some kind. He came from Oxford, or was it Cambridge ? Anyhow, he was giving a lecture in a village in Scotland—in Fife, I think it was. I forget the name of the place; I think it was Freuchie—no, it was Kettle—no, I think it was Freuchie after all. Anyhow, he was giving a lecture on astronomy—or was it geology ? &c.

We have all listened to the man who uses the latter version, and we have all longed to slay him.

Barrie in *Tommy and Grizel* makes a writer tell a young friend to write a descriptive passage, and then cut it down by one half *leaving nothing out.* The novice will find much pleasure and profit in cutting out the irrelevant passages and words from the stories in any monthly magazine of fiction.

The short story must depend either upon its interesting plot or upon its racy dialogue. If it is a humorous tale, plot does not matter so much; the humour of W. W. Jacobs' stories lies in the dialogue, and the night-watchman's comments on men and things. On the other hand this writer's serious short stories, *e.g. The Monkey's Paw, The Well,* or *The Ghost of Jerry Bundler,* rely upon their ingenious plots. Some of Kipling's yarns have weak plots, but Kipling is one of the masters of the short story. Wells, again, another master, can write a delightful short story on the flimsiest of plots.

The young writer should keep a note-book, and should jot down any incident that might work up into a story. If he has the imagination, every incident he sees is the foundation of a yarn. He passes a telephone-box. "I wonder what would happen if I rang up some stranger ?" he says to himself. If he is an original youth he will try the experiment. If his originality does not carry him the length of boldness in deed, he will go home and imagine what might

happen in such a case. Perhaps the latter is the better course; the average telephone subscriber has little of the artist in his nature, and would merely look upon the youth as an idiot or a very impertinent fellow.

This telephone suggestion reminds us of the contest between Romance and Realism. A realistic story written round this incident would contain the words, "I am afraid you have made a mistake; you must have got the wrong number." A romantic story would make a lady come to the 'phone and carry on a witty conversation, and ultimately marry the original youth who rang her up.

Beware of introducing stock characters. The black-moustached villain, the fair-haired hero, the insipid wronged heroine are all very well in a cheap melodrama, but in good short stories they are out of place.

The writer of short stories soon discovers that he cannot place his work unless he sacrifices his art to the popular taste. The whole atmosphere of a story may demand that a character dies at the end, but the writer, if he cares more for money than for art, will give the public its desired happy ending.

Dialogue.—Young writers generally make the mistake of putting literary language into the mouths of their characters. Instead of making Mr. Smith say, "I'm going to the club. If I can manage it, I shall be home about eleven," they make him say, "I am going to pay a visit to my club. If circumstances permit, I shall return to my domicile at the hour of eleven P.M."

We must remember that the speech must suit the speaker. If one of your characters is a pompous gentleman who likes stilted language, by all means make him use words like "domicile."

The writer of fiction must always ask himself the question, "Would this character say this?"

The novice has great difficulty in finding variants for "he said." It is much better to use the simple "he said" again and again than to cover a page with phrases like "he asseverated," "he ventured," "he remarked." Each of these has a specialised meaning; *e.g.* "asseverated" means "declared emphatically." The specialised meaning shows the danger of using a book of synonyms. In any book of synonyms the words *disengaged, generous, candid,* are given as synonyms for *free.* Imagine a novice using "A Candid Library" for "A Free Library." The dictionary of synonyms is a useful friend to the educated man, but to the beginner it is a dangerous companion.

Never use expressions like "he cried," "he exclaimed," "he groaned," &c., unless you mean them. On the other hand, beware of using weak expressions at the wrong times. Youths have been known to write, "'Hands up, or I fire!' he remarked," or "'Farewell, dearest,' he suggested."

The descriptive adverb is a difficult article to manage. Note the following:

He said softly, he said quickly, she answered impatiently, he shouted angrily, she asked firmly, he demanded sternly, he declared loudly, she said smilingly, Mr. Thoms replied nervously, he added hastily, she continued pleasantly.

These adverbs are used correctly. But the following are incorrectly used:

He shouted quietly, she asseverated doubtfully, he cried softly. But why multiply instances? Common sense will prevent a writer's using adverbs stupidly.

Dialogue should, if possible, run without tags like "he said," but there should never be any doubt about who is speaking. There is no doubt in the following passage:

"I am afraid," said he, "that you are Victorian in your ideas."

"Why do you say that?" she asked.

"Well, you don't believe in freedom for women."

"Oh yes I do—freedom of a kind."

Charles smiled.

"Are you a suffragette?"

"Theoretically, yes."

"And practically?"

"I don't burn mansions, if that's what you mean."

If more than two characters are present this method cannot be used.

If dialogue is used the writer should invent his own spelling; the idea is to convey the correct sound. For instance take the London pronunciation of *about.* In a dialect story it might be written "abaht," "abawht," or even "abart." In Scots the word is "aboot."

Writers of dialect should remember that they are using a dialect that is Greek to most people. If an East Coast Scot wrote this sentence, "Far ur ye gaein'? Ye hev' yer neeps to clat, an' ye man feenish the nicht." Few Englishmen would guess that the sentence meant, "Where are you going? You have your turnips to hoe, and you must finish to-night."

Barrie's dialect is not quite the dialect of Thrums (Kirriemuir); it is the Kirriemuir dialect rendered intelligible to Southerners.

The Long Novel.—As we said above, the novel is the province of the experienced writer. The great merit of the novel is its freedom; it has no conventional form; it does not necessarily require a strong plot; it may be a sermon in dialogue, or a tract on Socialism. The one thing demanded of it is that its characters should live. In an adventure story character is of subsidiary importance; if the hero comes unscathed through all dangers and the heroine is rescued at the end, we are quite pleased; we do not ask whether they have been puppets or real live people. The better class of adventure

story, however, takes care to make the characters live persons.

It is almost useless to sit down saying, "Now, I am going to make this man Watson a silly sort of person. I must make him a foil to the brilliant Johnson." If you say that, you will possibly find that Watson refuses to be a stupid person; he will persist in saying witty things to Johnson, and you will discover with alarm that Johnson is the stupid man who never has an answer ready. It is difficult to understand how novelists make characters that are mere "sticks" . . . until you try to write a novel. The natural thing for a creation to do is to grow, to evolve. The great danger is that it may grow in the wrong direction. The novel affords space for a character to grow; in the space of a hundred thousand words there is room for a man to grow from childhood to old age, to progress from Christianity to Atheism, from conservatism to anarchy.

The first step in writing a novel is to fix on an idea—it need not be a definite plot; if you make a hard and fast plot you will find, if you are really clever, that your characters will not fit into the framework. Shakespeare wrote some bad plays because he tried to make real characters fit into a conventional framework. Perhaps the best way is to form a provisional plot. Make up your mind that Algernon is to marry Margaret in the last chapter, but if you find that Margaret is in love with Reginald (and, remember, you have no control over Margaret), Margaret must marry Reginald. The novelist holds the reins in the first chapter; after that, the characters drive the chariot.

Novel-writing cannot be taught; but young writers of imagination and insight into character may be warned against certain faults that will mar their work.

It is in novels that we find the stilted style at its worst. The novelists refuse to be simple, and there are modern novels that compel a well-educated person to keep a dictionary close by. If a writer uses the word "pandiculate" instead of "yawn," a sensitive man will lay down the book at once.

Again, the use of hackneyed terms is common in many novels. Perhaps the most banal is the use of the word "individual." This word should never be used as a synonym for "person." The Victorian novelists made this a pet word; it came to have a semi-humorous application. When a nineteenth-century novelist wrote "Then entered a red-nosed individual;" his readers were supposed to laugh. Its pseudo-facetious meaning killed "individual" as a good substitute for "person." The best writers nowadays use the noun "individual" to indicate a person as opposed to a crowd. We can say that a crowd is composed of so many individuals.

Dickens and Thackeray are not the best guides for a young novelist. He will do better to study the technique of Wells, Bennett, and Locke. But much reading of novels is not the best training for a novelist. The best training is the writing of letters.

Letters.—The young writer should find a patient correspondent, and fill sheets with matter. This is the best manner of finding a style and, at the same time, a soul. There are two kinds of letter. The ordinary one runs in this fashion:

MY DEAR DOROTHY,—I had your note this morning and was glad to hear that your cold had gone.

I went to the Lyceum last night with Dick, and saw Tree in *The Darling of the Gods*. He was ripping.

I am thinking seriously of coming to London this Xmas. Father says that he can't afford the expense, but I think I shall manage to persuade him, &c. &c.

The above is a sample of the chatty "news" letter, but it is not the kind of letter that a young writer should compose. Here is a sample of the other kind, the only kind worth calling literature:

DOROTHY, DEAR FRIEND,—A phrase in your last letter set me thinking. You remarked, "Ferguson is a rough-looking man, but he has one great merit—he is chivalrous."

Now, I wonder what your ideas of chivalry are. Are you one of the many women who think chivalry is a matter of bowing and holding doors open? I hope not. Personally, I don't believe in chivalry, for chivalry is dead. Men rise to offer girls their seats in trains and tubes, and these men go off to boss typists and waitresses who are paid wages that are a disgrace to our civilisation. If chivalry were alive, would men allow women to work in East London for sixteen hours a day making shirts at three-halfpence an hour?

I am tired of all this cant about chivalry; it is all a sham . . . and the women do their best to keep up the sham. They cry for freedom, for votes, but they want to keep all the old cheap privileges. They are for the most part content with a lip service. They judge a man by the little unessential things, the things that shouldn't count in life. I despair of what is called Women's Freedom sometimes. I see so many women who love to be on a pedestal. I don't blame them so much as I blame the men. The knights of old placed woman on her pedestal; they hedged her round with a high wall to keep the ugly things of life from her eyes. And to-day the men that wear spats are still carrying bricks to that wall. Why should men presume to dictate to women about what they shall see? &c. &c.

This letter is the only letter that counts as an education. It educates the writer; it makes him or her marshal his or her thoughts. A good letter tells what one thinks, not what one does. It may be frankly egotistical; a good correspondence is the best training in introspection in the world. And without the power of introspection no one can write well. Write to your friends about the books you have been reading, about the things you have thought, the theories you have formed. Do not be afraid to preach; every one with any convictions preaches. Your theories may not be the accepted theories of your friends; if they are you had better give up all thoughts of writing anything worth reading.

COURSE OF READING

English Language.

The student should commence with a book on the history of words, rather than one on the history of language generally. Perhaps the most interesting book on words is *Words and Their Ways in English Speech*, by Greenough and Kittredge. Ernest Weekley's *The Romance of Words* and *The Romance of Names* are two recent books of interest.

There are three excellent books on the history of language. They are Jespersen's *Growth and Structure of the English Language*, Toller's *Outlines of the History of the English Language*, Emerson's *History of the English Language*. Jespersen is specially good on the Romance influence, and Toller is very exhaustive on the Latin influence.

Lounsbury's *Outlines of the History of the English Language* is very good also.

The Making of English, by Henry Bradley, is generally looked upon as the standard work on the subject. Wyld's *The Historical Study of the Mother Tongue* is full of suggestion. Its object is to create an attitude towards, not to give a history of the English language.

The above books will give any student an exhaustive knowledge of English philology. He who wants to study more deeply in philology will find a sufficient library ready to his hand. Sweet's *History of Language* is a good introduction. Max Müller's *Science of Language* is well known, and *History of Language* (an adaptation of Paul's *Principles of the History of Language*), by Strong, Logeman, & Wheeler, is an important work. Skeat has a good modern book called *Philology*, and Jespersen's *Progress in Language with Special Reference to English*, makes excellent reading.

Among older books are Whitney's *Life and Growth of Language* and his *Language and the Study of Language*; Sayce's *Introduction to the Study of Languages*.

Needless to say, the student should study modern works. Philology has moved rapidly in the past few years.

Old English.—Undoubtedly the best book on Old English Grammar is Cook's translation of Sievers' *English Grammar*. But we warn the reader who idly takes it up. It is literally crammed with information, and to the unenthusiastic student (and very few students like Old English) it is Greek—only ten times more difficult.

The usual way to get up Old English is to sit down with a book like Sweet's *Anglo-Saxon Reader* or Morris and Skeat's *Specimens of Early English*, Part I, on one's knee, and an Old English dictionary at one's feet.

Lazy (and incidentally sensible) students use "cribs." Personally we believe in keys. Read the *Beowulf* through with a good translation, and you get up a fair vocabulary. But so many translations of the *Beowulf* are bad that the experiment is often harmful. The translations of Child, Clark Hall, and Garnet are all "safe." A good text to use is Wyatt's *Beowulf*.

An excellent book on Old English is Cook's *First Book in Old English*; we strongly recommend all students to get a copy.

Good Old English dictionaries are those of Sweet, Toller, Clark Hall.

Middle English.—Most of the books already mentioned cover the Middle English Period. Sweet has a *First Middle English Primer*, and a *Second Middle English Primer*. Morris and Skeat's *Specimens of Early English*, Part II, is a familiar text-book in universities.

English Grammar.—It is useless to mention all the grammars found in schools. Everyone knows names like Meiklejohn, Nesfield, Mason. It should be remembered that grammar books soon go out of date.

The student will do well to read books on syntax and the correct use of words. One of the most interesting books of this kind is *The King's English*, issued by the Oxford Press. The attitude of this book to English writing is analogous with that of the public school boy to social ethics. As the public school boy has definite ideas of what is good and what is bad form, so has *The King's English* a definite idea of what is and what is not "correct" English. It appears to ignore the fact that the people make the language. It objects to the use of *mutual* in the phrase *mutual friend*; but nearly everyone says *mutual friend*. The present writer once gave offence to a nice old lady: he had been reading *The King's English*, and talked of the curate as "our common friend."

Mutual friend is fixed in the language, and all the "correctness" in the world will not drive it out. If *The King's English* cries "But *mutual* is used here with a wrong meaning," we reply, "Well, *manufactured* goods are goods *not made by hand*."

The King's English is a book that is well

worth reading. Our only objection to it is that it is liberal-conservative in its attitude to matters like split infinitives, the *shall* and *will* difficulty, the use of certain words. But in its treatment of grammar (*i.e.* the best order of speech of the best people) it is excellent. There is an abridged edition for school use.

Books like Hodgson's *Errors in the Use of English*, Nesfield's *Manual of English Grammar and Composition* (with key), and Miss Masson's *Use and Abuse of English* (containing a good section on Scotticisms), should also be read critically.

Any good dictionary will give the pronunciation of words. But even good dictionaries sometimes fall victims to pedantry. *Collins' Graphic English Dictionary*, for instance, a very good student's dictionary, gives the pronunciation of *phthisical* as *tiz'-i-kal*. But every doctor pronounces it *thigh'-si-cal*. If doctors don't know the medical language, who knows it? The only criterion is the usage of the men in the profession. If motorists decide to pronounce the word *garage* as *garr'-idge*, *garr'-idge* it will be.

Students should beware of degenerating into walking dictionaries. In other words, they should be ready to renounce a dictionary pronunciation if necessary.

There are three good books on phonetics—Sweet's *Primer of Phonetics*, Jones's *The Pronunciation of English: Phonetics and Phonetic Transcriptions*, and Williams' *Phonetics for Scottish Students*.

English Literature.

There are many books that aspire to giving a full account of English literature from the origins. The standard work is undoubtedly *The Cambridge History of English Literature*, but this huge work is beyond the means of the average student. It can be seen in most libraries.

Chambers's *Cyclopedia of English Literature* is very good. It can be had for about 7*s.* 6*d.* second-hand.

Of shorter "histories" Saintsbury's *Short History of English Literature* is perhaps the most exhaustive. It is a mine of information. But it cannot be denied that it tires the reader. It isn't that it lacks enthusiasm: what it does lack is philosophy. It is catholic and conservative; it is the work of a man with a definite point of view. Saintsbury has no sympathy with "modernism." But, according to many, his chief shortcoming is his devotion to "form." He looks on Blake as a great metrist; he dismisses Blake's social philosophy as the imaginings of a madman. So, in another book, he dwells on Nietzsche's prose style, not his teaching. But no man alive has a greater *knowledge* than Saintsbury. His books always instruct, and they instruct much by negation. His works are very important because he has a definit point of view.

Andrew Lang's *History of English Literatur* has more enthusiasm than critical value, but i is obviously a first writing without adequate revision.

Morley's *First Sketch of English Literature* is a popular text-book at universities.

A very good handbook is Stopford Brooke's *Primer of English Language* (1*s.*), which the student can read in a few hours. It is a very suggestive little book. The same author's *English Literature*, A.D. 670–1832, is also a good book.

Another exhaustive small book is Compton-Rickett's *A History of English Literature* (People's Books, 6*d.*). It is quite up-to-date, and its criticisms are original.

Good school text-books are Wyatt and Low's *Intermediate Text-Book of English Literature*, Thompson's *Student's History of English Literature*, Pantcoast's *Introduction to English Literature*.

The student should beware of books that pay too much attention to the lives of authors. The name of Milton's second wife is of no importance. Some of our modern "literary" weeklies and monthlies seem unable to distinguish between literature and gossip. They publish tit-bits about the number of pipes Carlyle smoked, or the quantity of snuff Ben Jonson used (if he used snuff); and the plumber with literary leanings thinks he is reading about literature.

Early Period.—Many histories of English literature are weak in their treatment of Old English, but fortunately we have some good works on the early period. Stopford Brooke's *History of Early English Literature* is a very good book. Jusserand's *Literary History of the English People* is especially good on Langland and Chaucer. Ten Brink's *Early English Literature* is an acknowledged classic.

Books on Chaucer are numerous. We have Coulton's *Chaucer and his England*, Ward's *Chaucer* in the English Men of Letters Series, Hales' *The Age of Chaucer*, Pollard's *Chaucer*, and the recent translation of Legouis' *Chaucer*—supposed by some scholars to be the best yet seen.

There are some excellent books on mediæval literature generally. Ker's *The Dark Ages*, Saintsbury's *Flourishing of Romance and Rise of Allegory*, Ker's *Epic and Romance*, and Rhys's *Arthurian Legend* are all very readable and suggestive.

The Renaissance.—Two arresting modern works are Stephenson's *The Elizabethan People* and Sheavyn's *The Literary Profession in the Elizabethan Age*. Jusserand's *Literary History of the English People* (vols. ii. and iii.) covers this period, as does also Saintsbury's *Elizabethan Literature*.

The Age of Dryden Onwards.—Garnett's *Age of Dryden*, and Dennis's *Age of Pope* are well worth reading.

For Nineteenth-Century Literature the student should read Herford's *Age of Wordsworth* and Walker's *Age of Tennyson.* Saintsbury's *Nineteenth-Century Literature* is full.

Mair's shilling *English Literature, Modern,* is a very suggestive and sound book dealing with the period from the Renaissance to Mr. Yeats.

Saintsbury and Raleigh each have a book entitled *The English Novel.*

Poetry.—The standard history of English poetry is Coupthope's large work, the volumes of which are usually consulted in free libraries. It is full of theories that one will challenge. Because of this it is excellent, and part of its excellence lies in the fact that there are so many theories that one challenges . . . and accepts.

Every student must read Hazlitt's delightful *Essays on Poetry,* Wordsworth's *Prefaces,* and Coleridge's reply to Wordsworth's theories on poetry. The main points of these works are given by Saintsbury in his *Loci Critici,* a book that gives excerpts from all the important critics from Aristotle to Pater.

The Channels of English Literature series has some very good books in poetry. They are *English Epic and Heroic Poetry,* by MacNeile Dixon; *English Lyric Poetry,* by Rhys; *English Elegiac, Didactic, and Religious Poetry,* by Beeching and Bayne; *English Dramatic Poetry,* by Schelling; *English Satiric and Humorous Literature,* by Smeaton.

Greg's *Pastoral Poetry* is a very good book; it is specially interesting on the Masque. A work worth reading is Stopford Brooke's *Studies in Poetry.* And Stedman's *Victorian Poetry* is a well-known book.

There are a few good books on the Ballad. One of the most charming is Gummere's *The Popular Ballad.* Henderson's *The Ballad in Literature,* and Hart's *Ballad and Epic* are suggestive. And we must not forget Andrew Lang's treatment of the Ballad in the *Encyclopœdia Britannica.*

It is impossible to give the works dealing with all the poets, but a few must be mentioned.

Books on Shakespeare are very numerous. Everyone knows the books by Dowden (*Shakespeare: his Mind and Art*), Raleigh, Sidney, Lee, and Hudson. There are books by Herford, Swinburne, Brandes, Masefield, and Darrell Figgis. The heretical view is found in Shaw's *Dramatic Essays and Opinions,* and in a few of his prefaces to plays, and in *Tolstoy on Shakespeare,* a sixpenny book, including *Shakespeare and the Working Classes,* by Crosby, *Mr. G. Bernard Shaw on Shakespeare,* and *The Press against Shakespeare.*

The student should read Boas' *Shakespeare's England,* and a book of the same title by Lee; also *Shakespeare's Predecessors in the English Drama,* by Symonds.

There are good books on Milton by Professor Raleigh, Stopford Brooke, Hudson, Mark Pattison, and Verity.

Blake, after long neglect, has now got a small library to himself. There are six "lives" of importance—by Ellis, Symons, Swinburne, W. B. Yeats, Hugh de Selincourt, Chesterton. Symons deals with the "English Nietzsche" aspect of Blake, and Chesterton deals with his alleged madness and his art.

Dowden and Symonds on Shelley cannot be ignored, and admirers of Tennyson should read the works by Ker, Watson, Benson, and Jones.

Chesterton is always delightfully suggestive in his "lives." He has splendid works on Dickens, on Thackeray, and on Browning. Swinburne also has a book on Dickens.

Readers interested in modern literature will find the works of Irving and of Palmer on the theatre very readable. William Archer is excellent in his *Play-making, a Manual for Craftsmen,* and Titterton's *From Theatre to Music Hall* is good. The "lives" in the English Men of Letters Series are all "safe," but few of them are startling in their views.

The fullest bibliography in existence will be found in the *Cambridge History of English Literature.* If a student is specially interested in an author, he will easily discover what books deal with his works by asking any bookseller to lend him the Publishers' Catalogue.

A. S. Neill, M.A.

GREEK

THE UTILITY OF GREEK AND LATIN

There was a time, not more than two generations ago, when the education of every boy included some sort of grounding in Latin and Greek. Not only so, but every man who laid claim to any degree of culture possessed a scholarly knowledge of these languages, and was familiar with their literature. No speech in Parliament was considered complete unless pointed with a quotation from the Classics, Horace for preference—a different state of things from that obtaining at present, when one member has been known publicly to rebuke another for quoting in a language unintelligible to an appreciable portion of the House. The main contributing cause to this has been the rapid progress of applied science, and the consequent necessity for advanced technical training in very many occupations. Another factor that has told against the study of Latin and Greek is the increasing cosmopolitanism of commerce. Trade with foreign countries increases day by day, and with it grows the need for knowledge of the various European languages, to make room for which something of less value in education must give way.

Thus it is that more and more Classics have been displaced from our schools by other subjects. We have been told that, in an age of bustle and grinding competition, no man who wishes to succeed in business or to become expert at his trade can afford to give precious hours to the study of a dead language, or to spend in acquiring a dry-as-dust and empty erudition the time in which he might be equipping himself to face the great struggle for existence.

So strong is this feeling in some quarters, to such an extent is classical learning regarded as a backwater, leading nowhere on the stream of life, that a few words seem desirable here, not as an apology for Latin and Greek, but to point out the real benefits that may be obtained from their study, so that anyone setting out to acquaint himself with them may feel, not that he is, at the best, following a leisure-hour fancy, but rather that he is undertaking what from many points of view will be for his benefit.

Taking the severely practical standpoint in the first place, the Classics are of great utility when the study of languages other than our own is in question. The Roman Empire extended for several centuries over these islands, France, Spain, and the Balkans; the Roman soldiers who campaigned there, the merchants who traded, and the colonists who settled, all brought their language with them, with the result that, although they themselves in time disappeared, they left an indelible impression on the language of the country in which they had sojourned.

Taking our own language first, the influence of Latin on English has not been so pronounced as in the case, for example, of French or Spanish. For this the successive conquests by Saxon and Dane must account, though the later Norman conquest brought the influence of Latin indirectly to bear through the medium of Norman-French. At any rate this is certain, that a large proportion of words in common use in English are derived from Latin, and it follows naturally that one who knows Latin is better equipped to understand his own language and to appreciate subtle distinctions of meaning. In scientific terminology Latin reigns supreme. The doctor, the surgeon, the chemist, the botanist, the zoologist, and the lawyer all find the technical terms of their profession in the storehouse of Latin. Nor is the process at an end. New words of a technical nature are continually being formed, if not from Latin words, at any rate on Latin models. An instance of this is seen in the terminology of the art of flying. From *avis*, a bird, are formed *aviation* and *aviator*, words which are new to either language, but are constructed on the analogy of derived nouns in Latin.

It is thus clear that a knowledge of Latin enables the possessor to understand his own language scientifically, and gives him a command over it that is otherwise to be attained with difficulty.

In the case of French, Spanish, and Italian, a knowledge of Latin is of still more utility. French is based on Latin, so that one who has learned the latter can readily appreciate the structure of the former, and has, as it were, a start in the race for efficiency. While Spanish and Italian have developed so truly from Latin that a working acquaintance with Latin enables one to understand the

with little trouble, and to learn them with ease.

A knowledge of Latin and Greek, moreover, has a value other than mere utility. The masters of classical literature have been for centuries, and still are, the source whence writers of all modern languages seek very largely their models. The Renaissance took life from Latin and Greek literature, and, quite apart from the intrinsic value of the literatures of Greece and Rome, it is hard without some knowledge of them to appreciate, and often to understand, some of the most treasured writers of later times.

Add to all this that classical literature includes poets and prose writers surpassed only by few, so that not to have read them is to have missed one of the highest possible literary pleasures, and add further that they can only be properly appreciated when read in the original; the case for the Classics then stands sufficiently strong to warrant our entering on their study without further preface.

The Greek Alphabet

Capital.	*Small.*	*Name.*	*English equivalent.*
Α	α	alpha	a
Β	β	beta	b
Γ	γ	gamma	g, as in *game*

N.B.—When γ is followed by γ, κ, χ, or ξ in the same word, it is pronounced as *n*.

Δ		delta	
Ε		epsīlon	e, as in *bed*
Ζ		zeta	dz
Η		eta	e, as in *feet*
Θ		theta	th, as in *thin*
Ι	ι	iota	i, as in *it*
Κ	κ	kappa	k
Λ	λ	lambda	l
Μ	μ	mu	m
Ν	ν	nu	n
Ξ	ξ	xi	x
Ο	ο	omīcron	o, as in *pot*
Π	π	pī	p
Ρ	ρ	rho	r
Σ	σ, ς	sigma	s

N.B.—The form ς is always used at the end of a word, and nowhere else.

Τ	τ	tau	t
Υ	υ	upsīlon	ü
Φ	φ	phi	ph
Χ	χ	chi	kh
Ψ	ψ	psi	ps
Ω	ω	ōmega	o, as in *oh*

Note.—There also was used in early Attic Greek a letter *F* called digamma and pronounced as *w* or *v*.

Diphthongs.—The proper diphthongs are:

αι	pronounced	as	eye
αυ	,,	,,	aw
ει	,,	,,	eye
ευ	,,	,,	ewe
οι	,,	,,	oy
ου	,,	,,	ow
ηυ	,,	,,	e-ewe
υι	,,	,,	wy

There are also the so-called improper diphthongs, ᾳ, ῃ, ῳ, in which the iota which goes to form them is written underneath and is not sounded.

Breathings.—In the absence of a letter like the English *h*, the Greeks used to represent the aspirate by the sign ʽ. This only occurs at the beginning of words, and is written over the vowel to which it belongs. In the case of a diphthong it appears over the second of the two vowels. Whenever the vowel is not aspirated, the sign ʼ is used instead.

Note.—Alone of all the consonants, ρ at the beginning of a word always has the ʽ sign above it.

Note that in order to avoid pronouncing two successive vowels Attic Greek makes use of the following various means:

1. *Elision*—the dropping out, or eliding, of a short vowel at the end of a word before a vowel beginning the next word, its loss being marked by an apostrophe —*e.g.* ἀπὸ ἡλίου becomes ἀφ' ἡλίου.
2. *Crasis*—the running of a word which ends in a vowel or diphthong into the vowel or diphthong which begins a following word—*e.g.* τὰ αὐτα becomes ταὖτα; καὶ ἀγαθός becomes κἀγαθός.
3. *Contraction.*—When one vowel follows another in the same word it generally merges with it into a single long vowel or diphthong — *e.g.* φιλέω becomes φιλῶ; τιμάεις becomes τιμᾷς.
4. *Attachable ν.*—At the end of words terminating in -σι, and of verbs in the Third Person ending in -ε, ν is added, often before a consonant, always before a vowel.

Inflexion

In English, when we wish to express the relation of one word to another, we do so by means of prepositions. For instance, if it is desired to associate the two words *King* and *England*, we use the preposition *of* to show the relation in which one stands to the other, and say the *King of England*.

In a language such as Greek, which makes use of inflexion, the relationship of words towards their context is expressed by means of

varying forms of the words themselves with or without the further aid of prepositions.

Inflexion of this nature is seen to a slight extent in English in the case of verbs—*e.g.* *I gave the book* indicates Past time, while *I give the book* indicates Present time; the essential part of the word *give* is retained in each case, but its form is changed to express a different shade of meaning.

In Greek, Nouns, Pronouns, Adjectives, and Verbs are subject to inflexion, which is of two kinds:

1. *Declension* of Nouns, Pronouns, and Adjectives.
2. *Conjugation* of verbs.

Declension

Declension comprises differences according to Gender, Number, and Case.

(a) *Gender.*—In Greek there are three genders: *Masculine*, *Feminine*, and *Neuter*.

(b) *Number.*—There are three numbers in Greek, viz. *Singular*, *Dual*, and *Plural*.

The *Dual* number is used when two persons or things are represented as doing something or as the object of an action.

(c) *Case.*—It is the case that marks the relation which a noun, pronoun, or adjective bears to the words that surround it. Thus in the expression, "There comes a tide in the affairs of man," the relation of the word *man* to the word *affairs* is made clear by the possessory preposition *of*. In Greek that relation is expressed by a variation in the form of the word for *man*, which shows clearly that *man* is a possessive and depends on one of the contiguous words.

There are five cases in Greek, which are generally listed in the following order:

Nominative—the case of the subject.

Vocative—the case used in speaking to a person.

Accusative—the case of the direct object of a verb, *e.g.* "To wake to ecstasy the living lyre"—*the living lyre* is accusative.

Genitive—the case of
  i. Possession;
  ii. Motion from.

Dative—the case of advantage.

There were also originally an Ablative, a Locative, and an Instrumental case, of which the functions of the Locative are discharged by the Dative and of the Instrumental and Ablative by the Genitive.

The cases are distinguished by different endings, which again are divided into three different series, known as the three declen-

First Declension.—In this declension there are five types:

θύρα (fem.), a door.

	Sing.		Dual.	Plur.
Nom.	θύρα	a door	θύρα	θύραι
Voc.	θύρα	o door		θύραι
Acc.	θύραν	door		θύρας
Gen.	θύρας	of the door	θύραιν	θυρῶν
Dat.	θύρᾳ	to the door		θύραις

N.B.—This type of ending in -ᾱ is only found after ρ or ι.

Μοῦσα (fem.), Muse.

	Sing.	Dual.	Plur.
N.V.	Μοῦσα	Μούσᾱ	Μοῦσαι
Acc.	Μοῦσαν		Μούσᾱς
Gen.	Μούσης	Μούσαιν	Μουσῶν
Dat.	Μούσῃ		Μούσαις

The commonest type is:

λήθη (fem.), forgetfulness.

	Sing.	Dual.	Plur.
N. V.	λήθη	λήθα	λῆθαι
Acc.	λήθην		λήθας
Gen.	λήθης	λήθαιν	ληθῶν
Dat.	λήθῃ		λήθαις

Nouns of the above types are always feminine. Masculine nouns in this declension are always of the third or fourth type:

νεᾱνίας (masc.), a young man.

	Sing.	Dual.	Plur.
Nom.	νεανίας	νεανία	νεανίαι
Voc.	νεανία		νεανίαι
Acc.	νεανίαν		νεανίας
Gen.	νεανίου	νεανίαιν	νεανιῶν
Dat.	νεανίᾳ		νεανίαις

ναύτης (masc.), a sailor.

	Sing.	Dual.	Plur.
Nom.	ναύτης	ναύτα	ναῦται
Voc.	ναῦτα		ναῦται
Acc.	ναύτην		ναύτας
Gen.	ναύτου	ναύταιν	ναυτῶν
Dat.	ναύτῃ		ναύταις

Note.—In the First Declension
  i. All nouns of which the nominative singular ends in -η or -α are feminine.
  ii. All nouns in -ας or -ης are masculine.
  iii. The genitive singular of masculine nouns ends in -ου.

Second Declension.—This declension has five types:

Masculine:

λόγος, word.

	Sing.	Dual.	Plur.
Nom.	λόγος	λόγω	λόγοι
Voc.	λόγε		λόγοι
Acc.	λόγον		λόγους
Gen.	λόγου	λόγοιν	λόγων
Dat.	λόγῳ		λόγοις

Neuter :

ἔργον, work.

	Sing.	Dual.	Plur.
N.V.A.	ἔργον	ἔργω	ἔργα
Gen.	ἔργου	ἔργοιν	ἔργων
Dat.	ἔργῳ		ἔργοις

Many nouns ending in -εος, -οος, -εον, and -οον fall under the influence of the Attic dislike for two consecutive vowels, and are contracted, as in the two types that follow:

νοῦς (masc.), mind (νόος).

	Sing.	Dual.	Plur.
Nom.	νοῦς (νόος)	νῶ (νόω)	νοῖ (νόοι)
Voc.	νοῦ (νόε)		νοῖ (νόοι)
Acc.	νοῦν (νόον)		νοῦς (νόους)
Gen.	νοῦ (νόου)	νοῖν (νόοιν)	νῶν (νόων)
Dat.	νῷ (νόῳ)		νοῖς (νόοις)

ὀστοῦν (neut.), bone (ὀστέον).

	Sing.	Dual.	Plur.
N.V.A.	ὀστοῦν (ὀστέον)	ὀστῶ (ὀστέω)	ὀστᾶ (ὀστέα)
Gen.	ὀστοῦ (ὀστέου)	ὀστοῖν (ὀστέοιν)	ὀστῶν (ὀστέων)
Dat.	ὀστῷ (ὀστέῳ)		ὀστοῖς (ὀστέοις)

Note.—All nouns in -ον are *neuter* in this declension, and most in -ος are masculine, except

1. Names of trees, countries, towns, and islands, which are feminine.
2. Twenty-one other nouns ending in -ος are feminine; viz. ψῆφος, pebble; ψάμμος, sand; πλίνθος, brick; σπόδος, ashes; κέλευθος, path; ἀτραπός, path; ὁδός, road; ληνός, vat; σορός, coffin; γνάθος, jaw; νόσος, disease; βίβλος, book; ῥάβδος, staff; τάφρος, ditch; δρόσος, dew; δοκός, beam; ἤπειρος, continent; βάσανος, touch-stone; νῆσος, island; κάμινος, oven; γέρανος, crane.

There is a fifth type in which -ω appears in the case-endings instead of -ο. Masculines in -ως and neuters in -ων are found according to it. One will show how all are declined.

λεώς (masc.), people.

	Sing.	Dual.	Plur.
N.V.	λεώς	λεώ	λεῴ
Acc.	λεών		λεώς
Gen.	λεώ	λεῴν	λεών
Dat.	λεῴ		λεῴς

Third Declension.—The Third Declension comprises many different types. The general scheme of declension is, however, the same throughout, and the following table of case-endings will be found always to be applicable, apparent variations being explained by rules of sound which will be commented on as they arise.

	Sing. Masc. and Fem.	Sing. Neut.	Dual. Masc., Fem. and Neut.	Plur. Masc. and Fem.	Plur. Neut.
N.V.	-ς	none	-ε	-ες	-α
Acc.	-α or -ν	none		-ας	-α
Gen.	-ος	-ος	-οιν	-ων	-ων
Dat.	-ι	-ι		-σι(ν)	-σι(ν)

Thus, given the stem of a word, it is always easy, by means of the appropriate ending, to put it into any particular case.

By the stem of a noun is meant that part of it on which the cases are built up. A noun consists:

1. Of a root which conveys the basic notion of the word;
2. Added to the root, as a rule, are one or more suffixes which so far modify the meaning of the root as to determine with which of the parts of speech the word shall be classed.

1 and 2 combine to form the stem.

3. The case-ending.

The stem of a noun of the Third Declension can generally be discovered by discarding the -ος of the gen. sing.: what is then left is the stem. The simplest type in this declension is that in which the stem ends in -β, -γ, -δ, -κ, -τ, -χ, or -λ. In all these cases:

i. The nom. sing., if masc. or fem., retains the case-ending -ς.

ii. The acc. sing. ends in -α.

iii. In the nom. sing. and dat. plur., by the laws of euphony, β and φ become π before σ; γ and χ become κ; τ, δ, θ, and ν are dropped; while ντ, νδ, νθ are dropped and the preceding vowel lengthened (ᾰ to ᾱ, ε to ει, ο to ου).

Bearing these remarks in mind, it should be easy to grasp the declension of the consonant stems which follow.

The parts given of each word will be the nom. sing., acc. sing., gen. sing., and dat. plur. Knowing these, the full declension of each word can be made out with the aid of the table of case-forms given above.

θώραξ	breastplate, masc.	θώρακα	θώρακ-ος	θώραξι
σάλπιγξ	trumpet, fem.	σάλπιγγα	σάλπιγγ-ος	σάλπιγξι
φλέψ	vein, fem.	φλέβα	φλεβ-ός	φλεψί
γίγας	giant, masc.	γίγαντα	γίγαντ-ος	γίγᾱσι
φροντίς	thought, fem.	φροντίδα	φροντίδ-ος	φροντίσι

N.B.—ὄρνις, ὄρνιθος; χάρις, χάριτος; κόρυς, κόρυθος; ἔρις, ἔριδος, all make acc. sing. ending in -ν.

ἅλς	salt, masc.	ἅλα	ἁλ-ός	ἁλσί

Note that in neuter words, which, as we have seen, add no case-ending to the stem in the nom. sing., when the stem ends in -τ, the -τ drops out in the N.V. Acc. sing.

ἅρμα	chariot, neut.	ἅρματ-ος	ἅρμασι

Consonant stems that do not add -ς in the Nominative.—It is to be noted that in the

case of stems ending in -ν, -ρ, or -οντ, the nom. sing., masc. or fem., is constructed in accordance with the following rules :

1. No -ς is added.
2. The vowel of the last syllable of the stem is lengthened.
3. In the case of stems in -οντ, owing to the dislike of Greek for a final -τ, the -τ is dropped.

The following examples will illustrate this :

γέρων	old man, masc.	γέροντα	γέροντ-ος	γέρουσι
λιμήν	harbour, masc.	λιμένα	λιμέν-ος	λιμέσι
Ποσειδῶν	Poseidon, masc.	Ποσειδῶνα	Ποσειδῶν-ος (Voc. Πόσειδον)	
τέρμων	boundary, masc.	τέρμονα	τέρμον-ος	τέρμοσι
δελφίς	dolphin, masc.	δελφῖνα	δελφῖνος	δελφῖσι

Note.—All stems in -ντ are masculine, and most of those in -ν.

ῥήτωρ	orator, masc.	ῥήτορα	ῥήτορ-ος	ῥήτορσι
πατήρ	father, masc.	πατέρα	πατρ-ός	πατράσι

N.B.—In these stems the voc. sing. is formed by using the pure stem. Thus ῥήτωρ has voc. ῥῆτορ, πατήρ has voc. πάτερ.

Like πατήρ are declined μήτηρ, mother; θυγάτηρ, daughter; γαστήρ, belly; Δημήτηρ, Demeter, of which all except πατήρ are fem.—*e.g.*

	Sing.	Dual.	Plur.
Nom.	μήτηρ	μητέρε	μητέρες
Voc.	μῆτερ		μητέρες
Acc.	μητέρα		μητέρας
Gen.	μητρ-ός	μητέροιν	μητέρων
Dat.	μητρί		μητράσι

Stems ending in vowels : -ι and -υ.

Masculine and Feminine

πόλις (fem.), city.

πόλις	πόλει	πόλεις
πόλι		πόλεις
πόλιν		πόλεις
πόλε-ως	πολέοιν	πόλεων
πόλει		πόλεσι

σῦς (com.), pig.

σῦς	σύε	σύες
σῦ		σύες
σῦν		σῦς
συ-ός	συοῖν	συῶν
συΐ		συσί

πέλεκυς (masc.), axe.

πέλεκυς	πελέκεε	πελέκεις
πέλεκυ		πελέκεις
πέλεκυν		πελέκεις
πελέκε-ως	πελεκέοιν	πελέκεων
πελέκει		πελέκεσι

Neuters

ἄστυ (neut.), city.

N.V.A.	ἄστυ	ἄστει	ἄστη
Gen.	ἄστε-ως	ἀστέοιν	ἄστεων
Dat.	ἄστει		ἄστεσι

N.B.—δάκρυ, *tear*, keeps -υ instead of changing it to -ε throughout, and has gen. sing. δάκρυος.

Stems in Diphthongs.—The only diphthong types that are regular are those in -ευ and -ου, *e.g.* :

βασιλεύς (masc.), king.

Nom.	βασιλεύς	βασιλεῖ	βασιλεῖς
Voc.	βασιλεῦ		βασιλεῖς
Acc.	βασιλέα		βασιλέας
Gen.	βασιλέ-ως(βασιλε(F)-ος)	βασιλέοιν	βασιλέων
Dat.	βασιλεῖ		βασιλεῦσι

χοῦς (masc.), a six-pint measure.

Nom.	χοῦς	χόε	χόες
Voc.	χοῦ		χόες
Acc.	χόᾰ		χόας
Gen.	χο-ός	χοοῖν	χοῶν
Dat.	χοΐ		χουσί

Stems in -ο and -ω.—There are three types of these :

αἰδώς (fem.), shame : declined only in the sing.

αἰδώς, αἰδοῖ, αἰδῶ (ο-α), αἰδοῦς (ο-ος), αἰδοῖ.

ἠχώ (fem.), echo : declined only in the sing.

ἠχώ, ἠχοῖ, ἠχώ (ο-α), ἠχοῦς (ο-ος), ἠχοῖ.

δμώς (masc.), slave.

N.V.	δμώς	δμῶε	δμῶες (δμῶς)
Acc.	δμῶα (δμῶ)		δμῶας (δμῶς)
Gen.	δμω-ός	δμώοιν	δμώων
Dat.	δμωΐ (δμῴ)		δμωσί

Stems that reject their Final Consonant.—One of the peculiarities of Greek pronunciation was that **σ** between two vowels was repulsive to it and tended to drop out. Hence the declension of some nouns whose stem ends in **-σ**, where the **σ** drops and the two vowels that then come together are contracted into one sound.

τεῖχος (neut.), wall.

N.V.A.	τεῖχος	τείχη (-ε(σ)-ε)	τείχη (-ε(σ)-α)
Gen.	τείχους (τειχε(σ)-ος)	τειχοῖν (-ε(σ)-οιν)	τειχῶν (-ε(σ)-ων)
Dat.	τείχει (τειχε(σ)-ι)		τείχεσι

Δημοσθένης (masc.), Demosthenes.

Nom.	Δημοσθένης
Voc.	Δημόσθενες
Acc.	Δημοσθένη (-ε(σ)-α) (often Δημοσθένην)
Gen.	Δημοσθένους (-ε(σ)-ος)
Dat.	Δημοσθένει (-ε(σ)-ι)

Some stems in -τ drop it between two vowels:

κέρας (neut.), horn, wing of an army.

N.V.A.	κέρας	κέρα	κέρα
Gen.	κέρως	κέρῳν	κερῶν
Dat.	κέρᾳ		κέρασι

Neuter stems in -αρτ drop τ in the N.V.A. sing., and drop ρ in the other cases, *e.g.*:

ἧπαρ	liver, neut.	Gen.	ἥπατος, &c.
ὕδωρ	water, neut.	Gen.	ὕδατος, &c.

The following nouns are *irregular*, *i.e.* cannot be grouped into a class with others according to a recognised scheme of declension:

γραῦς (fem.), old woman.

Nom.	γραῦς	γρᾶε	γρᾶες
Voc.	γραῦ		γρᾶες
Acc.	γραῦν		γραῦς
Gen.	γρᾱ-ός	γραοῖν	γραῶν
Dat.	γρᾱΐ		γραυσί

ναῦς (fem.), ship.

Nom.	ναῦς	νῆε	νῆες
Voc.	ναῦ		νῆες
Acc.	ναῦν		ναῦς
Gen.	νε-ώς	νεοῖν	νεῶν
Dat.	νηΐ		ναυσί

ἔαρ (neut.), spring.

N.V.A. ἔαρ Gen. ἦρος Dat. ἦρι

Ζεύς (masc.), Zeus.

Nom. Ζεύς. Voc. Ζεῦ. Acc. Δία. Gen. Δι-ός. Dat. Διί.

κλείς (fem.), key.

N.V. κλείς. Acc. κλεῖν. Gen. κλειδ-ός, &c.

θρίξ (fem.), hair.

N.V. θρίξ. Acc. τρίχ-α, &c. Dat. plur. θριξί.

ἀνήρ (masc.), man.

Nom. ἀνήρ. Voc. ἄνερ. Acc. ἄνδρ-α, &c. Dat. plur. ἀνδράσι.

γόνυ (neut.), knee.

N.V.A. γόνυ. Gen. γόνατ-ος, &c. Dat. plur. γόνασι.

γυνή (fem.), woman.

Nom. γυνή. Voc. γύναι. Acc. γυναῖκ-α &c.

γάλα (neut.), milk.

N.V.A. γάλα. Gen. γάλακτ-ος, &c.

γέρας (neut.), privilege.

Sing. N.V.A. γέρας. Gen. γέρως. Dat. γέρᾳ.
Plur. N.V.A. γέρᾱ. Gen. γερῶν. Dat. γέρασι.

γῆρας (neut.), old age.

N.V.A. γῆρας. Gen. γήρως. Dat. γήρᾳ. No plural.

κρέας (neut.), meat.

Sing. N.V.A. κρέας. Gen. κρέως. Dat. κρέᾳ.
Plur. N.V.A. κρέα. Gen. κρεῶν. Dat. κρέασι.

κνέφας (neut.), murk.

N.V.A. κνέφας. Gen. κνέφους. Dat. κνέφᾳ. No plural.

κύων (com.), dog.

Nom. κύων. Voc. κύον. Acc. κύνα, &c. Dat. plur. κυσί.

οὖς (neut.), ear.

N.V.A. οὖς. Gen. ὠτ-ός, &c.

πούς (masc.), foot.

N.V. πούς. Acc. πόδ-α, &c. Dat. plur. ποσί.

πῦρ (neut.), fire.

N.V.A. πῦρ. Gen. πυρ-ός, &c. Dat. plur. πυροῖς.

ὕδωρ (neut.), water.

N.V.A. ὕδωρ. Gen. ὕδατ-ος, &c.

υἱός (masc.), son.

Sing. Nom. υἱός. Voc. υἱέ. Acc. υἱόν. Gen. υἱοῦ, υἱέος. Dat. υἱῷ, υἱεῖ.
Dual. N.V.A. υἱῆ. Gen. Dat. υἱέοιν.
Plur. N.V.A. υἱεῖς. Gen. υἱέων. Dat. υἱέσι.

φρέαρ (neut.), tank.

N.V.A. φρέαρ. Gen. φρέᾱτ-ος, &c. Dat. plur. φρέασι.

χείρ (fem.), hand.

N.V. χείρ. Acc. χεῖρ-α, &c. Dat. plur. χερσί.

The Definite Article

ὁ, ἡ, τό, the.

	Masculine.	Feminine.	Neuter.
	Singular.		
Nom.	ὁ	ἡ	τό
Acc.	τόν	τήν	τό
Gen.	τοῦ	τῆς	τοῦ
Dat.	τῷ	τῇ	τῷ
	Dual.		
N.A.	τώ	τώ	τώ
G.D.	τοῖν	τοῖν	τοῖν
	Plural.		
Nom.	οἱ	αἱ	τά
Acc.	τούς	τάς	τά
Gen.	τῶν	τῶν	τῶν
Dat.	τοῖς	ταῖς	τοῖς

Translate, giving every possible meaning of—
ἡ χώρα: τοῦ βασιλέως: τοῖς ποσίν: ὄρνιθος: πῦρ καὶ ὕδωρ: τῇ τοῦ Διός χειρί: οἱ τοῦ ἀγγέλου λόγοι: τὸ τῆς ἀρετῆς κάλλος: οἱ τῆς νεώς ναῦται: τὰ τοῦ Δημοσθένους ἔργα: τώ τῆς γυναικός υἱῆ: ἡ τοῦ Κύρου μήτηρ τοῦ τῶν Μήδων βασιλέως.

(*N.B.*—Note the use of the following prepositions: **ἐν** = *in*, takes the dative case; **ἐκ** = *out of, from*, takes the genitive; **διά** = *through* (of space), takes the genitive; **διά** = *on account of*, takes the accusative.)

Nom. λιμήν	Gen. λιμέν-ος, &c.
Nom. τέρμων	Gen. τέρμον-ος, &c.
Nom. ῥήτωρ	Gen. ῥήτορ-ος, &c.

At first this vowel-gradation is extremely puzzling; some words seem to vary their spelling and others to keep it unchanged according to the vagaries of some mysterious chance.

There is, however, a definite principle underlying this vowel-gradation, and when this is understood, all the regular and most of the so-called irregular words become plain and straightforward in their declension. In the original Indo-Germanic language from which Greek, in common with most of the European languages, is derived, an accented short syllable was lengthened if the syllable following it was lost. Now the stem-suffixes, *-εν, -ον, -μεν, -μον, -ερ, -ορ, -τερ, -τορ,* and *-ντ* appear originally to have had the forms *-ενο, -ονο, -μενο, -μονο,* &c. The second syllable came to be dropped in many words, with the result that, according to the rule just enunciated, the first syllable has been lengthened.

Thus there was originally a nominative *ποιμενο,* in which the Indo-Germanic accent fell on the second syllable. Then, owing to some change in the language not yet understood, the *-ο* was lost and the preceding *-εν* became *-ην*. In the other cases there is another syllable following the stem-suffix, so that the form *-μεν* is retained.

In the case of the vocative, there was originally no accent at all, so that the rule did not apply; and the stem-vowel underwent no change.

The declension of such a word as *ῥήτωρ, ῥῆτορ, ῥήτορα* is thus easily understood.

A further apparent anomaly is shown in the declension of *μήτηρ* and the group of words that resemble it. The change from *μήτηρ* in the nom. to *μῆτερ, μητέρα* in the voc. and acc. is explained by the rule discussed above. There still remain, however, to perplex the student the forms *μητρός, μητρί,* and *μητράσιν,* and to understand these it is necessary to go back once more to the original Indo-Germanic language.

Originally there were two sorts of accent used in speaking—pitch accent, indicated by the varying pitch of the voice; and stress accent, indicated by the force or absence of force with which the syllable was pronounced. In Greek itself, only pitch accent was used, but the original stress accent had an effect on the form of words which can be directly traced in Greek. The absence of the principal stress accent led naturally to the appearance of a syllable in its lowest pronounceable form. In the gen. and dat. sing. and the dat. plur. the original stress accent fell on the last syllable, and the last syllable but one had no stress at all, and tended to appear as a result in its weakest pronounceable form. Hence the stressed *-τερ-* of *πατέρα* became *-τρ-* in *πατρός,* when it was not stressed at all. In the dat. plur. the syllable *-τρ-* was followed, not by a vowel as in the gen. and dat. sing., but by a consonant. In those circumstances, as will be found by experiment, the only way in which it could be pronounced was by inserting a weak vowel such as ᾰ between the *-ρ-* and the following consonant, and this gives us *πα-τρά-σιν.*

Another example to illustrate this is found in Pindar, where *φρασί* is used as the dat. plur. of *φρήν, φρενός, φρα-* being the lowest pronounceable form in which Greek could put the syllable *φρεν-.*

Adjectives.—The function of an adjective is to add a quality to a substantive. Therefore we find in an inflected language such as Greek that an adjective is made to correspond to its noun in *number, gender,* and *case.*

Consequently adjectives must be declined, and in Greek they have case-forms similar to those of substantives, which fall into three groups:

1. 1st and 2nd Declensions.
2. 1st and 3rd Declensions.
3. 3rd Declension.

1. *Adjectives of the* 1*st and* 2*nd Declensions.*—Adjectives of this declension can be subdivided into four types:

(*a*) Masculine like *λόγος.*
Feminine like *λήθη.*
Neuter like *ἔργον.*

(*b*) Masculine like *λόγος.*
Feminine like *θύρα.*
Neuter like *ἔργον.*

(*c*) Contracted words:
Masculine like *νοῦς.*
Feminine of a special type.
Neuter like *ὀστοῦν.*

(*d*) Masculine and feminine, like *λεώς.*
Neuter of the same type.

(*a*) *καλός,* beautiful.

MASCULINE.	FEMININE.
καλός	καλή
(declined like λόγος).	(declined like λήθη).

NEUTER.

καλόν
(declined like ἔργον).

(*b*) ἐχθρός, hateful.

Masculine.	Feminine.
ἐχθρός	ἐχθρά
(declined like λόγος).	(declined like θύρα).

Neuter.

ἐχθρόν
(declined like ἔργον).

(*c*) διπλοῦς (διπλόος), double.

Masculine.	Feminine.			
		Sing.	Dual.	Plur.
διπλοῦς	N.V.	διπλῆ	διπλώ	διπλαῖ
(declined like νοῦς)	Acc.	διπλῆν		διπλᾶς
	Gen.	διπλῆς	διπλοῖν	διπλῶν
	Dat.	διπλῇ		διπλαῖς

Neuter.

διπλοῦν
(declined like ὀστοῦν).

N.B.—Adjectives in -εος contracted to -ους have -α instead of -η in the fem. sing. when the preceding letter is ρ or a vowel—*e.g.* ἀργυροῦς (of silver) makes fem. ἀργυρᾶ.

(*d*) ἵλεως, gracious.

Masc. and Fem.	Neuter.			
		Sing.	Dual.	Plur.
ἵλεως	N.V.A.	ἵλεων	ἵλεω	ἵλεω
(declined like λεώς)	Gen.	ἵλεω	ἵλεῳν	ἵλεων
	Dat.	ἵλεῳ		ἵλεῳς

Note.—It should be noted that there is also a large class of compound adjectives (*i.e.* made up of two or more simple words) which have only two endings—-ος in the masc. and fem. and -ον in the neuter.

2. *Adjectives of the 1st and 3rd Declensions.*—Adjectives coming under this head form their masc. and neut. according to the 3rd Declension, and form the fem. by adding -ια to the stem.

The principal type of adjectives pure and simple in this class is that of the -υ stems, *e.g.*:

γλυκύς, sweet (to the taste).

	Masculine.	Feminine.	Neuter.
		Singular.	
N.V.	γλυκύς	γλυκεῖα (-υ-ια)	γλυκύ
Acc.	γλυκύν	γλυκεῖαν	γλυκύ
Gen.	γλυκέος	γλυκείᾱς	γλυκέος
Dat.	γλυκεῖ	γλυκείᾳ	γλυκεῖ
		Dual.	
N.V.A.	γλυκέε	γλυκείᾱ	γλυκέε
G.D.	γλυκέοιν	γλυκείαιν	γλυκέοιν
		Plural.	
N.V.	γλυκεῖς	γλυκεῖαι	γλυκέα
Acc.	γλυκεῖς	γλυκείᾱς	γλυκέα
Gen.	γλυκέων	γλυκειῶν	γλυκέων
Dat.	γλυκέσι	γλυκείαις	γλυκέσι

A less numerous type is that of stems in -ν, *e.g.*:

τέρην, tender.

	Masculine.	Feminine.	Neuter.
N.V.	τέρην	τέρεινα (*i.e.* τερεν-ια)	τέρεν
Acc.	τέρενα	τέρειναν	τέρεν
Gen.	τέρενος	τερείνης	τέρενος
	&c.	&c.	&c.

Of great importance is the large class of participles which are declined as of the 3rd Declension in the masc. and neut. and as of the 1st in the fem. The majority of them have stems ending in -ντ, and, allowing for differences of stem-vowel, knowledge of the declension of one will enable the student to decline the others.

πράττων, doing (Present Participle).

	Masculine.	Feminine.	Neuter.
		Singular.	
N.V.	πράττων	πράττουσα	πρᾶττον
Acc.	πράττοντα	πράττουσαν	πρᾶττον
Gen.	πράττοντος	πραττούσης	πράττοντος
Dat.	πράττοντι	πραττούσῃ	πράττοντι
		Dual.	
N.V.A.	πράττοντε	πραττούσᾱ	πράττοντε
G.D.	πραττόντοιν	πραττούσαιν	πραττόντοιν
		Plural.	
N.V.	πράττοντες	πράττουσαι	πράττοντα
Acc.	πράττοντας	πραττούσας	πράττοντα
Gen.	πραττόντων	πραττουσῶν	πραττόντων
Dat.	πράττουσι	πραττούσαις	πράττουσι

Similarly are declined the types represented by the following:

πράξας, πράξᾱσα, πρᾶξαν, doing (referring to past action), aor. part. act.
πραχθείς, πραχθεῖσα, πραχθέν, done, aor. part. pass.
διδούς, διδοῦσα, διδόν, giving.
δεικνῡ́ς, δεικνῦσα, δεικνύν, showing.

There are also a few non-participle adjectives with stems in -ντ- declined after the following type:

Nom.	χαρίεις	χαρίεσσα	χαρίεν	graceful
Voc.	χαρίεν	χαρίεσσα	χαρίεν	
Acc.	χαρίεντα	χαρίεσσαν	χαρίεν	
	&c.	&c.	&c.	

Finally comes the type of participles with stem ending in -οτ-, *e.g.*:

λελυκώς (perf. part. act.), having loosed.

N.V.	λελυκώς	λελυκυῖα	λελυκός
Acc.	λελυκότα	λελυκυῖαν	λελυκός
	&c.	&c.	&c.
D.Pl.	λελυκόσι	λελυκυίαις	λελυκόσι

3. *Adjectives of the 3rd Declension.*—(*a*) -εσ-stems:

εὐμενής, gracious.

	Masculine and Feminine.	Neuter.
	Singular.	
N.V.	εὐμενής	εὐμενές
Acc.	εὐμενῆ	εὐμενές
Gen.	εὐμενοῦς	εὐμενοῦς
Dat.	εὐμενεῖ	εὐμενεῖ

Masculine and Feminine.		Neuter.
	Dual.	
N. V. A.	εὐμενῆ	εὐμενῆ
G.D.	εὐμενοῖν	εὐμενοῖν
	Plural.	
N.V.A.	εὐμενεῖς	εὐμενῆ
Gen.	εὐμενῶν	εὐμενῶν
Dat.	εὐμενέσι	εὐμενέσι

(b) -ον- stems:

κακόφρων, malicious.

	Masc. and Fem.	Neuter.
	Singular.	
N.V.	κακόφρων	κακόφρον
Acc.	κακόφρονα	κακόφρον
Gen.	κακόφρονος	
Dat.	κακόφρονι	
	Dual.	
N.V.A.	κακόφρονε	
G.D.	κακοφρόνοιν	
	Plural.	
N.V.	κακόφρονες	κακόφρονα
Acc.	κακόφρονας	κακόφρονα
Gen.	κακοφρόνων	
Dat.	κακόφροσι	

Note.—Comparatives in -ων have alternative endings as follows:

	Masc. and Fem.	Neuter.
	Singular.	
Acc.	-ονα, -ω	
	Plural.	
N.V.	-ονες, -ους	-ονα, -ω
Acc.	-ονας, -ους	-ονα, -ω

A few adjectives are declined irregularly with two stems after the following type:

πολύς, much.

	Masc.	Fem.	Neuter.
		Singular.	
N.V.	πολύς	πολλή	πολύ
Acc.	πολύν	πολλήν	πολύ
Gen.	πολλοῦ	πολλῆς	πολλοῦ
Dat.	πολλῷ	πολλῇ	πολλῷ
		Plural.	
N.V.	πολλοί &c.	πολλαί &c.	πολλά &c.

The only other example in common use is:

μέγας, μεγάλη, μέγα, great.

Comparison of Adjectives.—There are in Greek, as in English, three degrees of comparison, viz. Positive, Comparative, and Superlative.

e.g. Good is positive, stating that the quality exists.

Better is comparative, comparing the thing described with something else.

Best is superlative, stating the existence of the quality in its greatest extent.

The commonest method of comparison in Greek is to add to the stem the ending -τερος, -τερα, -τερον to form the comparative, and -τατος, -τατη, -τατον to form the superlative.

In -ο stems the -ο is lengthened to -ω if the preceding syllable is short—*e.g.*:

πονηρό-ς	wicked	πονηρό-τερος	πονηρό-τατος
λόγιο-ς	learned	λογιώ-τερος	λογιώ-τατος
γλυκύ-ς	sweet	γλυκύ-τερος	γλυκύ-τατος
τέρην	tender	τερέν-τερος	τερέν-τατος
εὐμενής	gracious	εὐμενέσ-τερος	εὐμενέσ-τατος

Adjectives whose stems end in -αιο- drop the -ο- in comparison—*e.g.*:

παλαιός	ancient	παλαίτερος	παλαίτατος.

Adjectives whose stems end in -ον form the comparative and superlative by adding -εστερος and -εστατος respectively—*e.g.*:

κακόφρων	malicious	κακοφρονέστερος	κακοφρονέστατος

Irregular Comparison.—Some adjectives are irregular in their comparison. The following are the most important examples:

Positive.		Comparative.	Superlative.
ἀγαθός	good	ἀμείνων	ἄριστος
		βελτίων	βέλτιστος
κακός	bad	κακίων	κάκιστος
μικρός	small	μείων	
		μικρότερος	μικρότατος
ὀλίγος	little		ὀλίγιστος
		ἐλάττων	ἐλάχιστος
φίλος	beloved	φίλτερος	φίλτατος
εὔνους	kind	εὐνούστερος	εὐνούστατος
πολύς	much	πλείων	πλεῖστος
καλός	beautiful	καλλίων	κάλλιστος
ἡδύς	sweet	ἡδίων	ἥδιστος
ῥᾴδιος	easy	ῥᾴων	ῥᾷστος
ταχύς	swift	θάττων	τάχιστος
ἐχθρός	hostile	ἐχθίων	ἔχθιστος
ἀλγεινός	painful	ἀλγίων	ἄλγιστος
μέγας	great	μείζων	μέγιστος
αἰσχρός	disgraceful	αἰσχίων	αἴσχιστος

Translate, giving every possible meaning of: ὁ Σωκράτης ὁ πάντων ἀνθρώπων σοφώτατος. αἰσχρὸν ἔργον. ὦ φίλτατ' ἀνδρῶν. ἡ καλῆς μητρὸς καλλίων θυγάτηρ. τὸ ὕδωρ, τὸ ἄριστον τοῖς σώφροσι ποτόν.

(*N.B.*—Note the very common and idiomatic use of μέν, a conjunctive particle, used to distinguish the word or clause with which it stands from something that is to follow, and δέ which generally answers it in the corresponding clause, the general sense being "on the one hand . . . on the other . . .")

τὸ μὲν πνεῦμα πρόθυμον ἡ δὲ σὰρξ ἀσθενής. πρῶτος καὶ μέγιστος ποιητῶν ὁ Ὅμηρος. ἔργον ῥᾴδιον μὲν ἀλλ' οὐ γλυκὺ ταις εὔναις γυναιξίν. πόλεμος χρησιμώτερος τοῖς Ἀθηναίοις. πάντες οἱ τῶν Θηβῶν πολῖται. ἀγαθοῦ λεὼ ἀγαθὸς ἄναξ. ὁ χρυσὸς πολλῶν κακῶν ἀρχή. ὁ Ζεῦς ὁ παντῶν τῶν θεῶν κράτιστος. ἡ γλυκεῖα μακαίρας γυναικὸς φωνή.

Adverbs.—Adverbs are regularly formed from adjectives by adding tho ending *-ως* to the stem, subject to the following rules:

1. In forming adverbs from *-ο* stems the *-ο* is dropped.
   (*E.g.* the adverb formed from *καλό-ς*, good, is *καλ-ῶς*, well.)
2. In forming adverbs from adjectives of the 3rd Declension, that form of the stem is used which appears in the gen. sing. masc.
   (*E.g.* the stem of *σαφής*, clear, is really *σαφεσ-*, but the gen. sing. masc. is *σαφέ-ος*, hence the adverb meaning "clearly" is *σαφῶς*, contracted from *σαφέ-ως*.)

Comparison of Adverbs.—The comparative of an adverb is the acc. sing. neut. of the comparative of the adjective. The superlative of an adverb is the acc. plur. neut. of the superlative of the adjective.

σοφῶς wisely	σοφώτερον more wisely	σοφώτατα most wisely	
κακῶς badly	κακίον	κάκιστα	
φίλως	φίλτερον	φίλτατα	
ταχέως	θᾶττον	τάχιστα	

Besides the adverbs in *-ως*, formed regularly from adjectives, there are many others formed from nouns and verbs. Of these the commonest is the use of the dat. sing. of nouns in an adverbial sense—*e.g.* *ἡ σπουδή*, zeal, gives us *σπουδῇ*, zealously.

Another adverbial ending on noun-stems is *-δον*, and many adverbs are formed by adding to verb-stems the endings *-δην* or *-τι*.

There are three suffixes that go to form adverbs of place, viz.:

-ι added to the stem, indicating "where."
-θεν added to the stem, indicating "whence."
-δε added to the accusative, indicating "whither."

Finally there are many adverbs for the formation of which no general principle is apparent—*e.g.* *αὖθις*, again; *τότε*, then; *ἐκεῖ*, there, &c.

Numerals.—There are three classes of numerals, viz.:

1. *Cardinals*, which tell how many there are.
2. *Ordinals*, which tell in what order they come.
3. *Numeral Adverbs*, which tell how many times a thing happened.

Not.		Cardinal.	Ordinal.	Adverb.
1.	α'	εἷς, μία, ἕν, one	πρῶτος, first	ἅπαξ, once
2.	β'	δύο	δεύτερος	δίς
3.	γ'	τρεῖς, τρία	τρίτος	τρίς
4.	δ'	τέτταρες, τέτταρα	τέταρτος	τετράκις
5.	ε'	πέντε	πέμπτος	πεντάκις
6.	ς'	ἕξ	ἕκτος	ἑξάκις
7.	ζ'	ἑπτά	ἕβδομος	ἑπτάκις
8.	η'	ὀκτώ	ὄγδοος	ὀκτάκις
9.	θ'	ἐννέα	ἔνατος	ἐνάκις
10.	ι'	δέκα	δέκατος	δεκάκις
11.	ια'	ἕνδεκα	ἑνδέκατος	ἑνδεκάκις
12.	ιβ'	δώδεκα	δωδέκατος	δωδεκάκις
13.	ιγ'	τρεῖς καὶ δέκα	τρίτος καὶ δέκατος	τρισκαιδεκάκις
14.	ιδ'	τέτταρες καὶ δέκα	τέταρτος καὶ δέκατος	τετταρεσκαι-δεκάκις
15.	ιε'	πεντεκαίδεκα	πέμπτος καὶ δέκατος	πεντεκαιδεκά-κις
16.	ις'	ἑκκαίδεκα	ἕκτος καὶ δέκατος	ἑκκαιδεκάκις
20.	κ'	εἴκοσι(ν)	εἰκοστός	εἰκοσάκις
21.	κα'	εἴκοσιν εἷς	εἰκοστὸς πρῶτος	εἰκοσάκις ἅπαξ
30.	λ'	τριάκοντα	τριακοστός	τριακοντάκις
40.	μ'	τετταράκοντα	τετταρακοστός	τετταρακοντάκις
50.	ν'	πεντήκοντα	πεντηκοστός	πεντηκοντάκις
60.	ξ'	ἑξήκοντα	ἑξηκοστός	ἑξηκοντάκις
70.	ο'	ἑβδομήκοντα	ἑβδομηκοστός	ἑβδομηκοντάκις
80.	π'	ὀγδοήκοντα	ὀγδοηκοστός	ὀγδοηκοντάκις
90.	ϟ'	ἐνενήκοντα	ἐνενηκοστός	ἐνενηκοντάκις
100.	ρ'	ἕκατον	ἑκατοστός	ἑκατοντάκις
200.	σ'	διακόσιοι, -αι, -α	διακοσιοστός	διακοσιάκις
1,000.	͵α	χίλιοι, -αι, -α	χιλιοστός	χιλιάκις
2,000.	͵β	δισχίλιοι	δισχιλιοστός	δισχιλιάκις
10,000.	͵ι	μύριοι, -αι, -α	μυριοστός	μυριάκις

εἷς, μία, ἕν, one, is declined as follows:

	Masculine.	Feminine.	Neuter.
Nom.	εἷς	μία	ἕν
Acc.	ἕνα	μίαν	ἕν
Gen.	ἑνός	μιᾶς	ἑνός
Dat.	ἑνί	μιᾷ	ἑνί

δύο, two, is declined thus:

N.A.	δύο
G.D.	δυοῖν

τρεῖς, three, is declined:

	Masc. and Fem.	Neuter.
N.A.	τρεῖς	τρία
Gen.	τριῶν	τριῶν
Dat.	τρισί	τρισί

τέτταρες, four, is declined:

	Masc. and Fem.	Neuter.
Nom.	τέτταρες	τέτταρα
Acc.	τέτταρας	τέτταρα
Gen.	τεττάρων	τεττάρων
Dat.	τέτταρσι	τέτταρσι

Like *εἷς* are declined *οὐδείς, οὐδεμία, οὐδέν*, and *μηδείς*, &c., which mean "no one." These negatives, however, also are declined in the plural.

None of the other cardinals are declined down to *χίλιοι*, &c., which are declined like the plural of *καλός*.

All the ordinals are declined like *καλός*.

Pronouns.—*Personal Pronouns* :

	1st Person. Sing.	Dual.	Plur.	2nd Person. Sing.	Dual.	Plur.
Nom.	ἐγώ	νώ	ἡμεῖς	σύ	σφώ	ὑμεῖς
Voc.	—	—	—	σύ	σφώ	ὑμεῖς
Acc.	ἐμέ, με	νώ	ἡμᾶς	σέ	σφώ	ὑμᾶς
Gen.	ἐμοῦ, μου	νῷν	ἡμῶν	σοῦ	σφῷν	ὑμῶν
Dat.	ἐμοί, μοι	νῷν	ἡμῖν	σοί	σφῷν	ὑμῖν

The nominative of the personal pronoun of the 3rd Person is not found. For the other cases Greek used the oblique cases of *αὐτός*, self, which is declined as follows :

	Masc.	Fem.	Neut.	Masc.	Fem.	Neut.
	Singular.			Plural.		
Nom.	αὐτός	αὐτή	αὐτό	αὐτοί	αὐταί	αὐτά
Acc.	αὐτόν	αὐτήν	αὐτό	αὐτούς	αὐτάς	αὐτά
Gen.	αὐτοῦ	αὐτῆς	αὐτοῦ	αὐτῶν	αὐτῶν	αὐτῶν
Dat.	αὐτῷ	αὐτῇ	αὐτῷ	αὐτοῖς	αὐταῖς	αὐτοῖς

Note.—When *αὐτός* is placed between the article and its substantive it takes the meaning "same," *e.g.* *ἡ αὐτὴ γυνή*, the same woman. When the particular form of the article used ends in a vowel it often merges into the first syllable of the pronoun, *e.g.* *αὑτὸς ἀνήρ* = the same man ; *ταὐτῇ ἡμέρᾳ* = on the same day. When *αὐτός* is used in an intensive sense like *ipse* in Latin, it comes before the article, *e.g.* *αὐτὴ ἡ γυνή* = the woman herself.

The Reflexive Pronouns :

Myself.

	Masculine.	Feminine.
Acc.	ἐμαυτόν	ἐμαυτήν
Gen.	ἐμαυτοῦ	ἐμαυτῆς
Dat.	ἐμαυτῷ	ἐμαυτῇ

Ourselves.

Acc.	ἡμᾶς αὐτούς	ἡμᾶς αὐτάς
Gen.	ἡμῶν αὐτῶν	ἡμῶν αὐτῶν
Dat.	ἡμῖν αὐτοῖς	ἡμῖν αὐταῖς

Thyself.

Acc.	σεαυτόν, σαυτόν	σεαυτήν, σαυτήν
Gen.	σεαυτοῦ, σαυτοῦ	σεαυτῆς, σαυτῆς
Dat.	σεαυτῷ, σαυτῷ	σεαυτῇ, σαυτῇ

Yourselves.

Acc.	ὑμᾶς αὐτούς	ὑμᾶς αὐτάς
Gen.	ὑμῶν αὐτῶν	ὑμῶν αὐτῶν
Dat.	ὑμῖν αὐτοῖς	ὑμῖν αὐταῖς

N.B.—The contracted forms *σαυτόν*, &c., are more common in Attic Greek.

Himself, herself, itself.

Acc.	ἑαυτόν	ἑαυτήν	ἑαυτό
Gen.	ἑαυτοῦ	ἑαυτῆς	ἑαυτοῦ
Dat.	ἑαυτῷ	ἑαυτῇ	ἑαυτῷ

Themselves.

Acc.	ἑαυτούς	ἑαυτάς	ἑαυτά
Gen.	ἑαυτῶν	ἑαυτῶν	ἑαυτῶν
Dat.	ἑαυτοῖς	ἑαυταῖς	ἑαυτοῖς

Possessives.—The personal pronouns of the 1st and 2nd Person have each an adjectival form with a possessive meaning.

Thus—

to ἐγώ	corresponds	ἐμός	declined like	καλός.
„ σύ	„	σός	„	„
„ ἡμεῖς	„	ἡμέτερος	„	ἐχθρός
„ ὑμεῖς	„	ὑμέτερος	„	„

Demonstrative Pronouns :

οὗτος, this.

	Masculine.	Feminine.	Neuter.
	Singular.		
Nom.	οὗτος	αὕτη	τοῦτο
Acc.	τοῦτον	ταύτην	τοῦτο
Gen.	τούτου	ταύτης	τούτου
Dat.	τούτῳ	ταύτῃ	τούτῳ
	Dual.		
N.A.	τούτω	τούτω	τούτω
G.D.	τούτοιν	τούτοιν	τούτοιν
	Plural.		
Nom.	οὗτοι	αὗται	ταῦτα
Acc.	τούτους	ταύτας	ταῦτα
Gen.	τούτων	τούτων	τούτων
Dat.	τούτοις	ταύταις	τούτοις

ὅδε, "this," is declined like the definite article, each case being followed by *δε*. *ἐκεῖνος*, "that," is declined like *αὐτός*.

The Reciprocal Pronoun ("each other") :

	Masculine.	Feminine.	Neuter.
	Dual.		
Acc.	ἀλλήλω	ἀλλήλω	ἀλλήλω
G.D.	ἀλλήλοιν	ἀλλήλοιν	ἀλλήλοιν
	Plural.		
Acc.	ἀλλήλους	ἀλλήλας	ἄλληλα
Gen.	ἀλλήλων	ἀλλήλων	ἀλλήλων
Dat.	ἀλλήλοις	ἀλλήλαις	ἀλλήλοις

The Relative Pronoun.—*ὅς*, "who," is declined as follows :

	Masculine.	Feminine.	Neuter.
	Singular.		
Nom.	ὅς	ἥ	ὅ
Acc.	ὅν	ἥν	ὅ
Gen.	οὗ	ἧς	οὗ
Dat.	ᾧ	ᾗ	ᾧ
	Dual.		
N.A.	ὥ	ὥ	ὥ
G.D.	οἷν	οἷν	οἷν
	Plural.		
Nom.	οἵ	αἵ	ἅ
Acc.	οὕς	ἅς	ἅ
Gen.	ὧν	ὧν	ὧν
Dat.	οἷς	αἷς	οἷς

Another form of the relative pronoun is *ὅσπερ*, which is declined in the same way, with the addition of *-περ* at the end of each case.

The Indefinite Pronoun :

τις, "anyone."

	Masc. and Fem.	Neuter.
	Singular.	
Nom.	τις	τι
Acc.	τινά	τι
Gen.	τινός or του	
Dat.	τινί or τῳ	
	Dual.	
N.A.	τινέ	
G.D.	τινοῖν	

	Masc. and Fem.	Neuter.
	Plural.	
Nom.	τινές	τινά
Acc.	τινάς	τινά
Gen.	τινῶν	
Dat.	τισί	

The Interrogative Pronoun.—τίς, "who?" is the same in form as the indefinite pronoun except that the interrogative always carries an accent when monosyllabic, and when dissyllabic puts the accent on the first syllable instead of the last.

The relative and indefinite pronouns are combined to form a relative ὅστις = "whoever," the declension of which is peculiar and should be carefully noted.

	Masculine.	Feminine.	Neuter.
		Singular.	
Nom.	ὅστις	ἥτις	ὅτι
Acc.	ὅντινα	ἥντινα	ὅτι
Gen.	ὅτου	ἧστινος	ὅτου
Dat.	ὅτῳ	ᾗτινι	ὅτῳ
		Dual.	
N.A.	ὥτινε	ὥτινε	ὥτινε
G.D.	ὅτοιν	ὅτοιν	ὅτοιν
		Plural.	
Nom.	οἵτινες	αἵτινες	ἅττα
Acc.	οὕστινας	ἅστινας	ἅττα
Gen.	ὅτων	ὅτων	ὅτων
Dat.	ὅτοις	αἷστισι	ὅτοις

Note.—Note that in writing Greek the sign of interrogation used is the English semicolon, *e.g.* Who is the man? τίς ἐστιν ὁ ἀνήρ;

The Verb.—Verbs, like nouns, are in Greek subject to inflexion, which in their case is called Conjugation. By means of conjugation are expressed:

1. *Person* and *Number*.
2. *Voice*.—Active, Middle, or Passive.

The Active Voice indicates that the action of the verb proceeds from the subject, *e.g.* λύω = I loose.

The Middle Voice indicates that the action of the verb proceeds from the subject and is directed towards the subject, *e.g.* λύομαι = I loose for myself.

The Passive Voice indicates that the action of the verb is directed towards the subject and proceeds from a source outside it, *e.g.* λύομαι = I am loosed.

Note.—Some verbs are only found in one voice. Of these some are Middle in form and Active in meaning. Such are called deponents.

Some verbs, again, have a future tense that is Middle in form but Active in meaning.

3. *Tense.*—Present, Future, Perfect, Future Perfect, Imperfect, Aorist, Pluperfect.

The *Present* tense denotes the existence of a fact or the continuance of an action at the moment of speaking, as "I am here," "He is walking."

The *Future* tense denotes what will happen at a time later than the moment of speaking, as "He will tell us to-morrow."

The *Perfect* tense denotes an action or state of things which began in the past and is completed at the moment of speaking, *e.g.* "I have eaten my dinner"—*i.e.* "I began to eat it and went on eating, and now, at the time when I speak, it is actually all eaten."

The *Future Perfect* denotes that at some time in the future the subject of the verb will be able to say, "I have done so-and-so," *e.g.* "To-morrow I shall have gone away."

These tenses are known as *Principal* tenses. The remaining tenses, which are known as *Historic*, are:

The *Imperfect*, which denotes that at a specific time in the past an action was being carried on or a state of things was continuing to exist, *e.g.* "He was for three years in charge of the office," or "I used to like listening to him."

The *Aorist*, which denotes the plain fact that at a point of time in the past a thing was done or an occurrence took place, *e.g.* "He was killed," "The horse ran away."

The *Pluperfect*, which denotes that at a moment in the past an action or state of things which had begun before then was at an end, *e.g.* "When he was found he had given up hope."

4. *Mood.*—Indicative, Subjunctive, Optative, Imperative.

The *Indicative* mood states a fact—"I come."

The *Subjunctive* represents futurity.

The *Optative* is used to express in a less definite sense most of the constructions of the other moods.

The *Imperative* is the mood of command, *e.g.* λῦέ με = loose me.

There are also the following verbal substantives:

The *Infinitive*, *e.g.* φιλεῖν = to love.

The *Participles*, *e.g.* φιλῶν = loving.

The *Verbal Adjectives*, *e.g.* φιλητέος ἐστι = he should be loved.

The Formation of the Verb.—Conjugation, like Declension, consists in affixing various endings to the stem in order to express various shades of meaning.

For the purposes of conjugation Greek verbs divide themselves into two classes:

1. Verbs ending in -ω in the pres. indic. act.
2. Verbs ending in -μι in the pres. indic. act.

Of these, those in -ω are the larger class, and will therefore be dealt with first.

Verbs in -ω.

The following is a completely inflected verb of the simplest type:

λύω, I loose (verb-stem λυ-)

ACTIVE VOICE.

		Indicative.	Subjunctive.	Optative.	Imperative.	Infinitive.	Participle.
PRESENT.	Sing.	1. λύω, I loose	λύω	λύοιμι		λύειν	λύων, -ουσα, -ον
		2. λύεις, thou loosest	λύῃς	λύοις	λῦε		
		3. λύει, he looses	λύῃ	λύοι	λυέτω		
	Dual.	2. λύετον, ye twain loose	λύητον	λύοιτον	λύετον		
		3. λύετον they two loose	λύητον	λυοίτην	λυέτων		
	Plur.	1. λύομεν, we loose	λύωμεν	λύοιμεν			
		2. λύετε, ye loose	λύητε	λύοιτε	λύετε		
		3. λύουσι, they loose	λύωσι	λύοιεν	λυόντων		
FUTURE.		1. λύσω		λύσοιμι		λύσειν	λύσων, -ουσα, -ον
		2. λύσεις		&c., like λύοιμι			
		&c., like λύω					
IMPERFECT.	Sing.	1. ἔλυον					
		2. ἔλυες					
		3. ἔλυε					
	Dual.	2. ἐλύετον					
		3. ἐλυέτην					
	Plur.	1. ἐλύομεν					
		2. ἐλύετε					
		3. ἔλυον					
FIRST AORIST.	Sing.	1. ἔλυσα	λύσω	λύσαιμι		λῦσαι	λύσας, -ασα, -αν
		2. ἔλυσας	λύσῃς	λύσειας	λῦσον		
		3. ἔλυσε	&c., like λύω, λύῃς, &c.	λύσειε	λυσάτω		
	Dual.	2. ἐλύσατον		λύσαιτον	λύσατον		
		3. ἐλυσάτην		λυσαίτην	λυσάτων

		&c., like λύομαι		λυοίμην			-η, -ον

VERBAL ADJECTIVES.

λυτός, λυτή, λυτόν, fit to be loosed.
λυτέος, λυτέα, λυτέον, requiring to be loosed.

Note.—The endings of second cases are as follows:—

Active and Middle.—*Second Aorist* ends like the imperfect in the indicative and like the present in the other moods.

Second Perfect ends like the first perfect.

Notes on the Tenses.—1. The future indicative active is generally formed by adding -σω to the verb-stem, *e.g.* λύ-σω. Verbs, however, whose stems end in -λ, -μ, -ν, or -ρ make their future by adding -ω to the stem and placing a circumflex accent on it, *e.g.* ἀγγέλ-λω, "I announce"; ἀγγελ-ῶ, "I will announce."

2. The commonest way of forming the aorist indicative active is by adding -α to the future stem, as in ἔλυσ-α. The stems, however, in λ, μ, ν, ρ, which do not add σ in the future, form their aorist by lengthening the last vowel of the stem and adding α. Thus μένω, "I remain," makes its future μενῶ and its aorist ἔμεινα. κρίνω similarly makes its aorist ἔκρῖνα.

This ending in -σα or -α is known as the First Aorist. Some verbs make what is known as a second aorist by adding to the verb-stem the ending -ον, which is then inflected like the imperfect, *e.g.* βάλ-λω, "I throw"; ἔβαλον, "I threw." This applies to both the active and the middle voices.

3. In the imperfect, aorist, and pluperfect tenses of the indicative the augment ἐ- is added before the verb-stem in the case of verbs which begin with a consonant; in the case of those beginning with a vowel, the vowel is lengthened according to the following table:

α and ε become η.
ι, ο, υ become ῑ, ω, ῡ.
ευ becomes ηυ.
οι becomes ῳ.
αι or ᾳ becomes ῃ.

Thus λύω makes aorist ἔλυσα, ἀγγέλλω makes aorist ἤγγειλα.

4. Some verbs have a second passive aorist which, instead of adding -θην to the stem, is formed by adding -ην, while the stem-vowel sometimes undergoes change—*e.g.* φαίνω, I show, makes its aorist passive ἐφάνην.

5. The perfect tenses are marked by reduplication, which is governed by the following rules:

i. Verbs beginning with a single consonant are reduplicated by prefixing that consonant followed by ε—*e.g.* πλέκω, I plait; πέπλεχα, I have plaited.

But an aspirate is changed to its equivalent unaspirated form—*e.g.* φεύγω, I flee; πέφευγα, I have fled.

ii. Verbs beginning with two consonants, with ζ, ξ, ψ, or ρ, have the augment ἐ- instead of reduplication—*e.g.* ζητέω, I seek; ἐζήτηκα, I have sought.

N.B.—There is an exception to this when the second of the two consonants is a liquid; in that case ordinary reduplication takes place—*e.g.* γράφω, I write; γέγραφα, I have written.

iii. In verbs beginning with a vowel reduplication takes the form of the augment.

6. There are first and second perfects just as there are first and second aorists. The first perfect ends in -κα and keeps the stem-vowel, as in λέλυ-κα.

The second perfect is formed by adding -α to the verb-stem, changing the stem-vowel, and sometimes changing a final κ, γ, π, or β into the corresponding aspirate—*e.g.* φεύγω (stem φυγ), perf. πέφευγα: κλέπτω, I steal (stem κλεπ), perf. κέκλοφα.

7. In the middle and passive voices the perfect is formed by adding -μαι to the verb-stem. When the stem ends in a consonant the following assimilation takes place:

κ and χ become γ.
β, π, and φ „ μ.
δ, θ, and τ „ ς.

Where the stem ends in a consonant the ending -νται of the 3rd person plural becomes impossible, and the periphrasis -μένοι εἰσι is used.

Contracted Vowel-Stems.—When a verb-stem ends in -ε, -α, or -ο, as in φιλέ-ω, τιμά-ω, or δηλό-ω, the vowel contracts with the person-ending. These contracted verbs form a very large class which makes familiarity with their forms essential. The following plan of conjugation of each of the three types should therefore be carefully studied:

φιλέω, I love; τῑμάω, I honour; δηλόω, I show.

INDICATIVE ACTIVE.

Present.

Sing.	1.	φιλῶ	τιμῶ	δηλῶ
	2.	φιλεῖς	τιμᾷς	δηλοῖς
	3.	φιλεῖ	τιμᾷ	δηλοῖ

Active.	Passive.	Active.	Passive.
φιλεῖν	φιλεῖσθαι	τιμᾶν	τιμᾶσθαι

Active.	Passive.
δηλοῦν	δηλοῦσθαι

Verbs in -μι.—These differ from verbs in -ω only in the inflexion of the present, imperfect, and second aorist tenses, and occasionally in the perfect and pluperfect.

They fall into two classes:

(*a*) Verbs which form their present by adding the person-endings directly to the verb-stem with or without reduplication.

(In the case of reduplication the vowel used is -ι-, not -ε- as in verbs in -ω.

e.g. τί-θη-μι, I place.)

(*b*) Verbs which form their present by putting -νυ- between the verb-stem and the person-endings.

e.g. ὄμ-νυ-μι, I swear.

Note.—Most verbs in -μι have peculiarities of their own which must be learned in each case. The general scheme of their conjugation, however, is shown by the following example:

τί-θη-μι, I place (stem θε).

ACTIVE VOICE.

		Indicative.	Subjunctive.	Optative.	Imperative.	Infinitive.	Participle.
PRESENT. Sing.	1.	τίθημι	τιθῶ	τιθείην			
	2.	τίθης	τιθῇς	τιθείης	τίθει	τιθέναι	τιθείς,
	3.	τίθησι	τιθῇ	τιθείη	τιθέτω		-εῖσα, -έν
Dual.	2.	τίθετον	τιθῆτον	τιθεῖτον	τίθετον		
	3.	τίθετον	τιθῆτον	τιθείτην	τιθέτων		
Plur.	1.	τίθεμεν	τιθῶμεν	τιθεῖμεν			
	2.	τίθετε	τιθῆτε	τιθεῖτε	τίθετε		
	3.	τιθέᾱσι	τιθῶσι	τιθεῖεν	τιθέντων		
IMPERFECT. Sing.	1.	ἐτίθην					
	2.	ἐτίθεις					
	3.	ἐτίθει					
Dual.	2.	ἐτίθετον					
	3.	ἐτιθέτην					
Plur.	1.	ἐτίθεμεν					
	2.	ἐτίθετε					
	3.	ἐτίθεσαν					
SECOND AORIST. Sing.	1.	ἔθηκα (First Aorist)	θῶ	θείην		θεῖναι	θείς
	2.	ἔθηκας (First Aorist)	θῇς	&c., like τιθείην	θές		θεῖσα
	3.	ἔθηκε (First Aorist)	θῇ		θέτω		θέν
Dual.	2.	ἔθετον	θῆτον		θέτον		
	3.	ἐθέτην	θῆτον		θέτων		
Plur.	1.	ἔθεμεν	θῶμεν				
	2.	ἔθετε	θῆτε		θέτε		
	3.	ἔθεσαν, ἔθηκαν	θῶσι		θέντων		

The future θήσω and perfect τέθεικα are inflected like λύσω and λέλυκα.

Middle Voice.

Indicative.		Subjunctive.	Optative.	Imperative.	Infinitive.	Participle.
Present. Sing.	1. τίθεμαι	τιθῶμαι	τιθείμην		τίθεσθαι	τιθέμενος, -η, -ον
	2. τίθεσαι	τιθῇ	τιθεῖο	τίθεσο		
	3. τίθεται	τιθῆται	τιθεῖτο	τιθέσθω		
Dual.	2. τίθεσθον	τιθῆσθον	τιθεῖσθον	τίθεσθον		
	3. τίθεσθον	τιθῆσθον	τιθείσθην	τιθέσθων		
Plur.	1. τιθέμεθα	τιθώμεθα	τιθείμεθα			
	2. τίθεσθε	τιθῆσθε	τιθεῖσθε	τίθεσθε		
	3. τίθενται	τιθῶνται	τιθεῖντο	τιθέσθων		
Imperfect. Sing.	1. ἐτιθέμην					
	2. ἐτίθεσο					
	3. ἐτίθετο					
Dual.	2. ἐτίθεσθον					
	3. ἐτιθέσθην					
Plur.	1. ἐτιθέμεθα					
	2. ἐτίθεσθε					
	3. ἐτίθεντο					
Second Aorist. Sing.	1. ἐθέμην	θῶμαι	θείμην			
	2. ἔθου	&c., like	&c., like τιθείμην	θοῦ	θέσθαι	θέμενος, -η, -ον
	3. ἔθετο	τιθῶμαι		θέσθω		
Dual.	2. ἔθεσθον			θέσθον		
	3. ἐθέσθην			θέσθων		
Plur.	1. ἐθέμεθα					
	2. ἔθεσθε			θέσθε		
	3. ἔθεντο			θέσθων		
Perfect.	1. τέθειμαι					
	2. τέθεισαι, &c.					

Passive Voice.

Future. τεθήσομαι, τεθήσει, &c. Aorist. ἐτέθην, ἐτέθης, &c.

εἰμί, I am.

The verb εἰμί is used so much that its inflexion in full should be learned by heart; it is irregular in that it adopts forms not shown by any other of the verbs in -μι.

Indicative.		Subjunctive.	Optative.	Imperative.	Infinitive.	Participle.
Present. Sing.	1. εἰμί	ὦ	εἴην		εἶναι	ὤν, οὖσα, ὄν
	2. εἶ	ᾖς	εἴης	ἴσθι		
	3. ἐστί	ᾖ	εἴη	ἔστω		
Dual.	2. ἐστόν	ἦτον	εἶτον	ἔστον		
	3. ἐστόν	ἦτον	εἴτην	ἔστων		
Plur.	1. ἐσμέν	ὦμεν	εἶμεν			
	2. ἐστέ	ἦτε	εἶτε	ἔστε		
	3. εἰσί	ὦσι	εἶεν	ὄντων		
Imperfect. Sing.	1. ἦ, ἦν					
	2. ἦσθα					
	3. ἦν					
Dual.	2. ἦτον					
	3. ἤτην					
Plur.	1. ἦμεν					
	2. ἦτε					
	3. ἦσαν					
Future. Sing.	1. ἔσομαι		ἐσοίμην		ἔσεσθαι	ἐσόμενος, -η, -ον
	2. ἔσει		&c., like λυοίμην			
	3. ἔσται					
Dual.	2. ἔσεσθον					
	3. ἔσεσθον					
Plur.	1. ἐσόμεθα					
	2. ἔσεσθε					
	3. ἔσονται					

Defective Verbs.—The following verbs are defective, and have only the parts given below:

φημί, I say.

		Indicative.	Subjunctive.	Optative.	Imperative.	Infinitive.	Participle.
PRESENT. Sing.	1.	φημί	φῶ	φαίην		φάναι	φάς
	2.	φής	&c.	&c.	φάθι		φᾶσα
	3.	φησί					φάν
Plur.	1.	φαμέν					
	2.	φατέ					
	3.	φᾱσί					
IMPERFECT. Sing.	1.	ἔφην					
	2.	ἔφησθα					
	3.	ἔφη					
Plur.	1.	ἔφαμεν					
	2.	ἔφατε					
	3.	ἔφασαν					

δέδοικα, I fear (Perfect in Present Sense).

		Indicative.	Subjunctive.	Imperative.	Infinitive.	Participle.
PRESENT. Sing.	1.	δέδοικα, δέδια	δεδίω		δεδιέναι	δεδιώς
	2.	δέδοικας	&c.	δέδιθι		δεδιυῖα
	3.	δέδοικε, δέδιε		δεδίτω		δεδιός
Plur.	1.	δέδιμεν				
	2.	δεδοίκατε, δέδιτε		δέδιτε		
	3.	δεδοίκᾱσι, δεδίᾱσι				

PAST TENSE.—*ἐδεδοίκη, -ης, ει, ἐδέδιμεν, ἐδέδιτε, ἐδέδισαν.*

οἶδα, I know.

		Indicative.	Subjunctive.	Optative.	Imperative.	Infinitive.	Participle.
PRESENT. Sing.	1.	οἶδα	εἰδῶ	εἰδείην		εἰδέναι	εἰδώς, -υῖα, -ός
	2.	οἶσθα	εἰδῇς	εἰδείης	ἴσθι		
	3.	οἶδε	εἰδῇ	&c., like optat. of εἰμί	ἴστω		
Dual.	2.	ἴστον	&c., like subj. of εἰμί		ἴστον		
	3.	ἴστον			ἴστων		
Plur.	1.	ἴσμεν					
	2.	ἴστε			ἴστε		
	3.	ἴσᾱσι			ἴστων		
IMPERFECT. Sing.	1.	ᾔδη					
	2.	ᾔδησθα					
	3.	ᾔδει					
Dual.	2.	ᾖστον					
	3.	ᾔστην					
Plur.	1.	ᾖσμεν					
	2.	ᾖστε					
	3.	ᾖσαν					
FUTURE.	1.	εἴσομαι					
	2.	εἴσει, &c.					

ἔοικα, I am like.

Indicative.			Subjunctive.	Optative.	Infinitive.	Participle.
PRESENT. Sing.	1.	ἔοικα	ἐοίκω &c.	ἐοίκοιμι &c.	εἰκέναι	εἰκώς, -υῖα, -ός
	2.	ἔοικας				
	3.	ἔοικε				
Dual.	2.	ἐοίκατον				
	3.	ἐοίκατον				
Plur.	1.	ἔοιγμεν				
	2.	ἐοίκατε				
	3.	εἴξασι				
IMPERFECT.		ἐῴκη, &c.				
FUTURE.		εἴξω, &c.				

Irregular Verbs.—The number of verbs in Greek that are conjugated irregularly is extraordinarily large. Only experience in reading and diligent memorising can give the mastery over them. A complete list would be too large for such a work as this, but the following table of those in more common use may be of help and should be studied with great care.

The verbs are given in alphabetical order. It should be understood that those tenses not given are regularly formed.

ἀκούω, I hear.

ACTIVE.—Fut. ἀκούσομαι. Aor. ἤκουσα. Perf. ἀκήκοα.

PASSIVE.—Fut. ἀκουσθήσομαι. Aor. ἠκούσθην. Perf. ἤκουσμαι.

ἀνοίγνυμι, I open.

ACTIVE.—Fut. ἀνοίξω. Imperf. ἀνέῳγον. Aor. ἀνέῳξα. Perf. ἀνέῳχα.

PASSIVE.—Fut. ἀνοιχθήσομαι. Aor. ἀνεῴχθην. Pert. ἀνέῳγμαι.

αὐξάνω, I make to increase.

ACTIVE.—Fut. αὐξήσω. Perf. ηὔξηκα.

PASSIVE.—Fut. αυξήσομαι. Aor. ηὐξόμην, ηὐξήθην.

ἀφικνοῦμαι, I arrive.

ACTIVE.—Fut. ἀφίξομαι. Aor. ἀφῑκόμην. Perf. ἀφῖγμαι.

βαίνω, I go.

ACTIVE. — Fut. βήσομαι. Aor. ἔβην. Perf. βέβηκα.

PASSIVE.—Fut. βαθήσομαι. Aor. ἐβάθην. Perf. βέβαμαι.

βάλλω, I throw.

ACTIVE.—Fut. βαλῶ. Aor. ἔβαλον. Perf. βέβληκα.

PASSIVE.—Fut. βληθήσομαι. Aor. ἐβλήθην.

βλώσκω, I go.

ACTIVE.—Fut. μολοῦμαι. Imperf. non-existent. Aor. ἔμολον. Perf. μέμβλωκα.

βούλομαι, I wish.

ACTIVE. — Fut. βουλήσομαι. Aor. ἐβουλήθην. Perf. βεβούλημαι.

γαμῶ, I marry (of a man).

ACTIVE.—Fut. γαμῶ. Aor. ἔγημα. Perf. γεγάμηκα.

γίγνομαι, I become.

ACTIVE.—Fut. γενήσομαι. Aor. ἐγενόμην. Perf. γεγένημαι, γέγονα.

γιγνώσκω, I get to know.

ACTIVE.—Fut. γνώσομαι. Aor. ἔγνων. Perf. ἔγνωκα.

PASSIVE.—Fut. γνωσθήσομαι. Aor. ἐγνώσθην.

δέω, I bind.

ACTIVE. —Fut. δήσω. Imperf. ἔδουν. Aor. ἔδησα. Perf. δέδεκα.

MIDDLE.—Perf. δέδεμαι.

PASSIVE.—Fut. δεθήσομαι. Aor. ἐδέθην.

δέω, I lack.

ACTIVE.—Fut. δεήσω. Imperf. ἔδεον. Perf. δεδέηκα.

MIDDLE.—Aor. ἐδεήθην.

διδάσκω, I teach.

ACTIVE.—Fut. διδάξω. Perf. δεδίδαχα.

δύναμαι, I am able.

ACTIVE.—Fut. δυνήσομαι. Aor. ἐδυνήθην. Perf. δεδύνημαι.

ἐθέλω, I wish.

ACTIVE.—Fut. ἐθελήσω. Perf. ἠθέληκα.

ἐλαύνω, I drive.

ACTIVE.—Fut. ἐλῶ. Aor. ἤλασα. Perf. ἐλήλακα.

PASSIVE—Fut. ἐλαθήσομαι. Aor. ἠλάθην. Perf. ἐλήλαμαι.

ἐπίσταμαι, I know.

ACTIVE.—Fut. ἐπιστήσομαι. Aor. ἠπιστήθην. Perfect not found.

εὑρίσκω, I find.

ACTIVE.—Fut. *εὑρήσω*. Aor. *ηὗρον*. Perf. *ηὕρηκα*.
PASSIVE.—Fut. *εὑρεθήσομαι*. Aor. *ηὑρέθην*.

ἔχω, I have.

ACTIVE.—Fut. *ἕξω*, *σχήσω*. Imperf. *εἶχον*. Aor. *ἔσχον*. Perf. *ἔσχηκα*.
PASSIVE.—Aorist does not exist.

ἐῶ, I allow.

ACTIVE.—Fut. *ἐάσω*. Imperf. *εἴων*. Aor. *εἴᾱσα*. Perf. *εἴᾱκα*.

ἥδομαι, I rejoice.

ACTIVE.—Fut. *ἡσθήσομαι*. Aor. *ἥσθην*. Perf. does not exist.

κάθημαι, I sit down.

ACTIVE.—Only imperfect *ἐκαθήμην*, *καθήμην* is found.

καλῶ, I call.

ACTIVE.—Fut. *καλῶ*. Aor. *ἐκάλεσα*. Perf. *κέκληκα*.
PASSIVE.—Fut. *κληθήσομαι*, *κεκλήσομαι*. Aor. *ἐκλήθην*.

κλαίω, I weep.

ACTIVE.—Imperf. *ἔκλᾱον*. Fut. *κλαύσομαι*. Aor. *ἔκλαυσα*. No Perfect.
MIDDLE.—Perf. *κέκλαυμαι*.
PASSIVE.—Fut. *κεκλαύσομαι*. Aor. *ἐκλαύθην*.

λαγχάνω, I obtain (by lot).

ACTIVE.—Fut. *λήξομαι*. Aor. *ἔλαχον*. Perf. *εἴληχα*.
PASSIVE.—No Future. Aor. *ἐλήχθην*.

λαμβάνω, I take.

ACTIVE.—Fut. *λήψομαι*. Aor. *ἔλαβον*. Perf. *εἴληφα*.
PASSIVE.—Fut. *ληφθήσομαι*. Aor. *ἐλήφθην*.

λανθάνω, I lie hid. (*N.B.*—In middle voice = I forget.)

ACTIVE.—Fut. *λήσω*. Aor. *ἔλαθον*. Perf. *λέληθα*.

μανθάνω, I learn.

ACTIVE.—Fut. *μαθήσομαι*. Aor. *ἔμαθον*. Perf. *μεμάθηκα*.

μάχομαι, I fight.

ACTIVE.—Fut. *μαχοῦμαι*. Aor. *ἐμαχεσάμην*. Perf. *μεμάχημαι*.

μιμνήσκω, I remind.

ACTIVE.—Fut. *μνήσω*. No Perfect.
PASSIVE.—Fut. *μεμνήσομαι*, *μνησθήσομαι*. Aor. *ἐμνήσθην*. Perf. *μέμνημαι* = I remember (has Subj. *μεμνῶμαι*, Optat. *μεμνήμην*, and Imper. *μέμνησο*).

νομίζω, I think.

ACTIVE.—Fut. *νομιῶ*. Aor. *ἐνόμισα*. Perf. *νενόμικα*.
PASSIVE.—Fut. *νομισθήσομαι*, *νομιοῦμαι*. Aor. *ἐνομίσθην*. Perf. *νενόμισμαι*.

οἶμαι, I think.

ACTIVE.—Fut. *οἰήσομαι*. Imperf. *ᾤμην*. Aor. *ᾠήθην*. No Perfect.

ὄλλυμι, I destroy (rarely found uncompounded).

ACTIVE.—Fut. *ὀλῶ*. Imperf. *ὤλλυν*. Aor. *ὤλεσα*. Perf. *ὀλώλεκα*.
PASSIVE.—Aor. *ὠλόμην*. Perf. *ὄλωλα*.

ὀφείλω, I owe.

ACTIVE.—Fut. *ὀφειλήσω*. Perf. *ὠφείληκα*.
PASSIVE.—Aor. *ὠφειλήθην*. No Perfect.

πάσχω, I suffer.

ACTIVE.—Fut. *πείσομαι*. Aor. *ἔπαθον*. Perf. *πέπονθα*.

πίπτω, I fall.

ACTIVE.—Fut. *πεσοῦμαι*. Aor. *ἔπεσον*. Perf. *πέπτωκα*.

πλέω, I sail.

ACTIVE.—Fut. *πλεύσομαι*. Aor. *ἔπλευσα*. Perf. *πέπλευκα*.
PASSIVE.—Perf. *πέπλευσμαι* alone is found.

πράττω, I do.

ACTIVE.—Fut. *πράξω*. Perf. *πέπρᾱχα*, *πέπρᾱγα* (intransitive).
PASSIVE.—Aor. *ἐπράχθην*.

πυνθάνομαι, I learn of.

ACTIVE.—Fut. *πεύσομαι*. Aor. *ἐπυθόμην*. Perf. *πέπυσμαι*.

τέμνω, I cut.

ACTIVE.—Fut. *τεμῶ*. Aor. *ἔτεμον*. Perf. *τέτμηκα*.
MIDDLE.—Aor. *ἐταμόμην*.
PASSIVE.—Aor. *ἐτμήθην*.

τίκτω, I bring forth (*i.e.* give birth to).

ACTIVE.—Fut. *τέξομαι*. Aor. *ἔτεκον*. Perf. *τέτοκα*.

τιτρώσκω, I wound.

ACTIVE.—Fut. *τρώσω*. No Perfect.
PASSIVE.—Aor. *ἐτρώθην*. Perf. *τέτρωμαι*.

τυγχάνω, I hit, obtain, happen.

ACTIVE.—Fut. *τεύξομαι*. Aor. *ἔτυχον*. Perf. *τετύχηκα*.

ὑπισχνοῦμαι, I promise.

ACTIVE.—Fut. *ὑποσχήσομαι*. Aor. *ὑπεσχόμην*. Perf. *ὑπέσχημαι*.

φαίνω, I show.

ACTIVE.—Fut. *φανῶ*. Aor. *ἔφηνα*. Perf. *πέφαγκα*.
PASSIVE.—Fut. *φανοῦμαι*, *φανήσομαι*. Aor. *ἐφάνην*. Perf. *πέφηνα*.

φθείρω, I destroy.

ACTIVE.—Fut. *φθερῶ*. Aor. *ἔφθειρα*. Perf. *ἔφθαρκα*, *ἔφθορα*.
PASSIVE.—Fut. *φθεροῦμαι*, *φθαρήσομαι*. Aor. *ἐφθάρην*. Perf. *ἔφθαρμαι*.

χαίρω, I rejoice.

ACTIVE.—Fut. *χαιρήσω*. Aor. *ἐχάρην*. Perf. *κεχάρηκα*.

χρή, there is need of (impersonal).

Fut. χρῆσται. Imperf. ἐχρῆν. Pres. Subj. χρῇ. Optat. χρείη. Infin. χρῆναι. Partic. χρέων. No other parts exist.

Verbs Inflected by means of Different Roots.—The most perplexing class of Greek verbs consists of a few in common use which form different tenses from different roots. The most important are given below in alphabetical order:

ἀγορεύω, I say.

Pres. ἀγορεύω. Fut. ἐρῶ. Aor. εἶπον, εἶπας, εἶπε, εἴπατον, εἰπάτην, εἴπομεν, εἴπατε, εἶπον. Perf. εἴρηκα. Aor. Pass. ἐρρήθην. Fut. Pass. εἰρήσομαι, ῥηθήσομαι.

αἱρῶ, I take.

Pres. αἱρῶ. Fut. αἱρήσω. Imperf. ᾕρουν. Aor. εἷλον. Perf. ᾕρηκα. Pres. Pass. ἁλίσκομαι. Imperf. Pass. ἡλισκόμην. Fut. Pass. ἁλώσομαι. Aor. Pass. ἑάλων, ἡρέθην. Perf. Pass. ἑάλωκα, ᾕρημαι.

ἔρχομαι, I go.

Pres. Indic. ἔρχομαι. Pres. Subj. ἴω. Pres. Optat. ἴοιμι. Pres. Imper. ἴθι, ἴτω, ἴτον, ἴτων, ἴτε, ἰόντων. Pres. Infin. ἰέναι. Pres. Part. ἰών. Imperf. ᾖα, ᾔεισθα, ᾔει, ᾖτον, ᾔτην, ᾖμεν, ᾖτε, ᾖσαν. Fut. εἶμι, εἶ, εἶσι, ἴτον, ἴτον, ἴμεν, ἴτε, ἴασι. Aor. Indic. ἦλθον. Aor. Subj. ἔλθω, &c. Perf. ἐλήλυθα, ἥκω. Pluperf. εἰληλύθη, ἧκον.

ἐσθίω, I eat.

Pres. ἐσθίω. Fut. ἔδομαι. Imperf. ἤσθιον. Aor. ἔφαγον. Perf. ἐδήδοκα. Pass. Perf. ἐδήδεσμαι. Pass. Aor. κατεδέσθην.

ζῶ, I live.

Pres. Indic. ζῶ. Subj. ζῶ. Optat. ζῴην. Imperat. ζῆ. Infin. ζῆν. Part. ζῶν. Imperf. ἔζων. Fut. βιώσομαι, ζήσω. Aor. ἐβίων. Perf. βεβίωκα.

κτείνω, I kill.

Fut. κτενῶ. Aor. ἔκτεινα. Perf. ἀπέκτονα. For the Passive is used ἀποθνήσκω. Fut. ἀποθανοῦμαι. Aor. ἀπέθανον. Perf. τέθνηκα.

ὁρῶ, I see.

Imperf. ἑώρων. Fut. ὄψομαι. Aor. εἶδον (Subj. ἴδω, Optat. ἴδοιμι, &c. &c.). Perf. ἑόρᾱκα, ὄπωπα. Pass. Aor. ὤφθην. Pass. Fut. ὀφθήσομαι.

τρέχω, I run.

Fut. θρέξομαι, δραμοῦμαι, θεύσομαι. Imperf. ἔθεον, ἔτρεχον. Aor. ἔδραμον. Perf. δεδράμημαι.

φέρω, I bear.

Fut. οἴσω. Aor. ἤνεγκ-ον, -ας, -ε, -ατον, -ατην, -αμεν, -ατε, -ον. Perf. ἐνήνοχα. Pass. Aor. ἠνέχθην.

ὠνοῦμαι, I buy.

Has Aor. ἐπριάμην.

Prepositions.—The only part of speech remaining that may present any difficulty is the *Preposition*. In Greek, prepositions govern some the Accusative, some the Genitive, and some the Dative case, *i.e.* the noun depending on them falls into one of those cases—*e.g.*

πλέων εἰς τὰς Ἀθήνας, sailing to Athens.
ἀπ' ἐκείνης τῆς ἡμέρας, from that day.

The following prepositions govern the accusative:

εἰς, to ἀνά, up

The following govern the genitive:

ἀντί, instead of. ἀπό, from.
ἐκ (ἐξ before vowels), out of. πρό, before.

The following govern the dative:

ἐν, in. σύν (in poetry sometimes ξύν), with.

The following govern the accusative or genitive, according to meaning:

	Accusative.	Genitive.
διά	on account of	through
κατά	at, by	down from, down over
ὑπέρ	beyond	over, for the sake of
μετά	after	with

The following govern the accusative, genitive, or dative, according to meaning:

	Accusative.	Genitive.	Dative.
ἀμφί	around.	about.	*of Place:* round about. *not of Place:* on account of, concerning.
ἐπί	*of Place:* extending over, towards, in quest of. *of Time:* for a certain time, until.	*of Place:* upon, by, at, towards. *of Time:* in the course of. *with Pers. Pronoun:* ἐφ' ἑαυτοῦ = by himself. *of Persons:* in the presence of, in the time of.	*of Place:* on, over against. *of Time:* at, on. *of Persons:* in the power of, with a view to, upon a condition.
παρά	*of Place:* past. *of Time:* during. *of Persons:* to the presence of. *of Things:* contrary to.	from the side of.	by the side of.

	Accusative.	Genitive.	Dative.
περὶ	*of Place:* round. *of Time:* about.	*of Things:* about.	*of Place:* about. *of the object of an action:* for. *of a cause:* by reason of.
πρὸς	*of Place:* towards. *of Time:* getting on for. *Generally of relation:* in regard to, according to, in proportion to. *in adversative sense:* against.	*of Direction:* towards. *in oaths:* by, *e.g.* πρὸς τῶν σῶν γονάτων = by your knees (I adjure you).	in addition to. *of Place:* at.
ὑπό	*of Place:* under, *i.e.* motion under. *of Time:* *e.g.* ὑπὸ νύκτα = at nightfall.	*of Place:* beneath. *of the agent:* by.	*of Place:* under, *i.e.* position under, subject to.

Exercise.—In the following exercise care should be taken to ascertain all the possible meanings of each word before passing on to the next.

Translate:

(1) *ὁ τῶν Περσῶν βασιλεὺς ἐμάχεσατο πρὸς τοὺς Ἀθηναίους.* (2) *αἱ μὲν γυναῖκες ἥδοντο, οἱ δ' ἄνδρες ἐβαρύνοντο.* (3) *ἀγαθὸς ἀνὴρ ὑπὸ παντῶν τῶν σοφῶν φιλητέος ἐστίν.* (4) *ἀνήρ τις ἀπὸ Κορίνθου.* (5) *τίς πάρεστιν;* (6) *αὐτὸς ὁ ἄρχων ἄφικται.* (7) *ἀνοίγνυ ταύτην τὴν θύραν.* (8) *τίς οὐκ οἶδε ταῦτα;* (9) *ἡ γεωμετρία ηὑρέθη ὑπὸ τοῦ Εὐκλείδους.* (10) *ἡδύ ἐστι τὸ φιλεῖσθαι.* (11) *οὐκ ἐδυνήθησαν παρελθεῖν.* (12) *δὸς μοὶ δύο ὀβόλους.* (13) *ἐπορεύου διὰ τῆς τῶν πολεμίων χώρας.* (14) *πρὸ τούτου τοῦ πολέμου οἱ Λακεδαιμόνιοι εὐδαίμονες ἦσαν.* (15) *μετὰ ταῦτα ὁ Θεμιστόκλης πολλὰ εἰπεῖν ἐπειρήσατο, οἱ δὲ Λακεδαιμόνιοι οὐκ ἐβούλοντο ἀκούειν.* (16) *αὐτὸς ὁ Κύρος πάρεισιν.* (17) *ὁ αὐτὸς ἄγγελος ἦλθεν ἀπὸ τοῦ Φιλίππου.* (18) *καίπερ ὀλιγοὶ ὄντες οὐ νικηθήσονται οἱ Ἀθήναιοι ἐν τοιαύτῃ μάχῃ.* (19) *αἱ μὲν Μοῦσαι ἔννεα εἰσίν, αἱ δὲ Χάριτες τρεῖς.* (20) *ποῦ ἐστὶν ὁ τούτων τῶν δούλων δεσπότης;*

Accents

There are in Greek three accents—*acute* (ˊ), *grave* (ˋ), and *circumflex* (ˆ). These represent variations of pitch in the language as originally spoken: the grave accent really indicates that the syllable on which it appears was unaccented.

The following technical adjectives are applied to words accented in different ways:

Oxytone—acute on last syllable.
Paroxytone—acute on last syllable but one.
Proparoxytone—acute on last syllable but two.
Perispomenon—circumflex on last syllable.
Properispomenon—circumflex on last syllable but one.
Barytone—grave or no accent on last syllable.

The rules for accentation are:

1. The last syllable but two can only bear an acute accent, and that only when the last syllable is short.

e.g. ἄριστος, but ἀρίστοις.

2. The last but one, if accented, takes the circumflex if it is long and the following syllable is short; otherwise acute.

e.g. νῆσος, but νήσοις.

For the purpose of these rules genitives in -εως, -εων, from nouns in -ις, -υς, are counted as short; similarly with final -αι, -οι.

e.g. ἄνθρωποι, πόλεως.

3. An oxytone word becomes barytone when followed by an accented word in the same sentence.

e.g. λαγώς, but λαγὼς τῆς Ἀρτέμιδος.

4. In the 1st Declension the gen. plur. is always perispomenon.

e.g. χώρα, but χωρῶν.

5. In the 1st and 2nd Declensions the last syllable of the gen. and dat. of oxytone words takes the circumflex.

e.g. τιμή, but τιμῇ.
ὁδός, but ὁδοῖς.

6. In the 3rd Declension words of one syllable place a circumflex on the ending of the gen. plur.

e.g. ναῦς, but νεῶν.

παῖς, πᾶς, οὖς, and a few other monosyllables are exceptions to this rule.

e.g. παῖς, παίδων.

7. Verbs are accented on the farthest syllable from the end which rules 1 and 2 allow.

e.g. ἐπιμαρτύρομαι, διώκω, &c.

But:

(*a*) Participles are accented as nouns.

(*b*) The weak aorist infinitive active, strong aorist infinitive middle, perfect infinitive and participle passive, and all infinitives in *-ναι*, have the accent on the last syllable but one.

e.g. *μαρτυρῆσαι, γενέσθαι, λελύσθαι, λελυμένος, πεποιῆναι.*

(*c*) The strong aorist participle active, participles in *-εις, -ους, -υς,* and *-ως*, and the present participle active of verbs in *-μι*, are oxytone.

e.g. *εἰπών, τιθείς, λυθείς, διδούς, λελυκώς*, &c.

(*d*) Strong aorist infinitives active in *-ειν*, and the 2nd pers. sing. of strong aorist imperatives middle in *-ου*, are perispomenon.

e.g. *εἰπεῖν, γενοῦ.*

But in the second case, if the verb is compounded with a preposition of two syllables, the rule does not apply.

e.g. *ἀπό-δου.*

8. Before an enclitic (a word that has no accent) the following takes place:

(*a*) Proparoxytone words add an acute on the last syllable.
(*b*) Properispomenon words do the same.
(*c*) Oxytone words retain the acute accent.
(*d*) Paroxytone words remain as they are—*e.g.* *κατήγορός τις, νῆσός τις, καλός τις, χώρα τις.*

Note.—Most of the above rules are subject to some exceptions which must be learned by experience.

Syntax, or the Use of Words

Syntax is the science of the use of words in sentences. Sentences are either *Simple* or *Compound.*

A Simple Sentence has two parts:

1. The *Subject*—the person or thing about which something is stated.
2. The *Predicate*—that which is stated about the subject.

Thus, in the sentence *ὁ Πελοπίδας ἐνίκησε τοὺς Ἀθηναίους*, "Pelopidas defeated the Athenians," *ὁ Πελοπίδας* is the subject and *ἐνίκησε τοὺς Ἀθηναίους* is the predicate.

The subject must be one of the following:

1. A *Substantive*: *ὁ βασιλεύς*, the king.
2. A *Substantive Pronoun*: *ὑμεῖς*, you.
3. An *Adjective, Participle*, or *Adjective Pronoun*: *ἐκεῖνος*, that man.
4. A *Verb Noun*: *τὸ φιλεῖσθαι ἡδύ ἐστιν*, to be loved is sweet.

Note.—A Personal Pronoun as subject is usually implied in the verb and is not separately expressed: *e.g.* *φημί*, I say. But for the purpose of emphasis the pronoun may be expressed: *e.g.* *ἐγὼ μὲν βούλομαι λέγειν, σὺ δ' οὐκ ἐθέλεις ἀκούειν*, I wish to speak, but you are not willing to listen.

The *Predicate* must be a verb or a group of words containing and centring round a verb.

e.g. *ὁ Ἀλκιβιάδης ἀπῆλθεν*, "Alcibiades went away"—*ἀπῆλθεν* is predicate.
ὁ ἄρχων ἐπαινεῖ τὸν ῥήτορα ὅνπερ νομίζει πάντων εἶναι σοφώτατον, "the archon praises the orator whom he thinks the wisest of all"—from *ἐπαινεῖ* to *σοφώτατον* is predicate.

Agreement.—Adjectives, participles, and articles agree with their nouns in number, gender, and case.

Pronouns agree with their antecedents in number and gender, except that a relative pronoun, the object of a verb, is generally attracted into the case of its antecedent.

e.g. *μητὴρ ἀνδρῶν ὧν εἶδον*, the mother of the men I saw.

Verbs agree with their subject in number, gender, and person, except that a subject in the neuter plural is followed by a verb in the singular.

e.g. *ταῦτα δεινά ἐστιν*, these things are dreadful.

A noun agrees in number, and where possible in gender, with a noun to which it is in apposition. After *εἰμί* or a similar verb it agrees in number and case with a noun of which it is predicative.

The Article.—The article *ὁ, ἡ, τό* corresponds generally to the English "the."

Originally it played the part of a personal pronoun. Traces of this usage survive in such phrases as *ὁ μέν . . . ὁ δέ*, the one . . . the other; *οἱ μέν . . . οἱ δέ*, some . . . others; or in the use of *ὁ δέ* at the beginning of a sentence = he, referring to a person already mentioned and indicating a new subject of the sentence.

e.g. *ταῦτα ἤγγειλε τῇ γυναικί, ἡ δὲ χαλεπῶς ἤνεγκεν*, he announced this to the woman and she was vexed.

The ordinary use of the article is to point out something definite, that is known to the speaker or has been mentioned before, just as the word "the" is used in English.

e.g. *ὁ τῶν βαρβάρων ἄναξ*, the king of the barbarians.

Note, therefore, the difference of meaning between *πολλοὶ τοῦτο ποιοῦσιν*, "many men do this," and *οἱ πολλοὶ τοῦτο ποιοῦσιν*, "the common herd do this."

Greek uses the article also where it is discarded in English in the following instances:

1. With *abstract* nouns: *ἡ ἀρετή* = virtue.
2. With *proper names*: *ὁ Πίνδαρος* = Pindar.
3. With nouns spoken of as a class: *οἱ κύνες εὐνούστεροι εἰσὶ τοῖς ἀνθρώποις ἢ οἱ λύκοι*, dogs are more friendly to men than wolves.

When a noun with the article is qualified by an adjective, the adjective is usually placed between the noun and the article.

e.g. *ὁ πρῶτος ἀνήρ*, the first man.

Occasionally it comes after the noun, in which case the article is repeated.

e.g. *ἡ γυνὴ ἡ καλή*, the beautiful woman.

When the adjective appears in any other position, its meaning is not qualifying, but predicative.

e.g. *ἡ κόρη καλὴ ἐγένετο*, the girl became beautiful.

The article is also used in Greek where English would employ a possessive pronoun (*e.g.* my, his, our), wherever the context leaves no room for doubt as to the meaning.

e.g. *ὁ Οἰδίπους ἀπέκτεινε τὸν πατέρα*, Œdipus killed his father.

The article is often used without any noun qualified by it in adjectival phrases.

e.g. *οἱ περὶ τὸν Σωκράτην*, those about Socrates.
οἱ ἐν τῇ πόλει, the men in the city.

Another very common and idiomatic use is with participles to denote a group of persons or things, where English would use a demonstrative pronoun followed by a relative.

e.g. *οἱ τὴν ἀλήθειαν φιλοῦντες*, those who love truth.

Translate, giving every possible meaning of:

(1) *οἱ μὲν τῶν ἀνθρώπων φιλοῦσι τὸ πολεμεῖν, οἱ δ' ἀπεχθαίρουσιν.* (2) *πολλοὶ μὲν ἐβούλοντο σώζειν τὸν Σωκράτην, ὁ δ' οὐκ ἤθελεν.* (3) *αὕτη ἡ ἡμέρα μεγάλων ἦν ἀρχὴ κακῶν τοῖς Ἀθηναίοις.* (4) *τῇ αὐτῇ ἡμέρᾳ οἱ πολέμιοι ἀπῆλθον.* (5) *ἡ σωφροσύνη, ἡ πασῶν τῶν ἀρετῶν μεγίστη.* (6) *τίς ἀνδρῶν οὐ φιλεῖ τὴν μητέρα;* (7) *οἱ εὖ διάγοντες ἀεὶ σεβίζουσι τοὺς θεούς.* (8) *τὸ μὲν ἐσθίειν χρήσιμον, τὸ δὲ πλέον ἐσθίειν αἰσχρόν ἐστιν.* (9) *αἱ οἶες ἀεὶ φοβοῦνται τοὺς κύνας.* (10) *ἡ σχολὴ ἡδεῖα ἐστι τοῖς δούλοις τοῖς σφόδρα κεκμηκόσιν.* (11) *ὁ Δημοσθένης, ὁ τῶν ῥητόρων δοκιμώτατος, πάντας τοὺς Ἀθηναίους ἐνίκα ἐν τῷ εὐρύθμως λέγειν.* (12) *τοὺς μὲν ἐν τῇ πόλει ηὗρον τοὺς δ' οὔ.* (13) *ὁ ἄνθρωπος θνητός ἐστιν.*

Pronouns.—*Possessive*: The pronouns that indicate possession are: *ἐμός*, mine; *σός*, thine; *ἡμέτερος*, our; and *ὑμέτερος*, your.

(In the case of the 3rd person, Greek has no possessive pronouns to convey the meaning of *his, her, its, their*. In their stead is used the genitive of the demonstrative pronoun, viz. *ἐκείνου, ἐκείνης, ἐκείνων*.)

When the possessor to whom the pronoun refers is the subject of the sentence, the article alone is used without any pronoun.

e.g. *ὁ Οἰδίπους ἀπέκτεινε τὸν πατέρα*, Œdipus killed his father.

When, however, emphasis is laid on the relationship of possessor and possessed, the pronoun is used even when referring to the subject.

e.g. *τὴν σὴν μητέρα οὐ τιμᾶτε*, you do not honour your own mother.

Note.—The possessive pronouns are never used without the article preceding them. Thus *ὁ ἐμὸς πατήρ* or *ὁ πατὴρ ὁ ἐμός* = "my father," but never *ἐμὸς πατήρ* or *πατὴρ ἐμός* except in poetry.

If it is desired to use particular emphasis, the genitive of the reflexive pronoun is used instead of the possessive.

e.g. *πῶς ἂν δυναίμην τὴν ἐμαυτοῦ μητέρα ἀτιμάζειν;* how could I insult my own mother?

When the person or thing that is the possessor is other than the subject of the sentence, then the possessive pronouns or the genitive of the personal pronouns are used. Thus "I saw your brother" can be translated *εἶδον τὸν σὸν ἄδελφον*, or *εἶδον τὸν σοῦ ἄδελφον*.

There is a distinct and idiomatic use of the possessive pronouns by which they are sometimes used to indicate dependence on rather than possession of the noun to which they refer. Thus *αἱ ἐμαὶ διαβολαί* can mean "my slanders"—*i.e.* uttered by me—or "the slanders against me." Similarly *δωρεὰ ἐμή* can mean "a gift made by me" or "a gift to me."

Reflexive.—Reflexive pronouns are those which are used when the subject of the sentence is referred to.

e.g. *γνῶθι σεαυτόν*, know thyself.

They are: *ἐμαυτόν*, myself; *σεαυτόν*, thyself; *ἑαυτόν*, him-, her-, or itself; *ἡμᾶς αὐτούς*, ourselves; *ὑμᾶς αὐτούς*, yourselves; *ἑαυτούς*, themselves.

These are used when the meaning is direct.

e.g. *σεαυτὸν διολώλεκας*, you have destroyed yourself.

In Greek a fine distinction was sometimes drawn between such a reflexive meaning and the case where the pronoun refers not to the immediate subject of the verb that governs it, but to the more distant subject of the whole sentence. In that case the forms *ἕ, οὗ, οἷ* in

the singular and σφᾶς, σφῶν, σφίσιν in the plural are used.

e.g. ἐκέλευσε τὸν οἰκέτην τὴν οὗ μητέρα περιμένειν, he bade the servant wait for his (the bidder's) mother.

This usage is more common in poetry than in prose.

Relative.—There are three chief relative pronouns: ὅς, ὅσπερ, which are definite; ὅστις, which is indefinite.

ὅς is the most general in meaning.

e.g. ἀνὴρ ὃν τιμᾷ ὁ βασιλεύς, the man whom the king honours.

ὅσπερ is more precise.

e.g. ἀνὴρ ὅνπερ εἶδον, the very man I saw.

ὅστις is the least precise, and refers to a class of persons or things.

e.g. εὐδαίμων ἐστιν ὅστις τοὺς θεοὺς σεβίζει, happy is he who reveres the gods.

Some phrases formed round the relative pronoun have become crystallised and are equivalent to pronouns.

e.g. ἔστιν οἵ (which is declined throughout) = some.
ἔστιν ὅστις; (also declined) = is anyone?
οὐδεὶς ὅστις οὐ = everyone (*lit.* nobody who not).

Generally speaking, the relative pronoun agrees with the noun it represents (called the antecedent) in number and gender, and takes whatever case is required by its position in its own clause. But there is a common idiom by which, when the relative would naturally be in the accusative case, it is attracted into the genitive or dative of its antecedent.

e.g. στρατιὰν ἦγεν ἀπὸ τῶν πόλεων ὧν ἔπεισε, he was leading an army from the cities that he persuaded.
οὐδὲν ὧν λέγω (ἐκείνων being understood after οὐδέν), nothing of what I say.

If the antecedent is a substantive it often transfers to the relative clause.

e.g. ἐπιλέλησται ὧν πρότερον ἐφίλει ἑταίρων, he has forgotten the companions he used to love.

Note.—The relative is never omitted in Greek as it is sometimes in English. Thus "the man I saw" is always ἀνὴρ ὃν εἶδον.

αὐτός.

αὐτός cannot be placed under one head, as it is used in various senses as follows:

1. In the nominative case:

(*a*) In an *intensive* sense = self.

e.g. ὁ στράτηγος αὐτὸς ἀφίκετο / αὐτὸς ὁ στράτηγος ἀφίκετο } the general himself came.
αὐτὸς τοῦτο ἔφην, I myself said this.

It is used in this sense in the idiom: αὐτὸς τρίτος ἐστρατήγει, he was general with two others (*lit.* himself the third).

(*b*) Meaning "same," preceded by the article: ὁ αὐτὸς δοῦλος, the same slave.

2. In the other cases:

(*a*) As the pronoun of the 3rd person: ἔπεμψα αὐτήν, I sent her.
(*b*) When first word in the sentence, meaning "self": αὐτοῦ ἤκουσα λέγοντος, I heard him speak himself.
(*c*) When followed by a personal pronoun, meaning "self": εἶδον αὐτοὺς ὑμᾶς, I saw you yourselves.
(*d*) Preceded by the article, meaning "same": εἶδον τὸν αὐτὸν δοῦλον, I saw the same slave.

A very idiomatic use is with the dative of a substantive to denote accompaniment.

e.g. ἡ πόλις ᾑρέθη αὐτοῖς ἀνδράσιν, the city was taken, garrison and all.

Translate, giving every possible meaning of:

(1) τὸν μὲν ἄρχοντα οὐκ εἶδεν, τὴν δ' αὐτοῦ γυναῖκα πρόσειπεν. (2) ἡ Μήδεια λέγεται τὸν ἄδελφον στύγησαι. (3) ὦ γύναι, τὸν σὸν ἄδελφον οὐ φιλῶ. (4) ὦ Μήδεια, πῶς δυνήσει τὸν σαυτῆς ἄδελφον ἀποκτείνειν; (5) ὁ βασιλεὺς μεγὰ δῶρον ἔδωκε τῷ ὑμῶν πατρί. (6) οὐ σὸν τόδ' ἐστι τοὔργον. (7) ὁ σὸς πόθος. (8) οὐ ῥᾳδίως ἐμαυτὸν τραυματίσω. (9) ἠρώτησεν αὐτοὺς εἰ βούλονταί ἑ ἀποκτεῖναι. (10) ἀφίκετο σὺν ὧνπερ εἶχεν οἰκετῶν. (11) οὐδεὶς γάρ ἐστιν ὅστις οὐκ οἶδεν τόδε. (12) ἐκεινός ἐστιν ὅνπερ εἶδον ἐν τῇ ὁδῷ. (13) ἀλλ' ἔστιν αἱ γυναῖκες οὐ φιλοῦσι τὸ τίκτειν. (14) αὐτῇ σὺν φόρμιγγι ἀνόρουσεν. (15) οὐ δυνάμεθα ταὐτὸ αὖθις πράττειν. (16) αὐτὸ τὸ ἔργον δείξει. (17) αὐτὸ τὸ περίορθρον πάρεστιν. (18) οὔ μοι μέλει ἄλγος αὐτῆς τῆς Ἑκαβῆς.

Demonstrative.—The demonstrative pronouns οὗτος, ὅδε, "this," and ἐκεῖνος, "that," are used in two ways:

1. As adjectives, in which case their position is predicative, *i.e.* without the article:

e.g. οὗτος ὁ ἀνήρ, this man.
ἡ γυνὴ ἐκείνη, that woman.

2. As pure pronouns:

e.g. οὗτοι ἦσαν ἐν τῇ μάχῃ, these men were in the battle.
λέγει τάδε, he speaks as follows.

Indefinite.—The indefinite pronoun τις and the interrogative τίς similarly may be used:

1. Adjectively.

e.g. ἀνήρ τις ἐμοὶ ταῦτα εἶπεν, some man told me this,

2. Pronominally.

τῶν στρατιωτῶν τινες ἔκαμνον, some of the soldiers were weary.

N.B.—The indefinite *τις* can never be the first word in the sentence.

The Cases. *Nominative.*—The case of the Name. The subject of the sentence is in the nominative case.

οἱ Λακεδαιμόνιοι ἀπῆλθον, the Lacedaemonians departed.

The nominative is also the case of the complement after *εἰμί,* "I am," *γίγνομαι,* "I become," and verbs of similar meaning, and also after the passive of such verbs as *καλῶ,* "I call."

e.g. ἡ κορὴ γέγονε γυνή, the girl has become a woman.

ὁ Σόλων ὁ σοφὸς ἐκαλεῖτο, Solon was called "the wise."

There are some verbs with the meaning of "perceive" or some similar meaning that are constructed with the accusative of a participle. The nominative of the participle is used, however, when the subject of the participle is the same as that of the main verb.

e.g. αἰσθάνομαι ὑπὸ πάντων μισούμενος, I perceive that I am hated by all.

Vocative.—The case of Address.

The vocative, or nominative used as vocative, stands isolated from the rest of the sentence without any place in its construction. In Greek it is usually accompanied by the exclamation *ὦ.*

e.g. τί δρᾷς, ὦ γέρον; what are you doing, old man?

Accusative.—The accusative expresses three main ideas:

1. Direct Object.
2. Limitations of Time and Space.
3. Adverbial Relations.

I. *Direct Object.*—The direct object of a transitive verb is in the accusative case.

οἱ Συρακόσιοι δύο τροπαῖα ἔστησαν, the Syracusans erected two trophies.

Verbs of *making, naming, thinking,* &c., have a second accusative agreeing with the object.

τὴν πόλιν Θήβας ὀνομάζουσι, they call the city Thebes.

Some verbs of *saying* and *thinking* may have as their object an accusative followed by an infinitive of which it is the subject.

e.g. ἔφη τὸν βασιλέα μὴ εἰδέναι τάδε, he said the king did not know this (*lit.* he said the king not to know this).

A similar construction is found with impersonal verbs.

δεῖ σε μανθάνειν, you ought to learn.

Some verbs, not properly transitive, may be used transitively.

e.g. θαρρῶ τὸν θάνατον, I have no fear of (*lit.* I am brave) death.

Verbs of *asking, concealing, teaching, clothing, depriving,* &c., take two accusatives, one of the person, the other of the thing.

τοῦτο μόνον αἰτῶ ὑμᾶς, this one thing I ask you.

μή με κρύψῃς τοῦτο, keep not this hid from me.

Intransitive verbs sometimes take as object an accusative noun with meaning similar to their own.

νόσον νοσεῖν, to be ill of a disease.
ἀγῶνα τρέχειν, to run a heat.

II. *Time and Space.*

1. *Motion towards* a thing or place.
   The accusative is used in prose with a preposition. In poetry the preposition is sometimes omitted.

ἀγγέλους ἔστειλαν ἐς τὰς ἄλλας πόλεις, they sent messengers to the other cities.

2. *Duration of Time.*

τέσσαρα καὶ δέκα ἔτη ἐνέμειναν αἱ σπονδαί, the truce lasted fourteen years.

3. *Extent of Space.*
   δέκα πόδας ἀπῆν, he was ten feet away.

III. *Adverbial Relations.*

1. *Accusative of Respect*—*i.e.* accusative of the thing in respect of which one looks or feels somehow.

e.g. ἀλγῶ τὴν κεφαλήν, I have a headache.
ἐτραυματίσθη τὸ στῆθος, he was wounded in the breast.

2. *Adverbial* accusative neuter of pronouns or adjectives.

τὸ λοιπὸν οὐκ ἐάσω ταῦτα, for the future I will not allow this.

Hence the many adverbs which are really neuter accusatives.

e.g. πολύ, πλέον, &c.

3. Under this head may be placed the *Absolute* use of the accusative neuter singular of the participles of impersonal verbs.

e.g. ἔξον μένειν οὐκ ἀπελεύσομαι, it being permitted to remain, I will not go away.

4. *In Oaths.*
   νὴ τὸν Δία, by Zeus!

Translate, giving every possible meaning of: (1) *ἔπεμψαν πέντε ναῦς ἐς τὴν Πύλον.* (2) *οἱ ἐν τῇ μάχῃ νενικημένοι ἀνεχώρησαν ὑπὸ τὸ τεῖχος.* (3) *τεῖχος περιεβάλετο τὴν πόλιν.* (4) *πόσον χρόνον ἔμεινας ἐν τῇ νήσῳ;* (5) *περιεδέθη*

τὰς χεῖρας. (6) ὡς μακρὸν ἔζηκας βίον. (7) ἔφη τὸν Σωκράτην μὴ σεβίζειν τοὺς θεούς. (8) οὐ χρὴ τοὺς ἀνθρώπους φιλεῖν τὸ πολεμεῖν. (9) οἱ Θήβαιοι ἱπποσύνας ἐδίδαξαν τοὺς Ἀθηναίους. (10) αὕτη ἡ κώμη δώδεκα σταδίους ἀπέχει. (11) ὕστερον ἐς Μεθώνην ἀφίκοντο. (12) μὰ τὸν Ἀπόλλωνα, τοιαῦτα οὐ πείσομαι. (13) εἰς τοιοῦτον ἄνδρα τίς δύναται ὑβρίζειν, δέον μᾶλλον τιμᾶν αὐτόν; (14) νόσον νοσεῖς ἣν οὐδαμῶς κρύψεις τὴν μητέρα. (15) οἱ δ' Ἀθήναιοι ἔπλευσαν αὐθημερὸν ἐς Κρομμυῶνα· ἀπέχει δὲ τῆς Κορινθίας εἴκοσι καὶ ἑκατον σταδίους. (16) δεῖ ἡμᾶς τὸν τῆς Χερσονήσου ἰσθμὸν τειχίζειν.

The Genitive.—The genitive is the case which, speaking generally, translates the English word "of."

Its chief uses fall under two heads—*Connection*, and *Separation or Origin*.

I. *Connection.*

1. *Genitive of Possession.*

(*a*) *Objective.* (*b*) *Subjective.*

Thus ἑταίρων φιλία may mean "affection of friends" or "affection for friends."

2. *Material.*

δύο τάλαντα ἀργυρίου, two talents of silver.

3. *Partitive Genitive*—*i.e.* the genitive of a whole of which a part or parts are distinguished.

τῶν στρατιωτῶν τινές, some of the soldiers.
αἱ ἡμίσειαι τῶν νεῶν, half the ships.

Akin to this is the use of the genitive after words meaning *to share*, &c.

οὐ βούλονται τῆς δαιτὸς μεταλαμβάνειν, they do not wish to share the feast.

4. *Describing Genitive.*

παῖς πέντε ἐτῶν, a boy five years old.
τριῶν ἡμερῶν ὁδός, a three-days' journey.

Akin to this meaning is the use of the genitive after verbs meaning *to condemn, try, acquit*, &c., defining the offence.

e.g. κατηγόρωσεν αὐτὸν ἀσεβείας, he denounced him for impiety.

5. Under this head may be placed the use of the genitive after verbs and adjectives implying *sharing, remembering, touching, tasting, aiming at, governing*, &c.

ἐπιλέληθε τῶν ὀφειλῶν, he forgot his debts.
οἱ Λακεδαιμόνιοι ἦρξαν τοῦ πολέμου, the Lacedaemonians began the war.
ἥψατο τῶν τοῦ στρατηγοῦ γονάτων, he clung to the general's knees.

6. *Genitive of Price.*

δῶρον πολλοῦ ἄξιον, a gift of great value.
πόσου ἐπράθη ὁ βοῦς; for how much was the ox sold?
ἐπριάμην αὐτὸν πέντε μνῶν, I bought it for five minas.

7. *Time within which.*

τρὶς τῆς ἡμέρας, three times a day.

8. *Genitive Absolute.*—This is a phrase consisting of a noun and a participle in the genitive case. It is independent of the construction of the rest of the sentence; hence the name *Absolute*. It has the force of a dependent clause, and thus may denote:

(*a*) *Time.*

ταῦτα ἔτυχεν ἄρχοντος τοῦ Κλέωνος, this happened when Cleon was archon.

(*β*) *Condition.*

Ἀθηναίων δὲ τοῦτο παθόντων νικηθησόμεθα, if the Athenians suffer this we shall be conquered.

(*γ*) A state of things in spite of which something happened.

καίπερ ὀλιγῶν ὄντων τῶν ἐν τῇ πόλει ἀπέβησαν οἱ Πέρσαι, although those in the city were few, the Persians went away.

(*δ*) *Cause.*

ὕοντος πολὺ οὐκ ἐβούλοντο περιμένειν, as it was raining heavily they did not wish to wait.

Note.—The genitive absolute, with a few exceptions, is used only when the subject of the participle is distinct from the subject of the sentence.

II. *Separation.*

1. After verbs meaning *to free from, keep off from, depart from*, &c., with or without prepositions.

οὐ μακρὸν ἀπέχει τῆς πόλεως, it is not far from the city.
ἐλευθέρου με τῶν φόβων, free me from my fears.

2. After adjectives compounded with α= without.

ἀτρύμων εἰμὶ τῶν ἐμῶν κακῶν, I am not worn out by my misfortunes.

3. After prepositions bearing a privative or separative meaning.

e.g. ἄνευ, ἀπό, ἐξ, &c.

4. After verbs indicating perception by the senses.

N.B.—In this case the genitive shows origin.

οὐκ ᾔσθετο τῶν νεφελῶν, he did not notice the clouds.

5. *Genitive of the Agent* with *ὑπό*.

ἐκολάσθη ὑπὸ τοῦ διδασκάλου, he was chastised by the teacher.

6. *Genitive of the Cause of Feeling.*

οἰκτείρω σε τῶν πάθων, I pity you for your misfortunes.

7. *Genitive of Origin.*

τοῦτο σοῦ ἔτυχον, I obtained this from you.

8. *Genitive of Comparison.*

τὸ ὅλον μεῖζόν ἐστι τοῦ ἡμίσεως, the whole is greater than the half.

N.B.—But note that when *ἤ* (="than") is used, the case of the thing with which comparison is made, as in English, is that required by ordinary rules of grammar.

e.g. φημὶ τὸν Κλέωνα σοφώτερον εἶναι ἢ ἐγώ, I say Cleon is wiser than I.

9. After words implying *fulness* or the reverse.

ὁ νέως πλήρης ἐστιν ἱερῶν, the shrine is full of priests.

ὀλίγου δέω, I want little.

Translate, giving every possible meaning of:

(1) *τὸ τῆς ἀρετῆς κάλλος*. (2) *ἀγαθῆς γυναῖκες πόθος*. (3) *ἡ εἰκὼν χρυσοῦ ἐστίν*. (4) *πίνετε μερός τι τοῦ οἴνου*. (5) *ἥδε ἡ κόρη θαυμασίου ἐστι κάλλους*. (6) *πολλῶν πόλεων ἡγεμονεύομεν*. (7) *ζῶντος τοῦ Λευκίππου οὐ δυνάμεθα νικᾶσθαι*. (8) *ἐδίωξε τὸν Σωκράτην ἀσεβείας*. (9) *ἅμα τελευτῶντος τοῦ θέρους ἔλαβον τὴν πόλιν*. (10) *τοῦ δ' αὐτοῦ χειμῶνος πρέσβεις ἔπεμψεν ἐς τὴν Σικελίαν*. (11) *οἱ δὲ Λακεδαιμόνιοι, γιγενημένου τοῦ ἐπὶ τῇ νήσῳ πάθους ἀνελπίστου, ἧττον ἐθάρσουν τῶν Ἀθηναίων*. (12) *ἡ νῆσος ἐτειχίσθη ὑπὸ τῶν ὁπλιτῶν*. (13) *φοβοῦμαι αὐτὸν πλέον σοῦ*. (14) *φοβοῦμαι αὐτὸν πλέον ἢ σύ*. (15) *φοβοῦμαι αὐτὸν πλέον ἢ ὑμᾶς*. (16) *χωρίζουσι τοὺς δούλους τῶν ἐλευθέρων*.

The Dative.—The dative case conveys three main meanings:

I. The person interested.
II. The instrument by means of which.
III. The place or time at or in which.

I. (1) *Indirect Object*—*i.e.* the person or thing to whom anything is told or given. This dative is used after many intransitive verbs signifying *pleasing, helping, sparing, giving, appearing, speaking*, &c.

ταῦτα μοι ἀρέσκει, this pleases me.
συγγιγνώσκω ὑμῖν, I agree with you.
λέγε μοι τοῦτο, tell me this.
νόμους ἔθετο ὁ Σόλων τοῖς Ἀθηναίοις, Solon gave laws to the Athenians.

Verbs of this class are used in the passive impersonally.

φαίνεταί μοι, it appears to me.

The use of the dative after words implying *likeness*, &c., is akin to the idea of the direct object.

αὕτη ἡ γυνὴ εἰκάζεται τῇ Ἀφροδίτῃ, this woman looks like Aphrodite.

(2) *Dative of Interest.*

πράττωμεν τοῦτο τῷ Σωκράτει, let us do this for Socrates.

Akin to this is the use familiarly known as the *Ethic Dative*, which is used in the case of personal pronouns to suggest *concern* or *interest* on the part of the person denoted.

τί μοι ποιήσεις; pray what will you do?

II. (1) *Dative of the Means, Cause, or Instrument.*

δεινῇ τινι νόσῳ διώλοντο, they perished from some dread disease.
τραυματισθεὶς τῷ τοῦ βαρβάρου ξίφει, wounded by the barbarian's sword.

(2) *Dative of Attendant Circumstances.*

σιγῇ ἀπέπλευσαν, they sailed away in silence.

(3) *Dative of the Agent* after the perfect passive and verbal adjectives.

οὐ καταφρονητέος ἐστιν ἡμῖν, we must not despise him.
φιλητέα ἐστί σοι ἡ μήτηρ, your mother should be loved by you.
οἱ Ἀθήναιοι νενίκηνται τῷ Γυλίππῳ, the Athenians have been defeated by Gylippus.

(4) *Dative of Accompaniment*, used in the following idiom:

ἔλαβον τὴν ναῦν αὐτοῖς ἀνδράσιν, they took the ship, crew and all.

III. (1) *Place at which.*

ἦν ποτ' ἀνὴρ Θήβαις, there was once a man at Thebes.

This use of the dative without a preposition is confined mainly to poetry.

The apparent datives in *-ι*, *e.g. Μαραθῶνι, οἴκοι, κ.τ.λ.*, are really survivals of the extinct locative.

(2) *Point of time.*

τῇ τρίτῃ ἡμέρᾳ ἐναυμάχησαν, on the third day they fought a naval battle.

Translate, giving every possible meaning of:

(1) ἔπειτα οἱ Πελοποννήσιοι ἐβούλοντο ἀμύνειν τοῖς Αἰγινήταις. (2) ἄμεινόν ἐστί σοι τοῦτο τειν. (3) τίς ἡμῖν ἐστιν οὗτος; (4) αὕτη ἡ ῥόδῳ ἐστὶν ὁμοία. (5) οἱ δ' Ἀθήναιοι τῷ ὕματι προσβάλοντες τοὺς ἐν τῇ πόλει ἠνάγκασαν ὁμολογίᾳ τὴν ἀκρόπολιν παραδοῦναι. (6) ἔδοξε τοῖς Λακεδαιμονίοις μείζονι στόλῳ τοῖς Δωριεῦσι τιμωρεῖν. (7) ποῦ κεῖνται οἱ Μαραθῶνι μεμαχημένοι; (8) τῇ αὐτῇ νυκτὶ ἀπέπλευσαν. (9) ἐν μέσῃ τῇ νυκτὶ ἀπέθανεν. (10) πλήθει βιαζόμενοι ἡσύχαζον. (11) οἱ γὰρ Ὀζόλαι ὅμοροί εἰσι τοῖς Ἀθηναίοις. (12) τῇ δ' ὑστεραίᾳ Τείχιον αἱρεῖ. (13) ὁ γὰρ ἡγεμὼν αὐτοῖς ἐτεθνήκη. (14) ηὗρε τὸν Ἀρχιμήδην ἐν τῷ οἴκῳ. (15) πεφοβημένοι τῇ μεγάλῃ τῶν πολεμίων ἰσχύι σιγῇ ἀνεχώρησαν. (16) δὸς δύο ὀβόλους τῷ Χάρωνι. (17) πειρατέον ἐστιν ἡμῖν παραπλεῖν τὴν Χάρυβδιν.

Syntax of the Verb. *Tenses: Present.*—The Present Tense in the *Indicative* represents three grades of meaning:

1. What happens at the present time (momentary action).

   ὁρῶ αὐτήν, I see her.

2. What is continuing to happen at the present time (continued action).

   εἰμὶ πόλλακις μετὰ τοῦ Σωκράτους, I am often with Socrates.

3. What is true at all times.

   οἱ θεοὶ φιλοῦσι τοὺς σοφούς, the gods love the wise.

In moods other than the indicative all idea of time disappears and the present simply indicates continued action.

Note.—An important exception to this is in the case of indirect speech.

The present has also a specialised use with adverbs or phrases indicating duration of time, by which it denotes something that began in the past and is still going on.

πέντε ἔτη πειρῶμαι πράττειν ταῦτα, for five years I have been (and still am) trying to do this.

The present tense is also used to indicate an attempted action.

πείθει με, he tries to persuade me.

Future Tense.—The future expresses:

1. What will take place (momentary).
2. What will be in the course of taking place (continued), at a time later than the present.

   πλανήσομαι, I shall wander, *or* I shall be wandering.

Note.—The subjunctive and imperative have no future. The future of the optative is only used in indirect speech to represent the future indicative of the direct.

The future infinitive (less often the present) is used after μέλλω to express either

1. Intention, or
2. Immediate futurity.

e.g. μέλλω ἀπίεναι, I am about to go away; I intend to go away.

Imperfect Tense.—The primary use of the imperfect is to denote what was happening at a moment in the past.

ἐνδιέτριβον αὐτόθι, they were wasting time there.

Akin to this sense is the meaning of doing a thing repeatedly in the past.

ἐγέλων τὸν Σωκράτην, they used to laugh at Socrates.

The imperfect is also used, like the present, with phrases denoting duration of time to indicate something that was happening at a given moment and had then been happening for some time.

πάλαι ταῦτα αὐτοῖς ἔλεγεν, he had been telling them this for a long time.

The imperfect tense is also used like the present to denote an attempt to do something.

ταῦτα πόλλακις ἐπράσσετο, this was attempted often.

Aorist Tense.—In the indicative the aorist expresses a momentary action in the past.

εἶδον τὴν βασίλισσαν, I saw the queen.

In the other moods, save in indirect speech, it denotes merely a single momentary act and carries no meaning of past time.

In the participle the aorist generally expresses time that is past in relation to the verb on which it depends.

e.g. ἰδών σε ἄπεισιν, having seen you, he will go.

ἰδὼν αὐτὸν ἄπιθι, when you see him, go.

The so-called *Gnomic* aorist (because used in γνῶμαι, proverbs) is used in the indicative to denote a statement of what generally happens.

πολλὰ παρὰ γνώμην ἔπεσεν, many things happen contrary to one's wishes.

The aorist (generally in the case of verbs which denote a condition) often expresses the beginning of the state of things of which the present denotes the continuance.

νοσῶ, I am ill; ἐνόσησα, I got ill.
γελῶ, I laugh; ἐγέλασα, I burst out laughing.

Perfect Tense.—The perfect represents an action as begun in the past and complete at the time of speaking.

Some perfect forms are by transference of ideas present in meaning. Among such are:

κέκτημαι, I possess (I have gained).
οἶδα, I know (I have seen).

Pluperfect.—This tense indicates that an act was, at a time in the past, completed.

ἤδη ἐλελύκεσαν τοὺς κύνας, already (at that time) they had loosed the dogs.

Future Perfect.—This tense denotes an act or state of things that will be complete at a future time.

e.g. ἤδη γεγράψεται ἡ τοῦ κρίτου γνώμη, the judge's decision will already have been written.

Translate, giving every possible meaning of :

(1) ὅταν ἄπηλθον ἀπεπεπόμφει τὸν ἄγγελον. (2) ἐπειδὴ ἐτελεύτησε ὁ Δαρεῖος, ὁ 'Αρταξέρξης κατέστη. (3) ὅταν εἶδον τὸν σὸν πατέρα, ἔμελλεν ἀπιέναι εἰς τὴν οἰκίαν. (4) ὥς γ' ἐμοὶ δοκεῖ, γίγνομαι θεός. (5) ἐν τῇ παιδίᾳ ἐφίλουν σφόδρα τὴν τίτθην. (6) δίδωμί σοι τοῦτον τὸν βίβλιον. (7) ἔδωκά σοι τοῦτο. (8) δέδωκά σοι τοῦτο. (8) πρίν σε προσελθεῖν, ἐπεφεύγεσαν. (9) ἔφυγον πρὶν ἡμᾶς ἀφικέσθαι. (10) ἥκω νέκρων κεύθμωνα λιπών.

The Use of the Moods in Simple Sentences :

Note.—In view of the interplay of the moods in the various types of simple sentence it has been thought better to deal with each type separately, showing how the different moods are used in each, it being felt that the use of the moods will thus more readily become a matter of instinct than if all the uses, say of the indicative, were exhausted before going on to deal with the subjunctive or optative.

Questions.—Questions that call for a direct answer are put in the *Indicative.* They are introduced by the following particles :

ἆρα when the answer is in doubt.
ἆρ' οὐ when the answer " Yes " is expected.
ἆρα μή / μῶν } when the answer " No " is expected.

N.B.—(1) μῶν is stronger than ἆρα μή. (2) ἆρα is often omitted.

e.g. ἆρα βέβληκα δὶς ἐφεξῆς ; have I thrown twice running ?

ὁ ναύτης ἆρα μὴ σωτηρίας ηὗρε μηχανήν ; did not the sailor find a means of safety ?

ἆρ' οὐκ ἄμεινον ἢ συ τὰν Θήβαις φρονῶ ; am I not wiser than thou in the affairs of Thebes ?

Double Questions—*e.g.* " Is he here or at Athens ? "—are expressed by πότερον or πότερα in the first part and ἤ in the second.

πότερον δέδρακεν ἢ οὔ, καὶ πότερον ἄκων ἢ ἑκών ; has he done it or not, and (if he has) was he unwilling or willing ?

Deliberative Questions—*i.e.* those which express doubt in the mind of the speaker as to what course to pursue—are put in the subjunctive. If negative, μή, not οὐ, is used.

τί φῶ ; what am I to say ?
τί μὴ λέγωμεν ; what are we not to say ?

Commands and Prohibitions.—Commands and prohibitions in the first person—*e.g.* " Let us do so-and-so "—are rendered by the subjunctive.

μὴ τοῦτο ποιῶμεν, let us not do this.
φέρε δὴ τὰς μαρτυρίας σοι ἀναγνῶ, come, let me read you the depositions.

Commands in the second and third persons are put in the imperative mood.

ἴθι δὴ κάλεσον τὸν προστάτην Κλέωνά μοι, quick, run and call my patron Cleon here.
παρίστασθον παρὰ τὼ πλάστιγγε, each of you stand beside his scale.
αὐτὸς ὁράτω, let him see for himself.

Second and third person prohibitions that are *general* are expressed by the imperative.

ἡ κλέπτε, do not steal.

Those that are *special*—*i.e.* that refer to a particular act that is forbidden—are expressed by the aorist subjunctive.

μὴ κλέψῃς τοῦτον τὸν ἵππον, do not steal this horse.

Wishes.—Wishes are of two sorts :

1. Those that are capable of fulfilment.
2. Those that are not.

1. *Wishes capable of Fulfilment.*—Obviously, the only kind of wish that can be fulfilled is one that refers to the future. In Greek a future wish can be expressed as follows :

i. By εἴθε or εἰ with the optative.
ii. By the optative alone.

εἴ μοι γένοιτο φθόγγος, may I find speech.
ὦ παῖ, γένοιο πατρὸς εὐτυχέστερος, my lad, mayst thou be more happy than thy father.
εἰ γὰρ 'Αθήνη κάρτος ἐμοὶ δοίη, would that Athene would give me strength.

2. *Wishes that cannot be Fulfilled.*—The only wishes that from their nature are incapable of fulfilment are those that relate to the past or to the present, which nothing can alter. Such wishes are expressed in Greek :

i. By εἴθε or εἰ with the indicative.
εἴθε μὴ ἐγένετο, would that it had not happened.
εἰ γὰρ ἦν ἐν ταῖς 'Αθήναις, would I were in Athens.

ii. By ὤφελον = I ought (aorist of ὀφείλω = to owe) with the infinitive.

ὤφελον εἶναι ἀμείνονος ἀνδρὸς ἄκοιτις, would I were (*lit.* I ought to be) the wife of a better man.

μηδ' ὤφελεν ὁ ξένος ἀπολέσθαι, and would that the stranger had not perished.

Note.—In all wishes the negative is μή, not οὐ.

The Infinitive.—The infinitive is generally called a verbal noun because it has some of the properties both of a verb and of a noun.

In the following respects it is a noun:

1. It can govern or be governed by a verb.
2. By means of the article it can be put into any case.

In the following respects it is a verb:

1. It can govern or be governed by a noun as object or subject.
2. It can be modified by adverbs.
3. It can be put into any voice or tense.

φιλῶ τὸ πίνειν, I love drinking.

ἡ τοῦ πίνειν ἡδόνη, the pleasure of drinking.

τὸ βελτίων γενέσθαι ἄριστον ἐστίν, to improve is best.

τὸ τὴν ἀρετὴν διώκειν ἄγει εἰς τὸ εὖ ζῆν, to pursue virtue leads to living well.

Note.—(1) Note that all words which depend on or qualify the infinitive go between it and the article. (2) The infinitive with the article is abstract in its meaning.

βούλομαι ἀπελθεῖν, I wish to depart.

οὐ θανεῖν θέλω, I do not desire to die.

Some verbs of *saying*, &c., take as their object an infinitive governed by a noun or pronoun. The noun or pronoun is in the accusative case, except when it refers to the subject of the main verb, in which case it is attracted to the nominative, or omitted, as in the second and third of the following examples:

φησὶν αὐτὴν καλλίστην εἶναι, he says she is very lovely.

οὐκ ἔφη ἥδεσθαι, he said he was not glad.

ἔφη αὐτὸς μέλλειν ἀποπλεύσειν, he said he himself intended to sail away.

Note.—The subject of the infinitive may be attracted to any case in which is put the noun to which it refers.

ἔδοξέ μοι γενέσθαι πένητι, I decided (it seemed good to me) to be poor.

The infinitive is used without the article after some verbs as a kind of object—that is to say, as expressing the end to which the action of the verb is directed. The *present* or *aorist* tense is generally used.

e.g. βούλομαι ὡς τάχιστα ἀποθανεῖν, I wish to die as quickly as possible.

κινδυνεύει δουλεύεσθαι, he runs the risk of being made a slave.

ἀξιωθήσεται θανεῖν, he will be judged worthy to die.

Note that after verbs implying *to promise, intend,* or *hope,* or similar meanings, when a future object is referred to, the *future* infinitive is used.

ἤλπιζον μάχην ἔσεσθαι, they expected there would be a battle.

ἠγγυᾶτο μηδὲν αὐτοὺς κακὸν πείσεσθαι, he promised that they should suffer no harm.

μέλλει τὸ Ῥήγιον χειρώσεσθαι, he intends to subdue Rhegium.

Explanatory Infinitive.—The infinitive is used without the article to modify the meaning of many adjectives and nouns.

ὥρα ἀπιέναι, it is time to depart.

δεινός ἐστι λέγειν, he is skilled in speaking.

οὐκ ἄξιός ἐστιν ἀποθνήσκειν, he does not deserve to be killed.

The infinitive is also used with adjectives and verbs to restrict their application to a certain specific action.

e.g. οἰκία ἡδεῖα ἐνδιαιτᾶσθαι, a house pleasant to live in.

λόγος ῥᾴδιος κατανοῆσαι, a speech easy to understand.

θαῦμα ἰδέσθαι, a wondrous thing to see.

θείειν ἀνέμοισιν ὁμοῖος, like the winds in speed (*lit.* in running).

Infinitive expressing Purpose.—The infinitive alone is used, *always in the active voice,* to express purpose.

e.g. παρέδωκαν τὴν πόλιν αὐτοῖς φυλάττειν, they gave up the city to them to guard.

οὐκ εἶχον ἀργύριον ἐπισιτίζεσθαι, they had no money to buy food.

It is also used with similar force after verbs implying *to hinder*, and the like.

εἴργει με τὰ ἄριστα διώκειν, he prevents me from pursuing what is best.

Occasionally the infinitive is used to express purpose after ἐφ' ᾧ or ἐφ' ᾧτε, which then mean "for the purpose of."

e.g. ᾑρέθησαν ἐφ' ᾧτε βοηθεῖν ὑμῖν, they were chosen for the purpose of helping you.

But the more common use of ἐφ' ᾧ and ἐφ' ᾧτε is in the meaning "on condition of."

e.g. ἄφεισαν τὸν Σωκράτην ἐφ' ᾧ μηκέτι φιλοσοφεῖν, they let Socrates go on condition of his no longer being a philosopher.

Infinitive expressing a Result.—The infinitive is used after ὥστε and sometimes after ὡς to express the natural result of an action.

e.g. οὐχ οὕτως ἀγαθός ἐστιν ὥστε μηδέποτε ἁμαρτάνειν, he is not so good as never to err.

This use is specially idiomatic after comparatives with ἤ = than.

e.g. σοφώτερός ἐστιν ἢ ὥστε τοῦτο ποιεῖν, he is too wise to do this.
Less often ὥστε is omitted.
κακὸν μεῖζον ἢ φέρειν, an evil too great to bear.

Parenthetical Infinitive.—The infinitive is used, generally with ὡς or ὅσον, as a parenthesis, qualifying the whole sentence.

e.g. οἱ ἄνθρωποι, ὡς ἔπος εἰπεῖν, δουλεύουσι τῇ τυχῇ, mankind, so to speak, are slaves of chance.
τοῦτο, ἐμοί γε δοκεῖν, οὐ δύναται ἀληθὲς εἶναι, this cannot be true, as it seems to me.

Infinitive after πρίν.—πρίν, meaning *before*, and referring purely to time, takes the infinitive in Attic Greek *when it depends on an affirmative clause.*

ἀποπέμπωμεν αὐτὸν πρὶν ἀκοῦσαι, let us send him away before we have heard him.
πρὶν ἔκπυστος γενέσθαι, προσῆλθεν, he came up before he was discovered.

Note.—In constructions with the infinitive *the negative is always μή.*

The infinitive is regularly used after the 3rd person singular of some verbs used impersonally. The commonest such verbs are:

πρέπει, προσήκει = it is fitting.
δοκεῖ = it seems good.
δεῖ, χρή = it is required.
συμβαίνει = it happens.
ἔνεστι = it is possible.
ἔξεστι = it is allowed.

e.g. δεῖ ἡμᾶς ἐλθεῖν, we ought to go.
δοκεῖ αὐτοῖς ἐλθεῖν, it seems good to them to go.
ἔξεστιν ἡμῖν ἐλθεῖν, we are allowed to go.
πρέπει σε λέγειν, it is fitting that you should speak.

Translate: (1) ἆρ' εὐτυχεῖς ἢ δυστυχεῖς; (2) ἆρ' οὐ χρὴ τοιοῖσδε χρησμοῖς πεποιθέναι; (3) ἆρα μὴ ἀπόντος αὐτοῦ κατηγόρησας; (4) πότερον ὑπισχνεῖ μοι νῦν βοηθήσειν ἢ οὔ; (5) πότερον μένωμεν ἢ φεύγωμεν, οὐδεμίας ἔτι ἐλπίδος οὔσης; (6) ἐπιχειρείτω τὸ ἔργον. (7) μαχώμεθα τῆς πόλεως ἕνεκα τῆς νῦν κινδυνευούσης ἀπολέσθαι. (8) μὴ κατηγόρει τοῦ Σωκράτους. (9) μήποτε ἀναιτίου κατηγορήσῃς. (9) ἐμοῦ γε ζῶντος ταῦτα μηδέποτε τύγχανοι. (10) πῶς ἂν γενοίμην ἀνὴρ ἀγαθός. (11) εἴθε μὴ οἱ Συρακόσιοι νικῷεν ἐν τῇ ναυμαχίᾳ. (12) εἴθ' ὤφελ' Ἀργοῦς μὴ διαπτάσθαι σκάφος. (13) ὤφελες ἀξίως πρᾶξαι. (14) εἰ τὸ φιλοσοφεῖν ἐφίλεις. (15) πολλοὶ γὰρ ἐνόμιζον αὐτὸν ἀσκεῖν τὴν ἀρετήν. (16) τί γὰρ τιμῶσιν οἱ ἄνθρωποι πλέον ἢ τὸ τῶν ἐχθρῶν φείδεσθαι; (17) ῥᾳδίως κατεγνώσθη διὰ τὸ μὴ δύνασθαι ψευδῆ λέγειν. (18) δεῖ αὐτοὺς ἀποθανεῖν. (19) ἐδέοντο αὐτῆς ἀγγέλλειν ταῦτα τῷ βασιλεῖ. (20) ἔφη Ὀλυμπίοις ἀποπλεύσεσθαι. (21) πᾶσι τοῖς βροτοῖς ἔξεστιν εὐδαίμοσιν εἶναι. (22) οὐκ ἔφη τὸν Κῦρον μέλλειν πολεμήσεσθαι. (23) βούλομαι αἱρεῖν τὰς ναῦς αὐτοῖς ἀνδράσιν. (24) πάρειχον ἐμαυτὸν τοῖς πολεμίοις ἀποκτεῖναι. (25) ὁ Ἀλκιβιάδης ἠγγέλθη νικῆσαι. (26) δεινὸς ἦ ὁ Ἀλκιβιάδης ἐξαπατᾶν τοὺς Ἀθηναίους.

Participles.—Besides its use as a simple adjective, the participle is used in the following ways:

1. With the article very frequently where in English we should use a relative clause.

ὁ στρατηγὸς ὁ τὴν Ἑλλάδα σεσωκώς, the general who has saved Greece.
οἱ τὴν ἀρετὴν ἀσκοῦντες εὐδαίμονές εἰσιν, those who practise virtue are happy.

N.B.—In negative clauses of this type οὐ is used if the clause is definite, μή if it is indefinite.

e.g. οἱ οὐ φιλοῦντες τὴν εἰρήνην, those (particular individuals) who do not love peace.

οἱ μὴ φιλοῦντες τὴν εἰρήνην, those (whoever they are) who do not, &c.

2. After the following classes of verbs:

(*a*) Verbs of perceiving, mentally and by means of the senses, and verbs which express emotion.
αἰσθάνομαι γελοῖος ὤν, I perceive that I am ridiculous.
αἰσχύνομαι τοῦτο ποιῶν, I am ashamed at doing this.
ἤκουσεν αὐτὴν ἐν πόλει ὄντα, he heard that she was in the city.

(*b*) Verbs implying *showing, declaring*, &c.
φανερός εἰμι ἀδικήσας, I clearly did wrong.
ἐδήλωσεν αὐτοὺς σοφίστας ὄντας, he showed that they were sophists.

(c) Verbs implying *beginning, continuing*, or *ending*.
δεῖ παύειν αὐτὸν γελῶντα, we must stop his laughing.
ἄρχεται διδάσκων τὸ φιλοσοφεῖν, he is beginning to teach philosophy.
διετέλουν καθεύδοντες, they continued to sleep.

(*d*) In a special idiom after *λανθάνω* = I escape notice; *τυγχάνω* = I chance; *φθάνω* = I come first.

e.g. *ἔφθασαν ἀφικόμενοι*, they arrived first.

φθάνω εὐεργετῶν, I am the first to do a kindness.

αἱ ναῦς λανθάνουσι τοὺς πολεμίους ἀφορμηθεῖσαι, the ships put to sea unobserved by the enemy.

ἔτυχον πότε εὐδαίμων ὤν, I happened then to be prosperous.

Note.—Note that in the case of *λανθάνω*, occasionally the idiom is reversed, the verb of action being finite and *λανθάνω* going into the participle. Thus, "He went away secretly" can be *ἔλαθεν ἀποβάς* or *ἀπέβη λαθών*.

3. The most regular use of the participle, however, is adverbial—that is to say, it qualifies the meaning of a verb. When thus used the participle agrees with a noun or pronoun expressed or understood, but stands without the article. Used in this way it can express:

i. *Time*—

ἀπήντησα Φιλίππῳ ἀπιόντι, I met Philip as he was leaving.

δειπνήσαντες ἀπελαύνετε, when you have had supper, ride off.

ii. *Means* by which a thing is done—

λῃζόμενοι ζῶσιν, they live by plunder.

iii. *Attendant circumstances*—

ναῦς δώδεκα λαβόντες ἀπέπλεον, they took twelve ships and sailed away.

ἔρχεται τὸν υἱὸν ἔχουσα, she comes with her son.

iv. *Purpose* (generally expressed by the future participle).

παρελήλυθα συμβουλεύσων, I have risen to give my advice.

ἦλθε τὴν εἰρήνην ἀγγελῶν, he came to announce the peace.

v. *The Cause* of an action.

ἀπείχετο τοῦ πίνειν, αἰσχρὸν νομίζων εἶναι, he avoided drinking because he believed it to be base.

τί παθὼν τοῦτο ποιεῖ; what has happened to him that he does this?

vi. *A Condition.*

ποίησας ταῦτα κατακριθήσει ἀποθνήσκειν, if you do this you will be condemned to death.

vii. *Concession*—*i.e.* to express the idea of "although."

ὀλίγα ἔχων πολλὰ ἀπεδιδου, though possessed of little he used to give away much.

This idiom is especially frequent with *καίπερ* = although, or *καί*.

πείθου γυναιξί, καίπερ οὐ στέργων, give way to women though you love them not.

The use of the participle in the *Genitive Absolute* construction and of the neuter of the participle of impersonal verbs in the *Accusative Absolute* construction has already been dealt with under the heads of Accusative and Genitive respectively.

Verbals in -τέος.—The verbal adjective in *-τέος* implies *necessity*. It is used in two ways:

1. Adjectivally.
2. Impersonally.

1. *Adjectival.*—In this construction the verbal is merely an adjective agreeing with a noun and is used only with transitive verbs. It takes the dative of the agent.

οὗτος ὁ ἀνὴρ τιμητέος ἐστιν ἡμῖν, this man must be honoured by us.

2. *Impersonal.*—In this construction the verbal is in the nominative neuter (generally singular), and is followed by the verb "to be" either expressed or understood. In sense it is equivalent to *δεῖ* with the infinitive. It takes the dative or accusative (the latter not frequently) of the agent.

e.g. *πειστέον σοι τάδε*, you must obey in this.

τί ἂν αὐτῷ ποιητέον εἴη; what would he be obliged to do?

ἐψηφίσαντο πολεμητέα εἶναι, they voted that they must go to war.

Translate: (1) *βουλόμενος τὰ δίκαια πράττειν ἤχθη ὑπὸ τῶν ἑταίρων εἰς τὸν ὄλεθρον.* (2) *οἱ τοιαῦτα λέγοντες ἐπιλανθάνονται τῶν ὄντων.* (3) *οὐκ ἀεὶ οἰκτείρονται οἱ δυστυχοῦντες.* (4) *ὁ τοῦ Περίκλους ἀσεβείας κατηγορήσας πάρηλθεν ἀγγελῶν τὸν ἄρχοντα καίπερ ἀχθόμενον μέλλειν τὸ δέον ποιήσειν.* (5) *μετεμέλοντο οὐ βοηθήσαντές σοι κινδυνεύοντι.* (6) *διατελεῖ τοὺς ἄρχοντας μάτην προσερχόμενος.* (7) *ἐλάνθανε δεινότατα νοσῶν.* (8) *ἔτυχεν ὁ Ἀλκιβιάδης τότε φεύγων.* (9) *ἑλὼν τὴν Ὄλυνθον παρέδωκεν.* (10) *εὖ γ' ἐποίησας ἀναμνήσας με.* (11) *δὸς τῷ ξένῳ ταῦτα φέρων.* (12) *ἦλθε τὴν θυγατέρα λυσόμενος.* (13) *τί γὰρ δεδιότες σφόδρα οὕτως ἐπείγεσθε;* (14) *προείλετο μᾶλλον τοῖς νόμοις ἐμμένων ἀποθανεῖν ἢ παρανομῶν ζῆν.* (15) *τοὺς Ἕλληνας ἐδίδαξεν ὃν τρόπον διοικοῦντες τὰς αὐτῶν πατρίδας μεγάλην ἂν τὴν Ἑλλάδα ποιήσειαν.* (16) *τυραννεύσας δ' ἔτη τρία ἐχώρει ἐς Σίγειον.* (17) *φημὶ δὴ διχῇ βοηθητέον εἶναι τοῖς πράγμασιν ὑμῖν.* (18) *φράζουσιν ὡς οὐ σφι στεριοπτέη ἐστὶν ἡ Ἑλλὰς ἀπολλυμένη.* (19) *οὐ παραδοτέα ἐστι τοὺς συμμάχους.*

Compound Sentences.—So far only simple sentences have been dealt with—that is to say, sentences in which each verb stands independent of the others and expresses a separate thought. The stage has now come at which compound sentences must be considered. A compound sentence consists of a simple sentence with one or several clauses

depending on it—that is to say, they represent a thought that exists only in some relation to the main sentence.

The commonest forms of compound sentence are treated below, grouped according to general type.

Result.—There are several ways in Greek of expressing the result of an action. Of these the most general is by means of the conjunction *ὥστε*=so that. *ὥστε* is used in two constructions:

(i.) With the *infinitive*, the negative used being *μή*.

e.g. *ἐκάετο ἡ νόσος ὥστε μὴ ἀλλό τι ἢ γύμνοι ἀνέχεσθαι*, the disease burned so that they could not endure aught but to be naked.

οὐ τηλίκος ἐστιν ὥστε δεσπότῃ πάντα πιθέσθαι, he is not of such age as to obey his master in all things.

(ii.) With the *indicative*, the negative being *οὐ*.

βέβηκεν, ὥστε πᾶν ἐν ἡσύχῳ ἔξεστι φωνεῖν, he has gone, so that thou mayst say all undisturbed.

οὕτω φρενοβλαβεῖς ἦσαν ὥστ' οὐκ ἐβούλοντο σωθῆναι, they were so crazy that they did not wish to be saved.

The precise shade of difference between the two constructions is that the infinitive emphasizes the fact of the result, while the indicative emphasizes the result as a fact.

Thus in the second example under (ii.), had the sentence read *ὥστε μὴ βούλεσθαι*, the translation would have been, "They were so crazy as not to wish," &c.

Result can also be expressed by the relative pronoun with the indicative.

e.g. *τίς οὕτως ἀγνώμων ἐστιν ὅστις ἐλπίζει ἀθάνατος γενήσεσθαι;* who is so senseless as to hope to become immortal?

Cause.—Dependent sentences expressing the cause of the principal clause are introduced by one of the following conjunctions:

ὅτι, ὡς=because.
ἐπεί, ἐπειδή, ὅτε, ὁπότε=since.

The mood used is the indicative, and the negative is expressed by *οὐ*.

e.g. *γλαυκὴ δέ σ' ἔτικτε θάλαττα ὅτι σοι νοῦς ἐστιν*, the grey sea bare thee, since thou art so hard of heart.

λέγε μοι ταῦτα ἐπεί συ μόνος οἶσθα, tell me this, since you alone know it.

ἄπειμι ὅτε δὴ τοῦτο οὐκ ἔχω ποιεῖν, I will go away since I cannot do this.

The optative is sometimes used *when the main verb is in a past tense* to indicate that the cause is not so much one believed in by the speaker as one suggested to him by someone else.

e.g. *ἐχθρὸς ἐγένετο τῷ Περικλεῖ ὅτι οὐ σέβοι τοὺς θέους*, he became an enemy of Pericles because (as he said) he did not reverence the gods.

This shows the feeling of the person spoken of and not the speaker's own opinion.

The relative pronoun is also sometimes used to introduce a causal sentence.

e.g. *οὐκ ἄξιον ποιεῖς ὅς οὐδὲν δίδως τοῖς πένησιν*, you act unworthily in that you give nothing to the poor.

Purpose.—The largest class of clauses expressing purpose is introduced by one of the following conjunctions:

ἵνα=in order that.
ὡς, ὅπως=so that.
μή=lest, in order that . . . not.

As regards mood, the dependent clause follows what is known as the sequence of moods, that is to say:

1. When the main verb is in a *Primary* tense, the dependent verb goes in the *Subjunctive*.
2. When the main verb is in a *Historic* tense, the dependent verb goes in the *Optative*.

Note.—When it is desired to indicate more vividly the actual thought that was in the mind of the subject of the main verb and prompted his action, the subjunctive can be used even after a historic tense.

The negative particle is *μή*.

ἄπιθι μὴ ἀποθάνῃς, depart lest thou die.
παρῆλθεν ἵνα μάθοι τι καινόν, he came in order to learn something fresh.
λίσσεται τὸν θέον ὅπως νημερτὲς εἴπῃ, he begs the god to speak sure truth.
διανοεῖται τὴν γέφυραν λῦσαι ὡς μὴ διαβῆτε, he proposes to break up the bridge so that you may not cross.

Occasionally, when it is desired to denote that the object sought was not achieved, a past tense of the indicative is used where the optative would be expected.

τί οὐκ ἔκτεινας αὐτὸν ἵνα μὴ προὐδώκε τὴν πατρίδα; why did you not kill him so that he might not have betrayed his country?

Purpose can also be expressed by the use of the future participle:

ἀγγέλους ἔπεμψεν εἰρήνην αἰτήσοντας, he sent envoys to ask for peace.

The use of the relative pronoun with the future indicative after a primary main verb is also equivalent to a purpose clause.

δοῦλον ὠνήσομαι ὅστις τοῦτο ποιήσει, I will buy a slave to do this.

Under the head of purpose clauses comes the use of *ὅπως* and the *Future Indicative* after verbs implying an *attempt* or *precaution*, or the like.

δεῖ ἡμᾶς σκοπεῖν ὅπως ταῦτα μὴ γενήσεται, we must see to it that this does not come about.

μηχανώμεθα ὅπως σώσομεν αὐτόν, let us plan to save him.

In phrases implying a caution the verb enjoining caution is generally omitted.

e.g. ὅπως δὲ τοῦτο μὴ διδάξεις αὐτήν, take care not to teach her this.

Here also is to be noted the idiom by which *μή* in affirmative statements and *μή οὐ* in negative statements are used after verbs expressing fear.

e.g. φοβοῦμαι μὴ ταῦτα μάθῃ, I fear he will learn this.

φοβοῦμαι μὴ ταῦτα οὐ μάθῃ, I fear he will not learn this.

ἐδείμαινε μὴ ταῦτα γένοιτο, he feared this would happen.

Note that the sequence of moods is normally regular. But when it is desired to intimate fear that something is in fact happening or has actually happened, the indicative may be used in the dependent clause.

e.g. δέδοικα μὴ νοσεῖ, I fear he is ill.

φοβοῦμαι μὴ ἡμαρτήκαμεν τῆς ὁδοῦ, I fear we have lost our way.

Translate: (1) *εἴκοσι ἔταξαν ναῦς ἐπὶ τῷ δεξιῷ κέρᾳ, ὅπως μὴ διαφύγοιεν οἱ Ἀθήναιοι.* (2) *οὐ γὰρ ἦν προσδοκία μὴ ἄν ποτε οἱ πολέμιοι ἐπιπλεύσειαν.* (3) *κρύσταλλος γὰρ ἐπεπήγει οὐ βέβαιος ἐν τῇ τάφρῳ ὥστ' ἐπελθεῖν.* (4) *ἡ νὺξ πολὺ τὸ ὕδωρ ἐπεποιήκει, ὃ μόλις ἐπεραιώθησαν.* (5) *ἔδεισαν μὴ ὅπερ ἐν Ναυπάκτῳ γένοιτο.* (6) *πολλοὶ τῶν πολιτῶν διεφθείροντο, ὅτι οὐ συνηγωνίζοντο.* (7) *δεδοίκασι μὴ λόγοις ἥττους ὦσι.* (8) *τοῦτο δὴ ἐγένετο ὥστε ἀποπλῆσαι τὸν χρησμόν.* (9) *ψυχρότερόν ἐστι τὸ ὕδωρ ἢ ὥστε λούσασθαι.* (10) *ταῦτα τὰ ἀγαθὰ δοκεῖ ἡμῖν παντὸς ἄξια εἶναι, ὥστε πάντες τὸ καταλιπεῖν αὐτὰ φεύγομεν.* (11) *ὅπλα κτῶνται οἷς ἀμύνονται τοὺς ἀδικοῦντας.* (12) *δεῖ ἡμᾶς τιμᾶν τὸν Ἀπόλλωνα ὅποτε θέος ἐστιν.* (13) *πρῶτον μὲν τὰ πλοῖα ἐμπρησαν, ὅπως ἀπόγνοια ᾖ τοῦ κρατεῖν τῆς γῆς.* (14) *ὁ δὲ Δημοσθένης δείσας μὴ κυκλωθῇ, λοχίζει ὁπλίτας ἐς τετρακοσίους ἐς ὁδόν τινα κοίλην.* (15) *πέμπει εὐθὺς τοῦ στρατοῦ μέρος τι τὰς ὁδοὺς προλοχιοῦντας καὶ τὰ κάρτερα προκαταληψομένους.* (16) *οὐ δεῖ σε, φοβούμενον μὴ οὐ γνῷς τὴν τῆς γῆς φύσιν, ἀπέχεσθαι γεωργίας.* (17) *οὐχ οὕτως ἀσθενής εἰμι ὥστε μὴ δύνασθαι πέντε σταδίους ἐν μιᾷ ἡμέρᾳ χωρεῖν.* (18) *δέδοικα μὴ νημερτῆ εἶπεν.*

Conditions.—A conditional sentence consists of two clauses, one containing the condition, and the other stating what follows as a result of the condition. The former is called the *Protasis;* the latter, which is the principal clause, is called the *Apodosis.* For example, in the sentence, "If you are well, I am happy," "If you are well" is the protasis, laying down the condition, while "I am happy" is the apodosis, which states as the principal fact what follows as a result of the condition being fulfilled.

There are four sorts of conditions:

1. *Particular Vivid,* where the protasis states a particular condition, and the apodosis follows naturally if the condition is fulfilled, without anything being said as to whether it is in fact fulfilled or not.

Type: "If so-and-so is the fact, then . . ."

A condition of this type may be past, present, or future in time.

(*a*) *Past* and *Present.*—In past or present vivid conditions the protasis is introduced by *εἰ* and the mood used in both protasis and apodosis is the indicative.

εἰ ὑγιαίνεις, ἐγὼ εὐδαιμονῶ, if you are well, I am happy.

εἰ μὴ ὑγιαίνεις, ἐγὼ οὐκ εὐδαιμονῶ, if you are not well, I am not happy.

εἰ τοῦτο ἐποίησας, καλῶς ἔπραξας, if you did this, you acted nobly.

εἰ ἡμῶν ἐπιλέλησται, νικήσομεν, if he has forgotten us we shall conquer.

(*b*) *Future.*—In future conditions of this type the protasis is introduced by *ἐάν* (*εἰ ἄν*) with the subjunctive, while the verb of the apodosis is in the future indicative.

φεύξεται, ἐὰν μὴ πείθηται τοῖς νόμοις, he will be prosecuted if he does not (in the future) obey the law.

ἐὰν ὁ Κῦρος ταῦτα πύθηται, χολώσεται, if Cyrus learns this, he will be angry.

2. *General Conditions.*—(*a*) *Present.*

Type: "If ever so-and-so happens, then . . ."

The protasis has *ἐάν* with the subjunctive, and the apodosis has the present indicative.

ἐὰν μὴ οἱ ἄνθρωποι εὐπράττωσι, κατηγοροῦσι τοὺς θέους, if men do not prosper, they accuse the gods.

ἐάν τις ἀσκῇ τὴν ἀρετήν, οὐ δύναται μῶρος καλεῖσθαι, if a man practises virtue, he cannot be called a fool.

(*b*) *Past.*

Type: "If ever so-and-so happened, then . . ."

The protasis has εἰ with the optative, and the apodosis has the imperfect indicative.

εἴ τις παραβαίη, ζημίαν αὐτῷ ἐπετίθεσαν, if anyone transgressed, they used to penalise him.

εἴ τι μὴ φέροιμεν, ὤτρυνεν φέρειν, if we did not bring him something, he used to urge us to do so.

3. *Vague Future Conditions.*

Type: "If so-and-so were to happen, then . . . would," &c.

The protasis has *εἰ* with the optative, and the apodosis has the optative with the particle *ἄν*.

εἰ ἔλθοι εἰς τὰς Ἀθήνας, τάχεως ἂν πείθοι τοὺς κριτάς, if he were to go to Athens he would soon persuade the judges.

εἰ δ' Ἀγησίλαος μὴ νικῴη ἐν τῇ μάχῃ, οἱ Λακεδαιμόνιοι οὐδὲν ἂν πειρῷντο πλὴν ἀναχωρεῖν, if Agesilaus were not to win the battle, the Lacedaemonians would attempt only to retreat.

4. *Unfulfilled Conditions.*—In conditions of this class the apodosis states what would happen if the condition of the protasis were fulfilled, though in fact it is not fulfilled.

Type: "If so-and-so were true (but it is not), then," &c.

The historic tenses of the *indicative* are used in both protasis and apodosis, and the particle *ἄν* is also used in the apodosis.

The tenses are used as follows:

The *Imperfect* can denote an action as
(*a*) going on now, or
(*b*) going on in the past.

The *Aorist* denotes an action as occurring in the past.

The *Pluperfect* denotes an action as being completed in the present or the past.

ταῦτα οὐκ ἂν ἐδύναντο ποιεῖν εἰ μὴ ἐμαίνοντο, they could not do this if they were not crazed.

εἰ ἦσαν ἄνδρες ἀγαθοὶ οὐκ ἄν ποτε ταῦτα ἔπασχον, if they had been good men, they would never have suffered these things.

εἰ παρήλθετε ἐδιώκομεν ἂν τοὺς Πέρσας, if you had come, we should now be pursuing the Persians.

Time.—In clauses expressing temporal relations no difficulty is presented if it be borne in mind that in essence many of them are of the nature of conditions and are constructed accordingly.

The rules for dependent time clauses can be epitomised as follows:

1. If a definite time is denoted, the indicative is used, the negative particle being *οὐ*.

ἐπεί, ὡς = "when," *ἐπειδή* = "after that," and *ἕως* = "while," "until," are most generally used to introduce definite temporal clauses.

e.g. ἕως ἐστὶ καιρός, ἀντιλάβεσθε τῶν πραγμάτων, while there is an opportunity, take the matter in hand.

ἐπεὶ ὑπηντίαζεν ἡ φάλαγξ καὶ ὁ σάλπιγξ ἐφθέγξατο, after the column began to advance and the bugle had sounded.

N.B.—Note the effect of the imperfect *ὑπηντίαζεν*.

2. When the time is indefinite it is expressed (*μή* being the negative particle):

(*a*) When it refers to the present or future, by adding *ἄν* to the conjunction and putting the verb in the subjunctive.

Note.—Note that *ὅτε, ὁπότε, ἐπειδή* coalesce with *ἄν* to form *ὅταν, ὁπόταν, ἐπειδάν*.

e.g. ταῦτα, ἐπειδὰν περὶ τοῦ γένους εἴπω, τότε ἐρῶ, I will speak of this when I (shall) have spoken of my birth.

ἐπειδὰν δὲ ἡ ἐκφορὰ ᾖ, λάρνακας φέρουσιν, when there is a funeral procession they carry coffins.

τίνα οἴεσθε αὐτὴν ψυχὴν ἕξειν, ὅταν ἐμὲ ἴδῃ; what do you think her feelings will be when she sees me?

(*b*) When it refers to the past, or when the main clause is apodosis of a vague condition in the optative, by the conjunction without *ἄν* with the optative.

ἤσθιεν ὁπότε πεινῴη, he used to eat whenever he was hungry.

εἰ νοσοίη, πάντες σιωπῷεν ἂν ἕως κάθευδοι, if he were to be ill, all would keep silent while he slept.

Note that: (1) After *ἐν ᾧ* or *ἕως* = "while," past or present time is treated as definite, future time as indefinite.

(2) After *ἕως* = "until" the same rule applies.

N.B.—*ἕως* = "until" is never used after a negative main clause.

(3) *πρίν* = "until" or "before," when it follows a negative main clause, is subject to the same rule.

(4) *πρίν* = "before," after an affirmative clause, is constructed with the infinitive, as illustrated above under the head of "Infinitive."

Relative Clauses.—Clauses introduced by a relative pronoun are for all practical purposes

conditional, and are constructed accordingly. The kinship between

ἃ μὴ ἐβούλετο δοῦναι, οὐκ ἂν ἔδωκεν, he would not have given what he had not wished to give,

and

εἴ τινα μὴ ἐβούλετο δοῦναι, οὐκ ἂν ἔδωκεν, if he had not wished to give anything he would not have given it,

is obvious at once; and similar relationship between relative and conditional clauses can be recognised in all cases with more or less ease. The following examples should be translated back into conditional form in order to attain familiarity with the conditional idiom:

οὓς δὲ μὴ εὕρισκον, κενοτάφιον αὐτοῖς ἐποίησαν, for those of them whom they did not find they raised a cenotaph.

νικῴη δ' ὅ τι πᾶσι μέλλει συνοίσειν, may anything prevail which will benefit all.

οὐκ ἂν οὕτως ἐπεχειροῦμεν πράττειν ἃ μὴ ἠπιστάμεθα, we should not thus be undertaking (as in fact we are) to do things that we did not understand.

δεῖ σε πάντα λέγειν, ἵνα ἃ ἂν ἐκείνῳ δοκῇ ταῦτα πράττηται, you must say all, so that whatever shall seem good to him may be done.

πῶς ἂν εἰδείης περὶ πράγματος οὗ ἄπειρος εἴης; how could you know about a thing of which you had no experience?

οὓς δ' ἴδοι σιωπῇ ἰόντας ἐπῄνει, all those whom he saw going in silence he used to praise.

Translate: (1) *εἰ ταῦτα οὕτως ἔχει, ἥδομαι.* (2) *εἰ ὁ παῖς ἀπόθανοι, ἄχθοιτο ἂν ἡ μήτηρ.* (3) *εἰ ἀπέκτειναν αὐτὸν πόνηροι εἰσίν.* (4) *ἐὰν ὁ σοῦ ἀδελφὸς ἀναγκάζῃ σε τοῦτο πράττειν, θαρσάλεως σοί πρακτέον ἔσται.* (5) *ἐπειδὰν τελέσῃς εἰπών, πάντες πρὸ σοῦ ἀναβοησόμεθα.* (6) *ὁπότε, ἀπαντήσειαν ἀλλήλοις, παίζονεν περὶ τούτων.* (7) *ὁπόταν ἴδῃς τὸν Περίκλεα ἀνάμνησον αὐτὸν τῶν πρὶν ὑποσχέσεων.* (8) *ἐπεὶ ἀπῆλθον οἱ Πέρσαι, ἠρξάμεθα ἐργαζόμενοι τοὺς ἀγρούς.* (9) *εἰ τοῦτο εἶπας, ἥμαρτες ἄν.* (10) *τάχεως ἂν σοὶ ἐδίδουν ὅ τι εἶχον.* (11) *οἱ γὰρ πολέμιοι ἀποκτενοῦσι πάντας οὓς ἂν ἕλωσιν.* (12) *εἰ δὲ σὺ τὰ τῆς πόλεως πράττοις, πάντες ἂν οἱ καλοὶ κἀγαθοὶ εὐτυχοῖεν.* (13) *ἐὰν ταῦτα εἴπῃς, ἁμαρτήσει.* (14) *ἕως ἂν μὴ στρατεύηται, τὰς σπονδὰς οὐ λύσει.* (15) *ἀληθές ἐστιν ὅ τι ἂν λέγῃ.* (16) *εἰ μὴ τὴν πόλιν ἔσωσεν, οὐκ ἂν νῦν ἐτίματο.* (17) *πρὶν μὲν γὰρ κριθῆναι οὐ ῥᾴδιόν ἐστιν εἰδέναι τὰς αἰτίας.* (18) *οὐ πρότερον ἐπανέστη Μαρδόνιος πρὶν ἢ σφᾶς ὑποχειρίους ἐποιήσατο.* (19) *οὐκ ἄπειμι πρὸς δόμους πάλιν, πρὶν ἂν σε ἔξω βάλω.*

"*Though*" *Clauses*.—The idea contained in the English word "although" can be expressed in Greek in the following ways:

(*a*) By using *εἰ καί, ἐὰν καί, καὶ εἰ,* or *κἂν* (*καὶ ἐάν*) in one of the various forms of condition, as though the English were "even if," &c.

e.g. καὶ εἰ μὴ δυνάμεθα δῶρα δοῦναι, οὐδέποτε νικώμεθα, although we cannot give bribes we are never defeated.

ἐὰν καὶ δυστυχῶμεν, οὐκ ἀδικήσομεν, although we suffer misfortune, we will not do wrong.

(*b*) By using *καί* or *καίπερ* with the participle, very often with *ὅμως* = "nevertheless" in the main clause.

e.g. πείθου γυναιξὶ καίπερ οὐ στέργων, obey the women, though you love them not.

ἐποικτείρω αὐτὸν καίπερ μοι ὄντα δυσμενῆ, I pity him though he is my enemy.

ἅλις ἤδη εἴρημαι καὶ πολλὰ παραλιπών, I have already said enough, though I have passed over much.

Indirect Speech.—Indirect speech is the narration of what someone thought or said: the thought or words narrated depend on a verb implying *saying, thinking,* &c. Thus "I am going" is what someone actually said—*i.e.* direct speech. If I am reporting his words to another person, I can do so either by using inverted commas, "He said, 'I am going,'" or by using indirect speech, "He said that he was going."

In English indirect speech is expressed by the use of the conjunction "that," together with a change in the time of the narrated verb so that it adopts the time of the verb on which it depends, as in the example above.

In Greek there are three means by which indirect speech may be expressed:

(*a*) When the verb that introduces the speech narrated takes the infinitive or a participle, the *principal verb* of the speech narrated is put into the infinitive or participle in the same tense as that of the direct speech. If *ἄν* was used in the direct speech, it is preserved in the indirect.

e.g. ὁ δὲ Κλέων οὐκ ἔφη αὐτὸς ἀλλὰ τὸν Νικίαν στρατηγεῖν, Cleon said that not he, but Nicias, was general.

ὁ Κῦρος λέγεται γενέσθαι Καμβύσεω, Cyrus is said to have been the son of Cambyses.

ἤλπιζον τοὺς 'Αθηναίους ἴσως ἂν ἐπεξελθεῖν, they hoped the Athenians would perhaps march out. (Direct speech would be *ἴσως ἂν ἐπεξέλθοιεν*.)

ἔφη ἐντὸς ἡμερῶν εἴκοσιν ἄξειν αὐτούς, he said he would bring them within twenty days. (Direct speech would be *ἄξω αὐτούς*.)

Κῦρον ἐπιστρατεύοντα αὐτῷ ἐγὼ πρῶτος ἤγγειλα, I first announced that Cyrus was on his march against him. (Direct speech would be *Κῦρος ἐπιστρατεύει σοί*.)

οὐκ ᾔδεσαν αὐτὸν τεθνηκότα, they did not know he had died (*i.e.* τέθνηκε in direct speech).

ηὗρον οὐδαμῶς ἂν ἄλλως τοῦτο διαπραξάμενος, I found I could accomplish this in no other way (*i.e.* οὐδαμῶς ἄλλως διαπραξαίμην ἄν).

(β) In cases other than those dealt with above, indirect quotations are introduced by ὅτι or ὡς = "that," and are subject to the following rules as to sequence:

i. When the tense of the introducing verb is primary, the verb of the narrated speech remains in the same mood and tense as in direct speech.

e.g. μάρτυρας παρέξομαι ὡς ταῦτ' ἀληθῆ λέγω, I shall bring witnesses to prove that I speak the truth (*i.e.* they will say "ταῦτ' ἀληθῆ λέγει").

ii. When the tense of the introducing verb is historic:

(*a*) The indicative or subjunctive of direct speech either changes to the same tense of the optative or keeps its original mood and tense.

e.g. ἐπειρᾶτο δεικνύναι ὅτι οἱ 'Αθήναιοι φαίνοιντο μὲν εἶναι ἄνδρειοι, εἶεν δ' οὔ, he tried to show that the Athenians appeared to be brave, but were not so (*i.e.* φαίνονται μὲν εἰσὶ δ' οὔ).

εἶπεν ὅτι ὁ τύραννος τέθνηκεν, he said that the tyrant was dead (*i.e.* ὁ τύραννος τέθνηκεν).

(*b*) A historic tense of the indicative that denotes an unfulfilled condition, and all optative tenses are kept without change.

εἶπεν ὅτι ταῦτα οὐκ ἂν ἐδύναντο ποιεῖν εἰ μὴ ἐμαίνοντο, he said that they could not do this if they were not mad (*i.e.* οὐκ ἂν ἐδύναντο, εἰ μὴ ἐμαίνοντο).

N.B.—By the rule stated immediately above this could never be οὐκ ἂν δύναιντο, &c.

εἶπεν ὅτι εἰ ἔλθοι εἰς τὰς 'Αθήνας τάχεως ἂν πείθοι τοὺς κριτάς, he said that if he were to go to Athens he would soon persuade the judges (*i.e.* εἰ ἔλθοι, τάχεως ἂν πείθοι).

(γ) *Dependent Verbs in Indirect Discourse.*—While the principal verbs of compound sentences follow the above rules in indirect speech, dependent verbs obey the following rules:

i. When the introducing verb is in a primary tense, dependent verbs do not change either mood or tense.

ii. When the introducing verb is historic, dependent primary tenses of the indicative and dependent subjunctives may either change to corresponding tenses of the optative or remain as they are. Dependent historic tenses of the indicative are not, however, changed.

e.g. ἀποκρινεῖται ὅτι δοῦλον ὠνήσεται ὅστις τοῦτο ποιήσει, he replies that he will buy a slave to do this (*i.e.* δοῦλον ὠνήσομαι ὅστις τοῦτο ποιήσει).

λέγει ὅτι ἐπειδὰν ἐκφορὰ ᾖ, λάρνακας φέρουσιν, he says that when there is a funeral procession they carry coffins (*i.e.* ἐπειδὰν ἐκφορὰ ᾖ, λάρνακας φέρουσιν).

ἔφη αὐτοὺς ὅτι ἐκφορὰ ᾖ (or εἴη), λάρνακας φέρειν, he said that when there was a funeral procession they carried coffins. (*i.e.* ἐπειδὰν ἐκφορὰ ἐστί).

ἔφη οὐκ ἂν δοῦναι ἃ μὴ ἐβούλετο δοῦναι, he said he would not have given what he had not wished to give (*i.e.* οὐκ ἂν ἔδωκεν ἃ μὴ ἐβούλετο).

ἠρώτησαν πῶς ἂν εἰδείη περὶ πράγματος οὗ ἄπειρος εἴη, they asked how he could know about a thing of which he had no experience (*i.e.* πῶς ἂν εἰδείης περὶ . . . οὗ . . . εἴης).

οὐ and μή.—A summary of the uses of the two different negatives may at this stage be useful.

The regular negative is οὐ. μή, however, is used in its stead in the following cases:

(*a*) With the subjunctive.
(*b*) With the imperative.
(*c*) In dependent purpose clauses. (But note that after μή = "lest," οὐ is used.)
(*d*) In all conditions.
(*e*) In relative clauses where the antecedent is indefinite, *i.e.* where the relative clause is equivalent to a condition.
(*f*) In time clauses under similar circumstances.
(*g*) In wishes.
(*h*) With the infinitive. (*N.B.*—But not in indirect speech.)
(*i*) With participles and adjectives that are equivalent to relative clauses with an indefinite antecedent.

e.g. οἱ οὐ φιλοῦντες τὴν εἰρήνην = those (particular individuals) who do not love peace.

But οἱ μὴ φιλοῦντες τὴν εἰρήνην = those (whoever they are) who do not love peace.

Thus οἱ μὴ ἀγαθοί = all those who are not good; οἱ οὐκ ἀγαθοί = those individuals who are not good.

(*k*) After verbs signifying *fearing, hindering,* &c.

The following instances of double negatives should be noted:

(*a*) Where μή is used to negative an infinitive,

if the verb on which the infinitive depends is itself negatived, the infinitive takes the double negative μή οὐ.

e.g. ἄξιός ἐστι μὴ ἀποθανεῖν, "he deserves not to die," becomes, when negatived, οὐκ ἄξιός ἐστι μὴ οὐκ ἀποθανεῖν, "he does not deserve not to die."

The same rule applies when the main verb is in the form of a question, but a negative is implied:

διὰ τί ἄξιός ἐστι μὴ οὐκ ἀποθανεῖν; "why does he deserve not to die?"—implying that he does not so deserve.

(b) οὐ μή is used as follows:

i. With the aorist subjunctive and future indicative as a stronger form of the negative.
   οὐ μὴ τοῦτο ποιήσῃ, he will never do this.
   οὐ μή σε πέμψω, I certainly will not send you.

ii. With the second person of the future indicative with the force of an emphasized prohibition.
   e.g. οὐ μὴ λαλήσεις, leave off chattering.

GREEK LITERATURE

The history of Greek literature may be divided into three epochs:

1. Early Literature, down to the first quarter of the fifth century B.C.
2. Attic Literature, from about 470 B.C. to the close of the fourth century.
3. The Literature of the Decline, which again falls into two periods:
   (a) The Alexandrian, from 300 B.C. to the middle of the second century.
   (b) The Graeco-Roman, from about 150 B.C. to about A.D. 500.

1. **Early Literature.**—It has been frequently pointed out that Greek literature, in contrast with the literatures of more modern times, is distinguished and its development is explained by the fact that it was essentially oral. The form which prevailed—epic, lyric, rhetoric, dialogue, or drama—each in turn was addressed to an audience rather than to a reading public. Such being the case, it is easily understood how the form adopted varied according to the variation in social conditions. The laurels awarded to merit were distributed not, as at Rome, by the decision of a few cultured experts, but according to the favour of the public at large, who heard the work of an author in the theatre, at feasts, in the courts, or in the assembly. So long as a great public was at liberty to express its opinions freely, literature flourished; when public liberty was lost, literature declined and became pedantic and academic.

The earliest extant works are the **Homeric poems.** Tradition tells us of songs earlier than Homer, which, from the vague details available, appear to have been of a ritualistic nature. In the history of Greek literature they play no other part than to form a beginning from which it may be traced.

The *Iliad* and the *Odyssey*, the two great Homeric poems, are now agreed to be composite works and not the creation of one author, the legendary Homer. Inconsistent details of style and matter, and the linking together of a series of seemingly irrelevant main episodes, lead to the belief, now general, that the poems represent accretions of legends, similar in character and nearly contemporaneous, into a more or less coherent whole. The probability is that in the first place different tales of well-known heroes of legend or memory were recited by professional story-tellers at feasts or similar gatherings, and that gradually the details became traditional and uniform, until the different tales were united, first perhaps as a series, and finally to make a single connected story.

Both the poems are divided into twenty-four books. The *Iliad* tells the story of the wrath of Achilles against the Greeks besieging Troy, the consequent Trojan successes, and the final return of Achilles to the field to avenge his slaughtered friend, resulting in the beginning of the Trojan downfall by the death of their champion Hector.

The *Odyssey* is the account of the wanderings of Odysseus after the fall of Troy, until he arrives once more at his home on Ithaca and triumphs over the suitors of his wife who have been trying to usurp his place.

Apart from the value of Homer as illustrating a civilisation which is only now beginning to be known, the *Iliad* and *Odyssey* rank as treasures of poetry. The sonorous rhythm of the hexameter verses in which they are composed has a beauty of its own; born of the recitative with which the ancient story-teller aided his memory, it possesses a flexibility and a majesty that later epic poets could only attain by conscious effort.

Beyond this, Homer possesses to the highest degree that simplicity of language and directness of expression, that human feeling and instinctive sense of the dramatic, that mark the great poet.

As regards date, the first recorded collection of the works of Homer is placed towards the end of the sixth century B.C.: from internal evidence the two poems seem to have originated in Ionia approximately 1000 B.C.

Numerous minor epics and hymns have been assigned to Homer, particularly the beautiful hymn to Demeter. No other reason for crediting

him with their authorship seems to exist than that their origin is very ancient and their authors unknown.

The next name in historical order is that of **Hesiod.** There is little doubt that, just as all the romantic epics were fathered on a mythical Homer, so the didactic epics were the putative offspring of Hesiod. Later in date than the *Iliad* and *Odyssey*, three of the Hesiodic poems survive.

Of these, the most interesting is the *Works and Days*, a treatise, or rather a series of hints, on agriculture, which form the backbone of the poem and are treated with an air of truth and considerable poetic feeling. To eke them out are interspersed a number of moral sayings, and a digression into the subject of the lucky and unlucky days of the month. The poem as a whole is more pedestrian than Homer; it is essentially peasant literature, and was the beginning of the characteristic poetry of Boeotia, Hesiod's home, which was always a land of husbandry.

The *Theogony*, next in importance, is a family history of the Gods. Its most interesting feature is the glimpses it gives of primitive myths too crude and prehistoric to be found elsewhere in Greek literature, which take us back to extreme antiquity.

The *Shield of Herakles* relates one of the legends about the hero and is mainly taken up with a description of his shield, in imitation of a similar description in the *Iliad*. It is inferior to its original, being full of dull particularity and lacking in imagination.

Many poems of the same school at one time existed, but survive now only in their titles. Their general character was the same; they dealt either with arts and crafts or with the commonplaces of morality.

As time went on and political consciousness developed, men no longer were content to assign their own compositions to a legendary Homer or Hesiod. The same circumstances tend to induce the poet (for in the early stages poetry is the only form of literature) more and more to express his own personality and to write what he thinks himself. This feeling of the need for self-expression gave birth to another metre than that of the epic; the heroic hexameter was too restricted as to the themes to which it lent itself. As a result there came into being the elegiac and the iambic metres.

The elegiac metre, originally associated with songs of mourning, as well as the iambic, came to be used to express the personal interests of the author; no theme came amiss to it, and it dealt now with war, now with love, now with politics or philosophy, always in a more or less conversational manner. At one thing it stopped short; the fervour of true lyric poetry was a height to which it could not attain.

The earliest elegiac poets were **Callinus** and **Tyrtaeus**, both belonging to the first quarter of the seventh century B.C. They sung of wars and noble deeds, but the wars were the wars of their fellow-men and not of legendary heroes. **Mimnermus of Colophon**, who has been given a later date, sang also of wars; but his principal theme was love and the personal longing of a luxurious nature for the delights of peace.

With **Solon** at the end of the seventh century we come nearer to an historical personality. Up till then there is always the feeling that the poet is merely a personification; that Tyrtaeus is held responsible for all elegy of a certain kind, just as all heroic epic has been laid to the account of Homer. Solon's elegiac poetry strikes out a new line, abandoning the heroic note and dealing with politics and ethics. From what survives we can see that no high level of poetry was attained.

Theognis of Megara, some eighty years later in date, is a truer poet than Solon; capable of expressing deep feeling, he strings together a number of maxims that show great strength of personality together with extreme narrowness of outlook.

The iambic metre (from ἰάπτω, to dart) was at first that used for the scurrilous jests bandied about at the feasts of Demeter. Its use by **Archilochus** for satire (680 B.C.) can be understood—not satire in the modern sense, however, aimed at individuals, but satire directed against the classes to which he was politically opposed. A freebooter and a poet, Archilochus has some affinity with the French Villon.

Hipponax (*c.* 540 B.C.) also wrote personal epigrams, but on a less exalted scale.

As the epic declined there grew up two other forms of poetry, lyric and choric. The Greeks were a song-loving race, and songs became part of their literature at an early date. The song pure and simple first took the form of traditional folk-songs, of which a survival is extant in the delightful Swallow-song which was sung in Rhodes at the spring festival. Tradition could not always, however, suffice for the artistic needs of the public; songs were required for public ceremonies and for private merrymakings, and poets arose to supply the deficiency. The first lyric poet known to us is **Alcaeus**, who flourished in the first half of the sixth century B.C. Alcaeus provided a new metre, distinctive and effective, which marked a departure from the heavier metres of epic and elegiac poetry. A fighter and a roisterer, he sang of war, wine, women, and party. His verses were full of fire and gained in force from the simplicity of their expression.

Alcaeus' younger contemporary, **Sappho**, the famous poetess of Lesbos, carried on his

tradition. Her verses show more variety of metre and, as might be expected, deal chiefly with themes of love and personal feeling. For beauty of expression she stands unsurpassed among the women-writers of the world.

At a later date (his traditional *floruit* is placed at 545 B.C.) arose **Anacreon**, also a singer of wine and love. But to these themes he added, for the first time, epigrams of a personal nature which served as a model for centuries after.

The needs of the community, as distinct from those of individuals, gave rise to choric poetry. The ceremonials of public gatherings, which were generally religious, required some medium for the expression of communal feeling, and this was provided by the choric song. At first composed for the community, as communal feeling waned the choric song came to be composed at the order and for the pleasure of private patrons.

A particular form of the choric song was the Dithyramb (*Δι*=god, *θρίαμβος*=rejoicing), a kind of mystery-play, in which a chorus, disguised as satyrs or centaurs, sang in praise of a god or enacted some episode to his glory. This was the real *τραγ-ῳδία* or Goat-song, which contained the germ that was to develop into Attic tragedy.

Alcman, the first of the choric poets, who flourished about 650 B.C., has only come down to us in fragments. His themes were mainly those of love, but he also wrote a sort of dramatic part-song in which several divisions of the chorus sang in turn.

Some fifty years after Alcman a new element was introduced into the choric poem, which was to have a far-reaching effect. **Stesichorus of Himera** in Sicily was the first to leaven the lyrical element with the epic, and to make the poem tell a story. Besides dealing with the great legends of gods and heroes, he made a further innovation by singing of legends of humble life which depended for their effect on the innate beauty of their sentiment rather than on a lofty theme. The fragments of his poems are remarkable for their strong dramatic power and their beautiful expression, and mark the beginning of the great period of choric poetry.

Simonides, the next great lyrist, flourished between 530 and 470 B.C. Renowned as a wit and a man of culture, he obtained a great reputation all over the Greek-speaking world. He wrote poems for occasional purposes—to celebrate a victory, to hallow a festival, or to congratulate on some private occurrence. The first to write definitely on private commission, he introduced the *ἐπινίκιον*, the ode celebrating victory at the games, wherein mention of the winning athlete or chariot and their patron or master is made an incident in a poem of larger interest. Nothing florid mars his poetry; in such lines as the epitaph on the heroes of Thermopylae—

> "Stranger, bear word to the Spartans that we
> lie here obedient to their charge."
> (Murray's translation.)

—he illustrates the Greek ideal of simple beauty and severe self-restraint.

Bacchylides, nephew of Simonides, followed along the lines pointed out by the latter as far as simplicity of style is concerned. He is notable for introducing the epic style into his poems to a greater extent than the other choric poets; his similes are rather quietly decorative than brilliant, and he adopts the epic manner of giving to nouns of importance each its own conventional epithet.

The *ἐπινίκια* of Bacchylides differ from others in that he makes more play with the details of the particular victory that he is celebrating, and is not content with a mere mention of it in the course of the poem.

The Dithyrambs, which constitute the other half of Bacchylides' works, are epic episodes in choric form.

Last of the choric poets comes **Pindar**, belonging in point of date (522–442 B.C.) to the Attic period, but ranking in point of style with the writers of the early period. With him the particular form of literature that he adopted reached both its height and its decline.

In spirit Pindar was behind his times; the champion of racial prejudice and religion as understood by the temple priests, he was more in harmony with the age when local gentry were proud to trace their descent back to the semi-divine heroes of saga than with the political freedom and communal consciousness that were stamped on the Greek cities that repulsed Darius and Xerxes.

Unfortunately, Pindar's only surviving works are the series of odes which celebrate victories at the Pythian, Nemean, Isthmian, and Olympic games, though we know that his poems included dithyrambs, hymns, and other choric forms. The outstanding characteristics of his poetry are his obscure style, which makes him perhaps the most difficult of Greek writers to read and to appreciate, and the quality that is a worthy set-off to that disadvantage, the true poet's inspiration, which depicts a scene, describes an emotion, or epitomizes a moral sentiment, in a few sparkling words. The difficulty of Pindar and the archaic nature of his thoughts cannot mar that quality of the true poet which makes the reader feel that in no other way could his thought have been so beautifully or so adequately expressed.

So far all the writers considered have been poets. Verse is naturally the earliest form in which man records his thoughts, principally owing to the aid which it affords the memory in an age when writing, if known, is a matter

of great tediousness and expense. Towards the latter end, however, of the early period, prose writing began to be practised, taking its rise in the Greek cities of Asia Minor. It assumed one of two forms, either chronicles or speculation, which were to develop later into the histories of Herodotus and Thucydides in the one direction, and the writings of the philosophers, culminating in the dialogues of Plato and the treatises of Aristotle, in the other. **Hecataeus of Miletus** (520 B.C.) and **Herodotus of Heraclea** (500 B.C.) stand out from the list of mere names as actual writers whose works, speculative and historical, are known to us vividly by reputation, though they have not survived.

2. **The Attic Period.** *Tragedy*.—The outstanding feature of the first part and middle of this period is the rise of tragedy to its zenith. To repeat what has been said of its origin, the germ of tragedy is found in the more or less primitive festival to a god, at which the band of worshippers sing a hymn describing the legend of the god or some incident therefrom. The divinity most generally thus celebrated was Dionysus, with whom the performances in the theatre came to be associated, so that his priest was always the central figure in the audience.

The simple chorus gradually develops a leader, who assumes the part of the god or his emissary and narrates the story with intervals of praise by the chorus.

The next step, and the first hint of dramatization, is when the leader does not sing to the chorus, but carries on a dialogue with the coryphaeus, the chief of the chorus. According to tradition, this was an innovation of **Thespis**, an Athenian poet of about 530 B.C., who may thus be said to have originated the tragic drama.

Of all the tragic poets who won popular favour, **Aeschylus** is the earliest who has survived. In technique he is said to have been the first to make the innovation of introducing a second actor besides the coryphaeus. The dialogue now carries the main burden of the play and stands independent of the chorus, which becomes of secondary importance.

The result of the Persian wars and the repulse of the power of the East were bound to affect the imagination of a poet who was himself an actor in some of the most stirring scenes of the war. Consequently Aeschylus is inspired by a Panhellenic patriotism such as no other Greek poet knew, while the awful lesson of the ruin of the great Persian expedition is reflected in the doctrine preached by him throughout, that self-restraint, the ideal Greek virtue, must never be relaxed, and that one momentary lapse into ὕβρις, "overweeningness," is sufficient to call down Nemesis from heaven and to start a whole train of evils.

The seven plays of Aeschylus that are extant show unsurpassed grandeur of language and of conception. The thought is speculative but not unorthodox; its main trend is to reconcile the seeming divergence between the will of the gods in heaven and the powers below, the solution to the problem being that all that happens is constrained by necessity in order to work out in full the law of righteousness.

After Aeschylus comes his younger contemporary, **Sophocles** (496–406 B.C.), whose tragedies mark a further advance in dramatic technique by the introduction of a third actor and painted scenery specially adapted to the particular play. He also survives in seven tragedies only, though he was a voluminous producer. Less grand in style than Aeschylus, he was a more conscious artist. His language is polished in the extreme, and the tragedies come nearer than those of Aeschylus or Euripides to modern ideas of well-constructed drama. He is remarkable for his skill of plot and his mastery of character delineation. Speculation as to the meaning of the legends that form his themes is no concern of his; he seeks only to show how men and women would speak or feel or act if all the circumstances of the traditional tale were true, and by his command of language and poetical feeling to raise the tale to the level of great poetry.

With **Euripides** (480–406 B.C.), the last of the great triad in development, we come to a different mental atmosphere. Saturated with the scepticism of late fifth-century Athens, he is yet not in sympathy with the sceptics around him. Unlike Sophocles he is not content to use the legends as he finds them merely as material for a play; he draws a lesson from each—not the lesson of inscrutable wisdom and order that inspired Aeschylus, but the lesson that picturesque glamour is a snare, that men are carried away by conventional appearances and do not understand the real meaning of what they see. When he thinks of war, he visualises not the triumph of the victors and the noble glory that they win, but the agony of the vanquished and the ignominy and suffering that follow on defeat. To him a victory means not a triumphant return of happy warriors, but the cries of widowed women, orphaned children, and ravished maidens. Especially did he attack the position of all good conservatives that the interest of the state must be served at the expense of individuals, whatever cruelty or wickedness it may involve. His wonderful power of pathos strengthens the effect of his teaching, and it is small wonder that the Athenian public, when the tide of war turned against them and they were seeking strength in a frenzied patriotism, came to hate and to fear him.

If one is asked to place Euripides in the development of Greek tragedy, it can be said

that, while he shows a decline from the restrained and formal beauty in which the Greek was always best expressed, he marks an approach to the humanity of interest that men value to-day.

Comedy.—Little is known of the early history of comedy save that, like tragedy, it took its rise in a religious celebration, that of Dionysus, and owed its inception to the coarse jesting and horseplay that mark the lighter side of a feast of the common people.

Before the Attic period the comic drama is in darkness: it is known merely that a poet of Megara, one **Susarion**, about 580 B.C. produced some sort of farce. This was probably of the type in which a chorus, itself or through a leader, bandied rude jests with one another or even with the audience. It was in Attica and in the fifth century that comedy took artistic shape. The names survive of **Cratinus and Eupolis**, who produced comedies between 480 and 420 B.C. Their works have not survived, but it is known that Cratinus altered the form of comedy considerably, modifying the number of actors and introducing for the first time that element of personal attack which characterized the old Attic comedy. That comic dramatists were abundant from about 470 B.C. onwards is certain, but the earliest comedies that have come down to us are those of **Aristophanes**, whose activity ranged from 427 B.C. over a period of about forty years.

The eleven plays of Aristophanes that we possess fall roughly into three classes, reflecting the differing political conditions of the times at which they were produced. Those dated between 425 and 421 B.C.—the *Acharnians*, *Knights*, *Wasps*, *Clouds*, and *Peace*—are unrestrained in their abuse of those to whom or to whose policy the poet objects. Later, when amid the public misfortunes popular taste was more subdued, the *Birds*, *Lysistrata*, *Thesmophoriazusae*, and *Frogs* depart more into the realms of fancy; while in the *Ecclesiazusae* and *Plutus*, written after the final disaster had overtaken Athens, the satire is directed against general tendencies, and party politics are not touched.

Aristophanes' place in literature is unique. Master of rhythm and metre, possessed of a poet's rich fancy which he lavished on his choruses, and with a sense of comedy unequalled in any age, he is the sole representative of a wonderful phase of a wonderful time.

After Aristophanes, the "Middle" comedy down to about 320 B.C. continued to develop towards the romantic plays of the "New" comedy. The lashing political satire of the *Knights* and the *Wasps* becomes softened into satire on literature and social tendencies, as foreshadowed in Aristophanes' latest plays, until at last the satire almost disappears and gives place to characterisation and romance.

Prose.—The epoch which witnessed the zenith and decline of tragedy, and in which comedy came into being, also saw the beginning of prose composition and its more gradual development to its best. So late a development may be explained by the influence of the epic, which in one form or another furnished a medium for moralising, declamation, instruction, and inventiveness. There were, of course, records of various kinds that were in prose, for the most part inscriptions on bronze or stone. Each city had its chronicles, which were kept up to date and expanded as needs required, but these were a mere collection of statements; anything approaching to literary style was unknown to them. The first definitely prose-writers were the Ionians, **Hecataeus** and **Herodotus**, at the end of the sixth century.

From Ionia prose-writing shifted its centre to Athens, where the rapid growth in the political importance of the city and the rise of the democracy brought to the front those who could speak or write, to take part in the increasing activity in the assembly and the courts. Attic Greek became the recognised literary medium, and Athens herself became the centre whither flocked the ablest men in Greece.

The earliest extant prose work is the essay on the Athenian constitution, so long attributed to Xenophon, but now recognised to be the writing of an unknown author, called for convenience the **Old Oligarch**. In date it belongs to the period of the first Athenian Empire. It is an attack on the democracy, written in familiar and vivid language. Of style there is little; the sentences are disconnected and the grammar is colloquial.

Some years later in date is the historical work of Herodotus. Though he writes in the Ionian dialect, **Herodotus** is kin to the spirit of Attic literature. His history is a series of accounts of different countries, made up of legends, actual records, and the result of personal observation, the whole being strung together to make a history of the war with Persia. In effect the work is a drama, the theme being the tragedy which inspired Aeschylus in the *Persae*, the punishment meted out to the overweening self-confidence of the great king.

As a historian Herodotus deals too much in the legendary and relies too much on hearsay to be of great value. As an artist, however, who can invest mere stories with the truth of a knowledge of human nature and can make phantom characters seem alive, he is hard to surpass. He stands half-way between the mythographers and geographers of Ionia and

the purely historical writings of Thucydides and Xenophon.

While Herodotus was writing his history in the Ionic dialect of the old writers of λόγοι, the dialect of Attica was being worked up and moulded into a literary vehicle of the utmost power. The Sophists, **Protagoras** and **Gorgias**, by their writings and disputations, and **Prodicus** by his speeches and lectures, exercised a great formative influence on the artistic development of prose style. At the same time public oratory, especially at the hands of **Pericles** and **Antiphon**, in turning to practical use the newly-awakened medium of expression, helped to give to prose its life, power, and polish.

Under these influences there leaped up suddenly the history of **Thucydides**. Historically the successor of Herodotus, Thucydides is as precise and scientific as the former is diffuse and romantic. For some reason his language is a conventional Ionic-Attic. He says ξύν for σύν, πράσσω for πράττω, &c., but in spirit and style he is an Attic writer. In eight books he gives an account of the Peloponnesian war, with the object, as he tells us, of giving to the world a thing of value for all time. He achieves this by carefully investigating facts, making clear the connection between events and their cause, and displaying throughout a truthfulness, impartiality, and consistent relevancy which make his history rank, as it does, among the masterpieces of its kind. Thucydides' literary power is evidenced particularly in the speeches which are here and there inserted in accordance with ancient practice; he does not pretend that they are authentic, and he does not use them merely to display his rhetorical skill, but makes them disclose the motives and sentiments of the speakers.

In style Thucydides is terse, vivid, and restrained. His choice of language is occasionally almost poetic, and he makes great play with the use of antithesis. The congestion of ideas that makes him so difficult for the student to read is due to the rapidity with which his mind works; before an idea is well expressed he is already mentally engaged with its logical sequence. Historically Thucydides is priceless: he gives the impression, so seldom obtained from ancient writers, that what he says is true and may be depended on as an authority.

The mantle of Thucydides was carried by **Xenophon**: he never succeeded in wearing it. The seven books of his *Hellenica* form a continuation of Thucydides, going down to 362 B.C. Partiality for Sparta, and want of a central idea or any scientific plan, mar the value of the work and discount the effect of clear and lively writing. Others of Xenophon's works are of great interest, notably those reminiscent of Socrates, which give us the actual man as compared with the idealisation of Plato. The most famous and, as a narrative, the best of Xenophon's works is the *Anabasis*, the account of how ten thousand Greeks, stranded in Asia Minor, made their way under his leadership through a difficult and hostile country to the sea. In minor works on hunting and other subjects Xenophon appears as the earliest essayist, while the *Education of Cyrus* is a political and philosophical romance.

Oratory.—In a state where the popular assembly and the law-courts played so large a part in every man's life as at Athens, the art of rhetoric was bound to be of importance and to affect the general progress of literature. The feeling for effective oratory was fostered by the Sophists of the second half of the fifth century, who dwelt on the importance of grammar and logic, of whom **Gorgias** obtained a high reputation as a rhetorician.

The earliest of the Attic orators is **Antiphon** (480–411 B.C.), who wrote speeches for litigants. His style is simple and dignified, relying on pathos rather than on subtlety.

Andocides (467–390 B.C.) is one of those speakers whose graphic diction sounds better than it reads: he is not so much an orator as a ready speaker. His language is plain, and he makes little use of the rhetorical figures of speech.

Lysias (458–378 B.C.) marks the successful marriage of perfect literary finish and everyday Attic idiom. While polished and effective, he steers clear of all rhetorical figures save the antithesis so dear to the Greek heart.

Isocrates (436–338 B.C.) was never a forensic orator; he wrote for a reading public, and so came to establish a standard for rhetorical prose. A political essayist and educationalist, he was widely read and his influence was widespread, even Cicero confessing to being his debtor. His language is pure and not too florid, but his composition is distinguished by ample periods, by conscious avoidance of all harshness, and by a tendency to use with discrimination the recognised rhetorical figures. Isocrates shows the transition from the purest prose endowed with spirituality to an artificial prose richer in technique but less sincere and less precise.

Isaeus (420–348 B.C.) has some of the conciseness, simplicity, and vividness of Lysias, but his style differs from that of the earlier writer in the consciousness of artistry that pervades it. In arrangement of subject, elaboration of proof, and in dealing point by point with an adversary's speech, he gave a new trend to Attic oratory and set a model which was to be followed by the most brilliant of all Greek orators.

With **Aeschines** and **Demosthenes** comes the end. Demosthenes fittingly closes the list of

great speakers, himself the greatest of all. Aeschines, his contemporary and adversary, was theatrical and brilliant, but not convincing; Demosthenes, a natural orator, was in command of every resource of language and of argument, uniting in himself all the best elements in those who had preceded him. We know him best of all the Greek orators, for we possess sixty of his speeches, of which the most important, both from the fierceness of their technique and the magnitude of their themes, are the speeches against Philip of Macedon (*Philippics*), the *Olynthiacs*, and the speeches on the Peace, the Crown, and the Embassy.

After Demosthenes some fame was won by **Lycurgus** and **Hyperides**, but oratory, in common with political freedom, gradually declined.

Philosophy.—The earlier philosophers—**Heraclitus**, **Anaxagoras**, and **Democritus**—wrote in the Ionic dialect. Heraclitus (died 475 B.C.) of Ephesus survives only in fragments of his work on Nature. Harsh and figurative in style, the thought is profound, making the work difficult to read; even in his own times he was called "the obscure."

Anaxagoras, the friend of Pericles (died 428 B.C.), also wrote on Nature; the fragments still extant afford little guide to his style.

Democritus (died about 370 B.C.) wrote on a variety of subjects; his remains are very scanty, but we know that his manner was vivid and interesting.

Socrates, who gave Athens the position of leader of Greek thought, has come down to us only in the writings of his disciples and through his influence on later philosophers. Of these the first and most illustrious is **Plato** (died 348 B.C.). By instinct a poet, and by training a great thinker, Plato has made his dialogues masterpieces of philosophic writing. In his hands Attic prose reached its acme of lucidity and grace, equally effective in the drawing of character, the expounding of intricate thoughts and the expression of pathos and emotion.

Last of the philosophers of this period comes **Aristotle**, a pupil of Plato, but, as a thinker, of a different school. His writings embrace logic, ethics, metaphysics, and natural science. A master intellect, he set a model of philosophic method which served the civilised world up to the end of the Middle Ages. His style, however, is not equal to his matter. The founder of scientific phraseology, he writes without pretension to elegance or charm. Those who read him do so for the sake of what he has to teach, and not for any intrinsic pleasure to be gained therefrom.

3. The Decline.—After the triumph of Macedon, Athens lost the premier position in Greek literature. The freedom of thought and speech and the sympathy between writer and public that had produced the great tragedians and orators was no more. Congenial surroundings were only to be found in a royal capital, where public order was maintained by troops, and even there the culture demanded of a writer was of a standard so high that pedantry and artificiality were bound to result.

Comedy alone remained enthroned at Athens, but it is a comedy of manners and no longer political or contentious. The New Comedy dates from about 300 B.C. Its plots were those of real life, and the adventures of young gallants, maidens fair and virtuous or otherwise, adventurous and roguish slaves, reflect the stirring times of the successors of Alexander. **Diphilus, Philemon**, and **Menander** are the authors of this class of work whose names have been handed down to us. Their plays survive only in epitomes and in the imitations and adaptations of Roman comedians, but we know that Menander had the greatest reputation, and that the staple theme was love in romantic circumstances.

The literary spirit that left Athens found refuge elsewhere. The conquests of Alexander had spread over Egypt and the East the externals of Greek civilisation. The native population of Alexandria and Pergamos cultivated Greek manners—in the Greek phrase made for the purpose, they "Hellenized"—and the literature which they produced, deriving its inspiration from Greek models and written in the Greek tongue, is called Hellenistic.

Alexandria was the centre of Greek thought from Alexander's time down to the Christian era. Learned men gathered there to use its museum and library, with the result that true Hellenistic literature is rather one of research and scholarship than of sublimity and inspiration. Alexandrian literature reached its most attractive form in the idylls of **Theocritus** (325–260 B.C.). The public, wearied of the material aspect of life in a great city, was drawn by the idea of the delights of country life, and Theocritus created for them an ideal countryside, where shepherds and shepherdesses sang and danced and loved all day beside their flocks. His poems are written with great charm, and those which depict scenes from everyday life, such as one lady paying a call upon another, are wonderfully true and dramatic. He cannot be read, however, without a feeling of artificiality; the very dialects in which he wrote were not his own, but chosen for artistic purposes.

The bucolic tradition of Theocritus was carried on by **Bion of Ionia** and **Moschus of Syracuse**, both in the third century B.C., who, however, lack the power and beauty while they achieve the elegance of their master.

Similarly the epic of **Apollonius Rhodius** (200 B.C.) on the adventures of the Argonauts, though it contains passages of beauty and deep feeling, falls far short of Homer, whom it attempts to follow; its learned allusions and studied construction kill what spontaneity it possesses and make it a typical product of its time.

The true expression, however, of the spirit of Hellenism was found in works of erudition. The poems of **Aratus** (270 B.C.) and **Nicander** (150 B.C.) on astronomy and medicine, and the prose treatises of **Timaeus** (died 256 B.C.), **Polybius** (died 122 B.C.) on history, **Eratosthenes** (*c.* 200 B.C.) on geography, **Aristarchus** (*c.* 150 B.C.) on literary criticism, **Euclid** (*c.* 300 B.C.) on geometry, **Hipparchus** (*c.* 150 B.C.), and **Hermagoras** (*c.* 120 B.C.) on the science of rhetoric, were all monuments of learning and cleverness, and very poor as literature pure and simple.

The Graeco-Roman Period.—The conquest of Greece by Rome once more affected the flow of the tide of Greek literature. Now more than ever original inspiration is sought in vain: Greece produces for the pleasure or education of Rome, with the result that can be imagined.

Some names stand out above the rush of mediocrities and bores. **Meleager of Gadara**, was a poet as well as a scholar, and wrote charming little elegies on love and death that form the basis of the collection of epigrams known as the Greek Anthology.

In prose, history and philosophy are the principal topics. **Plutarch's** *Lives* (A.D. 46–120) are full of charm and interest; perhaps too obviously meant to improve, they have no great value as history, but as sketches of character and means of entertainment they have attained a popularity for all time that few ancient authors have approached.

Quite unlike Plutarch was the earlier work of **Polybius** (205–122 B.C.), who is less read, though of far more value historically. Polybius possesses the true historical sense; in his history of Rome, from 264 B.C. to his own times, he shows a feeling for cause and effect and an appreciation of political exigencies that place him on a level with Thucydides himself. His follower Livy, who owes to him much of his information, is as inferior to him as a historian as he is superior in style; unfortunately the manner of Polybius is not as good as his matter and he makes sadly dull reading.

For the next great name it is necessary to go to the second century A.D. **Lucian**, who wrote about 150, was the author of dialogues in which he assails current ideas about religion, philosophy, and social life. Gifted with keen observation and humour and a vivid imagination, he has always interested and amused a large number of admirers.

Dionysius of Halicarnassus and **Josephus** the historians, **Strabo** and **Pausanias** the geographers, **Longus** and **Heliodorus** the novelists, and **Epictetus** and **Marcus Aurelius** the Stoic philosophers, close that stage in Greek literature which may be called classical. A Christian Greek literature arose restricted to the purposes of the Church. The days of Byzantine power saw a revival, but that falls outside the scope of the present article.

COURSE OF READING

How to Read Greek.—There is an error common among teachers with regard to their Greek reading: they frequently let their pupils begin too soon, and frequently make them begin too late. If he is set to reading too soon, the student begins to read his author with so imperfect a knowledge of word-forms, accidence, and syntax that every other word has to be looked up in a lexicon, with the result that the reader becomes disgusted, and loses all desire to appreciate what he is reading. Under any circumstances, and especially when he is his own teacher, the student should ground himself in grammar and syntax before he begins to read. Properly grounded, he can quickly learn to read and appreciate an author; without that grounding, what should be a labour of love becomes a trial of patience.

The student ought therefore to learn, by heart where possible, the rules for declension and conjugation given above, and to study the article on syntax until he feels acquainted with its principles. It may seem to him to be drudgery, but he will appreciate the soundness of the policy when he comes to his authors.

When he feels sufficiently well grounded, he should begin reading those authors whose style is easiest. *Xenophon*, *Euripides*, *Plato's* Apology, *Homer*, *Demosthenes*, *Sophocles*, is the order in which the first Greek writers should be attempted. When he feels at home with one, the student can go on to the next; and when he is able to read Sophocles with comparative ease, the whole field of Greek literature is open to him.

The bibliography that follows is an attempt to indicate the most suitable editions, and a proper course of reading for a scholar not very far advanced. The prices marked are nett prices in every case.

Besides the translations expressly indicated, nearly every work is translated in the "Tutorial Greek Translations" or in Bell's "Classical Translations," the single volumes averaging from 9*d.* to 3*s.* 6*d.* Bohn's translations also cover the whole field of Greek literature; their prices vary according to the size of the book.

Selections.

Text and Notes. Keene. Macmillan. 1*s.* 2*d.*

As soon as he can understand more or less as he goes on, the student should make a practice of reading aloud, translating in his mind the while. With a proper amount of practice he will find that, except for points of exceptional obscurity, he will be able to translate fluently and idiomatically. If at this stage he tries to render a piece of English into Greek, he will find that, sub-consciously, his mind has stored up the Greek idiom, and can express the English words as a Greek would have expressed them.

Too much reliance should not be placed on translations ; they are useful only for reading over *after the passage has been translated unaided,* to clear up any doubtful points. If used to save the trouble of translating, they will speedily cripple all power of reading.

The following list of books on Greek literature and some of its more important aspects will help the student to a further appreciation of his reading of the texts. Their titles sufficiently explain the point of view from which the books approach the subject, and, while the whole provides a fair course of reading, a student may find it unnecessary and less stimulating to work through the complete list than to select one or two of the more general books, such as Butcher's *Aspects* or Pater's *Studies,* and thoroughly assimilate them.

LITERATURE

Butcher. Some Aspects of the Greek Genius. Macmillan. 7*s.*

Jebb. Primer of Greek Literature. Macmillan. 9*d.*

Schlegel. Dramatic Literature. Bell. 2*s.* 8*d.*

Murray. Greek Literature. Heinemann. 4*s.* 6*d.*

Murray. Rise of the Greek Epic. Clarendon Press. 6*s.*

Jebb. Growth and Influence of Greek Poetry. Macmillan. 7*s.*

Pater. Greek Studies. Macmillan. 7*s.* 6*d.*

Mahaffy. History of Classical Greek Literature. Macmillan. 4 parts. Each 3*s.* 5*d.*

Two good grammars for reference are :

Rutherford.

Accidence. Macmillan. 1*s.* 6*d.*

Syntax. Macmillan. 1*s.* 6*d.*

(In one vol. 2*s.* 8*d.*)

Mansfield.

Greek Syntax. Rivington. 1*s.* 6*d.*

For composition, the student should work through *Hillard and Botting,* and then go over the ground again in *Browne* or *Sidgwick.* Keys should be used for the purpose of correction only, and after correction each exercise should be retranslated without the key. It is important to remember that the only way in which to learn to write Greek is by reading it, and the best matter for reading is the Greek authors themselves.

Hillard and Botting.

Elementary Greek Exercises. Rivington. 1*s.* 11*d.*

Browne.

Handbook to Greek Composition. Longmans. 3*s.*

Sidgwick.

First Greek Writer. Rivington. 2*s.* 8*d.*

Introduction to Greek Prose Composition. (More advanced.) Rivington. 3*s.* 9*d.*

Stuart M. Green, B.A., LL.B.

LATIN

Inflexion

In English, when we wish to express the relation of one word to another, we do so by means of prepositions. Thus, if we desire to associate the two words *king* and *England*, we use the preposition *of* to show the relation in which they stand to one another, and say the *King of England.*

In Latin, such relationship is expressed to some extent by means of prepositions, but, whether a preposition is used or not, words express their relations towards their context by the variety of their forms.

The English language does this to a slight degree in the case of verbs—e.g. *I gave the book* indicates past time, and *I give the book* indicates present time; the essential part of the word *give* is retained in each case, but its form is changed to express a different shade of meaning.

In Latin, nouns, pronouns, adjectives, and verbs are inflected, and the inflexion is of two kinds:

1. Declension of nouns, pronouns, and adjectives.
2. Conjugation of verbs.

Declension

Declension comprises differences according to gender, number, and case.

(a) **Gender.**—In Latin there are three genders: *Masculine, Feminine,* and *Neuter.* The rules governing gender are erratic, but the following three generalisations will form a rough guide.

(i) *Masculine* are names of months, rivers, and winds, and words essentially male in meaning—e.g. ***vir***, a man; ***taurus***, a bull.

(ii) *Feminine* are names of trees, plants, cities, countries, and islands, and words essentially female—e.g. ***mulier***, woman; ***soror***, sister.

(iii) *Neuter* are indeclinable nouns, substantival phrases, and quoted expressions, and very many inanimate objects.

(b) **Number.**—As in English, there are two numbers in Latin, singular and plural.

(c) **Case.**—It is the case that marks the relation borne by a word to the other words that surround it. Thus, in the expression, "There is a tide in the affairs of man," the relation of the word *man* to the word *affairs* is made clear by the possessory preposition *of*. In Latin, that relation is expressed by a variation of the word for *man*, which shows clearly that *man* is a possessive and depends on one of the contiguous words.

There are six cases in Latin, which are generally listed in the following order:

The Nominative, the case of the subject.
Vocative, the case used in speaking to a person.
Accusative, the case of the direct object of a verb—*e.g.* "To wake to ecstasy the living lyre," *the living lyre* is accusative.
Genitive, the case of possession.
Dative, the case of advantage.
Ablative, the case of agency or motion from.

There were also originally a locative and an instrumental case, now merged in the use of the ablative, though the locative is preserved in some names of places and adverbial expressions.

The cases are distinguished by different endings, which again are divided into five different series, known as the Five Declensions. The following table gives at a glance the whole scheme of Latin declension:

	1st Dec.	2nd Dec.	3rd Dec.	4th Dec.	5th Dec.
		Singular.			
		Neut.		Neut	
Nom. *the, a*	-a	-us : um / -er	-s (*originally*)	-us : -u	-es
Voc. *o*	-a	-e, -er „	„	„ „	„
Acc. *the, a*	-am	-um „	-em	-um : -u	-em
Gen. *of*	-ae	-ī	-īs	-ūs	-eī
Dat. *to, for*	-ae	-ō	-ī	-uī	-eī
Abl. *with, by*	-ā	-ō	-e	-ū	-ē
		Plural.			
Nom., Voc.	-ae	-ī : -a	-ēs : -a, -ia	-ūs : -ua	-ēs
Acc.	-as	-ōs : -a	-ēs : -a, -ia	-ūs : -ua	-ēs
Gen.	-arum	-orum	-um, -ium	-uum	-ērum
Dat., Abl.	-īs	-īs	-ibus	-ubus (ibus)	-ēbus

It will be observed that, while in the several declensions the case-endings end generally in the same way, the vowel parts thereof differ regularly, according to the declension. Thus it can be said that

-a is the vowel of the 1st Declension.				
-o	„	„	2nd	„
-ĕ or -ĭ	„	„	3rd	„
-u	„	„	4th	„
-ē	„	„	5th	„

It will also be apparent, on examining the above table, that:

1. Neuter substantives always have nom., voc., and acc. the same. Also their plur. nom., voc., and acc. always end in *-a*.
2. In the 3rd, 4th, and 5th Declensions the nom., voc., and acc. plur. are always the same.
3. The 2nd Declension is the only one in which there is a separate form for the voc. sing.
4. In all the declensions the dat. and abl. plur. are the same.

First Declension

Port-a, *a door*, -am, -ae, -ae, -ā.
Port-ae, *doors*, -ās, -ārum, -īs.

Note.—1. An original gen. form in *-s*, like the 3rd, 4th, and 5th Declensions, is shown in *paterfamilias*, father of a family.
2. The loc. sing. has the *-ae* of the gen.; *Romae*, at Rome.
3. The gen. plur. is sometimes in *-um*, chiefly in compounds of *-cola, -gena*. E.g. *coelicola*, deity, gen. plur. *coelicolum*.
4. The dat. and abl. plur. are found in *-ābus* where it is necessary to distinguish from the 2nd Declension. E.g. *ā deīs*, from the gods; *ā deābus*, from the goddesses.
5. Nouns of this declension are fem., save when males are meant—e.g. *nauta*, a sailor, is masc.

Translate, giving all the possible meanings of: mensae, nautarum, filiabus, filiis, agricolum, rosa reginae, Italiae regina, nautarum puellae, epistula ancillae.

Second Declension

Servus, *slave.*	Serv-us, -e, -um, -ī, -ō, -ō.
Servi, *slaves.*	Serv-ī, -ī, -ōs, -ōrum, -īs, -īs.
Puer, *boy.*	Puer, puer, puer-um, -ī, -ō, -ō.
Pueri, *boys.*	Puer-ī, -ī, -ōs, -ōrum, -īs, -īs.
Ager, *field.*	Ag(e)r, ag(e)r, agr-um, -ī, -ō, -ō.
Agri, *fields.*	Agr-ī, -ī, -ōs, -ōrum, -īs, -īs.
Bellum, *war.*	Bell-um, -um, -um, -ī, -ō, -ō.
Bella, *wars.*	Bell-a, -a, -a, -ōrum, -īs, -īs.

Note.—1. Most of the words in *-ero* and *-ro* drop the *-us* of the nom. sing., and in the case of words in *-ro* make the *-r*, thus left at the end, sound by placing *-e* before it—*e.g.* original *ag-r-os* becomes *ag-r*, and then *ager*.
2. *Deus*, god, is irregular, and has nom. plur. *dī, diī*, and abl. plur. *diīs, dīs*.
3. *-um* is found in the gen. plur. in words meaning measures and weights, and in a few other special cases.
4. The loc. sing. is like the gen., and in the plur. is like the abl.
5. Words ending in *-ius* make their voc. and gen. sing. in *-ī*, not *-iī*.

6. Nouns in *-us* are masculine; nouns in *-um* are neuter; save names of trees, &c., as noted in Gender, Rule (ii) above.

Translate, giving every possible meaning of: līberōrum, caprī, servī dominōrum, puer magistrī, dominī hortus, servī gladiō, bella Romanōrum, dōna virī, humerīs taurōrum, dōnīs deōrum, dominus Aegyptī, Delphīs, fīlī equus, numerus sociōrum, nummos virōrum, hospero, Gaius magister puerōrum, librī Graecōrum.

Third Declension

In this declension, to be able to decline the word it is necessary to know not only the nom. sing., but also the gen. sing., as the nom. generally shows a form of stem that is different from the stem shown in the other cases.

Note that in this declension the nom. and voc. sing., nom., voc., and acc. plur., and dat., abl. plur. form three groups, in which the endings are the same. Consequently only one example will be given for each group.

Vigil, gen. vigil-is, *watchman* (m.)	sing. -em, -is, -ī, -e, plur. -ēs, -um, -ibus.
Mel, mell-is, *honey* (n.)	sing. -is, -ī, -e, plur. -a, -um, -ibus.
Hiems, hiem-is, *winter* (f.)	sing. -em, -is, -ī, -e, plur. -ēs, -um, -ibus.
Homo, homin-is, *man* (m.)	sing. -em, -is, -ī, -e, plur. -ēs, -um, -ibus.
Carmen, carmin-is, *song* (n.)	sing. -is, -ī, -e, plur. -a, -um, -ibus.
Flamen, flamin-is, *priest* (m.)	sing. -em, -is, -ī, -e, plur. -ēs, -um, -ibus.

Note.—1. Nouns in *-l* are masc., save *mel*, and *fel*, bile, which are neut.
2. Nouns in *-en* are neut., save *flamen*, words meaning musicians compounded with *-cen*, and *pectēn*, a comb.
3. Nouns in *-do, -go, -io* are fem., except *cardo*, hinge; *ordo*, rank; *pugio*, dagger; and a few uncommon words. Other nouns in *-o* are masc., except *caro, carnis*, flesh.

Anser, anser-is, *goose* (m.)	-em, -is, -ī, -e, -es, -um, -ibus.
Marmor, marmor-is, *marble* (n.)	-is, -ī, -e, -a, -um, -ibus.
Ebur, ebor-is, *ivory* (n.)	-is, -ī, -e. -a, -um, -ibus.
Iter, itiner-is, *road* (n.)	-is, -ī, -e, -a, -um, -ibus.
Pater, patr-is, *father* (m.)	-em, -is, -ī, -e, -es, -um, -ibus.

Note.—1. Like *pater* are declined *māter*, mother; *frāter*, brother; *accipiter*, hawk.
2. Nouns in *-er* and *-or* are masc., except *arbor*, tree (f.), and words essentially fem., as *soror*, sister, and except the neut. words *iter; cicer*, pea; *piper*, pepper; *marmor; ver*, spring; *cadāver*, dead body; *papāver*, poppy.

3. Nouns in *-ar* and *-ur* are neut., except *solar*, trout; *furfur*, bran; *augur*, augur; and names of animals in *-ur*.

Flōs, flōr-is, *flower* (m.)	-em, -is, -ī, -e, -es, -um, -ibus.
Corpus, corpor-is, *body* (n.)	-is, -ī, -e, -a, -um, -ibus.
Os, oss-is, *bone* (n.)	-is, -ī, -e, -a, *-ium*, -ibus.
As, ass-is, *as* (a coin) (m.)	-em, -is, -ī, -e, -ēs, *-ium*, -ibus.

Note.—1. Nouns in *-is* (gen. *-eris*) and *-ōs* (*-ōris*), are masc., except *ōs*, mouth, neut.

2. Nouns in *-us* (*-eris*, or *-oris*) and *-ūs* (*-ūris*) are neut., except *lepus*, leporis, and *mus*, muris, which are masc.

Pēs, ped-is, *foot* (m.)	-em, -is, -ī, -e, -es, -um, -ibus.
Cor, cord-is, *heart* (n.)	-is, -ī, -e, -a, -um, -ibus.
Dux, duc-is, *leader* (m.)	-em, -is, -ī, -e, -es, -um, -ibus.

Note.—1. Of stems ending in *-d*, *-c*, *-p*, or *-t*, only *cor*; *lac*, lactis, milk; *caput*, capitis, head, are neut. Of the rest, masc. are nouns in *-es*, *-itis*; *-eps*, *-ipis*; and most in *-ex*, *-icis*. Fem. are nouns in *-tus*, *-tutis*; *-tas*, *-tatis*; and most other nouns in *-x*.

2. *Supellex*, furniture, has an irregular stem, supellectil-is.

Finis, fin-is, *limit* (m.)	-em, -is, -ī, -e, -es, -ium, -ibus.
Caedes, caed-is, *slaughter* (f.)	-em, -is, -ī, -e, -es, -ium, -ibus.
Imber, imbr-is, *shower* (m.)	-em, -is, -ī, -e, -es, -ium, -ibus.
Sedile, sedil-is, *stool* (n.)	-is, -ī, -ī, -ia, -ium, -ibus.
Animal, animāl-is, *animal* (n.)	-is, -ī, -ī, -ia, -ium, -ibus.

Note.—1. In these *-i* stems an acc. sing. in *-im* is found in *buris*, plough-beam; *febris*, fever; *pelvis*, basin; *puppis*, poop; *turris*, tower; *restis*, cable; *securis*, axe; *sitis*, thirst; and *tussis*, cough; also with names of cities and rivers.

2. Similarly an abl. sing. in *-ī* is found in all the *-i* stem neuts., save *rete*, net, and also in *turris*, *sitis*, *securis*, *bipennis*, and names of cities, rivers, and months.

3. Nouns in *-er*, *-ris*, are masc., except *linter*. Nouns in *-es*, and most in *-is*, are fem. Nouns in *-al*, *-e*, *-ar*, are neut.

Canis, can-is, *dog* (m.)	-em, -is, -i, -e, -es, -um, -ibus.

Note.—Like *canis* are declined *juvenis*, young man; *senex*, senis, old man; *volucris*, bird.

urbs, urb-is, *city* (f.)	-em, -is, -i, -e, -es, -ium, -ibus.

Note.—Like *urbs* are declined nouns in *-us*, *-utis*; *-rx*, *-rcis*; *-rs*, *rtis*; *-lx*, *-lcis*; also *dōs*, dotis, dowry; *lis*, litis, dispute, *fraus*, fraudis, fraud; *nox*, noctis, night; *nix*, nivis, snow; *fauces*, jaws; also all monosyllables in *-ps*, *-bs*, and nouns in *-ās*, *-is*, *-tās*.

Substantives of this type are generally fem., save a few masc. exceptions, of which the commonest are *mons*, mountain; *fons*, fountain; *pons*, bridge; *dens*, tooth.

Irregular Nouns

The following nouns differ in declension from any of the usual types:

Vīs, vis, *force* (f.)	vim, vis, vi, vī, vīrēs, vīrium, vīribus.
Sūs, su-is, *pig* (m.f.)	suem, suis, suī, sue, suēs, suum, suibus (sūbus).
Bōs, bov-is, *ox*, *cow* (m.f.)	bovem, bovis, bovī, bove, bovēs, boum, būbus (bōbus).
Jupiter, Jov-is, *Jupiter* (m.)	Jovem, Jovis, Jovī, Jove.

Nouns from the Greek

Nouns imported from Greek into the 3rd Declension retain their Greek forms in the nom., acc., voc., and sometimes gen. in the sing, and also in the nom. acc. plur.

Lampas, lampad-os, *torch*	-a, -os (-is), -ī, -e, -ĕs, -ăs, -um, -ibus.

Fourth Declension

Fructus, *fruit* (m.)	fructus, fructum, fructūs, fructuī, fructū, fructūs, fructūs, fructuum, fructibus.
Cornu, *horn* (n.)	cornu, cornūs, cornū, cornū, cornua, cornuum, cornibus.

Note.—1. The dat. abl. plur. end in *-ŭbus* in *arcus*, bow; *tribus*, tribe; *quercus*, oak; and sometimes in *artus*, limb; *lacus*, lake; *partus*, birth; *verū*, spit.

2. *-ū* is the regular dat. sing. ending in neut. words.

3. All nouns ending in *-u* are neut.; all in *-us* are masc., except *acus*, needle; *anus*, old woman; *domus*, house; *Idūs*, Ides; *socrus*, mother-in-law; *nūrus*, daughter-in-law; *tribus*, tribe; *porticus*, porch.

Irregular are:

domus, *house* (f.), domum, domūs(-ī), domī(-ō), domō(-ū); domūs, domōs(ūs), domorum (domuum), domibus.

senātus, *senate* (m.), gen. senatūs(-ī).

Fifth Declension

diēs, *day* (m.), diēs, diem, diēī, diēī, diē; diēs, diērum, diēbus.

Note.—1. The nom., voc., acc. plur. are the same.

2. All nouns in this declension are fem., except *dies* and *meridies*, mid-day, and *dies* is fem. when it means an appointed time.

Translate, giving every possible meaning of: Rex Britanniae, regum insignia, grex ovium, victores pugnā, nomine, divitiae urbis, tribuum

ordo, boum cornibus, rerum relīquiae, Athēnis, virginum caedes, pluvii imber, finis diēī, pater patriae, tribunus mīlitum, capite anseris, equitis calcāria, Jupiter rex et exemplar deorum, finibus tellūris, genera animālium, mel flōrum sanguis, virgo rēgis et rēgīnae fīlia, domi, domus, senatus princeps favore tribuum.

Roots and Stems.—Now that the five declensions have been reviewed, it may be of use to consider some of the difficulties that they present; the 3rd Declension offers the greatest number of apparent anomalies. In order to elucidate these, it is necessary to consider the history of Latin as a language. It is now an accepted fact that Latin is the descendant of an original mother-language, known to scholars as the Indo-European language, to which most of the languages of Europe look back as their common parent. The gap between the parent and the child in the case of Latin is a long one and not easy to bridge over, yet on examination many of the principles that governed the one are apparent in the other, and working on the basis of these it is possible to understand many of the apparent errings from the normal that bewilder the student of Latin.

One of the first peculiarities noticeable in the 3rd Declension is that a number of nouns show forms in the nom. that do not apparently account for the forms of the other cases. Why, for instance, do we find *corpus* and *corporis*, *homo* and *hominis*, *flos* and *floris*? These seeming anomalies render the path of the student hard, whereas to make them plain is not difficult, and the resulting clearness of vision fully rewards the extra time and trouble given to acquiring the knowledge of how to cope with them.

There existed in the original language, and there has largely survived in Latin, a system of word-formation, working more or less on regular principles. The notion of the word was expressed by a root, which is to be found in all the adaptations of the idea. To the root was often added a syllable, or one or two syllables, that brought the root-notion within the more narrow limits of one of the parts of speech; this gives us what is known as the stem. Finally to the stem may be added a case-ending or tense-ending, which assigns to the word its exact grade of meaning.

Take, *e.g.*, the root *opi-*, which expresses the idea of "plenty." To this is added the suffix *-lento-*, which carries an adjectival meaning, and the word is completed by the addition of the case-ending, e.g. *-s*, and we get *opulentus*, a rich man.

Again, from the root *gene-*(= beget) develops *genitor* (= ancestor); *gene-tor* (a noun suffix denoting one who performs the action indicated by the root).

Now, in the case of 3rd Declension nouns, the original rule was that neuter nouns in the nom. appeared as the stem without a case suffix, and with the vowel of the stem suffix as weak as possible.

Thus if the stem ended in *-os*, the nom. would end in *-us*, or if the stem was *-in*, the nom. would end in *-en*. The stronger form of the vowel of the stem suffix would appear normally in the gen., dat., and abl. Hence the forms

corpus—corporis,
semen—seminis.

In masc. and fem. nouns the rule was the reverse, the nom. using the strongest form of the vowel of the stem suffix. Take, for example, the stem *hom-in-*. Originally the root *hom-* (seen in a stronger form in *hūm-anus*) was followed by a sound as of the letter *n* used as a vowel, long or short. In Latin the long form of this vowel was *ōn*, the shorter form was *in*.

Then, remembering the rule that stems ending in *-m*, *-n*, *-l*, *-r* form the nom. masc. or fem. by dropping the final letter, we can understand the declension:

homō(n), hominis, &c.
ordō(n), ordinis, &c.

In *caro(n)*, *carnis*, can be seen the very weakest form of the *-n-* vowel in the oblique cases. Similar vowel gradation is shown in the case of pat*er*, pat*ris*, &c., the original vowel in this case being a vocalised *-r*.

The question then arises, Why does Latin have corp*us* in the nom. and corp*oris*, &c., in the other cases? The answer is that, as a general rule of Latin word-formation, an *-s-* from the original language, when it found itself between two vowels, tended to change to *-r-*. Thus *genus* gives genitive *generis* (orig. gen-es-is), *corpus* gives *corporis* (orig. corp-os-is), *flōs* gives *floris* (flosis), &c.

With the exceptions already noticed, the rule holds good that the nom. masc. and fem. in the 3rd Declension is formed by adding *-s* to the stem or root. Here, again, some peculiarities of Latin require notice. The Latin tongue found it awkward to pronounce the combinations *-ts*, *-ds*, and the result was that, where *-ts*, *-ds* occurred in the original language, in Latin they resolved simply into *-s*. Hence the declension:

Pēs (ped-s), pedem, pedis, &c.
Miles (milet-s), militem, militis, &c.

Another regular way in which consonants changed in Latin is shown by the manner in which *-t*, *-d*, after another consonant, disappear from the end of a noun—*e.g.*:

Original *cord* gives us *cor*, cordis.
„ *lact* „ *lac*, lactis.

So that the rule that the nom. neut. in the 3rd

Declension consists of the stem and nothing more is borne out really, though not apparently.

Assimilation of one sound to another accounts for the following forms:

sedeo, I sit: *sella*, seat (*sed-la*); *ad*, to, *curro*, I run: *accurro*, I run up; *sub*, under, *pono*, I place: *suppono*, I place under, &c.

The last change of importance is that by which *b* and *g* become *p* and *c* before *s* or *t*:

scrib-o, but *scrip*-si,
reg-o, but *rec*-tus.

And *m* becomes *n* before a dental or a guttural:

*prim*us, but *prin*ceps,
eum, but *cun*dem.

Accent

The Latin accent is responsible for some peculiarities in the form of words. In Latin, the accent is one of stress—that is to say, a syllable that is accented is pronounced with more vigour than those which are not accented. This stress-accent is employed according to a well-defined rule, namely:

If the last syllable but one in a word is long, the stress falls on it; if it is short, the stress falls on the syllable before it. In words of two syllables the first is always accented.

The use of a stress-accent has had some effect in word-formation. One of the results is seen in *syncope*.

Syncope—*i.e.* the cutting out of an unaccented syllable—is manifest in the following examples:

(*N.B.*— The sign ʹ represents the accent.)

*árid*us, dry: *ard*órem, heat; *ard*ére, to burn; *pró-vid*ens, seeing ahead: *prúd*ens, prudent; *régo*, direct: (pór*rigo*) pór*go*, proceed; *aévum*, (*aévitas*) *aé*tas, age.

Another result of stress-accent is the tendency for the unaccented vowels to lose their character, as in the case of the last syllable in the English words "fáther," "sister." In Latin this is evident when the following pairs of words are placed side by side:

cápio, ínc*ipit*.
rémum*ágo*, rém*igo*.
pário, pép*eri*.
cáno, céc*ini*.

Adjectives.—The function of an adjective is to add a quality to a substantive; therefore we find in an inflexional language, such as Latin, that an adjective is made to correspond to its noun in number, gender, and case.

Consequently, adjectives must be declined, and in Latin they have case forms similar to substantives, which, according to the stem-characteristic, are of 1st and 2nd, or 3rd Declensions.

Adjectives of First and Second Declensions

Masc, declined (*a*) like *dominus*, or (*b*) like *puer* or *ager*.
Fem., declined like *porta*.
Neut., declined like *bellum*.

A few adjectives of the 1st and 2nd Declensions have in the gen. and dat. sing. the pronominal forms *-ius* and *-i*—*e.g.*:

totus	tota	totum
totum	totam	totum
totīus	totīus	totīus
totī	totī	totī
totō	totā	totō

Similarly declined are *uter*, *alius*, *solus*, *ullus*, *unus*, *alter*, *neuter*.

(*N.B.*—*Alius* has *aliud* in the nom., voc., acc. sing., neut.)

Adjectives of the Third Declension

These have either (*a*) one, (*b*) two, or (*c*) three endings in the nom. sing.

(*a*)

	Singular.		Plural.	
	M. & F.	*N.*	*M. & F.*	*N.*
N., V.	capax		capaces	capacia
Acc.	capacem	capax	capaces	capacia
Gen.	capacis	capacis	capacium	
Dat., Abl.	capaci		capacibus	

Note.—This class includes all stems ending in consonants, also *vetus*, veteris, old. Yet note that the gen. plur. ends in *-ium*, and neut. nom. plur. in *-ia*.

(*b*)

	Singular.		Plural.	
	M. & F.	*N.*	*M. & F.*	*N.*
Nom., Voc.	omnis	omne	omnes	omnia
Acc.	omnem	omne	omnes	omnia
Gen.	omnis		omnium	
Dat., Abl.	omni		omnibus	

	Singular.		Plural.	
	M. & F.	*N.*	*M. & F.*	*N.*
N., V.	minor	minus	minores	minora
Acc.	minorem	minus	minores	minora
Gen.	minoris		minorum	
Dat.	minori		minoribus	
Abl.	minore		minoribus	

Note.—All comparatives are really *-s-* stems, the *-s-* becoming *-r-* between vowels, as in the case of *corpus*. The final *-r* in nom. masc. and fem. is due to analogy.

Note that the comparatives have abl. sing. in *-ĕ*, and neut. nom. plur. and gen. plur. in *-a* and *-um*.

All the adjectives of this class are from stems ending in *-ri-*, the nom. sing. masc. becoming *-er*, thus showing the longest form of the vocalised *-r-*, as in *imber*.

(*c*)

	Singular.			Plural.	
	M.	*F.*	*N.*	*M. & F.*	*N.*
N., V.	celeber	celebris	celebre	celebres	celebria
Acc.	celebrem		celebre	celebres	celebria
Gen.	celebris			celebrium	
Dat., Abl.	celebri			celebribus	

The system of variation between *-i* stem forms and others in abl. sing. and gen. plur., and nom.,

voc., acc. neut. plur. can be best appreciated when made clear by a diagram:

	Abl. Sing.	Gen. Plur.	N. V. A. Neut. Plur.
Adjectives of 3rd Decln. speaking generally:—	-i	-ium	-ia
Exceptions: celer, volucris, coelestis, agrestis, inops, memor, vigil and compounds of pes:—	-i	*-um*	-ia
coeles, compos, particeps, pauper, princeps, pubes, impubes, sospes, superstes, dives:—	*-e*	*-um*	mostly wanting
vetus	*-e*	*-um*	*-a*
All comparatives	-e	-um	-a
Present participles	*-e*, -i[1]	-ium	-ia

[1] The -i form only when used in an adjective sense; *e.g.*: me praesente, but praesenti tempore.

Comparison of Adjectives.—There are, as in English, three degrees of comparison—*i.e.* Positive, Comparative, Superlative; e.g. "*good*" is positive, stating that the quality exists. "*Better*" is comparative, comparing the thing described with something else. "*Best*" is superlative, stating the existence of the quality to its greatest extent.

Regularly in Latin the comparative is formed by adding *-ior*, the superlative by adding *-issimus* to the stem—*e.g.*:

fulvus, *tawny*	fulvior	fulvissimus
audax, *bold*	audacior	audacissimus
amans, *loving*	amantior	amantissimus
tener, *tender*	tenerior	tenerrimus

Note that:

1. In the case of stems in *-er*, the *-s-* of the superlative becomes *-r-*; e.g. *tenerrimus* = tener-simus.
2. Vetus, *old*, has irregular *vetustior* in the comparative.
3. Six adjectives in *-ilis* form the superlative by adding *-limus* to the stem—*e.g.*:

   facilis, *easy* facilior facillimus

   The others are difficilis, similis, dissimilis, gracilis, humilis.
4. Adjectives ending in *-ficus*, *-dicus*, *-volus* are compared like participles in *-ens*:

   beneficus, *beneficent* beneficentior beneficentissimus
5. Adjectives ending in *-us* preceded by a vowel, with the exception of those in *-quus*, compare by means of the words *magis*, more, and *maxime*, most:

   e.g. dubius, *doubtful*; magis dubius; maxime dubius.

N.B.—There are one or two unimportant exceptions to this.

6. Some adjectives show roots or stems in the comparative and superlative different from the positive—*e.g.*:

Bonus, *good*	melior, *better*	optimus, *best*
Magnus, *large*	major, *larger*	maximus, *greatest*
Parvus, *small*	minor, *smaller*	minimus, *smallest*
Multus, *much*	plus, *more*	plurimus, *most*

7. In some words indicating *position* or *order of time or place*, a positive form is lacking, though the stem of the positive may be found in an adverb or preposition:

Citerior, *on this side*.	citimus, *nearest*.	*Cf.* citra, *on this side*.
Prior, *before*.	primus, *first*.	*Cf.* prae, *before*.

Translate, giving every possible meaning of. Bonus rex; multum in parvo; puella magis idonea magno imperatori; imperium optimum omnium donum; Alba Longa Romae urbis mater; ultima dies; postremo die; facilis descensus Averni; homo conscius nequitiae; Regina Parthorum bello ferocissima; bellum utilius Caesari; Ciceronis opera omnia; serpens ingentis magnitudinis.

Adverbs.—1. The usual ending of adverbs derived from adjectives of the 1st and 2nd Declensions is *-e*—*e.g.*:

late, widely, from *latus*; *misere*, wretchedly, from *miser*.

2. The usual ending for adverbs formed from adjectives of the 3rd Declension is *-ter*, *-iter*, added to the stem—*e.g.*:

graviter, *weightily*, from gravis, *heavy*.

3. The next commonest ending is *-tim*, an old accusative form. There are also endings in *-o*, *-um*, *-am*, *-tus*, while, when added to pronominal stems, *-de*, implying direction from, and *-dem*, implying direction towards, are to be found.

Comparison of Adverbs.—The comparative of the adverb is the acc. sing. neut. of the comparative of the adjective. The superlative is formed according to Rule 1 above, from the superlative of the adjective.

e.g. graviter gravius gravissime

Numerals.—There are five classes of Numerals:

1. *Cardinals*, which tell how many there are.
2. *Ordinals*, which tell in which order they come.
3. *Distributives*, which tell how many apiece there are.
4. *Multiplicatives*, which tell how many fold they are.
5. *Numeral adverbs*, which tell how many times a thing happened.

Notation.		Cardinals.	Ordinals.
1	I.	unus, *one*	primus, *first*
2	II.	duo, *two*	secundus, *second*
3	III.	tres	tertius
4	IV.	quattuor	quartus
5	V.	quinque	quintus
6	VI.	sex	sextus
7	VII.	septem	septimus
8	VIII.	octo	octavus
9	IX.	novem	nonus
10	X.	decem	decimus

Distributives.	Multiplicatives.	Numeral Adverbs.
singuli, *one apiece*	simplex, *simple*	semel, *once*
bini, *two apiece*	duplex, *double*	bis, *twice*
terni	triplex	ter
quaterni	quadruplex	quater
quini	quincuplex	quinquiēs
sēni	—	sexies
septēni	septemplex	septies
octōni		octies
novēni		novies
dēni	decemplex	decies

Notation.		Cardinals.	Ordinals.	Distributives.	Multiplicatives.	Numeral Adverbs.
11	XI.	undecim	undecimus	undeni	—	undecies
12	XII.	duodecim	duodecimus	duodeni	—	duodecies
13	XIII.	trēdecim	tertius decimus	terni deni	—	terdecies
14	XIV.	quattuordecim	quartus decimus	quaterni deni	—	quaterdecies
15	XV.	quindecim	quintus decimus	quini deni	—	quinquiesdecies
16	XVI.	sedecim	sextus decimus	seni deni	—	sexiesdecies
17	XVII.	septendecim	septimus decimus	—		
18	XVIII.	duodēviginti	duodēvicesimus	duodeviceni	—	duodevicies
19	XIX.	undēviginti	undevicesimus	undeviceni	—	undevicies
20	XX.	viginti	vicesimus	viceni	—	vicies
21	XXI.	viginti unus (unus et viginti)	vicesimus primus (unus et vicesimus)	viceni singuli	—	semel et vicies
30	XXX.	triginta	tricesimus	triceni	—	tricies
40	XL.	quadrāginta	quadrāgesimus	quadrāgeni	—	quadrāgies
50	L.	quinquāginta	quinquagesimus	quinquageni	—	quinquagies
60	LX.	sexaginta	sexagesimus	sexageni	—	sexagies
70	LXX.	septuaginta	septuagesimus	septuageni	—	septuagies
80	LXXX.	octoginta	octogesimus	octogeni	—	octogies
90	XC.	nonaginta	nonagesimus	nonageni	—	nonagies
100	C.	centum	centesimus	centeni	centuplex	centies
101	CI.	centum et unus	centesimus primus	centeni singuli	—	semel et centies
121	CXXI.	centum viginti unus	centesimus vicesimus primus	centeni viceni singuli	—	centies semel et vicies
200	CC.	ducenti	ducentesimus	duceneni	—	ducenties
300	CCC.	trecenti	trecentesimus	treceneni	—	trecenties
400	CCCC.	quadringenti	quadringentesimus	quadringenteni	—	quadringenties
500	D.	quingenti	quingentesimus	quingenteni	—	quingenties
600	DC.	sescenti	sescentesimus	sescenteni	—	sescenties
700	DCC.	septingenti	septingentesimus	septingenteni	—	septingenties
800	DCCC.	octingenti	octingentesimus	octingenteni	—	octingenties
900	DCCCC.	nongenti	nongentesimus	nongenteni	—	nongenties
1000	M.	mille	millesimus	singula milia	—	millies
1121	MCXXI.	mille centum viginti unus	milles. centes. vices. primus	&c.	—	&c.
2000	MM.	duo milia	bis millesimus	bina milia	—	bis millies
1,000,000	$\overline{|X|}$	deciens centena milia	&c.	&c.	—	&c.

Cardinals, ordinals, multiplicatives, distributives, are adjectives.

Note.—1. Only the first three cardinals are declinable—viz. *unus*, one, f 1st and 2nd Declensions.

Nom.	duo, duae, duo, *two*	tres, tria, *three*
Acc.	duos, duas, duo	tres, tria
Gen.	duorum, duarum, duorum	trium
Dat. Abl.	duobus, duabus, duobus	tribus

2. Ordinals are adjectives of 1st and 2nd Declensions.
3. *Mille* is indeclinable, but has plur. *milia*, which is a noun declined like *tria*. It is used with the gen.—e.g. *duo milia hostium* =2000 of the enemy.
4. Distributives are declined as plurals of 1st and 2nd Declension adjectives, save that gen. plur. is *-um*, except in *singulorum*.
5. Multiplicatives are declined as consonant stem adjectives of the 3rd Declension.

Pronouns

Personal Pronouns

	First Person.		Second Person.	
	Sing.	*Plur.*	*Sing.*	*Plur.*
Nom.	ego, *I*	nos, *we*	tu, *thou*	vos, *you*
Acc.	me	nos, *us*	te, *thee*	vos
Gen.	mei	nostrum, -i	tui	vestrum, -i
Dat.	mihi	nobis	tibi	vobis
Abl.	me	..	te	..

Note.—The gen. plur. ending varies according to the meaning. The ending in *-i* is objective, that in *-um* denotes *a part.*

E.g. *That is our house*, Nostri est illa domus. *Twenty of us are getting ready*, Viginti nostrum se parant.

Third Person

The original personal pronoun of the 3rd person is used in Latin only as a reflexive; in its stead is used the determinative *is, ea, id,* which will be found declined under its proper head.

Reflexive Pronouns

For the 1st and 2nd person there is no separate form, but the forms of the personal pronoun are used with a reflexive meaning—e.g. *me amo*, I love myself; *amatis vos*, you love yourselves.

The 3rd person has a pronoun of its own, which, although declinable, has no distinctions of number or gender.

Acc.	se, sese, *himself, herself, itself, themselves*
Gen.	sui
Dat.	sibi
Abl.	se, sese

Possessives

The personal and reflexive pronouns have each an adjectival form with a possessive meaning.

Thus, to	ego	corresponds	meus
..	tu	..	tuus
..	se	..	suus
..	nos	..	noster
..	vos	..	vester

All are declined as regular adjectives of the 1st and 2nd Declensions, except that the voc. sing. of *meus* is *mi*.

Determinative Pronouns

is=*he, this, it.*

	M.	*F.*	*N.*
	Singular.		
N.	is	ea	id
Acc.	eum	eam	id
Gen.	eius	eius	eius
Dat.	ei	ei	ei
Abl.	eo	ea	eo
	Plural.		
Nom.	ei, ii	eae	ea
Acc.	eos	eas	ea
Gen.	eorum	earum	eorum
D. Ab.	eis, iis	eis, iis	eis, iis

Idem =the same, is really *i(s)-dem*, and is declined accordingly—e.g. *idem, eadem, idem.*

It is only necessary to note that *-m* becomes assimilated to the following *-d*—e.g. *eorundem*, not *eorumdem*.

Demonstrative Pronouns

Hic = *this*. Ille = *that*.

SINGULAR.

	M.	*F.*	*N.*	*M.*	*F.*	*N.*
Nom.	hic	haec	hoc	ille	illa	illud
Acc.	hunc	hanc	hoc	illum	illam	illud
Gen.	huius	huius	huius	illius	illius	illius
Dat.	huic	huic	huic	illi	illi	illi
Abl.	hōc	hāc	hōc	illo	illā	illo

PLURAL.

Nom.	hi	hae	haec	illi	illae	illa
Acc.	hos	has	haec	illos	illas	illa
Gen.	horum	harum	horum	illorum	illarum	illorum
D., Ab.	his	his	his	illis	illis	illis

Like *ille* is declined *iste* = that of yours.

Note.—*Hic*, *iste*, and *ille* correspond to the 1st, 2nd, and 3rd persons respectively. *Hic* means "this here by me," *iste* means "that there by you," and *ille*, "that there by him."

The Intensive Pronoun

The intensive pronoun *ipse* = self, as its name implies, intensifies the force of a noun or pronoun—e.g. *Ipse veniam* = I myself will come; *Ipsa Minerva volet* = Minerva herself will wish it.

Its declension is precisely the same as that of *ille*, save that the nom. sing. neut. ends in *-um*, and not in *-ud*.

The Relative Pronouns

Qui = who, is declined as follows:

	SINGULAR. *M.*	*F.*	*N.*	PLURAL. *M.*	*F.*	*N.*
N. V.	qui	quae	quod	qui	quae	quae
Acc.	quem	quam	quod	quos	quas	quae
Gen.	cuius	cuius	cuius	quorum	quarum	quorum
Dat.	cui	cui	cui	quibus	quibus	quibus
Abl.	quo	quā	quo			

Quicunque, whoever, has the *qui* declined as above. *Quisquis*, anyone, has both parts declined like *quis* below.

The Interrogative Pronouns

Quis = who? is declined like *qui*, except for the nom. sing. masc. and fem. which make *quis*, and the nom. and acc. sing. neut., which make *quid*.

Quisnam = who, pray? and *ecquis* = anyone? decline the *quis* as above.

Uter = which of two? and *utercunque* = whichever of two, decline *uter* as an adjective of the 1st and 2nd Declensions.

Indefinite Pronouns

The principal pronouns under this heading are *quis* and its compounds. It is only necessary to remember that they are used both in a substantive and in an adjective sense, and that, generally speaking, their nom. sing. forms vary between those of *quis* and those of *qui* respectively. Thus, *vidi aliquid* = I saw something, but *aliquod vulnus te accepisse necesse est* = you must have received some wound.

The Verb

Verbs, like nouns, are in Latin subject to inflexion, which in their case is called Conjugation. By means of conjugation are expressed:

1. *Person* and *Number*.
2. *Voice*—*Active* or *Passive*.

The Active Voice shows that the action of the verb proceeds from the subject—*amo*, I love.

The Passive Voice shows that the action of the verb is directed towards the subject—*amor*, I am loved.

Note.—Some verbs are only found in one voice. Of these, some again are passive in form, but active in meaning. Such are called *Deponents*.

3. *Tense*:

Present, Imperfect, Future,
Perfect, Pluperfect, Future Perfect.

The *Present* tense denotes the existence of a fact and the continuance of an action at the moment of speaking, as, "I am here," "He is walking."

The *Future* denotes what will happen at a time later than the moment of speaking: "He will tell us to-morrow."

The *Perfect* in its pure sense denotes an action or state of things begun in the past and completed at the moment of speaking—*e.g.* "I have eaten my dinner," *i.e.* "I began to eat it, and went on eating, and now, at the time when I speak, it is actually all eaten."

The *Future Perfect* denotes that at some time in the future the subject of the verb will be able to say, "I have done so and so," e.g., *cras abiero*, to-morrow I shall have gone away.

These tenses are known as Principal Tenses.

The remaining tenses, which are known as Historical, are:

The *Imperfect*, which denotes that at a specified time in the past an action was being carried on, or a state of things was continuing to exist. *e.g.* "He was for three years in charge of the office," or "I used to like listening to him."

The *Aorist Perfect*, denoting the plain fact that at a point of time in the past a thing was done or an occurrence took place—*e.g.* "He was killed." "The horse ran away."

The *Pluperfect*, denoting that at a moment in the past an action or state of things which had begun before then was at an end—*e.g.* "When he was found he had given up hope."

Note.—In form the Aorist and Pure Perfects are identical.

4. *Mood*—*Indicative*, *Subjunctive*, *Imperative*.

The Indicative Mood states a fact: *amo*, I love.

The Imperative is the mood of command: *abi*, go away.

The Subjunctive represents an idea, or something that exists only in a dependent sense: *ut amem*, so that I may love; *si amarem*, if I were to love. It has only four tenses—Present, Imperfect, Perfect, and Pluperfect.

The three moods make up what is known

as the Finite Verb. There are also in the verb-system forms akin to nouns classed as the Verb Infinite. They are as follows:

The *Infinitive*, which is related to the nouns, and denotes action or condition in general—*e.g.:*

pugnare, *to fight;* pugnavisse, *to have fought.*

The *Gerund* is a verbal substantive declined like neuters of the 2nd Declension. Its oblique cases are used to supply the want of them in the infinitive—*e.g.:*

Ars pugnandi, *the art of fighting.*

The *Gerundive* is an adjective, attaching to the noun it qualifies the idea of the verb.

The *Supine* shows the accusative and ablative of a verbal noun:

Horrescit relatu, *he shudders at the telling.*

The *Participles* have partly the nature of verbs and partly of adjectives, and are, besides the gerundive, three in number:

Active Present: amans, *loving.*
Active Future: amaturus, *about to love.*
Passive Perfect: amatus, *loved.*

The Formation of the Verb.—Conjugation, like declension, consists in affixing various endings to the stem to express various shades of meaning. In the case of a fully inflected verb there are three principal stems:

1. The *Present Stem*, on which are based: (Active and Passive.)
   - (*a*) The present, imperfect, and future of all moods.
   - (*b*) The present infinitive.
   - (*c*) The present participle.
   - (*d*) The future participle and the gerund.
2. The *Perfect Stem*, on which are based: (Active.)
   - (*a*) The perfect, pluperfect, and future perfect.
   - (*b*) The perfect infinitive.
3. The *Participial Stem*, on which are based: (Passive.)
   - (*a*) The perfect participle.
   - (*b*) The perfect, pluperfect, and future perfect indicative.
   - (*c*) The perfect and pluperfect subjunctive.
   - (*d*) The perfect infinitive.

On this stem (3) also are apparently formed the supine, future active participle, and future infinitive, active and passive.

The inflexion of verbs falls into four conjugations, distinguished by the ending of the present stem. As this ending is always apparent unmodified in the *present infinitive*, that is chosen as the most convenient means of determining the conjugation.

Conjugation.	*Present Stem Ending.*	*Infinitive.*
1	-a	-āre
2	-ē	-ēre
3	-e *or* -o	-ere
4	-ī	-īre

Thus to be able to conjugate a verb it is necessary to know the present stem, perfect stem, participial stem, and present infinitive active, and therefore these are always cited as the *principal parts* of a verb:

1. *The Present Indicative* (1st person singular). (Active.)
2. *Present Infinitive.* (Active.)
3. *Perfect Indicative* (1st person singular). (Active.)
4. *Past Participle Passive* (nom. sing. neut.).

Note.—If there is no past participle passive, the supine is cited, or, in the absence of a supine, the future participle active.

The endings characteristic of the various persons are as follows:

	Active.		Passive.	
	Sing.	*Plur.*	*Sing.*	*Plur.*
1.	-o, -m	-mus	-r	-mur
2.	-s	-tis	-ris, -re	-mini
3.	-t	-nt	-tur	-ntur

Note.—The perfect indicative active has its own endings:

	Sing.	*Plur.*
1.	-ī	-mus
2.	-stī	-stis
3.	-t	-ērunt (*or* ēre, *poetical*)

Before proceeding to deal with conjugation at length, it is necessary to give first the verb *sum*, I am, an irregular verb, which enters as an auxiliary into the inflexion of the regular verbs.

Principal Parts

Pres. Ind.	Infin.	Perf. Ind.	Fut. Partic.
sum	esse	fui	futurus

Indicative Mood.		Subjunctive Mood.	
	Present		
sum, *I am*	sumus, *we are*	sim	simus
es, *thou art*	estis, *you are*	sis	sitis
est, *he, she, it is*	sunt, *they are*	sit	sint
	Imperfect		
eram, *I was*	eramus		essemus
eras	eratis		essetis
erat	erant	esset	
	Future		
ero, *I shall be*	erimus		
eris	eritis		
erit	erunt		
	Perfect		
fui, *I have been, or I was*	fuimus	fuerim	fuerimus
fuisti	fuistis	fueris	fueritis
fuit	fuerunt	fuerit	fuerint
	Future Perfect		
fuero, *I shall have been*	fuerimus		
fueris	fueritis		
fuerit	fuerint		
	Pluperfect		
fueram, *I had been*	fueramus	fuissem	fuissemus
fueras	fueratis	fuisses	fuissetis
fuerat	fuerant	fuisset	fuissent

Imperative Mood

es, *be thou*	este, *be ye*
esto, *thou shalt be*	estote, *ye shall be*
esto, *he shall be*	sunto, *they shall be*

Infinitive

Pres. esse, *to be*
Perf. fuisse, *to have been*
Fut. futurus esse, *to be about to be*

Participle

Fut. futurus, *about to be*

Note.—There also occur:

Imperf. subj. forem, fores, foret, forent
Fut. Inf. fore

The Four Conjugations

Active

	I		II		III		IV	
				Indicative				
Present Stem.								
Present	-o -ās -at	-āmus -ātis -ant	-eo -ēs -et	-ēmus -ētis -ent	-o -is -it	-imus -itis -unt	-io -īs -it	-īmus -ītis -iunt

Perfect Stem								
Perfect	-āvi -āvisti -āvit	-āvimus -āvistis -āvērunt	-ui -uisti, &c.		-i -si -vi -ui } &c.		-īvi &c.	
Future Perfect . .	-āv-ero -āveris -āverit	-āverimus -āveritis -āverint	-uerim &c.		-erim &c.		-īverim &c.	
Pluperfect . . .	-āv-eram -āveras -āverat	-āverāmus -āverātis -āverant	-ueram &c.		-eram &c.		-īveram &c.	
				Subjunctive				
Present Stem.								
Present	-em -ēs -et	-ēmus -ētis -ent	-eam -eās -eat	-eāmus -eātis -eānt	-am -ās -at	-āmus -ātis -ant	-iam -ias, &c.	
Imperfect . . .	-ārem -ārēs -āret	-ārēmus -ārētis -ārent	-ērem -ērēs &c.		-erem -eres &c.		-īrem -īres &c.	
Perfect Stem								
Perfect	-āv-erim -āveris -āverit	-āverimus -āveritis -āverint	-uerim &c.		-erim &c.		-iverim &c.	
Pluperfect . . .	-avissem -avisses, &c.		-uissem &c.		-issem &c.		-īvissem &c.	
				Imperative				
Present Stem.	-ā -āto -āto	-āte -ātōte -anto	-ē -ēto -ēto	-ēte -ētōte -ento	-e -ito -ito	-ite -itōte -unto	-ī -īto -īto	-īte -ītōte -iunto
				Infinitive				
Present . . . . Perfect . . . . Future	-āre -avisse -āturus esse		-ēre -uisse -iturus esse		-ere -isse -turus esse *or* -surus esse		-īre -īvisse -īturus esse	
				Participle				
Present . . . . Future	-ans -aturus		-ens -iturus		-ens -turus *or* -surus		-iens -iturus	
				Gerund				
	-andum -ī -o		-endum &c.		endum &c.		-iendum &c.	

Passive

To form the passive *present* stem, indicative and subjunctive tenses, *i.e.* present, future, and imperfect indicative and subjunctive, it is merely necessary to substitute for the active endings :

-o *or* -m	-mus
-s	-tis
-t	-nt,

the passive endings :

-or	-mur
-ris	-mini
-tur	-ntur

Thus, if the future indicative active of *audio* is :

audiam, -es, -et ; -emus, -etis, -ent,

the passive will be :

audiar, -eris, -etur ; -emur, -eminī, entur.

The passive *perfect* stem tenses in the indicative and subjunctive are formed by using the past participle passive, together with the following tenses of *sum* :

		Indic.	*Subj.*
In the	Perfect	sum	sim
„	Fut. Perf.	ero	
„	Pluperf.	eram	essem

Thus the 1st person plural pluperfect of *rego* will be *recti essemus.*

The infinitive passive is as follows :

Conj.	I	II	III	IV
Pres.	-āri	-ēri	-ī	-īri
Perf.	-ātus esse	-itus esse	-tus *or* -sus esse	-ītus esse
Fut.	-ātum īri	-itum īri	-tum *or* -sum īri	-ītum īri

The imperative is :

I		II		III		IV	
-āre	-āminī	-ēre	-ēminī	-ere	-iminī	-īre	-īminī
-ātor		-ētor		-itor		-ītor	
-ātor	-antor	-ētor	-entor	-itor	-untor	-ītor	-iuntor

The *Gerundive* is *-ndus* added to the present stem.

An analytical examination of the above tables of forms shows the following aids to verb inflexion :

1. The future indicative in conjugations 1 and 2 ends in *-bo* ; in conjugations 3 and 4 in *-am.*
2. Imperfect subjunctive can always be formed by adding *-m* to the present infinitive.
3. In the passive imperative the 2nd person singular is the same as the present infinitive active.
4. The 3rd person plur. imperative active is 3rd plur. indicative active+*o*.

The tables only show the commonest type in each conjugation. Below are given the principal parts of each of the various types of regular verbs. It will be noted that the 3rd conjugation shows the largest variety.

First Conjugation.—Perfect in *-avi.*

amo, *love* amare amavi amatum
N.B.—But poto, *drink*, has potum

Perfect in *-ui.*

cubo, *lie* cubare cubui cubitum
N.B. But seco, *cut*, has sectum

Perfect in *-i*, with lengthened root-vowel.

lavo, *wash* lavare lavi lautum, lotum

Reduplicated perfect.

sto, *stand* stare steti statum

Second Conjugation.—Perfect in *-ui.*

moneo, *warn* monere monui monitum

Perfect in *-ui*, and past participle in *-tus* (*-sus*).

doceo, *teach* docere docui doctum
censeo, *estimate* censere censui censum

Perfect in *-si.*

augeo, *increase* augere auxi auctum

Perfect in *-vi.*

repleo, *fill* replere replevi repletum

Reduplicated perfect.

tondeo, *shear* tondere totondi tonsum

Perfect in *-i*, with lengthened root-vowel.

video, *see* videre vidi visum

Third Conjugation.—*A.* Present formed by adding *-o* to root.

Perfect in *-si.*

rego, *rule* regere rexi rectum

Note.—With few exceptions whenever the root ends in a mute consonant.

Perfect in *-ui.*

molo, *grind* molere molui molitum

Reduplicated perfect.

cado, *fall* cadere cecidi casurus

Perfect in *-i*, without lengthening.

verto, *turn* vertere verti versum

Perfect in *-i*, with lengthened root-vowel.

Ago, *drive*, *do* agere egi actum

Perfect in *-īvī.*

peto, *seek* petere petivi petitum

B. Where the present stem is formed by reduplication of the root.

sisto (si-sto), *set* sistere stiti statum
gigno (gi-gno), *beget* gignere genui genitum
sero (si-so), *sow* serere sevi satum
bibo (bi-bo), *drink* bibere bibi —

C. Where the present stem inserts a nasal after the root-vowel, as is manifest from the past participle or perfect stem.

Perfect in *-si.*

fingo, *mould* fingere finxi fictum

Reduplicated perfect.

tango, *touch* tangere tetigi tactum

Perfect in *-i*, with lengthened root-vowel.

fundo, *pour* fundere fūdi fusum

Perfect in *-i*, without lengthening.

findo, *split* findere fidi

Perfect in *-ui.*

recumbo, *lie down* recumbere recubui recubitum

D. Present in *-no* and *-llo* (from *-lno*).

Perfect in *-vi.*

cerno, *see* cernere crevi cretum

Reduplicated perfect.

pello, *drive* pellere pepuli pulsum

Perfect in *-si.*

contemno, *despise* contemnere contempsi contemptum

E. Present in *-to.*

flecto, *bend* flectere flexi flexum

F. Present in *-sco.* Primary verbs.

cresco, *grow* crescere crēvi crētum

Inchoatives (*i.e.* verbs describing a process) in *-esco.*

calesco, *grow hot* calescere calui ——

In *-isco.*

dormisco, *fall asleep* dormiscere dormīvi ——

In *-asco.*

vesperasco, *grow dusk* vesperascere vesperāvi ——

G. Present in *-esso.*

capesso, *seize* capessere capessīvi capessītum

H. Present in *-uo.*

Perfect in *-ui.*

statuo, *set up* statuere statui statutum
ruo, *rush* ruere rui ruiturus

Perfect in *-xi.*

struo, *build* struere struxi structum

I. Present in *-io.*

Perfect in *-i*, with lengthened root-vowel.

facio, *make* facere fēci factum

Perfect in *-si.*

aspicio, *look at* aspicere aspexi aspectum

Perfect in *-īvi.*

cupio, *desire* cupere cupīvi cupītum

Perfect in *-ui.*

rapio, *seize* rapere rapui raptum

Reduplicated perfect.

pario, *give birth to* parere peperi partum

Fourth Conjugation.—Perfect in *-īvi.*

audio, *hear* audīre audīvi audītum

Perfect in *-si.*

vincio, *bind* vincīre vinxi vinctum

Perfect in *-ui.*

aperio, *open* aperīre aperui apertum

Perfect originally reduplicated.

reperio, *find* reperīre repperi repertum

Perfect in *-i*, with lengthened root-vowel.

venio, *come* venīre vēni ventum

Irregular Verbs.—Compounds of *sum.*

These are conjugated like *sum*, with the exception of

possum, *I can* posse potui

Note.—*Possum* (potis-sum) in its present system follows *sum*, dropping the *-s-* and substituting *-t-* before vowels—e.g. *poteram*, I was able.

In its perfect system it is conjugated as belonging to an obsolete form, *poteo*, of the 2nd Conjugation.

volo, *wish.* nōlo, *be unwilling.* mālo, *prefer.*

Present

Indic.	*Subj.*	*Indic.*	*Subj.*	*Indic.*	*Subj.*
volo	velim	nolo	nolim	malo	malim
vis	velis	nonvis	nolis	mavis	malis
vult	velit	nonvult	nolit	mavult	malit
volumus	velimus	nolumus	nolimus	malumus	malimus
vultis	velitis	nonvultis	nolitis	mavultis	malitis
volunt	velint	nolunt	nolint	malunt	malint

Imperfect

volēbam vellem nolēbam nōllem malēbam māllem

Future

volam nolam malam
-ēs, -et, &c. -ēs, -et, &c. -ēs, et, &c.

The perfect system is formed on a perfect in *-ui.*

Infinitive

velle	nolle	malle
voluisse	noluisse	maluisse

Participle

volens nolens

Fero, *bear.*

Principal parts : *fero, ferre, tuli, lātum.*

Pres. Ind. : fero, fers, fert, ferimus, fertis, ferunt. All the other forms are regularly based on the principal parts, except 2nd person sing. imperative, *fer.*

Eo, *go.*

Principal parts : *eo, īre, ii, itum.*

	Indicative.		*Subjunctive.*	
Pres.	eo	īmus	eam	eāmus
	īs	ītis	eās	eātis
	it	eunt	eat	eant
Fut.	ībo			
Imperf.	ībam		īrem	
Perf.	ii	iimus	ierim	
	īsti, iisti	īstis, iistis		
	iit, īt	iērunt		
Fut. Perf.	iero			
Pluperf.	ieram		īssem	

Imperative.		*Infinitive.*	*Participle.*	*Gerund.*
ī	īte	Pres. īre	Pres. iens (genitive euntis, &c.)	eundum
īto	ītote	Perf. īsse, iisse	Fut. itūrus	
īto	eunto	Fut. iturus esse		

Fīo, *become.*

Fīo acts as the passive of *facio*, make, in the present system. In the perfect system, and in the gerundive, the forms of *facio* are used.

	Indicative.		*Subjunctive.*	
Pres.	fīo	—	fīam	fīāmus
	fīs	—	fīas	fīātis
	fīt	fīunt	fīat	fīānt
Fut.	fīam, -ēs, -et, &c.			
Imperf.	fīēbam		fierem	

	Imperative.		*Infinitive.*
Pres.	fi	fite	fieri

Edo, *eat.*

Principal parts : *edo, edere, ēdi, ēsum.*

ACTIVE

	Indicative.		*Subjunctive.*	
Pres.	edo	edimus	edim, -am	edimus, -amus
	ēs	ēstis	edis, -ās	editis, -ātis
	ēst	edunt	edit, -at	edint, -ant
Fut.	edam			
Imperf.	edēbam		ēssem	

	Imperative.		*Infinitive.*	*Participle.*
Pres.	ēs	ēste	ēsse	edēns
Fut.	ēstō	ēstōte	ēsurus esse	ēsūrus
	ēsto	edunto		

PASSIVE

Pres. Indic. 3rd. pers. sing.	ēstur
Imperf. Subj. ,, ,, ,,	ēssētur

The perfect system is regular.

Dō, *give.*

Principal parts : *do, dare, dedī, datum.*

ACTIVE

	Indicative.		*Subjunctive.*	
Pres.	dō	damus	dem	dēmus
	dās	datis	dēs	dētis
	dat	dant	det	dent
Fut.	dabo			
Impf.	dabam		darem	
			&c.	

Defective Verbs.—*Aio,* say, has only the following forms :

Pres. Indic.	aio, ais, ait, aiunt.
Pres. Subj.	aiās, aiat.
Imperf. Indic.	aiēbam, -ās, -at, -āmus, -ātis, -ant.
Imperative.	ai. Participle. aiēns.

Inquam, say, has the following forms :

Pres. Indic.	inquam, inquis, -it, -imus, -itis, -iunt.
Imperf. ,,	inquiēbat Perf. Indic. inquii, inquisti.
Fut. ,,	inquiēs, inquiet. Imper. inque, inquito.

Fārī, speak, has :

Pres. Indic.	fātur (-fāmur in compounds)
Imperf. ,,	(-fābar, -fābantur in compounds)
Fut. ,,	fābor, fābitur (-fābimur in compounds)
Perf. ,,	fātus sum, &c.
Pluperf. ,,	fātus eram, &c.
Imper.	fāre
Infinitive.	fārī
Pres. Part.	fāns
Perf. Part. Pass.	fātus
Gerundive.	fandus
Gerund.	fandī, fandō
Supine.	fātū

Meminī, *remember ;* ōdī, *hate ;* coepī, *begin.*

These three verbs, while Perfect in system, are Present in meaning. But *memini* has imperative *memento, mementote,* and *odi* has future participle *osurus.*

Impersonal Verbs

Some verbs occur only in the 3rd person singular and infinitive, and are used impersonally :

The commonest are :

licet, *it is allowed.*	decet, *it is fitting.*	libet, *it is pleasing*
miseret, *it is pitiful.*	ninguit, *it snows.*	pluit, *it rains.*
oportet, *it is necessary.*	pudet, *it shames.*	taedet, *it disgusts.*
tonat, *it thunders.*		

Prepositions.—The only part of speech remaining that may present any difficulty is the *preposition.* In Latin, prepositions govern, some the accusative, some the ablative case—*i.e.* the noun depending on them falls into one of those cases ; *e.g.* :

ad urbem veni, *I came to the city.*
ex Oriente lux, *light from the East.*

The following prepositions govern the accusative :

ad, *to.*	contrā, *against.*	pōne, *behind.*
adversus, *against, opposite to.*	extrā, *outside.*	post, *after.*
ante, *before.*	infrā, *beneath.*	praeter, *beside.*
apud, *among.*	inter, *between.*	propter, *because of.*
circā, circiter, circum } *around, about.*	intrā, *within.*	secundum, *according to.*
	juxtā, *beside.*	suprā, *above.*
	ob, *on account of.*	trans, *across.*
citrā } *this side of.*	penes, *in the power of.*	ultra, *beyond.*
	per, *through.*	versus, *towards.*

The following govern the ablative :

a, ab, *from, by.*	coram, *in the presence of.*
absque, *without.*	cum, *with.*
clam, *unknown to.*	sine *without.*
palam, *in sight of.*	de, *from, concerning.*
ex, e, *out of, from.*	prae, *before, in front of.*
pro, *before, for.*	tenus, *as far as.*

The following govern either case according to meaning :

	Accusative.	*Ablative.*
in,	*into, to, against ;*	*in, among, on.*
sub,	*up to;*	*under.*
subter,	*underneath;*	*close to.*
super,	*over;*	*upon.*

Translate, giving every possible meaning of : Rex vēnit ; milites pugnabunt ; mox adveniet ; fiat justitia, ruat coelum ; puellae cecinerint ; lampada trādā ; vox populi terribilis est ; quid facis, o demens ? nocte abiērunt ; Caesar nonvult regnare ; maluistis domi manēre ; omnium assensu proelium inceptum erat ; Juno amatur ; monēre ; audiebamini ; amari dulce est ; quis non meminit ? recumbere coeperat ; cavēto ; tulisset ; mala non ferenda ; horribile dictu ; oblivisci malum est ; servi vincti erunt ; porta aperta ; fac ; sol caluit ; ipse ruet ; ipse rueris. Quis, talia fando, temperet a lacrimis ?

Syntax, or the Use of Words

Syntax is the science of the use of words in sentences.

Sentences are either *Simple* or *Compound.*

Simple Sentences.—A simple sentence has two parts :

1. The *Subject :* the person or thing about which something is stated.
2. The *Predicate :* that which is stated.

Thus, in the sentence, *Pompeius signum dedit,* Pompey gave the signal, *Pompeius* is the subject, and *signum dedit* is the predicate.

The *Subject* must be one of the following:

1. A *Substantive*: *rex*, the king.
2. A *Substantive Pronoun*: *ego*, I.
3. An *Adjective, Participle*, or *Adjective Pronoun* concealing a hidden noun: *audax*, a bold man; *iratus*, an angry man; *ista*, that woman of whom you were speaking.
4. A *Verb Noun*: *decorum est pro patria mori*, to die for one's country is a noble thing.

Note.—A personal pronoun as subject is usually implied in the verb, and is not separately expressed—e.g. *loquor*, I speak. But for the purpose of emphasis the pronoun is expressed—e.g. *ego loquor et tu audis*, I speak and you hear.

The *Predicate* must be a verb, or a group of words containing and centring round a verb:

Cicero advenit, *Cicero arrived. Advenit* is predicate.

Princeps oratorem ex omnibus disertissimum laudavit, *the emperor praised the most eloquent orator of them all.* From *oratorem* to *laudavit* is predicate.

Agreement.—A *Verb* agrees with its subject in Number and Person:

Haec tria sunt, *these things are three.*
Romani vincunt, *the Romans conquer.*

An *Adjective* or *Participle* agrees with the noun it qualifies in *Number, Gender*, and *Case*:

Magnam partem dividunt, *they divide a large part.*

The *Relative Pronoun* agrees with its antecedent in Gender, Number, and Person; in Case it follows the construction of the clause of which it is part:

Quis est homo quem video? *who is the man I see?*

Te sequor, qui fortis es, *I follow you, who are strong.*

A *Noun* agrees in number, and, where possible, in gender:

1. In apposition to another noun.

Juno, Jovis conjunx, *Juno, the wife of Jove.*

2. When predicative of another noun after the verb *sum* or some similar verb:

Croesus non semper mansit rex, *Croesus did not always remain king.*

Note.—1. When two or more nouns jointly are the subject, verbs and adjectives agreeing with them are generally in the plural:

Romulus et Remus abierunt, *Romulus and Remus went away.*

2. If the persons composing such a subject are different, agreement is with the first person rather than the second, and with the second rather than the third:

Si tu et Cicero id cupitis, ego et Caesar cupimus, *if you and Cicero desire this, Caesar and I desire it.*

3. When the genders are different, adjectives show a preference for the masculine:

Antonius Aegyptiacque regina profecti sunt, *Antony and the Queen of Egypt set out.*

4. Where all the nouns denote inanimate things, the adjectives are neuter:

Amor et dementia consanguinea sunt, *love and madness are kin.*

The Cases.—*Nominative*, the case of the Name.

The subject of a finite verb is in the nominative case:

Fortuna fortes adjuvat, *fortune favours the brave.*

Vocative, the case of Address.

The vocative or nominative used as vocative stands isolated from the rest of the sentence, without any place in its construction:

Infandum, regina, jubes renovare dolorem, *Unspeakable, O queen, is the pain thou biddest me renew.*

Accusative.—The Latin accusative expresses three main ideas:

1. Limitations of time and space.
2. Adverbial relations.
3. Direct object.

I. *Limitations of Time and Space.*

1. *Duration of time:*

Quinque et viginti annos natus, *twenty-five years old.*

Abhinc tres annos, *three years ago.*

2. *Extent of space:*

Arbores quinquaginta pedes altae, *trees fifty feet high.*

3. *Motion towards* a thing or place.

(*a*) The accusative alone is used with names of towns and small islands, and with *domum* and *rus*:

Romam veni, *I came to Rome.*
Rus ibo, *I shall go to the country.*

(*b*) In the case of other words a preposition is used:

Ad castra fugerunt, *they fled to the camp.*

II. *Adverbial Relations.*

1. *Accusative showing degree*, in adjectives and pronouns in the neuter:

Multum sunt in venationibus, *they are much occupied in hunting.*

Maximam partem severus erat, *for the most part he was stern.*

2. *Accusative borrowed from Greek* (misnamed accusative of respect).

Generally used with words expressing parts of the body :

Tremit artus, *he trembles in his limbs.*
Mentem pressus, *overwhelmed in mind.*

III. *Accusative of Direct Object.*

The *direct object of a transitive verb* is in the accusative case :

Exegi monumentum, *I have wrought a monument.*

Fabius in suam provinciam exercitum reduxit, *Fabius led his army back into his own province.*

Verbs of *making, saying, thinking,* &c., have a second accusative agreeing with the object :

Illi me comitem misit, *he sent me to him as companion.*

Urbem Romam vocavit, *he called the city Rome.*

Verbs of *saying, thinking, perceiving,* &c., may have as their object an accusative followed by an infinitive of which it is the subject:

Scio te Romanum esse, *I know you are a Roman* (lit. *I know you to be a Roman*).

Dixit se nuper venisse, *he said he had lately come* (lit. *He said himself to have come lately*).

A similar construction is found with impersonal verbs :

Taedet nil praeter coelum videre, *it is wearisome to see nought but the sky.*

Some verbs of *teaching, asking, concealing* take two accusatives, one of the person, the other of the thing :

Hoc solum te rogo, *this one thing I ask you.*
Nihil nos celat, *he conceals nothing from us.*

Intransitive verbs sometimes take as object an accusative noun with meaning similar to their own :

Somniare somnium, *to dream a dream.*
Stadium currit, *he runs a race.*

Note.—This is the construction known as the cognate accusative.

Translate :—Ruit per urbem. Revenit sub murum. Duxit milites trans pontem. Quot annos Romae eras ? Vincta manus. Te mitem praebuisti. Longam vivere vitam. Hoc unum vos rogabo. Sentiunt se morituros esse. Nego me adfuisse. Dicunt se Caesarem vidisse. Scio Ciceronem disertum esse oratorem. Pueros docebat versūs componere. Boadicea nuda pectus negat se talia diutius passum iri. Quod dixi, dixi. Istius libri primam paginam perlexi, sed nolo te putare me talia amare. Patriae leges sacrae esse debent. Augur consulem monet hostes mox adfuturos esse. Multa timeo. Cicero se timidum praestitit.

Genitive.—The genitive is the case which, speaking generally, translates the English word "of."

Thus, it is used :

A. *To define :*

Hoc regis nomen, *this name of king.*

So to denote authorship :

Iste liber Platonis est, *that book of yours is by Plato.*

Words containing the idea of *accusing, condemning, convicting,* or *acquitting* take a genitive of the offence :

Ambitus accusare, *to accuse of bribery.*
Impietatis absolutus, *acquitted of blasphemy.*

B. To indicate *possession :*

Amici Caesaris, *Caesar's friends.*

Hence the idiom in which the genitive is used impersonally with such a verb as *est,* to denote something that is characteristic :

Imbecilli animi est superstitio, *superstition is a mark of a weak mind.*
Judicis est, *it is the duty of a judge.*
Audacis animi est, *it requires a bold spirit.*

Under this head may be placed the use of the genitive of pronouns and words denoting persons after adjectives meaning *like, common,* &c. :

Viri propria est fortitudo, *bravery is characteristic of a man.*
Mei similis est, *he is like me.*

C. *To denote Quality.*

1. Denoting an attribute of a person or thing :

Vir excellentis ingenii, *a man of distinguished ability.*

Ingentis magnitudinis serpens, *a serpent of enormous size.*

2. Denoting measure :

Exilium decem annorum, *an exile of ten years.*
Murus decem pedum, *a wall ten feet high.*

3. To denote indefinite value, *tanti, quanti, pluris, minoris, parvi, magni, plurimi, minimi, maximi,* are used predicatively :

Sunt jurgia tanti ? *does railing amount to so much ?*

And the first four are used with verbs of buying and selling to denote indefinite price :

Frumentum tanti fuit, *corn was so dear.*

D. *Partitive Genitive.*

I.e. the genitive of a whole, of which parts or a part are distinguished:

Quis deorum? *who of the gods?*
Dimidium facti qui coepit habet, *he has half done the work who has begun it. (Well begun is half done.)*

E. *Objective Genitive.*

I.e. where the genitive is a person or thing acted on by the noun on which it depends, rather than acting upon it:

Hoc maximum periculorum incitamentum est, *this is the greatest encouragement to confront danger.*

Thus *amor parentum* can mean either "love towards . . . ," or "love felt by one's parents."

Under this head may be placed the use of the genitive with adjectives signifying *desire, knowledge, recollection, fear, participation,* and their opposites, together with adjectives in *-ax* formed from verbs, and many participles used adjectivally:

Avidus pecuniae, *greedy of money.*
Beneficii immemor, *apt to forget a kindness.*
Antiquitatis peritus, *learned in archæology.*
Circus capax populi, *a circus big enough to hold a nation.*
Officii negligens, *neglectful of duty.*

Akin to the objective genitive is the use of the genitive *of the thing which* after *obliviscor,* forget; *memini,* remember; *reminiscor,* recollect; *admoneo* and *commoneo,* remind; *misereor* and *miseresco,* pity; and Impersonal Verbs of Feeling, such as *piget, pudet, taedet, miseret,* and *paenitet.*

Officii sui commonere, *to remind (a man) of his duty.*
Taedet me desidiae, *I am tired of sloth.*
Miserere mei debent, *they ought to pity me.*

Translate: Statuam auri dedicavit. Ille equus regis est. Metus deorum magnam partem hominum regit. Oblitus es iter plenum periculorum esse. Quanti libros vendidisti? Tantae molis erat Romanam condere gentem. Furti accusatus judicem praeteritae amicitiae admonet. Timor deorum. Viginti annorum bellum. Satis industriae quis habet? Deorum oblivisci nefas est.

The Dative.—Dative of indirect object, i.e. the case of the person or thing to whom anything is told or given.

This dative is used with many intransitive verbs signifying *pleasing, helping, sparing, pardoning, appearing, speaking, believing, obeying*:

Si illa tibi placet, *if she is pleasing to you.*
Bonis nocet qui malis parcit, *he harms the good who spares the bad.*
Amicis confido, *I trust my friends.*
Regi haec dicito, *tell this to the king.*
Praedam militibus donat, *he presents the booty to the soldiers.*

Verbs of this class are used in the passive only impersonally:

Pio generi parcitur, *the pious race is spared.*
Mihi invidetur, *I am envied.*
Caesari paretur, *Caesar is obeyed.*

A similar dative is used after many verbs compounded with the prepositions:

ad, ante, ab, sub, super, ob,
in, inter, de, con, post, and prae.

Subvenisti homini jam perdito, *you have come to the help of a man who is already lost.*
Consiliis interdum fortuna obstat, *Fortune sometimes opposes our plans.*
Praesentia confer praeteritis, *compare things present with things past.*

The use of the dative after adjectives implying *nearness, fitness, likeness, help, kindness, trust, obedience,* or their opposites, is akin to the idea of the indirect object:

Illi par in belligerando, *his equal in warfare.*
Mihi amicissimus, *most friendly to me.*

Note.—The following take genitive or dative: *communis,* common; *proprius,* proper.

The following take dative more usually, but genitive sometimes: *affinis,* akin; *alienus,* foreign; *par,* equal; *sacer,* sacred. *Similis,* like, generally takes genitive.

Dative of Reference.—This use of the dative denotes the person *to whom a statement refers, of whom it is true,* or *to whom it is of interest:*

Intercludere hostibus commeatum, *to cut off the supplies of the enemy.*

Akin to this dative is the use familiarly known as the *Ethic Dative,* which is used in the case of personal pronouns to suggest *concern* or *interest* on the part of the person denoted:

Quid mihi Celsus agit? *what is my Celsus doing?*
Sit mihi orator tinctus litteris, *our orator should have a smattering of culture.*

Dative of Agency.—The dative is used to denote agency regularly with the gerundive:

Vobis erit videndum, *you will have to see to it.*
Carthago Romanis delenda est, *Carthage must be destroyed by the Romans.*

Also, less freely, with the past part. pass.:

Civis formidatus Othoni, *a citizen dreaded by Otho.*

Dative of Possession:

Est mihi hoc consilium, *I have this plan.*
Roma, tibi quot sunt cives? *O Rome, how many citizens hast thou?*

Dative of Purpose.—This use of the dative denotes *the object prompting an action*, or *the purpose of a thing's existence :*

Canem tibi praesidio relinquam, *I will leave the dog as a guard for you.*
Exemplo est magni formica laboris, *the ant is an example of great industry.*

This construction is used in a special idiom with the gerundive :

Decemviri stlitibus judicandis, *decemvirs for judging disputes.*

Dative of Direction.—This use is solely poetical:

It clamor coelo, *the shout rises to heaven.*

Translate : Imperator mihi dixit, "dā pecuniam mulieri." Castris aggerem circumdedit. Rex innocentibus favet. Quomodo tibi persuadebo ? Cohorti praeest. Judicis est justitiam favori anteponere. Medicinus ei morbum deminuit. Plato mihi maximus est philosophorum. Quis mihi honorem detrahet ? Uxor tibi est amanda. Longum iter militibus faciendum est. Viginti homines praesidio relicti sunt. Cui bono est ? Mox Caesar tibi veniet auxilio. Dictatorem creaverunt hostibus expellendis. Urbs Romae proxima. Haec arma pugnae idonea sunt.

Ablative.—The Latin ablative comprises the uses of three cases originally distinct in form and meaning :

The Ablative or *from*-case.
The Instrumental or *with*-case.
The Locative or *where*-case.

A. *Genuine Ablative.*

Separation.—Verbs of *freeing, depriving, lacking*, and their corresponding adjectives take the ablative, as also the adverb *procul*, far from :

Populum metu liberat, *he frees the people from fear.*
Leva me hoc onere, *relieve me of this burden.*
Curis liberatus, *free from cares.*

Note.—Compounds of *dis-* and *sē-* require a preposition with the ablative :

Dissentio a te, *I differ from you.*

Ablative of Comparison.—The ablative is used with comparatives as a substitute for *quam*, than, with the nominative or accusative :

Natu Catullo major est, *he is older than Catullus.*
Neminem Lycurgo utiliorem Sparta genuit, *Sparta bore no son more useful to her than Lycurgus.*

Ablative of Source.—Chiefly used with the participles *natus* and *ortus :*

Nate deā, *O goddess-born !*

Note.—Pronouns regularly require *ex :*

E quo natus ? *sprung from whom ?*

Ablative of Agent.—The ablative with *ab* is used to denote the *personal agent :*

A Bruto interfectus, *slain by Brutus.*

B. *Instrumental Ablative.*

1. To denote *means :*

Hastā vulneratus, *wounded by a spear.*

The ablative is used in this grade of meaning with *utor*, use ; *fruor*, enjoy ; *fungor*, perform ; *potior*, get possession of ; *vescor*, eat.

Libris utitur, *he uses his books* (lit. *he benefits himself by his books*).
Pane vescor, *I eat bread* (lit. *I feed myself by means of bread*).

Similar is the use of the ablative with *opus est*, there is need :

Quid opus est verbis ? *what need is there of words ?*

The same sense is apparent in the use of the ablative :

(*a*) With *nitor*, lean on ; *innixus*, leaning on ; and *fretus*, supported by.

Fretus virtute, *relying on courage* (lit. *supported by*).

(*b*) With verbs denoting *to consist of :*

Venis et nervis et ossibus continentur, *they are made up of veins, sinews, and bones.*

(*c*) With verbs denoting *exchanging, mixing, accustoming*, or *joining :*

Pace bellum mutavit, *he has exchanged war for peace.*
Virtus pulchritudine conjuncta, *virtue joined with beauty.*

(*d*) With *facio* and *fio :*

Quid fecisti scipione ? *what have you done with the stick ?*

(*e*) With verbs and adjectives of *plenty, fulness*, and *possession :*

Villa abundat gallinā, *the farm abounds in poultry.*
Omni culpa carens, *free from any blemish.*

Note.—But *plenus*, full, more usually takes the genitive.

2. To denote *cause :*

Coeptis immanibus effera Dido, *Dido driven mad by her awful deeds.*

Hence the use with verbs denoting *mental states*, as

delector, *I am pleased.* glorior, *I glory.*
gaudeo, *I rejoice.* fido, *I trust.*
laetor, *I am glad.* confido, *I trust.*
contentus, *satisfied.*

Illum, quo antea confidebant, metuunt, *him in whom they trusted once, they fear.*

3. To denote *attendant circumstances:*

(*a*) Personal manner:

Cum elephanti facie puer natus est, *the boy was born with an elephant's face.*

Silentio evasit, *he slipped away in silence.*

(*b*) Outside circumstances:

Exercitum duarum cohortium damno deducit, *he leads his army back with a loss of two cohorts.*

(*c*) With *cum*, with, to denote accompaniment:

Cum Caesare omnis spes salutis absumpta est, *with Caesar died all hope of safety.*

4. To denote *description.*

In this sense the ablative is used with an adjective in agreement with it:

Summā virtute adulescens, *a youth of high courage.*

Eximiā formā est, *she is of exceptional beauty.*

5. To denote *degree of difference:*

Dimidio minor quam Britannia, *smaller by half than Britain.*

Paucis ante diebus, *a few days before.*

6. To denote *price.*

With verbs of *buying* and *selling:*

Vendidit hic auro patriam, *this man sold his country for gold.*

7. To denote that *in respect to which* something is or is done:

Major natu, *older* (i.e. *greater as to age*).
Minor natu, *younger.*
Eloquentiā ceteris praestitit, *he surpassed the rest in eloquence.*

Under this head comes the use of the ablative with *dignus*, worthy, and *indignus*, unworthy:

Supplicio digni, *deserving of punishment.*

8. *Ablative Absolute.*—This is a phrase consisting of a noun and a participle or another noun in the ablative case. It is independent of the construction of the rest of the sentence; hence the name *Absolute.*

It has the force of a dependent clause and thus may denote:

1. *Time.*

Natus est Augustus consule Cicerone, *Augustus was born when Cicero was consul.*

2. *Condition.*

Te duce, vincemus, *if you are leader, we shall win.*

3. A state of things in spite of which something happened.

Paucis defendentibus oppidum expugnare non potuit, *though the defenders were few, he could not take the town.*

4. *Manner:*

Incitato equo se hostibus obtulit, *he set spurs to his horse and charged the foe.*

C. *Locative use of the Ablative.*

Place where is regularly denoted by the ablative with a preposition:

Corpus in via repertum est, *the body was found in the road.*

Place whence is denoted in the same way:

Ab Africa cras redibit, *he will return tomorrow from Africa.*

But in both these senses
(*a*) Names of towns and small islands;
(*b*) Domo, ruro;
(*c*) Any ablative in poetry
are used without a preposition.

Time at which:

Idibus Martiis accidit, *it happened on the Ides of March.*

Time within which:

In decem annis quater consul fuerat, *he had been consul four times in ten years.*

Note.—The preposition *in* is necessary:
(*a*) with words denoting *time of life* or *office*, unless qualified by an adjective; thus:

In pueritiā, *in boyhood;* but prima pueritia, *in early boyhood.*

In consulatu, *in his consulship;* but quarto consulatu, *in his fourth consulship.*

(*b*) In phrases expressing situation:

In tali tempore, *at such a season.*

(*c*) After a numeral adverb:

Ter in anno, *three times in the year.*

Translate: Nemo nobili genere ortus potest honestate carere. Vir sapientiā vacuus. Fatis desertus ab Africā cum decem servis rediit. Caesar a Bruto pugione interfectus est. Quid melle dulcius, quid leone fortius est? Nemo qui carne vescitur potest vitā frui. Coelum

monte quodam fretum est. Quid meā Tulliolā fiet? Proelio victus urbem militibus complet. Gaudeo Romanorum victoriis. Bonis auspiciis profecti sunt. Pater fili virtute gloriatur. Suā sponte pecuniam reddiderat. Equum ēmi singulari velocitate. Judaeā captā, Titus revēnit. Sole oriente volucres canere coepērunt. Vere resplendent columbae. Jove adverso victor revenit. Omni pecuniā absumptā, nobis laborandum est. Passis crinibus deorum altaria petunt. Londinio profectus triginta diebus ad Africam pervenit. Tertiā horā adero. Haustus ter in die sumendus.

Case Construction with Impersonal Verbs.—*Miseret, piget, paenitet, pudet, taedet,* take an accusative of the person and genitive of the cause:

Miseret me alienorum injuriorum, *I pity the injuries of others.*

Decet, dēdecet, take an accusative of the person with an infinitive as predicate:

Te decet haec dicere, *it becomes you to say this.*

Libet, licet, liquet, contingit, convenit, evenit, expedit, take a dative of the person:

Ne libeat tibi quod non liceat, *let not that please you which is not allowed.*

Interest, it is of importance, it concerns, takes the genitive of the person or thing concerned, save in the case of the possessive pronouns, when it takes the ablative feminine:

Hoc plebis interest, *this concerns the common people.*
Multum vestrā interest, *it concerns you much.*

Refert, with the same meaning as *interest,* is used in the same way, save that the construction with the genitive is rare.

Pertinet, attinet, take the accusative with *ad:*

Quid ad me attinet? *what does it concern me?*

Oportet is used with the accusative and infinitive, or with the subjunctive alone:

Oportet loquamur, *we must speak.*
Hanc scire oportet filia tua ubi sit, *this woman must know where your daughter is.*

Translate: Taedet me tot imitatorum. Pudet eum pigritiae. Multum Caesaris interest hoc scire. Parum te decet tales libros legere. Cuivis licet suum servum punire. Haud meā interest Caesarem Gallos vixisse. Oportet nos id solum facere quod bonis civibus licet. Multum ad regem attinet populum legibus parēre. Mox paenitebit me clementiae. Quid nostrā refert Lesbiam ā Catullo amari?

Uses of Adjectives. *Position.*—In prose the natural position for the adjective in Latin is after the word it qualifies, unless it is desired to emphasize it.

There are cases of set phrases depending for their meaning on the position of the adjective—*e.g.:*

mensa secunda = *a second table.*
secunda mensa = *dessert.*

Adjectives are often used alone in the sense of substantives, thus

Boni can mean *good men.*
Bonae „ „ *of a good woman.*
Bona „ „ *goods.*

Superlatives expressing order or sequence in time or space are often used to denote a part of the noun that they qualify—*e.g.:*

Primo vere, *at the beginning of spring.*
Media nocte, *in the middle of the night.*

The *Comparative* is used where English would use the positive after another comparative followed by *quam:*

Divitior est quam cultior, *he is more rich than polished.*

The *Superlative* is used with *quam* to express the utmost possible limit:

Hominem quam mitissimum interfecisti, *you have killed a man who was as gentle as a man can be.*
Partem quam maximam tibi donabo, *I will give you the largest part I can.*

Translate: Omnes boni mediā nocte dormiunt. Mulierem formosiorem quam pudentiorem amare stultissimi est. Pueri poma quam maxima capiunt. Athenienses Socratem hominem quam sapientissimum veneno interierunt. Maxima pars bonorum tuorum igne consumpta est. Dei fortes homines diligunt.

The Use of Pronouns.—The reflexive pronoun *se,* and its possessive *suus,* are used in all clauses.

A. When reference is made to the *grammatical* subject of the clause:

Miles se ipse interfecit, *the soldier slew himself.*
Si se telo defenderet fur, *if the thief should defend himself with a weapon.*
Hoc sibi nomen adrogat, *he assumes this name.*
Litteras ad se ab amico missas produxit, *he produced letters sent to him by a friend.*

B. When reference is made to a *logical* subject:

Sui colligendi hostibus facultatem relinquunt, *they allow the enemy the opportunity to collect themselves.*
Jusso magistro equitum abdicare se magistratu, *when the Master of the Horse had been bidden to depose himself from his office.*

Suus is idiomatically used in conjunction with *quisque*, each:

Suam quisque puellam malit, *each man prefers his own sweetheart.*
Suum cuique donum dabo, *I will give each man a separate gift.*

As Latin has no reciprocal pronoun to express the idea of "one another," use is made of the periphrasis "*inter se.*" The following examples will explain its use:

Puellae inter se amant, *the girls love one another.*
Romani et Carthaginienses inter se odio sunt, *the Romans and Carthaginians are hateful to one another.*
Rem inter se disputant, *they discuss the matter with one another.*
Munera inter se donant, *they give one another rewards.*

The relative pronoun *qui, quae, quod* always refers to a noun or pronoun which is called the *antecedent.*

Thus, in the sentence *homo quem vidi*, the man whom I saw, *homo* is the antecedent.

The antecedent is sometimes omitted in Latin:

Qui deos veneratur nil timet, *he who worships the gods fears nothing.*

The relative pronoun is used sometimes with the meaning of *talis*, such:

Qui meus amor in te est, *such is my love towards you.*
Quae tua natura est, *such is your disposition.*
Qua es diligentia, *such is your diligence.*

The relative is also used at the beginning of a clause where English would use a demonstrative pronoun with a conjunction, thus:

Res loquitur ipsa, quae valet plurimum, *the thing speaks for itself, and this is of great weight.*
Caesari haec nuntiata sunt, qui statim profectus est, *this was told to Caesar, and he set out at once.*

Note.—The relative is never omitted in Latin, as it is sometimes in English. Thus "the man I saw" is always *homo quem vidi.*

Quis, anyone, is the weakest of the indefinite pronouns. It is almost always used after *si*, if; *nisi*, unless; *ne*, lest; *num*, whether.

Rogat num quis venerit, *he asks whether anyone has come.*

Aliquis, someone, is more definite than *quis:*

Aut ipse occurrebat aut aliquos mittebat, *he would either come to meet him himself or send somebody.*

Quidam, a certain one, is the most definite of all:

Quidam ex militibus, *a certain soldier.*
Quidam ex his ad Nervios pervenerunt, *some of these got through to the Nervii.*

Quisquam, anyone, is very general in its meaning:

Estne quisquam omnium mortalium? *is there anyone of all mortal men?*

Quisque, each one, is used idiomatically as follows.

1. With superlative adjectives:
   Piissimus quisque tyrannum odit, *all the most pious men hate a tyrant.*
   Fortissimus quisque bello cecidit, *all the bravest fell in the war.*
2. With *suus* (cf. *sub* Reflexives).
3. With ordinal numerals.
   Septimus quisque filius, *every seventh son.*

Translate: Mulier se in flumen praecipitavit. Si quis se interficit. Suo cuique judicio utendum est. Exercitui diem primam quamque dicit. Nec quisquam tantum audet adire virum. Excessērunt urbe quidam, alii mortem sibi conscīvērunt. Quod tuum ingenium est, doctissimum quemque Graecorum superavisti. Tiberius spectaculis quae ab aliquo ederentur, quam rarissime interfuit. Nisi quis advenerit, abibo. Optime vivit qui omnia amat. Haec reginae dixi, quae nihil locuta est. Ne saucio quidem sui recipiendi facultas dabatur. Omnino est amans sui virtus.

Syntax of the Verb. *Indicative Mood, Present Tense.*—The present tense represents three grades of meaning:

1. What happens at the present time:
   Amo te, *I love you.*
2. What is continuing to happen at the present time:
   Ambulo, *I am walking.*
3. What is true at all times:
   Fortuna fortes adjuvat, *Fortune helps the brave.*

It has also a specialised use with *jam*, and other words of similar meaning, to indicate something that began in the past and is still going on:

Jamdudum est intus, *he has been indoors for a long time (and is there now).*

In narration, when it is desired to make the account especially vivid, the present tense is used for the past, more particularly by the

historians. This use is known as the Historic Present.

Dumnorigi custodes ponit, *he set guards over Dumnorix.*

Cf. English, "Although you knew he was there, you go and do a silly thing like that."

The present tense is also used to indicate an attempted action:

Censeat is qui poenam removet, *let him who is for removing the penalty express his opinion*—i.e. *who is trying to remove.*

Future Tense.—The future expresses:

1. What will take place.
2. What will be in the course of taking place.

In foro ambulabo, *I shall walk in the forum*, or *I shall be walking in the forum.*

In expressing future time, Latin is far more exact than English, taking care to denote, by the use of different tenses, the precise order in time of the actions they express. Thus: "If I tell them this, they will be annoyed," becomes in Latin, *Si haec illis dixero, irascentur*, which means literally, "If I shall have told them this, &c." The Latin mind saw that the "telling" must precede the "becoming annoyed" which is to result from it, and expresses that fact by the use of the future perfect.

Similarly, where English says, "The man who kills Caesar will have to be brave," Latin has *Oportebit fortem esse eum qui Caesarem occidet*, or literally, "He who shall kill Caesar will have to be brave"—*i.e.* "He will have to be brave at the time when he shall in the future kill Caesar."

Similarly, "I shall go away before you come" is in Latin, *Abiero antequam venies.*

Imperfect Tense.—The primary sense of the imperfect is to denote what was happening at a moment in the past:

Ibam forte via sacra, *I was going by chance along the Holy Way.*

Akin to this sense is the meaning of doing a thing repeatedly in the past:

Equos verberabat, *he kept on whipping his horses.*

Abhinc decem annos pila ludebam, *ten years ago I used to play ball.*

The imperfect is also used like the present with *jam* and similar words to indicate something that was happening at a given moment and had then been happening for some time:

Jamdudum flebam, *I had been weeping for a long time.*

Another use in which the imperfect resembles the present is in denoting an attempt to do something:

Quid faciebas? *what were you trying to do?*

Perfect Tense.—The Perfect Tense has two grades of meaning:

1. *Perfect.* *Scripsi*, I have written.
2. *Aorist.* *Scripsi*, I wrote.

Quid hodie fecisti? *what have you done today?*

Quid heri fecisti? *what did you do yesterday?*

Future Perfect Tense.—The future perfect denotes an act that will, at a certain future time, be completed:

Cras abiero, *by to-morrow I shall have gone.*

For the use of the future perfect in expressing relations of time, *cf.* further the notes on the future tense

Pluperfect Tense.—This tense indicates that an act was, at a time in the past, completed:

Caesar milites pugnare jusserat, sed illi nolebant, *Caesar had ordered the soldiers to fight, but they were not willing to do so.*

Note.—In letters, what are known as *Epistolary* tenses are often used—that is to say, the writer uses a tense which is more suited to the time of reading the letter than to the time of writing it; *e.g.*:

Cum hanc epistolam scribebam, sol occidebat et aves jam tacuerant, *as I write this letter the sun is setting, and the birds have already ceased to sing.*

Translate, giving every possible meaning of: Pompeius abiit priusquam Caesar Romam advēnerat. Si non properabis occasionem praetermittes. Ut puto, deus fio. Conticuērunt omnes intentique ora tenebant. Obsides per tres dies interrogabat. Puer nutricem amabam. Hostes nostros progredi frustra prohibebant. Villam Puteolis jam decem annos habeo. Cum mortuus erit, tibi scribam. Nihil habebam quod scriberem, neque enim novi quidquam audieram. Dum vitat taurum, in fossam cadit. Jam diu cupio Romam visere. Virtus homines optime conservat. Antequam vēnisti, te venientem audieram.

Subjunctive Mood.—In independent sentences the subjunctive is used in the following grades of meaning:

1. To express *Command.*

Stet porta aperta, *let the door stand open.*
Precemur, *let us pray.*

Under this head come the following special idioms:

(*a*) *Ne* with the 2nd person of the perfect subjunctive:

Ne hoc feceris, *do not do this.*

(b) The use of the historical tenses, generally in the 2nd person, to denote what should have been done in the past:

Vera locutus esses, *you should have spoken the truth.*
Romam ires, *you should have been going to Rome.*

2. To express *Wish.*

Sit tibi terra levis, *may the earth lie lightly on thee.*

Hence the idiomatic use of the subjunctive with *utinam:*

Utinam venisses, *would that you had come.*

3. To express *Doubt.*

Quid faciam? *what am I to do?*
Quid facerem? *what was I to do?*

4. To express a *Condition.*

Pluros amicos sic habeas, *in this way you would have more friends.*
Caesari non paream, *I would not obey Cæsar.*

Translate, giving every possible meaning of: Sit imperator clemens. Milonis gladium ne contempseris. In proelio mortem oppetisses. Istum librum mihi monstres. Quid faceret Antonius? Inter se pugnent. Illum regis patrem esse crederes. Ne sit servus procax. Utinam de negotio destitisset. Jovis aedem ineamus. Ego, mehercle, non dubitem. Coelum augur observet. Aquam potius quam vinum biberes.

Imperative.—The imperative mood expresses *command:*

Dic mihi, quid agis? *tell me what are you doing.*

The forms in *-to, -tote,* are especially used when the command is to do something in the future or generally, and so they are always employed in the text of laws.

Duo consules sunto, *let there be two consuls.*

Prohibition is expressed by the imperative *noli* with the infinitive: *noli me tangere,* touch me not.

Also, with a more abrupt force, by the use of *ne* with the perfect subjunctive, commented on above.

Infinitive.—The commonest use of the infinitive is *Prolative—i.e.* to complete the construction of other verbs. The verbs taking the infinitive are:

Verbs of *knowing, teaching, learning:*

Mox discetis mala pati, *you will soon learn to bear troubles.*
Philosophia docet non timere mortem, *philosophy teaches not to fear death.*

Verbs of *wishing, intending:*

Certe statuerat non adesse, *he had certainly decided not to be present.*
Cato servire quam pugnare mavult, *Cato prefers to be a slave rather than to fight.*
Stoicus esse voluit, *he wished to be a Stoic.*

Verbs of *custom, duty, ability:*

Nihil in occulto agere soleo, *I am accustomed to do nothing underhand.*
Debes hoc scribere, *you ought to write this.*
Proelio adesse nequibat, *he was unable to be present at the battle.*

Verbs of *beginning, trying, continuing, hastening,* and their opposites:

Cum ver esse coeperat, *when it began to be spring.*
Frustra mihi subvenire conamini, *in vain do ye try to aid me.*
Illud jam mirari desino, *I am already ceasing to wonder at that.*

The Passive of verbs of *saying* and *thinking:*

Lucullus dicitur pavonum linguas edisse, *Lucullus is said to have eaten peacocks' tongues.*

The past tenses of the infinitive are used in Latin in a manner different from the English idiom after verbs denoting *ability, duty,* &c. The following table will illustrate how in Latin the past tense is conveyed by the principal verb, where in English it would have been contained in the infinitive.

I ought to do this, debeo hoc facere.
I ought to have done this, debebam hoc facere.
I could have done this, potui hoc facere.

Potui hoc fecisse thus means, "I could at that time have had this completed."

Accusative and Infinitive.—The tenses of the infinitive follow the sense—that is to say, if the infinitive expresses what was happening at the time of the principal verb, the present infinitive is used; if it expresses what had happened at the time of the principal verb, the perfect infinitive is used; if it expresses what was still to happen at the time of the principal verb, the future infinitive is used. Thus:

Intelligo eum venturum esse, *I understand he will come.*
Intelligebam eum venturum esse, *I understood he would come.*
Intelligebam eum venire, *I understood he was then coming.*
Intelligo eum venire, *I understand he is now coming.*
Intelligo eum venisse, *I understand he came.*
Intelligebam eum venisse, *I understood he had come.*

The infinitive is used as the subject of impersonal verbs and verbs used impersonally:

Forsan et haec olim meminisse juvabit, *perhaps one day it will give us pleasure to remember these things.*

Curae est scire Caesarem abiisse, *it is an anxiety to know that Caesar has departed.*

Gerund and Gerundive.—The gerund is a verbal noun, and so is used in some noun constructions as follows.

The *Genitive* is used idiomatically with *causā* and *gratiā:*

Fugiendi causa, *for the purpose of fleeing.*

It is used objectively:

Amor pugnandi, *love of fighting.*

Also it is used after some adjectives:

Avidus bellum gerendi, *eager to wage war.*

The *Accusative* is used with *ad* to express purpose:

Milites ad pugnandum misit, *he sent soldiers to fight.*

Non aptus est taurus ad equitandum, *a bull is not suited for riding.*

The *Dative* is used with adjectives implying *fitness,* &c.:

Locus pugnando idoneus, *a place suitable for fighting.*

The *Ablative* is used to denote *means, cause,* &c.:

Discit docendo, *he learns by teaching.*

Also with *a, de, ex, in:*

In vitia corrigendo summa est voluptas, *there is a great pleasure in correcting faults.*

De coenando deliberant, *they deliberate about dining.*

If the verb is transitive, it is more usual in Latin to use, instead of the gerund, the gerundive as an adjective agreeing with the object. It is important to remember that in this construction the object takes the case of the gerundive.

Thus, the example above might more idiomatically read: *In vitiis corrigendis summa est voluptas.*

The gerund and gerundive are frequently used impersonally:

Pugnandum est, *one must fight.*
Nobis eundum est, *we must go.*

Translate, giving every possible meaning of: Infandum, regina, jubes renovare dolorem. Dulce et decorum est pro patriā mori. Si monumentum requiris, circumspice. Tres cohortes adducit oppidi oppugnandi causā. Optissima est haec occasio ad leges mutandas. Non debuisti munera militibus dare. Juvat ire et Dorica castra visere. Meridie coenare solebat. Meridie coenavisse narratur. Ambitūs condemnari turpe putamus. Vires acquirit eundo. Brutus dicitur negavisse se pugionem ad Caesarem interficiendum paravisse. Sperabat puella se a reginā osculatum iri. I, sequere Italiam. Urbem ex suis faucibus ereptam esse luget. Quam celerrime pax nobis petenda est. Negavit hostibus parcendum esse. Non opus est Caesare maledicendo. Sciebam puellam servum amare. Negavit se unquam elephantum vidisse. Malo Romae manere. Dixi vos satis cibi habituros

Participles.—The participles are adjectives, and are normally used as such. The only idioms that call for note are:

1. The use of the past participle passive with a noun where English would use two nouns, one in the genitive depending on the other:

Caesar interfectus reipublicae exitium fuit, *the murder of Caesar* (lit. *Caesar slain*) *was the destruction of the commonwealth.*

2. The *Ablative Absolute* construction, noted under the heading Ablative.

Supine.—The form ending in *-um* is used with verbs implying motion to express *purpose:*

Cubitum ire, *to go to lie down.*

Fabros misit pontem exstructum, *he sent pioneers to build a bridge.*

The form ending in *-u* is used with adjectives to denote *that in respect of which* the adjective is applied.

Mirabile dictu, *wonderful to tell* (lit. *wonderful in the telling*).

Horribile visu, *dreadful to see.*

Note.—The form in *-u* never takes an object.

Translate, giving every possible meaning of: His rebus cognitis senatus Ciceronem jussit Catilinam punire. In silvas venatum abiit, quā re Tarquinio in horto ambulanti nuntiatā, milites jubet praesidio ei proficisci. Hoc vinum consule Planco factum est. Armis depositis ad castra revertērunt. Te dictatore res Romana florebit. Passis crinibus manus ad coelum tendunt.

The Verb in Compound Sentences.—By a compound sentence is meant a principal clause with one or several dependent clauses depending on it. In dependent clauses Latin employs what is known as the *Sequence of Tenses.* Roughly, by the sequence of tenses, where the principal verb is primary, it is followed by the present or perfect subjunctive; where it is secondary, the dependent verb is in the imperfect or pluperfect subjunctive.

The following table will make the system plain:

Scio qualis sit, *I know what he is like.*
Sciam qualis sit, *I shall know what he is like.*

Scivi qualis sit, *I have known what he is like.*
Sciero qualis sit, *I shall have known what he is like.*
Scio qualis fuerit, *I know what he was like.*
Scio qualis futurus sit, *I know what he will be like.*
Sciam qualis fuerit, *I shall know what he was like.*
Scivi qualis futurus sit, *I have known what he will be like,* &c.
Sciebam qualis esset, *I knew what he was like.*
Sciebam qualis futurus esset, *I knew what he would be like.*
Sciebam qualis fuisset, *I knew what he had been like.*
Scieram qualis esset, *I had known what he was like.*
Scieram qualis fuisset, *I had known what he had been like.*
Scieram qualis futurus esset, *I had known what he would be like.*
Scivi qualis esset, *I knew what he was like,* &c.

Note.—The historic present and the historic infinitive are treated generally as historic tenses and take a corresponding sequence.

The Subjunctive in Dependent Clauses. Cause.—In dependent clauses expressing the cause of the principal clause the subjunctive is used after *cum,* since:

Cum tyrannus interfectus sit, gaudeat populus, *since the tyrant is slain, let the people rejoice.*
Cum sit in nobis ratio, necesse est deum eam nobis dedisse, *since we have reason, God must needs have given it to us.*

After *quod, quoniam,* because, the subjunctive is used, except when the reason given is that supplied by the speaker or writer of the sentence:

Mirari Cato se aiebat, quod non rideret haruspex, *Cato used to say he wondered that the diviner did not laugh.*
Attico gratias agebat Cicero quod se vivere coegisset, *Cicero was grateful to Atticus for forcing him to go on living.*

But when Cicero writes this himself to Atticus, he uses the indicative after *quod:*

Gratias tibi ago quod me vivere coegisti, *I am grateful to you for forcing me to remain alive.*

Note.—*Quando, quia,* because, take the indicative.

Purpose.—Dependent clauses indicating *Purpose* go invariably into the subjunctive. Thus the subjunctive is used after *ut,* in order that; *ne,* lest, in order that—not; *quo,* in order that:

Haec scribo, non quo ipse legam, *I write this, not in order that I may read it myself.*
Haec res acta est ut nobiles restituerentur, *this thing was done that the nobles might be restored.*
Id egi ne interessem, *I did it so that I might not be present.*

Here is to be noted the idiom by which *ne* and *ut* are used after verbs expressing "fear":

Vereor ne quid Andria apportet mali, *I fear Andria will bring some evil* (lit. *I fear lest Andria may,* &c.).
Vereor ne exercitum habere non possit, *I fear he will not be able to have the army.*
Timeo *ut* tantos sustineas labores, *I fear you will not bear up under such great exertions.*

Some verbs are regularly constructed with a dependent clause of purpose introduced by *ut* or *ne.* Such are:

(*a*) Verbs meaning *to advise, persuade, request, command,* &c.:

Petunt atque orant ut sibi pareat, *they ask and entreat him to spare himself.*
Te hortor ut meas orationes legas, *I urge you to read my speeches.*
Ei persuadet ut ad hostes transeat, *he persuades him to go over to the enemy.*
Mihi ne abscedam imperat, *he orders me not to go away.*

Note.—*Hortor,* sometimes, and *jubeo,* command, regularly, take the infinitive.

(*b*) Verbs meaning to *try, endeavour,* &c.:

Nitebantur ne gravius in eum consuleretur, *they endeavoured to bring it about that the decision against him should not be too severe.*
Da operam ut valeas, *take care to keep well.*
Qui stadium currit, eniti et contendere debet ut vincat, *a runner in a race ought to endeavour and strive to win.*

Note.—*Conor,* try, always takes the infinitive.

(*c*) Verbs meaning to *allow, grant,* &c.:

Permisso ut seu dicere prius seu audire mallet, *it being allowed him to choose either to speak first or to listen.*

Note.—*Permittere* also takes the infinitive.

Non concedo ut sola sint, *I do not allow that they should stand alone.*
Neque suam consuetudinem pati ut socios desereret, *and (he said) that his habits of action did not allow him to desert his comrades.*

Note.— *Patior* takes the subjunctive only when it is coupled with *non* or *neque.*

(*d*) Verbs meaning to *decide, resolve,* &c.:

Plerique censebant ut noctu iter faceret, *many expressed the opinion that he should march by night.*

Placuit ei ut ad Ariovistum legatos mitteret, *it seemed good to him to send envoys to Ariovistus.*

Mihi cum Deiotaro convenit ut simul abiremus, *I agreed with Deiotarus that we should go away together.*

Note.—Some verbs with this meaning take the infinitive—e.g. *constituo*, resolve; but the subjunctive is, generally speaking, more regular.

The relative pronoun and relative adverbs are also used to introduce a clause of purpose in the subjunctive after verbs of motion :

Equitatum qui sustineret hostium impetum misit, *he sent a body of horse to sustain the enemy's charge* (lit. *who might sustain*).

Locum elegit unde castra videret, *he chose a place whence he might see the camp.*

In such a use ***qui* = *ut is*, *ubi* = *ut ibi*, *unde* = *ut inde***, &c.

Result.—Dependent clauses denoting *Result* are in the subjunctive. They are usually introduced by *ut*, so that, or its negative, *ut non :*

Non sum ita hebes ut istuc dicam, *I am not so dull as to say that.*

Non talis est figura ut eam factam a Scopa diceres, *the statue is not such that you would say it was made by Scopas.*

Casu accidit ut primus id nuntiaret, *it happened by chance that he was the first to announce it.*

Est mos hominum ut nolint eundem pluribus rebus excellere, *it is the custom of men that they do not wish one man to excel in too many things.*

Effecit ut honeste vivere non possem, *he brought it about that I could not live honourably.*

Note.—In clauses denoting *result* the strict sequence of tenses is often subordinated to the sense—*e.g.:*

Tam luxuriose degebat ut nunc pane egeat, *he used to live so extravagantly that to-day he lacks for bread.*

Under the head of *Result* may be classed the use of the subjunctive in dependent clauses introduced by the relative pronoun *qui, quae, quod,* to denote an attribute or characteristic; it is used in this sense especially after *dignus*, worthy, and its opposite *indignus;* after *demonstrative, indefinite,* and *interrogative pronouns;* after *nemo, nihil,* and *nullus;* after *comparatives* followed by *quam*, and after *sunt*, there are, and *est*, there is, used impersonally; *e.g.:*

Non videris dignus qui liber sis, *you do not seem worthy to be free.*

Is est cui facillime persuadeatur, *he is one who can be very easily persuaded.*

Quis est qui mortem non timeat? *who is there who does not fear death?*

Nil est quod oratori plus conveniat, *there is nothing more befitting an orator.*

Vigilantior est quam qui talibus insidiis capiatur, *he is too wide-awake to be caught in such a trap.*

Sunt qui discessum animi a corpore putent esse mortem, *there are some who think that death is the departure of the soul from the body.*

Sunt qui non habeant, est qui non curet habere, *there are some who have not, there is one who does not care to have.*

Subjunctive after Quin *and* Quominus.—*Quin*, but that, and *quominus*, lit., by which the less, are used with a dependent subjunctive after verbs implying *hindrance, falling short; quin* is also used after verbs expressing *hesitation.* In any construction *quin* is only used after a negative, expressed or implied in the meaning of the clause on which it depends; *e.g.:*

Facere non possum quin ad te mittam, *I cannot refrain from sending to you.*

Non est dubium quin plurimum possent, *there is no doubt that they were the most powerful.*

Non quin breviter reddi responsum potuerit, *not but that an answer could have been briefly given.*

Nemo erat quin hoc se audiisse diceret, *there was no one who did not say he had heard this.*

Nihil abest quin sim miserrimus, *there is nothing between me and abject misery.*

Hiemem credo prohibuisse quominus epistolas a te acceperimus, *I suppose the winter has prevented our receiving any letters from you.*

tus ? 19. Nemo est qui parricidium probet. 20. Cum ea ita sint, tamen pacem cum iis faciam. 21. Moriens, cum jam ceteris ex partibus oppressa mens esset, extremum sensum ad memoriam reipublicae reservabat. 22. Dicebant se timere ut res frumentaria satis commode supportari posset. 23. Non is sum qui amicos deseram. 24. Caesar vehementer irascebatur quod hostes Romanorum socios vexavissent. 25. Laborabat ut reliquas civitates adjungeret. 26. Eo erant vultu ut eos Argivos esse diceres. 27. Lamiam ad eum misi, qui demonstraret Caesarem sibi imperavisse ut ad me scriberet, ut in Italiam quam primum venirem.

Time in Dependent Clauses.—The general rule is that the dependent verb is in the indicative when its time is independent of the clause governing it, the subjunctive when its time depends on that of the principal clause. The conjunctions that introduce temporal clauses and their construction are as follows:

Cum, when, if it refers to the *present* or *future*, takes the indicative:

Cum hoc legeris, intelliges omnia, *when you have read this you will understand all.*

Cum aderis omnes dormibunt, *when you arrive all will be asleep.*

Cum canis omnes delectantur, *when you sing all are charmed.*

If it refers to the *past*, *cum* takes the indicative to denote a *point of time* and nothing more, the subjunctive to denote the *circumstances attending* the action of the main verb:

Dixerat hoc ille cum puer advenit, *he had said this when the boy came.*

Qui non propulsat injuriam a suis cum potest injuste facit, *he who does not, when he can, ward off an injury from those near to him, acts wrongfully.*

Aquilifer,cum ab hostibus premeretur, aquilam intra vallum projecit, *the standard-bearer, when he was being borne down by the enemy, threw the standard within the stockade.*

The difference in sense between the two moods is, it will be observed, not easy to define. Roughly, it may be laid down that the indicative is used:

(*a*) When *cum* means "whenever," and

(*b*) When by the use of *eo tempore*, *tum*, or some similar expression, it is made clear that *point of time* alone is meant to be expressed.

This rule can only be followed in writing Latin; it will be found on coming to read Latin authors that the boundary between the two uses is very narrow, and depends largely on the feeling of the writer.

Dum, *donec*, *quoad*, when they mean "until," and *ante . . . quam*, and *prius . . . quam*, meaning "before," take the indicative to denote *an actual event*, the subjunctive to denote *anticipation* in the mind of the subject of the main verb:

Sosiae non credebam donec fecit ut sibi crederem, *I did not believe Sosias till he made me.*

Hoc in aliud tempus differunt, dum ira defervescat, *they put this off to another time, until their anger cools.*

Ante aliquanto quam tu natus es, *some time before you were born.*

Priusquam quidquam conaretur, Balbum ad se vocari jussit, *he ordered Balbus to be summoned before him, before any attempt should be made.*

Dum, *donec*, *quoad*, meaning "while," "so long as," regularly take the indicative:

Ipse, quoad potuit, fortissime restitit, *as for himself, while he could, he made a stout resistance.*

Postquam, *ubi*, *quando*, &c., are generally used with the indicative.

Conditional Sentences.—A **Conditional Sentence** consists of two clauses, one containing the *condition*, and the other stating what follows as a result of the condition. The former is called the Protasis; the latter, which is the principal clause, is called the Apodosis. For example, in the sentence, "If you are well, I am happy," "If you are well" is the protasis, laying down the condition, while "I am happy" is the apodosis, which states as the principal fact what follows as a result of the condition being fulfilled.

There are three sorts of conditions:

1. *Vivid*, where the apodosis follows naturally if the condition is fulfilled, without anything being said to indicate whether it is fulfilled or not.

Type: "If so-and-so is the fact, then, &c."

A condition of this type may be past, present, or future, but, whatever the time, the indicative is used in both protasis and apodosis.

(*a*) *Present.*—Si vales, felix sum, *if you are well, I am happy.*

Nisi me amas, vita mihi vana est, *unless you love me, life to me is worthless.*

(*b*) *Past.*—Si hoc fecisti, bene egisti, *if you did this, you acted well.*

Post prandium foro ambulabat, nisi pluebat, *after lunch he used to walk in the forum, unless it rained.*

(*c*) *Future.*—Si me audietis, omnia tibi dicam, *if you will listen to me, I will tell you all.*

Nisi ante sextam horam veneris, actum erit de nobis, *unless you come* (lit. *shall have come*) *before the sixth hour, it will be all up with us.*

(*N.B.*—Note the idiom, *actum est de* with the ablative, "It is all over with . . .")

2. *Vague Future.*—Type: "If so-and-so were to happen, then . . . would . . ." In conditions of this type, the apodosis expresses what would happen if at any time the condition were to be fulfilled. The present or perfect subjunctive is used in both protasis and apodosis.

Abire nullo pacto possim si velim, *I could on no account go away, if I wished to.*
Si hoc audiat, irascetur, *if he were to hear this, he would be angry.*
Nisi omnem rem eis patefacias, decipiantur, *unless you made the whole thing clear to them, they would be deceived.*

3. *Unfulfilled Protasis.*—Type: "If so-and-so were true (but it is not), then, &c." In conditions of this type, the protasis expresses a condition that is, in fact, not fulfilled, and the apodosis states what would happen if it were. The time may be either past or present; in either case the subjunctive is used in both protasis and apodosis.

(*a*) *Present.*—The imperfect tense is used in both parts of the sentence.

Si Caesar adesset, urbs salva esset, *if Caesar were here* (*but he is not*) *the city would be safe.*
Nisi te noverim, mentiri dicerem, *if I did not know you* (*but I do*), *I would say you were lying.*

(*b*) *Past.*—The pluperfect tense is used in both parts.

Si Caesar adfuisset, urbs salva fuisset, *if Caesar had been here* (*but he was not*), *the city would have been safe.*

(*c*) *Mixed Time.*—Pluperfect in the protasis, imperfect in the apodosis.

Nisi deus voluisset, hodie non viveres, *if God had not willed it* (*but He did*), *you would not be alive to-day.*

Translate, giving every possible meaning of:
1. Vix flumen transierat cum dextrā tonuit. 2. Obsidio deinde per paucos dies magis quam oppugnatio erat, dum vulnus ducis curaretur. 3. Tityre, dum redeo, nostras pasce capellas. 4. Haud desinam donec hoc perfecero. 5. Dum haec in Apuliā gerebantur, Samnites urbem non tenuērunt. 6. Undecimo die postquam a te discesseram Capuam pervēni. 7. Hoc ego, prius quam loqui coepisti, sensi. 8. Oravit ut te ante videret quam e vitā discederet. 9. Si vis, dabo tibi testes. 10. Id persequar, si potero, subtilius. 11. De iis te, si qui me forte locus admonuerit, commonebo. 12. Ipsi auxilium duci ferre, si cupiant, non queant. 13. Haec descriptio, si esset ignota vobis, a me explicaretur. 14. Si aliter accidisset, Caesar non interfectus esset. 15. Tum magis id diceres si nuper in hortis Scipionis adfuisses. 16. Si valebis, cum recte navigari poterit, tum naviges. 17. Zenonem, cum Athenis essem, audiebam frequenter. 18. Socrates, cum inter amicos erat, de philosophiā eos interrogabat. 19. Nisi quid sceleste fecisset, capitis non damnatus esset.

Clauses of Comparison.—A clause of comparison is one which supposes a condition, not in fact true, to exist, to which the action of the main verb is compared. The mood is always the subjunctive:

Ceteri, tanquam ita necesse sit, sequuntur, *the rest follow, as though of necessity.*
Tantus eos metus cepit, velut si jam ad portas hostis esset, *as great a fear got hold of them as though the foe were already at the city gates.*

"*Though*" *Clauses.*—Clauses introduced by a word meaning "although" are in the subjunctive mood, except in the case of *quamquam*, which takes the indicative always, and *etsi*, *etiamsi*, *tametsi*, which take either mood.

In post-Augustan prose and in poetry the above rules are not closely adhered to.

Indirect Speech.—Indirect speech (*oratio obliqua*) is the narration of what someone thought or said, the thought or words narrated depending on a verb implying *saying, thinking*, &c. Thus, "I am going," is someone's actual words, *i.e.* direct speech (*oratio recta*); if I am reporting them to another person as having been spoken by myself or someone else, I can do so either by using inverted commas: He said, "I am going," or by using *oratio obliqua:* He said that he was going.

In English, indirect speech is expressed by the use of the conjunction "that" and the change of the time of the narrated verb to that of the verb on which it depends, as in the example given above. In Latin the rule is that in *oratio obliqua* the main clause adopts the accusative and infinitive construction, and dependent clauses go into the subjunctive mood.

Thus, *Te amo*, I love you, becomes in *oratio obliqua:* (*Dixit*) *se illum amare*, he said he loved him.

Hoc non faciam, I will not do this, becomes (*Negavit*) *se hoc facturum esse*, he said he would not do this.

Edo ut vivam, I eat to live, becomes (*Dixit*)

se edere ut viveret, he said he ate that he might live.

Note.—Note the sequence of tenses, *dixit* . . . *viveret*, following the regular rule.

Commands and questions in the second person go into the subjunctive in *oratio obliqua*. So, *I, sequere Italiam*, go, seek Italy, becomes (*Dixit*) *iret, sequeretur Italiam.*

Cur hoc facis? why do you do this? becomes (*Rogat*) *cur hoc faciat*, or (*Rogavit*) *cur hoc faceret*, the sequence of tenses being duly observed.

But when the question is in the 1st or 3rd person, the accusative and infinitive is used in *oratio obliqua*. Thus, *Num hoc feram?* shall I bear this? becomes (*Rogat*) *num se illud laturum esse.*

Conditional Clauses in Oratio Obliqua.—In *oratio obliqua* the protasis goes into the subjunctive, following the sequence of tenses, and the apodosis, which is the principal clause, takes the accusative and infinitive. The following examples will illustrate the working of the rule:

O.R. Si vales, bene est, *if you are well, it is good.*

O.O. Dixit, si valeret, bene esse.

O.R. Si me amabis, te amabo, *if you love me, I will love you.*

O.O. Dixit si ille se amaret, se illum amaturum esse.

O.R. Si hoc dixisti, mentitus es, *if you said this, you lied.*

O.O. Dixit eum, si illud dixisset, mentitum esse.

O.R. Si veneris, videbis, *if you have come, you will see.*

O.O. Dixit eum, si venisset, visurum esse.

O.R. Si hoc dicas, mentiaris, *if you were to say that, you would be lying.*

O.O. Dixit eum, si illud diceret, mentitum iri.

O.R. Si adesset, vinceret, *if he were here he would win.*

O.O. Dicit eum, si adesset, victurum esse.

O.R. Si eum vidissem, abiissem, *if I had seen him, I would have gone away.*

O.O. Dixit se, si eum vidisset, abiturum fuisse.

O.R. Si ibi venisses, interfectus esses, *if you had come there, you would have been killed.*

O.O. Dixit, si ibi venisset, futurum fuisse ut interficereris.

Note.—The form *futurum esse* or *fore* followed by *ut* with the imperfect subjunctive is always used in this type of condition in *oratio obliqua.*

The following extract from Livy shows how the transposition from *oratio recta* to *oratio obliqua* is effected in a running narrative:—

O.R.

Nullius consilium imperatoris in speciem audacius, re ipsa tutius, fuit quam meum. Ad certam victoriam vos duco: quippe ad quod bellum collega non ante profectus est quam ad suam satietatem peditum atque equitum datae a senatu copiae essent, eo vos, quantumcunque virium momentum addideritis, rem omnem inclinabitis: auditum modo in acie—nam ne ante audiatur operam dabo—alterum consulem et alterum exercitum advenisse, haud dubiam victoriam faciet.

O.R.

No general has had a plan of action seemingly more rash, but actually more safe, than mine. I am leading you to certain victory: surely in a campaign for which my colleague did not set out till forces of foot and horse had been granted by the senate to his full satisfaction, you, whatever additional weight of force you add, will turn the entire scale of events. Once it is heard during the fray (for I will take care that it be not heard before then) that the other consul and a second army have arrived, it will render the victory beyond all doubt.

O.O.

Negat ullius consilium imperatoris in speciem audacius, re ipsa tutius fuisse quam suum: ad certam eos se victoriam ducere: quippe ad quod bellum collega non ante, quam ad satietatem ipsius peditum atque equitum datae a senatu copiae fuissent, profectus sit, eo ipsos, quantumcunque virium momentum addiderint, rem omnem inclinaturos: auditum modo in acie—nam ne ante audiretur daturum operam—alterum consulem et alterum exercitum advenisse, [illegible] dubiam victoriam facturum esse.

Question and Answer.—1. A plain question in direct speech, when the speaker is in doubt as to the answer, is expressed by using the particle *-nĕ* after the emphatic word:

Meministine me in Senatu dicere? *do you remember my saying in the Senate?*

Or by using an interrogative pronoun:

Quis est ille miles? *who is that soldier?*
Quot sunt homines? *how many men are there?*

Or occasionally without using any special word:

Tu mihi etiam C. Gracchi mentionem facis? *do you indeed speak to me of Caius Gracchus?*

2. When the answer "yes" is expected by the questioner, *nonne* is used;

Nonne abiisti? *did you not go away?*
Nonne me amas? *don't you love me?*

3. When the answer "no" is expected by the questioner, *num* is used:

Num barbarorum Romulus rex fuit? *was Romulus king of a tribe of savages?* (*Of course not.*)

Num quis sapientiam odit? *does anyone hate wisdom?* (*Of course not.*)

Double questions—*e.g.* Is he here or at Rome?—are expressed in one of three ways:

1. By *utrum* in the first part, and *an* in the second:

Utrum me amat an te? *does he love me or you?*

2. By *-ne* in the first part, and *an* in the second:

Romamne veniam an hic maneam? *am I to come to Rome or remain here?*

3. By *an* in the second part.

Eloquar an sileam? *am I to speak or be silent?*

When the second part in English consists of the words "or not," *e.g.* "Is he here, or not?" *annon* is used, or (rarely) *necne*.

Dicam huic annon? *shall I tell this man or not?*

History of Roman Literature

The first form taken among any people by the manifestation of the literary spirit is the composition of verses. A set composition, intended to be remembered, before the general use of writing was put into the form best adapted for retention by the memory, and that form necessarily adopts the shape of some metrical arrangement. To this general rule the Romans were no exception. Before 240 B.C. we have extant nothing that can be said to be a literary composition, but we know that on occasions of public holiday the people indulged in some sort of organised clowning, which consisted chiefly of one or two performers dancing and bandying broad jokes with one another and with the audience. These humorous dialogues, known as *Saturae*, akin very much to the "back-chat" of the modern American music-hall artist, were set in the metre indigenous to the Latin tribes, the Saturnian metre, one of rapid movement and full of life, approximating very nearly to the cadence of the ordinary spoken language. At the same time, the populace interchanged with one another scurrilous jests in a similar metre, the *Fescennine* verses, which in later days were the type of unrefined abuse.

The service of religion also required set forms, which again found expression in Saturnian verses. Scarcely any remains exist of this primitive literature, religious or secular, and it is very unlikely that much of it, and almost certain that none of the secular verse, was committed to writing.

The success of Rome in the first Punic War, and the accession in wealth and importance that was its result, had a great uplifting effect on the character of Roman social life. More especially, the contact with the advanced civilisation of the Greek cities of Southern Italy introduced at Rome a sudden advance in culture and appreciation of the arts hitherto unknown. Greek slaves were brought to Rome, who taught their masters the arts in which they were proficient, and made known to them the treasures of Greek literature.

Among these was one Andronicus, whose servitude was in the great house of Livius. He dwelt among them for thirty years, during which the Greek leaven continued to work at Rome. At last, in 240 B.C., under the patronage of his master's family, Livius Andronicus produced a Satura unlike all that had preceded it, in that it possessed a plot. In fact it was a drama, either translated or adapted from a Greek original. From this time onward, drama proper flourished at Rome, the more so as the taste for Greek culture continued to grow every year.

Livius Andronicus also composed a Latin translation of the *Odyssey*. This work possessed little literary merit, but it opened up a new field of interest to the citizen of Rome, besides indicating a higher level to which literature might attain, and turning Roman letters into the channel which they were eventually to follow.

The example of Livius Andronicus was followed shortly after by **Cn. Naevius,** whose work is significant by reason of his being a true-born Roman. His literary activity consisted in adapting Greek plays, especially the works of the comedians. Naevius followed the example of the Old Attic Comedy, in making his plays centre round some political question, and in utilising the traditional scurrility of the old Saturae for pillorying those who were prominently before the public. During the banishment which his outspokenness brought upon him, Naevius composed an epic poem on the first Punic War, in which he put together for the first time the traditions about Aeneas, the mythical progenitor of the Roman people, into a connected story. The account of the flight from Troy, and the wanderings of the Trojan hero and his followers, were detailed with an abundance of episode, to which the great singer of Aeneas, Vergil himself, was largely indebted for the incidents of the *Aeneid*. The work, as far as can be judged from the fragments that survive, was merely a bare narrative in metre, lacking any pretence to poetic adornment.

Plautus.—The route which Naevius had pointed out for comedy was followed by Plautus, his younger contemporary. Beginning to write shortly before 200 B.C., Plautus produced comedy after comedy, right up to his death in 184 B.C. Taking warning by the fate of Naevius, he confined his plays to the model of the late Greek comedians, leaving politics alone, and dealing entirely with scenes of private life. Into the frame of the Greek plots which he adapted, Plautus worked the language of Roman everyday life, and perhaps we have no surer guide to the Latin that was used in familiar conversation by the common people. Avowedly he wrote only to amuse, and the humorous situations conceived by the comedians of Greek decadence

appealed strongly to the lively and rather coarse vitality and the keen passions of the Italian temperament. Generally speaking, his stage-types were conventional; his young men and their mistresses, his money-lenders and parasites were those of Alexandria, though here and there he dealt a shrewd hit at the weaknesses of his audience, and such a character as the *Miles Gloriosus* shows that when he cared to exercise it he possessed considerable power of character delineation.

The successor of Naevius in epic poetry was **Q. Ennius,** 239–169 B.C. Born among the Greek cities of Southern Italy and educated there, he served in the Roman army until he came to Rome in 204 B.C. At Rome he enjoyed the intimacy of the noblest families, and was the particular friend of the Scipio who conquered Hannibal. The combination of his early training and his later Roman environment enabled him, for the first time, to effect a true reconciliation between the Greek and the Roman genius, and made of the product a homogeneous native literature. His tragedies gave a new life to that form of drama; his works, though inspired by the Greek masterpieces, were neither translations nor adaptations, and under his care there grew up an essentially Roman tragedy. The characters were conventional in so far as they were Greek, but the sentiments they expressed were Roman, and the whole spirit of his tragic works was that of the people for whom they were written.

In the *Annals*, the chief work of his life, Ennius gave the history of Rome. The work, which only survives in fragments, dealt with the inspired destiny of the Roman people as made clear by the various incidents through which their history had passed. With some of the art of the great Greek epics, Ennius put into language the national traditions of Rome and the ideal characteristics of the national character. The men whose story he told all illustrated the virtues and aims of the best type of Roman, by their devotion to the State and their earnest working for its advancement.

In the *Saturae*, Ennius gave an old name to a new form of composition. Instead of the old scenic element which had now been usurped by comedy, his Saturae consisted of his thoughts on subjects of the day, expressed in a familiar and effective manner, and often rambling on from one topic to another. He thus forms a link between the old Saturae and the satires of Lucilius and Horace.

Cato.—While Ennius was building up the structure of Latin heroic verse, and Plautus was pouring into Roman vessels the old wine of Greek comedy, one man of outstanding gifts refused to join in the Graecising tendency of those around him. Marcus Porcius Cato used all the weight of his influence and his intellect to stem the Greek tide that he feared would submerge the identity of his countrymen, and while others were forcing the Latin language into channels that were not natural to it, gave it an impulse which enabled it to develop along lines of its own. Cato's speeches have not survived, save in fragments, but these show that he had great command of language. At a later time, when literary criticism had become an art, there were some who thought him a greater orator than Cicero, who himself pays Cato the tribute of being witty and concise.

De Re Rustica is a treatise on husbandry, one of a series on various subjects. It is written in a series of hints to the farmer, with no sort of literary adornment, but shrewd and to the point, and is of interest as showing in its simplest form the prose which was to develop into the magnificent instrument of Cicero.

Terence.—The tendency against which Cato fought is most clearly illustrated by the comedies of Terence, who came to Rome soon after the fall of Carthage. In the six plays which were all his short life allowed him to produce, he shows how slavish admiration for another language may imperil the literature of one's own. Terence has many of the virtues of an accomplished writer; his style is smooth, his language polished, and his drawing of character is careful and exact, but the inspiration is stifled. Whereas Ennius and Plautus used the forms of Greek as a vehicle for thoughts of their own, Terence merely imitates, under the fatal illusion that by reproducing the very tones of another language he was making the most perfect use of his own. The result was mediocrity, a polished style being discounted by the lifelessness of his thought.

After Terence Roman comedy sank very low, and the type of mind to which comedy gives expression sought outlet in the form of Satura introduced by Ennius. The Satires of **Lucilius** (160–102 B.C.) definitely settled the form which familiar poetry was henceforth to take. Little is left to us of his work, but we know that a later age regarded him as the originator of that blending of prose style with metrical form which reached its height in the Satires and Epistles of Horace. The Satires of **Lucilius** consisted of criticisms of men, books, and manners, enlivened by vivid pictures of contemporary life, in a style plain enough to appeal to the man in the street, and attracting the man of culture by its delicacy and genius.

Lucilius closed the list of the great names of the early period of Roman literature. The stormy days that ended the second century and ushered in the first were not conducive to a flourishing literature. Considerable activity did, in fact, exist: we know that **Accius** wrote successful tragedies, and **Afranius** was prominent as a writer of comedies, but it was prose that showed most life during this period. In

the realm of oratory. **Scipio** the younger, the **Gracchi,** and others were masters of what was becoming a science, and their excellence is reflected by the mastery of Cicero, who was their direct successor. At the same time, men were writing on history and antiquities, and though time hides their work from us, some fruit of their labours survives in the works of Livy and Varro, whose authorities they often were.

Thus ends the early period, one in which Latin literature found itself. Drawing inspiration and form at first from Greek, and then gradually, as confidence and strength were gained together, relying more and more on native genius and native forms of expression, the early writers prepared a way along which the masters of the golden age might pass in triumph.

The Age of Cicero.—With the death of Sulla at the beginning of the second quarter of the first century B.C. there started the second period of Roman literature, the age of Cicero. The Social War, ending as it did in the extension over all Italy of Roman citizenship, added a great impulse to literature, both by the broadened outlook that all men gained therefrom, and by the admission to the franchise of intellect of the agile Italian imagination. There arose for the first time a real reading public, one which enjoyed good literature and constantly demanded fresh supplies. The result was a quickening of the literary spirit; appreciation is the surest spur to production, and men were quickly forthcoming to supply the public demand.

In the realm of prose **Cicero** ranks first. His writings fall into three classes—speeches, letters, and philosophical works. It is by his oratory that he is most famous; the traditions handed down from the time of the Gracchi are caught up by him and carried to their utmost height. His speeches show the Latin language at its best as a vehicle for expressing convictions or conveying emotion. With a command of language that none have surpassed, he combined every art of the trained orator, sure of his knowledge of men and the effect that words can have upon them. To this is added a feeling for form and rhythm so true that the reading of his best speeches aloud gives almost the impression of verse.

The letters of Cicero are in a more familiar strain. Covering every variety of subject of personal interest, they are written in a natural style, more easy than that of the speeches. As a guide to the family and political life and methods of thought of his time, they are invaluable.

As a philosopher Cicero added nothing to the world's store. His rôle is rather that of the expositor than of the creative genius, and he is content with restating the doctrines he has learned in language so simple, and in a style so pure, that all who run may read. The moralising of the *De Senectute* may not inspire, but such as it is, it is expressed in a manner both lucid and interesting.

Julius Caesar is a writer of another stamp. His histories of the Gallic War and the Civil War are masterpieces of narrative writing. Simple in style and without a superfluous word, they give a plain account of actual events, devoid of all personal feeling. The simple directness of his literary style perhaps gives us as true an impression of Caesar as any other record of him that we possess.

Historical writing of this period is also represented by **Sallust,** who occupied his retirement after Caesar's death by writing the *Historiae,* a record of the years immediately following the death of Sulla, and monographs on *Catiline* and *Jugurtha.* His style is modelled on that of Thucydides, and forecasts the change in prose that was to be apparent under the Empire in its use of Greek idioms and constructions.

Cornelius Nepos also contributed to the writing of history by his series of biographies. Purer in style than Sallust, and without any attempt at rhetorical adornment, his work has little literary merit, and is chiefly of value as a record of facts and as an easy book for the reading of beginners.

Among the many writers on miscellaneous subjects, one survives, the antiquarian **Varro,** who wrote on antiquities, biography, grammar, and agriculture. Varro is a voluminous writer, but of a dulness that is hardly compensated by the usefulness of the information that he collected.

Lucretius.—This period saw the awakening into life of Latin Poetry. The straining of Ennius with a new material, and the tentative experiments of his successors, at last gave way to genius sure of itself and master of its craft, and Poetry came into her own. Lucretius (99–55 B.C.) was the first to break forth from the chrysalis in his hexameter poem *De Natura.* Inspired by the doctrines of the school of Epicurus at their highest, he gave to the world a poem remarkable for its insight into natural causes, and the scientific intuition of its speculations, while grandeur of rhythm and high poetic imagination give it a high place in the range of the world's poetry. Untouched by the tide of Greek influence that was always threatening to swamp Latin poetry, his Latin is pure in a time when Latin was most perfect, and, combined with the stateliest metre ever devised by man, affects the mind in its most perfect parts as does some deep-stopped organ. In places, where science and poetry conflict, poetry has to give way, but the poem never becomes mean, and its stately progress swells here and there into the highest expression of true reverence and lofty poetic feeling.

A perfect counterfoil to Lucretius was the group of which Catullus (87–54 B.C.) alone

survives to us. **Cinna and Calvus** we know only by their reputation, but, if they were on the same plane as he, then their loss is a heavy one. **Catullus** was a professed follower of the Alexandrian school, steeped in the Greek polish that was part of the equipment of young men of his class. His experiments in various styles and with various metres show this, as well as his intimate use of Greek mythology. Yet throughout his work there is such delicate feeling, such passion, and such poetic power in the simplicity of his language, that he stands out as one of the greatest lyric poets of the world.

The Augustan Age.—With the Republic ended the second period of Roman literature, one marked by an advance in technique from the founders of Latin literature, and by a vigour of thought, independence of character, and strength of passion to which succeeding generations subservient to an Emperor could not attain.

The Emperor Augustus brought Rome to the zenith of its order and magnificence, and after the troubled times that marked the end of the Republic, men were glad to settle down under a wise rule. The result, however, was a loss of national energy; relief from anxiety brought with it relief from State cares altogether, and the inevitable consequence was loss of interest in public affairs. The literature of the Augustan age reflects this tendency, and side by side with the culmination of literary excellence shows an acquiescence in the loss of individual responsibility and a leaning towards paths that are easy, which inevitably led to loss of inspiration.

The decay of independent political feeling brought in its train an increasing attention to the interests of private life, and Greek art came more and more to assert its sway over Roman thought and letters. At the same time, literature began to be a profession to which men might devote all their energies; to this and to the existence of a Court where influence could make or mar, was due the institution of literary patronage. Such men as Maecenas, the patron of Vergil and Horace, cultured and influential, gathered round themselves a circle of followers of art, whom they assisted to gain favour, and who in return took care that their patron's fame should not diminish.

Three men—Vergil, Horace, and Livy—arose to perpetuate the relief felt under the new régime and the pride that a Roman took in the exaltation of his city.

The greatest of these was **P. Vergilius Maro** (70 B.C.–A.D. 19). Vergil's first work was the *Eclogues*, published in 38 B.C.. Admittedly imitations of Theocritus, they are often uncertain and flat in execution. The *Georgics*, published some seven years later, are the work of the poet's first perfection. Completely at home with his subject, the various aspects of husbandry, Vergil brought to play on it his full poetical powers and a complete mastery of technique, producing as the result a perfect example of its type.

The poem, however, by which Vergil lives for the ordinary man is the *Aeneid*, an epic poem in twelve books, relating the story of Aeneas' escape from Troy and his wanderings until he planted foot on Roman soil. In all probability the scheme of the *Aeneid* was approved, if not directed, by the Emperor; certainly it achieves its object, which is to glorify the tradition and destiny of Rome and of the Empire, and by stirring up patriotism among the people to lift them to a plane of feeling where they might accept and combine with the Imperial system for the aggrandisement of the State. Incidentally the *Aeneid* shows the Latin hexameter at perfection—thought, language, and metre being at the same time majestic and yet tender, powerful and yet smooth.

Vergil added indirectly to the store of Roman poetry by introducing to his patron, Maecenas, the writer whom we know as Horace (65 B.C.–A.D. 8). Horace's first work, the *Epodes*, was copied from Alexandrine models, being epigrammatic exercises in personality. Next came the *Satires*, less epigrammatic but more purely Roman in form and spirit, which are sketches of the life and manners of the day. The *Odes* are finished poems in lyric form, marked by perfect command over metre and language, and rich in shrewd observation. The work of his prime, the *Epistles*, are similar to the *Satires*, but more elegant and polished, and abounding in terse observations on manners and society.

Horace was a man of the world, but he was a poet as well, and the result has been to make him the most loved of ancient writers; no poet in all ancient literature has furnished more pointed and more elegant quotations to writers and speakers of modern times.

It was in this period that elegiacs first became fashionable. Catullus had experimented with them, but they were not the form in which his genius could be best expressed. Now, however, a school of elegiac poets arose, remarkable rather for elegance than for loftiness of inspiration.

Tibullus, Propertius, and Ovid have survived to represent this school. Of these, **Tibullus** is graceful and refined, singing of simple things in a lifeless manner, and never rising above the dead level of gentlemanly mediocrity. **Propertius** is more robust. His style is less elegant than that of Tibullus, but he has the power of showing feeling and an eye for dramatic situation, and so can command the sympathies of the reader.

Ovid (43 B.C.–A.D. 18) is a poet of unbounded facility. All his work shows complete mastery of the medium with which he worked, and especially in his adaptation of the heroic

hexameter to the lighter and more fanciful subjects of his *Metamorphoses*, a collection of mythological stories. His *Fasti*, a poetical calendar, shows much of the pride in Roman history that Augustus endeavoured to stimulate. His love poetry is bright and perfect in style, but shallow in feeling, and often very gross. The works which closed his career, the *Tristia* and *Ex Ponto*, are lamentations in exile, full of genuine feeling, but lacking in dignity.

In the realm of prose **Livy** (59 B.C.–A.D. 19) performed the same function as Vergil in popularising a feeling of patriotism and magnifying the Empire. His history of Rome from the beginning down to 9 B.C. is written in a bright and picturesque style, sometimes compared to that of Macaulay. His Latin shows the beginning of the tendency to use poetical diction in prose. Keen to dwell on the glory of Rome, he did not trouble overmuch to investigate facts or to take any pains in verification, so that his work is of less value as a history than it might have been had not knowledge been eked out by imagination.

These names close the Augustan age, the chief features of which may be thus summed up. It shows the creative genius of Roman literature at its fullest power, combined with the elegance and polish of masters of the language. But that very polish marked the beginning of the decline, and henceforward skill in technicalities is developed at the expense of true inspiration.

The era of the Silver Age of Latin literature was led up to by the writings of the early post-Augustans. Of those that survive, the poem on Astronomy of **Manilius** shows the highest level of language and of inspiration. The *Fables* of **Phaedrus,** the Histories of **Velleius Paterculus** and **Valerius Maximus,** and the work on Architecture of **Vitruvius,** illustrate the increasing loss of inspiration and the debasing of the language, due to the growing cosmopolitan character of the population of Italy.

The Silver Age proper began in the reign of Nero. Its salient feature is the increasing penetration of the Stoic philosophy into the life of Rome. The earliest and greatest exponent of Stoicism is **Seneca,** whose inferiority as a writer is compensated by his value as a teacher of morals. His philosophical writings, though marred by the passion for rhetoric of his time, combine high thinking with sincerity of feeling. His tragedies are lifeless exercises in rhetoric, correct and sometimes grand in form, but devoid of the dramatic sense and poor in characterisation.

Seneca's nephew, **Lucan,** is the sole outstanding poet of this period. The *Pharsalia*, his only extant work, is an epic on the struggle between Caesar and Pompey, who is its hero. Its lofty style and often trenchant phrases are spoilt by the straining of thought and expression of the rhetorician, which combine with a tedious rhythm to justify Quintilian's criticism that he is *magis oratoribus quam poetis imitandus.*

Lucan's contemporary, **Persius,** wrote Satires on the model of Horace. He is not a man of the world, however, but a bookman, and the result is to make his style involved and his thought obscure.

One other writer of Nero's reign stands out. **Petronius** wrote a novel describing the adventures of a freed slave, which gives us a perfect idea of the Latin of the common people. It is remarkable for its humour and its vivid descriptions of life and manners among different classes.

After the quiet days at the beginning of Nero's reign literature stood still until the time of Domitian. Under him **Statius** (45–96) wrote verses, which were the admiration of his time. That admiration is a sufficient index of the literary degeneracy of the time; for, judged from a modern standpoint, his work is over-elaborated and wanting in inspiration. The *Silvae*, a collection of short pieces on familiar subjects, are polished and graceful, but their artificiality makes them of little value as expressions of thought or feeling. The *Thebaid*, an epic on the war of Thebes, is clever and tasteful, but is eloquent of the skill of the author rather than of his genius.

The *Argonautica* of **Valerius Flaccus** is an inferior work, prolix and rhetorical, and entirely without imagination.

Silius Italicus also wrote an epic on the Punic War. It is enough to say that it contains all the traditional apparatus of Homer and Vergil as dry bones with no originality or inventive power to make them live.

The *Epigrams* of **Martial** form the largest collection of this class of writing that is left to us. Martial gives a clear picture of contemporary life; he had not the moral indignation of Juvenal to make him exaggerate. He wrote to make a living, and consequently his main object is to amuse. He lacks the delicate touch of Horace or Catullus, whom he strove to emulate, and so illustrates the poorer side of Roman taste—its love of verbal cleverness and its tendency towards heavy coarseness.

The *Natural History* of the **Elder Pliny** is a painstaking and accurate work, written in a plain and somewhat dull style.

The outstanding feature of this generation is the treatise of **Quintilian,** entitled *Institutio Oratoria.* By it he stands eminent as a rhetorician and writer, and also as a literary and artistic critic of very great merit. The most valuable portions of his work are those in which he gives a critical sketch of the whole of Latin literature, and again where he lays down the discipline to which the would-be orator must subject his nature.

In the next generation, which closes the roll of classical Latin, only three names stand out.

Tacitus (64–119) wrote a life of Agricola, a study of the German tribes, and two works, the *Annals* and the *Histories*, giving the history of Rome from the death of Augustus. Tacitus is a writer of great dramatic force and had at his command a power of epigram which makes his work unique in literature. His satiric sense, as with Juvenal, tends to distort the picture, but the result is full of interest, and justifies his title of the Roman Gibbon. His Latin is steeped in Vergilian phraseology, and abounds in Greek constructions; his natural terseness leads to syncopated idioms of his own, which makes it not easy to read him, and difficult to render him in English as concise as his own Latin.

The *Satires* of **Juvenal** are the last of their type. They give us wonderfully vivid pictures of the life of the time, exaggerated by the fierce indignation with which its vices inspired him. His power over language is very great; few ancient writers have lived to a larger extent in familiar quotations.

Juvenal's contemporary, **Pliny the Younger**, has left us a series of letters, which give a clear picture of a pleasant, cultured, ordinary man of taste. Pretending to no inspiration, they throw light on the life of his time, and especially illustrate the agreeable "pottering-about," which was the only occupation for the leisure of a well-to-do Roman of refinement.

With Pliny closes the history of classical Roman literature. Minor writers continued to produce works of little literary value, such as **Suetonius'** *Lives of the Caesars*, published under Hadrian, a mere string of anecdotes and personal descriptions, devoid of style, and written with no historical perception. The centre of European culture shifted to Athens, where a Graeco-Roman literature sprang up, with which we are not concerned.

How to Read Latin

A fact that is too often forgotten by teachers of languages is that, when spoken and heard by those whose native tongues they are, each word, as it is spoken, is grasped and appreciated immediately; that, if it is capable of more than one construction or meaning, the mind of the hearer holds it automatically in suspense without interrupting the flow of the sentence, until the remaining word or words are heard which classify it finally.

For instance, when a speaker says, "I know the *man's* honest," *man's* is immediately recorded by the hearer as being either equivalent to *man is* (*e.g.* "The man is right"), or to the genitive (*e.g.* "I know the man's wife"). The choice between these two possibilities depends on what follows, and the mind of the hearer therefore reserves its decision until it hears the word *honest*. Here, again, *honest* may be predicative after the verb *is*, or may describe some noun to follow which depends on the genitive *man's*. All doubt is finally disposed of by the stop after *honest*, which rules out the second of these two possibilities.

This process, of course, is as rapid as that of speaking itself, but it does in fact take place, and in reading also the same course is pursued, the eye taking the place of the ear. This fact has generally been lost sight of by teachers of Latin, with the result that the student has had to go hunting about from end to end of a sentence in order to pick out first the verb, then the subject, then the predicate, and so on. The consequence has been to increase the likelihood of going wrong and to lose all touch with the natural Latin order of words, which has to be learned all over again when the student has acquired sufficient proficiency in putting together the dissected puzzle set him by a misguided system.

Assuming that the preceding articles on grammar and syntax have been carefully studied, and that the exercises have been translated with special pains to find out *every possible meaning* that the sentences may contain, the following exercises will prepare the way for rapid and intelligent sight-reading of the Latin authors. The system of notes therein adopted is that propounded by Professor Hale of Cornell University.

First Exercise (Livy, xxi, 47, 1)

Hoc [1] primum [2] cum [3] Hannibalo [4] proelium [5] fuit [6, 7]; quo [8] facile [9] apparuit [10, 11] equitatu [12] meliorem [13] Poenum [14] esse [15] et [16, 17] ob [18] id [19] campos patentes,[20, 21] quales sunt inter Padum Alpesque, bello gerendo [22] Romanis [23] aptos [24] non esse.[25]

[1] May be one of three things. What are they? Abl. sing. masc. or neut., or nom. or acc. sing. neut.

[2] May be an adverb, or acc. sing. masc., or nom. acc. sing. neut. of an adjective.

[3] May be a conjunction or a preposition. In the former case it will command a dependent verb, in the latter it will take the ablative case.

[4] What case is *Hannibale*? The ablative. What inference follows? That it depends on *cum*, which is therefore a preposition.

[5] May be either nom. or acc. sing. It is neuter. What inference follows? That *Hoc* and *primum* agree with it.

[6] Can the verb *to be* govern an accusative? No. Hence *Hoc*, *primum*, *proelium* must be nominative. Of these part must be subject, part predicate. *Hoc* must be subject, being emphasized by coming first in the sentence.

[7] What is shown by the stop after *fuit*? That there is no dependent clause, therefore *cum* is undoubtedly a preposition.

[8] What part of speech? Conjunction or relative pronoun.

If the former, it requires a subjunctive dependent verb. If the latter, it refers either to the whole preceding sentence or to a noun therein.

[9] May be either of what parts of speech? Adjective in nom. or acc. neut. sing., or adverb.

[10] May be impersonal, or governed by a subject yet to come.

If impersonal, what construction will follow? The accusative and infinitive.

[11] What inference now follows as to *facile*? It is an adverb qualifying *apparuit*.

[12] What part of speech? Ablative of supine.

What meaning will it then have? Either *means* with a verb, or ablative of the thing in respect to which with an adjective.

[13] What part of speech? Adjective.

Hence *equitatu* is abl. of respect depending on it.

[14] Obviously acc. sing. masc. agreeing with *meliorem*.

[15] Must depend on *apparuit*. With the preceding acc. it forms the acc. and infin. construction after *apparuit*, which is thus impersonal.

[16] What three uses has *et*?

1. Connecting two words = *and*;
2. As the first of two *ets* = *both . . . and*;
3. As bearing on a single word = *also, even*.

[17] What uses may *et* have, in each case, in the present passage? It may connect *apparuit* or *meliorem* to something that follows; or it may be the first of two balanced *ets*; or it may emphasize a word or phrase to follow.

[18] What case does *ob* take? Accusative.

Of the three accusatives that follow, which is the most likely to depend on it? The nearest.

[19] What part of speech? Neuter nom. or acc. of pronoun *is*. Obviously acc. depending on *ob*.

[20] What part of speech? Nom. or acc. plur. masc. or fem. of pres. part. of *pateo*. Obviously agrees with *campos*.

[21] What is the construction of *campos patentes*? Must be another acc. and infin. after *apparuit*, connected with the former acc. and infin. by *et*.

[22] What is the construction of *gerendo*? Dat. or abl. sing. agreeing with *bello*. If dative, depends on some word to follow. The gerund takes the dative of the person by whom the act is to be done.

[23] May be dat. or abl. plural. Must be dative, depending on the preceding gerundive.

[24] What is the construction of *aptos*? It takes the dative of the thing for which a person or thing is fitted. It goes, therefore, with *bello gerendo*. It must agree with *campos*.

[25] Completes the second acc. and infin. construction; *campos patentes*, coming first, must be its subject, and *aptos* its predicate.

The passage thus runs literally:

"This was the first battle with Hannibal, by which it was easily apparent that the Carthaginian was better in horsemanship, and on account of this that open plains, such as there are between the Po and the Alps, were not suited to carrying on war by the Romans."

Having thus got the sense of the passage we can proceed to put it into idiomatic English:

"This was the first engagement with Hannibal; from it clearly appeared that the Carthaginians were superior in cavalry, and that on this account open plains, such as those between the Po and the Alps, were unsuited to the Roman arms."

Now, having exchanged the Latin for the English idiom, read the passage once more *aloud* in Latin, endeavouring to express the meaning by voice inflexion, as one would do in English.

This process should be gone through with each sentence. The student should write down every possible meaning of each word in its order, taking care not to look at one word before he has completely dealt with the last. Words of doubtful meaning or construction should be left in abeyance until the word is reached which gives the key. On reaching the end of the sentence the meaning will be clear; go back and translate the whole, reading it rapidly in English, as idiomatic and free as you like; then read it over again aloud and rapidly in Latin, and go on to the next.

This method, if faithfully pursued, and by its faithful pursuit alone can success be attained, will enable the student, in a surprisingly short time, to dispense with the elaborate system of notes; he will be able to read the Latin straight on, merely pausing to make notes when a word or phrase new to him presenting some special difficulty is encountered. And in the end he will find that he can read sentence after sentence in Latin without stopping to translate, performing at the same time the double function of reading the Latin and sensing its meaning in English. This will lead him to the stage at which he can think in Latin, when nothing will stand between him and the full enjoyment of what he reads.

The following exercises will serve as models, and should be carefully studied.

SECOND EXERCISE (Cicero, *De Senectute*, 55)

Possum [1] persequi [2, 3] permulta [4] oblectamenta [5] rerum [6] rusticarum,[7] sed ea [8] ipsa [9] quae [10] dixi [11] sentio [12] fuisse [13] longiora.[14, 15]

[1] What construction follows *possum*? The infinitive.

[2] What part of speech is *persequi*? Pres. infin. of *persequor*. It therefore probably goes with *possum*.

[3] Is it transitive or intransitive? Transitive, therefore an acc. is to be expected.

[4] What part of speech ? An adjective in the nom. or acc. neut. plur. May mean "many things," or may agree with some noun which follows.

[5] Either nom. or acc. plur. Is qualified by *permulta*. Must be the object of *persequi*.

[6] Genitive plural. Depending on what ? On *oblectamenta*. What gender ? Feminine.

[7] What part of speech ? Adjective in gen. plur. fem. Must qualify *rerum*.

[8] What part of speech ? May be nom. sing. fem., or nom. or acc. neut. plur. of *is*.

[9] May be nom. sing. fem., or nom. or acc. neut. plur. Probably agrees with *ea*.

[10] May be nom. sing. fem., or nom. or acc. neut. plur. either of relative or interrogative pronoun. As it follows so closely on *ea ipsa*, with which it seems to agree, is probably the relative pronoun.

[11] First pers. sing. perf. indic. Transitive verb governing the acc. Obviously its object is *quae*. If *quae* is its object, then *quae* must be neut. plur., and so must *ea ipsa*.

[12] What do you expect after *sentio* ? Either an acc., or acc. and infin.

As it is in the 1st person, what inference follows as to *ea ipsa* ? That *ea ipsa* is acc. and governed by *sentio*.

[13] Perfect infinitive. Together with *ea ipsa*, therefore, forms the acc. and infin. construction depending on *sentio*.

[14] What must it agree with ? *ea ipsa*.

[15] What may it mean ? "Longer," or "Too long."

Which does the sense require ? The latter.

Translation : "I could go on to tell of very many pleasures afforded by rural pursuits, but I feel that what I have already said has been too long."

The remaining exercises are intended to be noted by the student himself.

THIRD EXERCISE (*Livy*, xxvii, 48, 4)

Hasdrubal, omissa munitione castrorum, postquam pugnandum vidit, in prima acie ante signa elephantos collocat.

"Hasdrubal, having failed to fortify his camp, when he saw that he must fight, stationed his elephants in the front of his line of battle, just before the standards."

FOURTH EXERCISE (Cicero, *Pro Archia*, 28)

Nulla enim virtus aliam mercedem laborum periculorumque desiderat praeter hanc laudis et gloriae : qua, quidem, detracta, quid est quod in hoc tam exiguo vitae curriculo tantis nos in laboribus exerceamus ?

"For no virtue desires any reward for the toils and dangers it undergoes other than this one prize, praise and fame ; and when that too is taken away, what is there in this short span of life to induce us to wear ourselves with such great exertions ?"

FIFTH EXERCISE (*Livy*, xxvii, 8, 9)

Consules, priusquam in provincia irent,[1] duas urbanas legiones, quantum opus erat [2] ceteris exercitibus militum, scripserunt.

"Before going to their spheres of action, the consuls enrolled two city legions to the number of men required by the other divisions."

[1] What is the force of the subjunctive after *postquam* ?

[2] What is the construction of *opus est* ?

SIXTH EXERCISE (Cicero, *De Senectute*, 66)

Quarta restat causa, quae maxime angere atque sollicitam habere nostram aetatem videtur, appropinquatio mortis, quae certe a senectute non potest esse longe.

"There remains a fourth cause which seems to pain and keep in trouble men of our age, namely, the approach of death, which certainly cannot be long distant from old age."

After carefully going through the above exercises, the student should be sufficiently adept to be able to start the course of reading indicated in the Bibliography that follows. The one point on which emphasis must be laid is that the whole system falls to the ground unless scrupulous care is taken not to let the attention, or even the eye, pass from a word to what follows it until all the possibilities of its meaning have been reviewed.

COURSE OF READING

The following bibliography is an attempt to indicate a course of reading advisable for the student of Latin. For the titles see the section immediately following on *Books to Read*.

The articles on Accidence and Syntax contained in this volume are sufficient to give a working knowledge of the subject with which to start reading the classics. For a fuller and more scientific treatment, reference may be had to *Gildersleeve* and *Riemann*, but only after a long course of reading has made the student familiar with the written language. *Kennedy* and *Roby* are more elementary books, and may be turned to for the difficulties which are met in the earlier stages.

For composition, the student should work through *Macmillan's Course*, and then go over the ground again in *Browne* and *Hagarty*, or *Postgate*. The keys should be used only for the purpose of correction, and after correction

each exercise should be retranslated without the key.

It is important to remember that the only way in which to learn to write Latin is by reading it, and the best matter for reading is the Latin authors themselves.

Caesar, Nepos, and *Ovid,* having the simplest style, should form the beginning of the course of reading. When they can be read with ease, the student can go on to *Livy* and *Vergil. Cicero* should form the next stage, after which the student may suit his own taste.

The editions given below are those considered of most use to the student consonant with lowness of price; the price stated is in each case nett.

For the study of literature, *Mackail* is the shortest and easiest book for a beginning. *Tyrrell* should follow, and then others may be read as they come.

Dictionaries.—The only satisfactory way to work is to use *Lewis and Short,* which gives the use of each word by different authors. For reading, a smaller dictionary may be used, but for composition, after the student has begun to do continuous pieces, *Lewis and Short* is essential if classical Latin is to be written.

The English-Latin dictionary should be most sparingly used. It is very rarely that an English phrase has an exact Latin equivalent, and dependence on an English-Latin dictionary spells ruin for all hopes of writing good Latin.

Books to Read

ACCIDENCE AND SYNTAX.

Roby. School Latin Grammar. Macmillan. 3*s.* 9*d.*
Kennedy. Revised Latin Primer. Longmans. 1*s.* 11*d.*
Gildersleeve and Lodge. Latin Grammar. U.S.A. 4*s.* 6*d.*
Riemann. Syntaxe Latine. France. 5*fr.*

Of these, Kennedy is the most elementary and best suited to beginners.

FRENCH

HOW TO USE THIS ARTICLE

If this article is to be in any way a manual of a language, it must provide the reader with some kind of exercises in the different constructions of the language: otherwise he will read it but get no permanent value from it.

Now, to set exercises in conjunction with each section of this work would turn it into a school-book at once, and probably occasion a certain distaste for it. The writer, then, proposes the following plan, by which the reader should make himself familiar with the subject-matter in the most systematic way.

In the first place, he should provide himself with a fair-sized exercise book, and number the pages according to the sections. This numbering should be done gradually, so that the reader may know what space to allow himself. Then, after reading any introductory matter there may be, he should study the extracts very carefully, comparing them with the translation annexed, and reading them through aloud several times. It would also be a good thing to copy out the French several times—not, however, in the exercise book. He should then collect and tabulate instances of the construction or rule being dealt with—*e.g.* Plural of Nouns, Agreement of Adjectives, Tenses of Verbs (tabulated in Conjugation), and so forth. When a rule has been stated in summary at the end of a section, he should copy it out against the section number in his exercise book. Where forms are given—*e.g.* of Verbs or Pronouns—he should memorise them carefully.

He should then take the translation of the earlier extracts and endeavour to put them back into French. He should, of course, let a reasonable time elapse between looking at the French and attempting the re-translation (the ideal being a night in between).

When the version he has made has been compared with the original, a fair copy should be made of it in the exercise book. The amount of vocabulary he should provide himself with before starting an attempt at a translation must depend on the individual. A quick, retentive mind will remember most of the words, and will only require a list of the verbal forms occurring in the passage. After the section on verbs has been done, this need should cease. The mind less at home in letters should make a list of the other words he may require for the composition, and should put an M. or F., as the case may be, against the nouns, to show what gender they are.

It may be found preferable not to work through the whole of the article in detail at first. In this case the sections marked ** may be taken first, and the extracts marked * only attempted.

In this way it may be claimed that the study will be endowed with considerable interest, and will not involve meaningless tedium. To obtain an active vocabulary—*i.e.* one in which the French for a word comes to the mind willingly—it is useful to try to reproduce extracts orally, phrase by phrase.

For those who wish to acquire some facility in spoken French it is absolutely necessary that they get a Frenchman or some qualified person to put them on the right road in pronunciation. The best thing to do is to read passages of French with this tutor, for reading is the safest way to speaking. But it is not sufficient to be taught the pronunciation of a word or phrase by itself: what is necessary is to be taught the sound, and then when this sound comes again it will be recognised and pronounced in the same way. (See Pronunciation Section.)

FOR THOSE BEGINNING TO SPEAK FRENCH

Of course, the first need is a vocabulary. If anyone wishes to begin to speak from the first, he must provide himself with some phrase-book or vocabularies (such as Professor Spiers' well-known series), and learn lists by heart; and he must at the same time learn the indicative mood of the verbs, both directly and interrogatively and negatively. For this is the crux of speaking in the early stages—to put a verb into, say, the questioning form, perhaps in a compound tense, and at the same time perhaps to put the pronoun object in its place in front of the verb. To take an instance. You are demanding your shoes in the morning from the attendant in a Paris hotel. Now it is true that if you have a touch of the superman you will yell 'May sooliay' till you get them. But if you allow yourself to listen to the explanations of the waiter, and if you try to relate the facts in a rational way to him and to answer any questions he may ask you, the conversation will go on something like this: you lead off

with, 'Où sont mes souliers ?' He replies, 'Monsieur ne les a pas ?' He would think it rude to call you 'You,' so he says 'Monsieur,' alluding to you, and he makes the question in an affirmative form, conveying the question by the intonation. However, he will know that you have not got them, since you are asking for them. You now start off with an explanation of how you put them outside your door the night before, and you say, 'Je placay'—you have forgotten that 'mettre' is *put ;* and if you have not, you are far too wise to embark on a nasty irregular verb like that. 'Je placay,' you resume, and then your mind goes hunting for *them* in French ; perhaps you arrive at 'les'—yes, 'Je placay lay.' *Outside the door* is clearly beyond your powers, but your native English common-sense coming to your rescue, you say boldly, 'à la porte.' 'Pré-ci-se-ment-mon-si-eur-je-le-sai-bi-en-ra-ma-ssé-ce-ma-tin-et-je-crois-le-sa-voir-rempla-cé-à-hui-t-'eu-res.' You are now hopelessly out of your depth. If you try to unravel all that, you will require the whole morning. The injured father in *L'anglais tel qu'on le parle* distributes half-sovereigns at this stage, but that is always easier on the stage than in real life.

Perhaps you get him to start again, holding his arm to check him when necessary. 'JE LES AI BIEN RAMASSÉ CE MATIN, ET JE CROIS LES AVOIR REMPLACÉ À HUIT HEURES.'

'Je les ai bien ramassé.' He uses the compound tense, and he puts the *them* in front of the *have*. Now, if you are going to shut yourself up in your bedroom till you are master of that style of thing, you must in the first place be able to give any tense of an ordinary verb almost automatically, and you should be able to turn all the *yous* round if necessary, and say 'vous mangez' or 'mangez-vous,' 'vous avez mangé' or 'avez-vous mangé,' equally rapidly. You must also learn to put the *nots* into their right places, so : 'Je ne mange pas,' 'vous ne mangez pas,' etc. etc. ; and you must learn to put a pronoun object in at intervals. Thus : 'Je *vous* ai vu,' 'vous m'avez vu,' etc. The more thoroughly this is done, the more subsequent advantage you will get from it. The three tenses of primary importance are the Present, the Future, and the Past Indefinite, which is the ordinary conversational tense for past actions, though the Imperfect—which 'will do'—has this advantage, that four forms out of the six are identical.

A working knowledge of the verb is by far the most important consideration in starting to speak a foreign language. Mistakes in the gender of nouns or adjectives do not cause the deadlock that inability to 'predicate' a thing does.

Note.—We saw that the 'garçon,' in making the statement which knocked 'you' out, made it all the more deadly by running his words together—or speaking 'so fast,' as the foreigner expresses it. This difficulty can only be overcome by accustoming the ear to interpret French sounds by reading aloud, by getting a competent person to read to you and to talk to you.

I. INTRODUCTORY LESSON

The following extract is intended as a pronunciation extract, and also as an illustration of the simplest and most frequently occurring grammatical rules. The beginner should study carefully and master the principles explained below, as they will be found to be of the widest application and to constitute the base of most of what follows. Too much stress need not be laid on the translation, so long as the meaning is roughly grasped. It will be very useful to commit the piece to memory, and, if possible, the learner should get a competent person to exercise him in the pronunciation. (See Pronunciation Section for reading aloud.)

LES DJINNS PAR VICTOR HUGO	THE GENIES BY VICTOR HUGO
1. *Murs*, ville Et port, Asile De mort, Mer grise Où *brise* La brise. Tout *dort*.	Walls, town And port, Asylum Of death, Sea grey Where breaks The breeze. All sleeps.
2. Dans la plaine *Naît* un bruit. *C'est* l'haleine De la nuit. Elle brame Comme une âme Qu'une flamme Toujours suit.	In the plain Springs up a sound. 'Tis the breath Of the night. It wails Like a soul Which a flame Follows aye.
3. La rumeur approche, L'écho la re-dit. *C'est* comme la cloche *D'un* couvent maudit, Comme un bruit de foule Qui tonne et qui roule, Et tantôt s'écroule, Et tantôt grandit.	The rumour approaches. The echo repeats it. It is as the bell Of a convent accursed, As a noise of a crowd Which thunders and rolls, And now falls away, And now swells forth.
4. C'est l'essaim des Djinns qui passe Et tourbillonne en *sifflant*. Les ifs que leur vol fracasse, Craquent comme un *pin brûlant*. Leur *troupeau lourd* et *rapide*, *Volant* dans l'espace *vide*, Semble un nuage vide Qui porte un eclair *au flanc*.	'Tis the swarm of the Genies Which passes whirling and hissing. The yews which their flight shivers Crack like a burning pine. Their herd, heavy and rapid, Flying in empty space, Seems a hollow cloud Bearing the lightning in its flank.
5. Cris de l'enfer ! voix qui hurle et qui pleure : L'horrible essaim, *poussé* par l'aquilon, Sans doute, Ô ciel ! *s'abat* sur ma demeure. Le mur fléchit sous le noir bataillon. La maison crie et chancelle *penchée*, Et l'on dirait que, du sol *arrachée*, Ainsi qu'il chasse une feuille *sechée*, Le vent *la* roule avec leur tourbillon !	Cries infernal ! Voices which howl and weep ! The awful swarm, by the North wind urged on Doubtless, O Heaven ! dashes itself on my abode. The wall bends beneath the dark battalion. The house groans and slanting staggers, And one would say that, torn up from the soil, As it might chase a withered leaf, The wind rolls it along with their whirl.

6. Ils sont *passés!* Leur cohorte	They are past! Their cohort
S'envole et fuit et leurs pieds	Recedes and flies, and their feet
Cessent de battre ma porte	Cease to beat at my door
De leurs coups *multipliés.*	With their strokes repeated.
L'air est plein d'un bruit de chaînes,	The air is full of a noise of chains,
Et dans *les* forêts *prochaines*	And in the forests hard-by
Frissonnent tous les *grands* chênes,	Shiver all the great oak-trees
Sous leur vol de feu *pliés!*	Beneath their fiery flight inclined.
7. *D'*étranges syllabes	Strange syllables
Nous *viennent* encore:	Come to us still:
Ainsi des arabes	Thus from the Arabs
Quand sonne le cor,	When the trumpet sounds,
Un chant sur la grève	A song on the strand
Par instants s'élève,	At instants arises,
Et l'enfant *qui* rêve	And the child who dreams
Fait *des* rêves d'or.	Has golden dreams.
8. Les Djinns funèbres,	The Genies of the grave,
Fils *du* trépas,	Sons of death,
Dans les ténèbres	In the darkness
Pressent leurs pas;	Urge on their steps:
Leur essaim gronde:	Their swarm growls:
Ainsi, profonde,	As profoundly
Murmure une onde	There moans a wave
Qu'on *ne* voit *pas.*	Which one sees not.
9. Ce bruit *vague*	This vague sound
Qui s'endort,	Which dies away,
C'est la vague	'Tis the billow
Sur le bord;	On the shore;
C'est la plainte	'Tis the call,
Presqu'*éteinte*	Almost hushed,
D'une sainte	Of a saint
Pour un mort.	For one dead.
10. *On* doute	One doubts
La nuit . . .	(Of) the night . . .
J'écoute:	I listen:
Tout fuit,	All is flying,
Tout passe;	All passes;
L'espace	And space
Efface	Effaces
Le bruit.	The sound.

NOTES TO 'LES DJINNS'

v. 1. 'murs.' The *s* in 'murs,' as in 'Djinns,' shows that in French, as in English, *s* is the sign of the plural. ll. 6–8, 'brise . . . dort.' In English *breaks* and *sleeps* end in *s*. Why? To indicate that a singular subject is being spoken of. In French the sign is *e* or *t*.

v. 2. 'naît.' *t*-ending again. Collect all the instances of both endings. l. 2, 'un,' but in l. 6 'une.' Why? In French, *a* or *the* show the gender. 'Un' with a 'male' word, 'une' with a 'female' word. 'La' with a female—'la plaine'—'le' with a male. v. 5. 'le mur,' 'le vent' (*l'* before a vowel sound). Collect instances.

v. 3, l. 3. 'c'est . . . d'un.' An unaccented *e* has been slurred here. This is usual. Collect instances. 'la redit.' This is the regular order when the object is a personal pronoun.

v. 4, l. 2. 'sifflant,' and 'brûl-ant' in l. 4, with 'vol-ant' in l. 6, indicate that the verbal ending *-ant* in French is the equivalent of the English *-ing*. 'craquent.' This is the plural form of 'craque.' l. 4. 'pin brûlant.' Note order, and compare with 'troupeau lourd' in next line, and also with 'couvent maudit' in v. 3, l. 4. Customary in French. l. 8. Why 'au'? We shall see later.

v. 5. Why 'l'enfer,' *the* hell? In French an article usually accompanies the noun. Thus 'voix' would probably be 'une voix' in prose. l. 2. Notice 'poussé,' *pushed*, and in ll. 5, 6, 7, 'penchée,' *tilted*; 'arrachée,' *snatched*. Are these corresponding endings? Yes. The *-é* has the force of the English *-ed* as the sign of the past participle, in verbs which make the 3rd singular present in *-e*. l. 3, 's'abat.' Why is the *s* there? It means *itself*. In French many verbs are made reflexive, as it is called, where in English there seems no need.

v. 6, ll. 3, 4, 5. Does 'de' mean *to*, *with*, and *of*? No; but it does in these cases. ll. 3, 5. Notice plural verbs 'cess-ent' and 'frissonn-ent.' ll. 6, 7, 'les.' This is the plural form of 'le' or 'la.' Moreover, the adjectives 'prochaines' and 'grands' also add an *s*. We say that they agree with the nouns they accompany. 'prochaines' shows that it agrees in gender too ('forêts' is a feminine word) by adding an *e* to the masculine form, 'prochain.' If the adjective ends in an unaccented *e* already, as 'rapide' and 'vide' in v. 5, it remains unchanged. This *agreement* accounts for the *-s* at the end of 'passés' (l. 1), which is looked on as an adjective, and in 'pliés' (l. 8). All instances should be collected, as this is a very common rule.

v. 7, l. 1. 'D''—*i.e.* 'de'—here has another meaning, untranslated in English. (See next note.) l. 3. 'des,' short for 'de les,' *of the*. l. 8, 'des' here again means *some*. The truth must now out. Two things must be said. In French 'de le' is written 'du,' and 'de les' is written 'des.' (At the same time, it may as well be said that 'à le' is written 'au,' as we saw in 'au flanc' (v. 4, l. 8), and 'à les' becomes 'aux.' 'De l'' and 'à l'' do not alter.) Moreover, the French have a passion for precision—'on dit'—and this manifests itself in their always stating, when they are speaking of any persons or things, whether they mean *all* or *some*, the *general* or the *particular*. Now the expression they have consecrated to render this *some* is the one used to stand for *of the*. The general is expressed, it may be added, by the 'le,' 'la,' 'l',' or 'les,' as the case may be.

v. 8, l. 2. 'du.' An instance of the contraction of 'de le.' l. 7. A poetical inversion. The normal order would be 'une onde murmure.' l. 8. 'Qu'on ne voit pas,' *which one sees not*. Compare the French and English way of making a negative statement. We use the verb *do*, except with *am*, *is*, *are* (the various parts of the verb *to be*), and verbs such as *have*, *can*, *will*, etc.; the French negative by inserting 'ne' before and usually 'pas' after it. The force of 'ne . . . pas' is similar to our *not at all*. l. 6. 'éteinte' has the feminine *e*-ending, in agreement with 'la plainte.'

v. 10, l. 1. 'On,' *one*, is used much more in French than in English. When speaking

generally, we use a pronoun of any person—*you never can tell; they say*. In French 'on' is always used. The preciseness of the language demands that an indefinite word shall introduce an indefinite statement. Thus *On ne peut jamais dire* was the title under which Shaw's play was presented in Paris. *On ne saurait penser à tout* is a similar title of a play of Musset. *They say* is '*on dit*' (l. 3). 'j'écoute.' The ending of the 1st person of the verb (present tense) is the same as the 3rd with verbs which make that ending *e*.

We will now summarise the commonest rules we have obtained.

1. To form the plural nouns add *-s* to the singular, as a rule.

2. Adjectives 'agree' with their nouns in gender and number. An adjective becomes feminine by adding *-e*, and plural by adding *-s*, to the masculine singular. Adjectives ending in an unaccented *-e* do not add an *e* to form the feminine. Similarly, adjectives ending in *s* in the masculine do not add an *s* to form the masculine plural.

3. We have obtained the following verbal forms for the present tense: 'j'écoute,' 'elle brame,' 'il chasse,' 'on doute,' in the 1st and 3rd persons singular; and also a number of forms of the 3rd singular in *-t*: 'suit,' 'grandit,' 'fuit,' etc. In the 3rd person of the plural we have invariably found the form in *-ent*: 'craqu-ent,' 'frissonn-ent,' 'vienn-ent,' 'press-ent,' etc. Note, however, the exception 'sont,' *are*, plural of 'est,' *is*.

4. The forms 'vol-ant,' 'siffl-ant,' 'brul-ant' equal the English *fly-ing*, *hiss-ing*, *burn-ing*, the participle present.

5. The forms 'poussé,' 'penchée,' 'sechée' give examples of the past participle ending, corresponding to the English *pushed*, *tilted*, *dried*. We have, however, found 'éteinte,' *hushed*, and 'maudit,' *accursed*. The verbs which make their past participles in *e* belong to the same class as those which form the present tense, 1st and 3rd persons singular, in *-e*. The forms 'maudit' and 'éteinte(e)' belong to the class of verbs such as 'suit,' 'grandit.'

6. 'De le' becomes 'du.' 'De les' becomes 'des.' 'À le' becomes 'au.' 'À les' becomes 'aux.' 'De l',' 'à l',' 'de la,' and 'à la' do not alter.

7. A French noun generally is accompanied by an Article. Where we say *fire and water*, *justice and truth*, the French say 'le feu et l'eau,' 'la justice et la vérité.' When a thing is referred to in part, this is expressed in French.

8. A negative statement is made in French by the word 'ne' being put before the verb, and a complementary term, usually 'pas,' after it.

9. The participle, being a verbal adjective, is treated as an adjective in the question of 'agreeing' with the noun to which it refers, unless it is used in a more verbal manner.

10. The personal pronoun object precedes the verb.

We will now take another example. It is from Daudet, the great French humorist. 'Le voici,' *here it is*:

Il faut vous dire qu'en Provence c'est l'usage quand viennent les chaleurs d'envoyer le bétail dans les Alpes. Bêtes et gens passent cinq ou six mois là-haut logés à la belle étoile dans l'herbe jusqu'au ventre. Puis au premier frisson de l'automne on revient. . . . Donc hier soir les troupeaux rentraient. Depuis le matin le portail attendait. Les bergeries étaient pleines de paille fraîche. D'heure en heure on se disait, Maintenant ils sont à Eguyères, maintenant au Paradou. Puis tout à coup vers le soir un grand cril Les voilà . . . et là-bas au lointain nous voyons le troupeau s'avancer. Toute la route semble marcher avec lui.	It is necessary to tell you that in Provence it is the custom when the 'heats' come to send the cattle into the Alps. Beasts and folk pass five or six months up there lodged 'beneath the stars,' in the grass up to the belly. Then at the first shiver of autumn they return. . . . Well, yesterday eve the flocks came back. Since the morning the gate was awaiting them. The folds were full of fresh straw. From hour to hour one told oneself, Now they are at Eguyeres, now at Paradou. Then all at once towards the evening a great cry, Here they are. . . . And away there in the distance we see the troop advancing. All the road seems to march with it.

We will notice the occurrence of the rules we have already discovered, and also any new ones which may present themselves.

l. 1. 'Il faut,' *it needs*, *it is necessary*. This is an impersonal verb, a much commoner thing in French than English. 'Il' stands for *it* as well as for *he* in French. 'C'est,' *this is*; we say, *it is*.

'vous dire,' *to tell you*. In French a personal pronoun, when it is an object of a verb, is put before that verb.

l. 3. 'd'envoyer.' Why 'd''? The expression is 'c'est l'usage d'envoyer,' *the custom of sending*. In French the Infinitive is the verbal noun which in English is rendered by *send-ing*.

'logés.' Notice that 'logés,' a participle, is looked on as an adjective, and takes the plural *-s* in agreement with 'bêtes et gens.'

l. 6. 'à la belle étoile' is an idiom.

Notice 'l'usage,' 'l'herbe,' 'l'automne.' Why 'l''? Abbreviation of 'le' and 'la' before a vowel. So (l. 4) 'au ventre' and 'au premier frisson,' 'au' for 'à le.'

So far the story has been in the present tense, and the chief forms have been the 3rd plural ('reviennent' and 'passent'). In the next few lines we find 'les troupeaux rentraient . . . le portail attendait . . . les bergeries étaient . . . on se disait.' These endings, '-ait' and '-aient,' are the marks of the imperfect tense, the tense of the past which denotes continued action, or state. It is rendered in English sometimes by the form *was —ing*, *were —ing*, or by the simple past.

l. 12. 'paille fraîche.' The adjective here follows its noun. 'Fraîche' is an irregular feminine form. The masculine is 'frais.'

l. 13. 'D'heure en heure (on se disait).' This is an idiomatic form.

We will now take a short piece of prose, the subject of which will be probably well known to everyone. 'Le voici,' *here it is :*

Trois jours après on faisait des noces à Cana en Galilee, et la mère de Jésus y était. Et Jésus fut aussi convié aux noces, *lui* et ses disciples. Le vin ayant manqué, la mère de Jésus *lui* dit, Ils n'ont pas de vin. Mais Jésus *lui* repondit, Femme, qu'y a-t-il entre moi et toi? Mon heure n'est pas encore venu. Sa mère dit à ceux qui servaient, Faites tout ce qu'il vous dira. Or il y avait là six vaisseaux de pierres mis pour servir aux purifications des Juifs, et qui tenaient chacun deux ou trois mésures. Jésus *leur* dit, Emplissez d'eau ces vaisseaux, et ils *les* emplirent jusqu'au haut. Et il *leur* dit, Puisez maintenant et portez-en au maître d'hôtel. Et ils *lui* en portèrent. Quand le maître d'hôtel eut goûté l'eau qui avait été changé en vin (or il ne savait pas où ce vin venait, mais les serviteurs qui avaient puisé l'eau *le* savaient bien), il appela l'époux et il *lui* dit, Tout homme sert d'abord le bon vin et ensuite le moindre, après qu'on a beaucoup bu. Mais *toi*, tu as gardé le bon vin jusqu'à présent.

Three days after they made a marriage at Cana in Galilee, and the mother of Jesus was there. And Jesus was also invited to the marriage, He and His disciples. The wine having failed, the mother of Jesus told Him, They have no wine. But Jesus answered her, Woman, what is there between Me and thee? My hour is not yet come. His mother said to those who served, Do all that He shall tell you. Now there were there six vessels of stone, put to serve for the purifications of the Jews, and which held each two or three measures. Jesus said to them, Fill with water these vessels, and they filled them to the brim. And He said, Draw out now and bear to the master of the feast. And they bore to him. When the master of the feast tasted the water which had been changed into wine (now he did not know whence this wine came, but the servants who had drawn the water knew quite well), he called the bridegroom and said to him, Every man serves first the good wine and then the less, after one has drunk plenty. But thou, thou hast kept the good wine until now.

It will be seen that there exist several forms for the personal pronouns in their various cases and uses. Thus we have, after a preposition, 'moi,' 'toi' (1st and 2nd), and 'lui,' 'leur' (3rd person indirect object). 'Lui' is also used when the pronoun is in an emphatic position, 'lui et ses disciples.' We shall explain these different uses when we deal with the pronouns in detail. Let it suffice for the present to note the existence of these different forms. Tabulated, they are :

First Person (je).—Emphatic 'moi': pronominal adjective 'mon.'
Second Person (tu).—Emphatic 'toi'; plural 'vous.'
Third Person (ils).—Object 'le,' plural 'les'; indirect object 'lui'; plural 'leur'; emphatic 'lui'; pronominal adjective 'sa,' plural 'ses.'

This last difference points out to us that the possessive adjective takes its gender and number from the thing possessed, not from the possessor.

But it is the verbal forms which will occupy us most in this passage. We notice two recurring features: first, the appearance of the endings '-ait,' '-aient,' in what the English tells us is a past tense. Secondly, that, as in English, tenses are formed, compounded of the verbs 'avoir,' *have*, and 'être,' *to be*. Thus we have: 'Fut convié . . . est venu . . . eut goûté . . . avait été changé . . . avaient puisé . . . on a bu . . . tu as gardé,' and the participle 'ayant manqué.' Note that 'fut convié' is passive, and that 'est' is used to form the compound past tense of 'venu' (*cp.* English *is come*).

At the same time we have present forms—'ont,' 'faites,' 'emplissez,' 'puisez,' 'portez,' 'sert'—and another past tense form in 'dit,' 'répondit,' 'emplirent,' 'portèrent,' and 'appela.' It will be seen that the variety of forms for the verb in French demands a special and detailed study.

II. THE PARTS OF SPEECH

In a language we talk about 'things,' and we say what happens to them. The most important parts of speech, then, are the *names* we give to things (*nouns*, as we say in English; in French, 'noms'), and the words for the happenings or actions the—*verbs* (French, 'verbes').

** 1. **The Nouns.**—(We can couple with the study of nouns that of adjectives, for they closely resemble them in form, and they are always associated with nouns in their use.)

We already know that the noun usually forms its plural by adding *-s* to the singular, and that the adjective does the same, as it agrees with its noun in number, while at the same time it 'agrees' in gender, if feminine, by adding an *-e* to the masculine form. We must also remember that, as there is no neuter in French, such nouns will go either into the masculine or the feminine class.

1. Let us now examine this extract with reference to the nouns and adjectives :

SAINT FRANCIS

C'était dans sa première jeunesse un homme de vanité, un bouffon, un farceur, un chanteur, léger, prodigue, hardi. . . . Tête ronde, front

ST. FRANCIS,

He was in his first youth a man of vanity, a buffoon, a joker, a singer, giddy, reckless, bold . . . (his) head round, forehead small, eyes

petit, yeux noirs, sourcils droits, nez fin et droit, oreilles petites et comme dressées, langue aiguë et ardente, voix véhémente et douce ; dents serrées, blanches, égales ; lèvres minces, barbe rare, col grêle, bras courts, doigts longs, ongles longs, jambe maigre, pied petit, de chair peu ou point. . . .—MICHELET.	black, eyebrows straight, nose fine and straight, ears small and as if pricked up, (with a) tongue keen and ardent, (the) voice vehement and soft; teeth close together, white and even, the lips thin, (a) scanty beard, a scraggy neck, short arms, fingers and nails long, a thin leg, (a) small foot, of flesh little or none. . . .

What do we find in this extract beyond the two cardinal rules that the plural is formed by adding an *-s*, and the feminine by adding an *-e*, to the normal masculine singular ? There is one unusual plural, 'yeux.' The singular is 'œil.'

In the adjectives, where gender shows itself more commonly, it will be useful to collect the masculine singular and plural, and the feminine singular and plural, with their nouns. Note 'prodigue' and 'aiguë.' The former must be masculine, as it refers to a man, while 'aiguë' is feminine ('ardente' shows that the noun 'langue' is so). 'Prodigue,' then, like 'mince,' 'rare,' 'grêle,' 'maigre,' is an instance of the rule that if the adjective already ends in an *-e* (mute), no additional *-e* is added for the feminine. The participles, 'dressées' and 'serrées,' which end in an accented *-é*, however, add the feminine *-e*. The writer has placed all his adjectives after their noun, although 'petit' as a rule comes before the noun (as does 'première'). As he is giving a list of characteristics, he drops the article, definite or indefinite, which would otherwise be required. Notice that 'première' is written with a grave accent. This is due to the rule of pronunciation, when a mute *-e* ends a word, that the previous vowel becomes grave by position. So 'leger' would make its feminine 'legère.' (*Cp.* p. 248.) Note 'douce' and 'blanches'—masculine 'doux,' 'blanc.' With regard to the gender of nouns, we notice that 'jeunesse' is feminine, and this suggests that *-esse* is a feminine ending (*princess*). This is so, and 'farceur,' 'chanteur,' have masculine endings (*cp.* English *sing-er*, *songstress*). Note also that all nouns ending in *-e* are feminine, except 'ongle,' and all ending in a consonant masculine, except 'dent.' This, however, is by no means a universal rule.

We will now take another example and treat it in the same way :

DANTON	DANTON
Un colosse à tête de 'Tartare,' d'une laideur *tragique* et *terrible*, un masque *convulsé* de bouledogue *grondant*, de *petits* yeux *enfoncés* sous les *énormes* plis d'un front *menaçant*, une voix *tonnante*, des gestes de combattant, une surabondance et un bouillement de sang, de colère et d'energie, une déclamation *effrénée*, pareille aux mugissements d'un taureau, des images *démesurées*, une emphase *sincère*, des tressaillements et des cris d'indignation *capables* de réveiller les instincts *féroces* dans l'âme la plus pacifique, et les instincts *généreux* dans l'âme la plus abrutie, un cynisme *jaillissant*, spontané et de source *vive*, des crudités *énormes* et dignes de Rabelais, une bonhomie *gouailleuse*, des façons *cordiales* et *familières*, *propres* à capter la confiance et les sympathies d'une plèbe *gauloise* et *parisienne*—un grand seigneur de la sans-culotterie.—TAINE.	A colossus with (a) Tartar head, of an ugliness tragic and terrible, the distorted visage of a growling bulldog, little eyes buried beneath the enormous folds of a scowling forehead, a thundering voice, aggressive gestures, a superabundance and a 'boiling over' of blood, of wrath and energy, an unrestrained manner of speaking, like the bellowings of a bull, (with) similes out of all proportion, a sincere emphasis, shudders and cries of indignation capable of awakening ferocious instincts in the most pacific soul and generous instincts in the most degraded (soul), an outspoken cynicism, spontaneous and genuine, crudenesses enormous and worthy of Rabelais, a jesting heartiness, manners cordial and familiar, fitted to capture the confidence and sympathy of a Gallic and Parisian people —a great lord of the 'unwashed.'

The Nouns.—There is nothing to attract our attention in the plurals, though we may wonder how 'taureau' and 'voix' would form their plural.

Collecting the nouns and classifying them by gender, we get the following :

Names of males : 'Colosse,' 'Tartare,' 'bouledogue,' 'taureau,' 'seigneur,' and 'combattant' (the latter being a participle used in the masculine).

Ending in a consonant (masculine) : 'yeux,' 'front,' 'sang,' 'instincts,' 'bouillements,' 'mugissements,' 'tressaillements.' (Nearly all nouns ending in *-ment* are masculine). 'Pli,' 'cri,' 'masque,' and 'cynisme' are also masculine—these last two although ending in an *-e* mute.

Feminines ending in *-e* mute are 'tête,' 'image,' 'emphase,' 'âme,' 'source,' 'sympathie,' 'sans-culotterie,' 'energie,' 'bonhomie' (*-ie* is nearly always a feminine ending), 'surabondance,' 'confiance' (*-ance* another feminine ending), 'déclamation,' 'indignation' (*-ation* always a feminine ending) ; while 'laideur,' 'voix,' 'façon' are exceptions to the rule that consonant endings are mostly masculine.

Adjectives.—We note 'terrible,' 'énormes,' 'sincère,' 'capables,' 'féroces,' 'dignes,' and 'propres' ending in the masculine in *-e* mute.

'Convulsé,' 'grondant,' 'enfoncés,' 'menaçants,' 'tonnante,' 'démesurées,' 'abrutie,' 'spontané,' are really participles used in an adjectival sense.

Now notice 'pareilles,' 'gouailleuse,' 'gauloise,' 'parisienne,' 'cordiales,' 'familières.' In each case it will be seen that the addition of the feminine *-e* has made the vowel of the preceding syllable grave. Hence in the vowel which shows the grave accent, 'parisiene' becomes 'parisienne' 'familiere' 'familières,' and 'pareil' 'pareille.' Doubling the consonant is an alternative way of expressing the force of a grave accent.

Note that 'généreux' is plural—that is to say, ending in *-x*, it does not alter in the plural. This is a general rule for nouns and adjectives ending in *-s*, *-x*, and *-z*.

'Vive.' What is the masculine of this ? Not 'viv.' Such a word might exist in Kalmuck, but not in French. The masculine is 'vif.' Final *-f* masculine always gives *-ve*.

'Gouailleuse.' The masculine is not 'gouailleus,' but 'gouailleur.' Another general rule :

-eur changes in feminine to *-euse*, but there are exceptions.

Note also the order of adjective in this piece. We can establish the following: (1) Participle adjectives always follow the noun. (2) When there are two or more adjectives, they both follow, unless one of them is an adjective usually put before the noun. (3) Adjectives of nationality come after the noun ('plèbe gauloise'), as do adjectives of colour, taste, etc. (4) Whether an adjective comes before or after is often decided by the ear: 'énormes plis,' but 'crudités énormes.'

To complete our observations, and to give further practice in the study of gender and number, we will take one more extract. (An intending martyr for the faith which he has just espoused apostrophises 'the world's offer.')

Source délicieuse en misère féconde,	Delicious source in misery rich.
Que voulez-vous de moi, flatteuses voluptés?	What will you from me, deceiving pleasures?
Honteux attachements de la chair et du monde,	Shameful attachments of the flesh and of the world,
Que ne me quittez-vous quand je vous ai quittés?	Why do you not leave me when I have left you?
Toute votre félicité, Sujette à l'instabilité,	All your happiness, subject to instability,
En moins de rien tombe à terre;	In less than nothing falls to (the) ground;
Et comme elle a l'éclat de verre, Elle en a la fragilité.	And as it has the glitter of glass, it has (too) its frailty.

Nouns with masculine endings are 'attachements,' 'plaisirs' (consonantal ending), and (contrary to the rule) 'monde' and 'verre.' Feminine are 'source,' 'guerre,' 'terre,' 'voluptés,' 'félicités,' 'instabilité,' 'fragilité,' 'honneurs' (*-eur*, a feminine ending), and (irregularly) 'chair.'

Masculine adjectives are 'honteux' (plural), of which the feminine would be 'honteuse,' as 'délicieuse.' 'Flatteuses,' on the other hand, is the feminine of 'flatteur' (*cp.* 'gouailleuses'). 'Sujette' doubles the final consonant to make its vowel grave. 'Toute' and 'votre' are normal, the latter a mute *-e*.

There is still one rule in the formation of plural nouns to be touched on. If you look at this extract:

La Providence a dispensé avec tant de sagesse les biens et les maux de la vie que chacun, quel que heureuse que sa destinée, trouve des croix et des amertumes, qui en balancent toujours les plaisirs.	Providence has dispensed with so much wisdom the good and the evil (things) of life that everyone, however happy his destiny, finds crosses and bitternesses, which always balance the pleasures thereof.

and then compare it with this one:

Tous les animaux ont la faculté de se mouvoir et de se porter ou de s'arrêter selon leur besoin.	All animals have the faculty of moving and carrying or stopping themselves according to their need.

you may be struck with the two plurals, 'les maux' and 'les animaux.' 'Animaux' must come from a singular, 'animal,' and this sug- 'maux' from 'mal' (a root found in *malady*). If you heard that 'chevaux' was the plural of 'cheval,' you would see that this was the common way for a plural to be formed from a singular ending *-al*. The origin of this is interesting. The letter *l* is one which easily becomes silent (cp. *palm*, *alms*), and in French this was shown by changing it to *u*. When the termination *-au* became plural it would be *-aus*, and in monkish writing *-us* was written *-x* for short. Thus the plural was written *-ax*, and then in course of time people, thinking there had been a misspelling, altered this to *-aux*. Hence the plural common in nouns and adjectives ending in *-al*. A few nouns have kept the *-als* plural, and 'travail' is a common word ending in *-ail* which makes its plural 'travaux.'

'Chou,' 'genou,' 'hibou,' are words ending in *-ou* with their plural in *-oux*.

Summarising the rules to be drawn from the observations we have made, we obtain the following:

Number.—The plural is generally formed by adding *-s* to the singular of noun or adjective. If the word ends in *-s*, *-x*, *-z*, it remains unaltered.

Nouns and adjectives ending in *-au* (and *-eu*) form their plural in *-x*, not *-s*.

Ending in *-al* they usually change to *-aux*.

Feminine adjectives of course remain, *-ale*, *-ales*.

'Travail' and a few other nouns ending in *-ail* make their plural also in *-aux*.

A few nouns in *-ou* make their plural *-oux* ('genou,' 'hibou,' 'chou,' etc.).

Gender.—Male things, of course, are masculine, and female feminine. What we know as neuter words must go into one of these two classes.

Nouns ending in a consonant, with few exceptions, are masculine.

Nouns ending in an *-e* mute are, with numerous exceptions, feminine.

Terminations are useful in determining the gender in some cases.

Nouns ending in *-ment*, *-age*, *-acle*, *-aire*, *-ere*, *-oire*, *-asme*, *-isme* are masculine. (Note that these cover many of the *-e* mute exceptions.)

Nouns ending in *-ance*, *-ation*, *-eur* (if an abstract noun) are feminine.

Adjectives.—The general rule is to form the feminine by adding *-e* to the masculine form. If the masculine already ends in *-e* mute, no change is made. If the adjective ends in certain consonants, some change is made for the sake of euphony. Examples: 'vi*f*,' 'vi*ve*'; 'heureu*x*,' 'heureu*se*'; 'ch*er*,' 'ch*ère*.' Doubled consonant: 'cruel-le,' 'ancien-ne,' 'net-te,' 'bon-ne,' 'pareil-le.'

2. Adjectives—Comparison.—There remains to treat of one use of adjectives, which does not come under the head of gender or number. It is the comparative use. As adjectives are used to denote the possession of a certain quality, it

often happens that this quality is denoted as being present to a greater or less extent. How is this done in French ? Here are some examples :

* 1. Trois fois en un siècle, sous Caligula, sous Néron, et sous Domitien, *le plus grand* pouvoir qui ait jamais existé tomba entre les mains d'hommes exécrables ou extravagants. . . . *Les plus terribles* secousses étaient inévitables. De là des horreurs qui ont été à peine dépassées par les monstres des dynasties mongoles. . . . *Les plus choquantes* ignominies de l'Empire venaient de l'Orient, et surtout de l'Egypte, qui était alors un des pays *les plus corrompus* de l'univers.	1. Three times in a century, under Caligula, under Nero, and Domitian, the greatest power which has ever existed fell into the hands of execrable or abnormal men. . . . The most terrible shocks were inevitable. Thence the horrors which have been hardly surpassed by the monsters of Mongol dynasties. . . . The most shocking ignominies of the Empire came from the East, and above all from Egypt, which was then one of the most corrupt countries of the universe.
Le véritable esprit romain, en effet, vivait encore. Un temps où se préparaient des esprits *aussi profondément honnêtes* que Quintilien, Pline le Jeune, Tacite, n'est pas un temps dont il faille désespérer. . . . Il y avait dans les maisons nobles d'admirables épouses, d'admirables sœurs. Fut-il jamais destinée *plus touchante que* celle de cette jeune et chaste Octavie, fille de Claude, femme de Néron, restée pure à travers toutes les infamies, tuée à vingt-deux ans, sans qu'elle eût jamais senti aucune joie ?—RENAN.	The real Roman spirit, indeed, still lived. A time when were being formed minds as profoundly honourable as Quintilian, Pliny the Younger, Tacitus, is not a time of which one needs despair. . . . There were in the noble houses admirable wives, admirable sisters. Was there ever fate more touching than that of the young and chaste Octavia, daughter of Claudius, wife of Nero, (who) remained pure amid all infamies, (and was) killed at twenty-two, without having ever tasted any joy ?

Again, in the 'Djinns' we have :

2. La voix *plus haute* semble un grelot d'un nain qui saute; c'est le galop.	2. The voice still louder is as a bell of a leaping elf ; 'tis the whirligig.

Here is another quatrain of Hugo :

3. L'immense empire attend un héritier demain : Qu'est-ce que le Seigneur va donner à cet homme, Qui, *plus grand que* César, *plus grand* même *que* Rome, Absorbe dans son sort le sort du genre humain ?	3. The immense empire awaits to-morrow an heir ; What is the Lord going to give to that man, Who, greater than Cæsar, even greater than Rome, Absorbs in his fate the fate of human kind ?
4. Nous sommes *moins offensés* du mépris des sots *que* d'être médiocrement estimé des gens d'esprit.—VAUVENARGUES.	4. We are less offended with the contempt of fools than with being meanly thought of by people of intelligence.
5. La France était *moins avancée* pour les arts de la paix *qu*'au XIVe siècle.—MICHELET.	5. France was less advanced (in) the arts of peace than in the fourteenth century.

We see from these extracts that the superlative—'le plus grand pouvoir,' 'les plus terribles secousses,' 'les plus choquantes ignominies'—is always rendered by the addition of 'le plus,' 'la plus,' 'les plus,' and that the comparative is expressed by 'plus' alone. If you say a thing is most terrible, most shocking, or what not, the comparison with other things need not be expressed ; but if you only say it is more terrible, you must say *than* what. We see in 1 and 3 that this is rendered by 'Fut-il jamais destinée plus touchante que celle' . . . 'plus grand que César, plus grand même que Rome.' In 2, 'la voix plus haute,' the meaning is that the voice is 'plus haute' than it was before; so comparison is understood. Comparison may be of equality, as in 1, 'des esprits aussi . . . honnêtes que Quintilien.' The formula here is, we see, 'aussi . . . que . . .'

In 4 and 5 we have a comparison of inferiority : 'Nous sommes moins offensés . . . que,' *we are less offended . . . than.* 'La France était moins avancée . . . que.' Here 'plus que' is replaced by 'moins que.'

To sum up, then, we find that comparison in French is shown logically and clearly by the words 'plus' and 'moins' (*more* and *less*), which denote it, and the superlative by the convention of prefixing the article to 'plus.' Only in a few cases is the comparative expressed as in English, by a suffix being added to the positive adjective. These exceptions are 'meilleur,' *better ;* 'pire,' *worse ;* and 'moindre,' *less.* Their superlative is formed by prefixing the article in the usual way.

3. The Definite Article.—In our introductory lesson we saw that the use of the article was a little different in French to the English use. It is necessary to go into this difference somewhat more fully. Any passage of French will illustrate the point. Take, for instance, De Musset's little poem.

La vie est vaine : Un peu d'amour, Un peu de haine, Et puis Bonjour.	Life is vain : A little love, A little hate, And then Good-day.
La vie est brève : Un peu d'espoir, Un peu de rêve, Et puis Bonsoir.	Life is short : A little hope, A little dream, And then Good-night.

Here we see clearly how with a term stated 'generally' the French use the definite article, and say 'la vie,' *the life*, where we say simply *life*. On the other hand, we see, in the case of 'amour,' 'haine,' etc., they drop the article. 'Bonsoir,' 'Bonjour,' of course, are elliptical expressions.

Let us take a few more examples. 'En voici,' *here are some of them :*

L'hypocrisie est un hommage que le vice rend à la vertu.—ROCHEFOUCAULD.	Hypocrisy, we say, is a homage which vice renders to virtue.
L'homme est un roseau, mais c'est un roseau pensant.—PASCAL.	Man is a reed, but 'tis a thinking reed.

These examples are enough to establish that when a thing is taken 'generally,' the French always use the article. It is a point of interest to anyone familiar with logic to notice that in French the article makes the proposition 'universal,' while the English use is not 'particular,' as may appear at first sight, but rather 'generic.'

Now look at this piece of splendid rhetoric:

6. *Le* pinson, *l'*alouette, *la* linotte, *le* serin jasent et babillent tant que le jour dure. *Le* soleil couché, ils fourrent *leur tête* sous *l'*aile, et les[1] voilà endormis. C'est alors que le génie prend *sa* lampe et l'allume,[1] et que l'oiseau solitaire, sauvage, inapprivoisable, brun et triste de plumage, ouvre *son* gosier, et commence son chant, fait retentir le bocage, et rompt mélodieusement le silence et les ténèbres de la nuit.—DIDEROT.	6. The chaffinch, the lark, the linnet, the canary chirp and chatter as long as the day lasts. The sun set, they stuff their head(s) under the wing, and there they are asleep. 'Tis then that the seer takes his lamp and lights it, and that the bird, solitary, wild, untameable, brown and sad of plumage, opens his throat, begins his song, makes the coppice ring, and breaks melodiously the silence and the darkness of the night.

The first thing to notice in this piece is that wherever the definite article is used in English it may be used in French, although you will often find that in French the stronger Demonstrative is preferred. This use is curiously creeping into our sporting press. But there is one important exception. You will notice that in English we can say either *they stuff the head under the wing*, or *their heads under their wings.* In French there is the same liberty; in speaking of parts of the body, when it is quite clear whose body is being referred to—*i.e.* when the possessor is clearly defined—the article is used instead of the possessive, *the* head, tail, legs, instead of *his, her,* head, tail, legs, wings, or what you will. This is brought out in the following passage:

7. En un instant cinquante soldats bondirent dans la cuisine où reposait pacifiquement Walter Schnaffs, et *lui* posant *sur la poitrine* cinquante fusils chargés, le culbutèrent, le lièrent des pieds à la tête. . . . Et tout d'un coup un gros militaire *lui* planta *son pied* sur *le* ventre en vociférant. . . . Il fut relevé, ficelé sur une chaise, et examiné avec une vive curiosité par ses vainqueurs qui soufflaient comme des baleines. Le gros militaire, qui s'essuyait le front, vocifera 'Victoire.' Et il donna l'ordre de repartir. La population anxieuse et surexcitée attendait. Quand on aperçut le casque du prisonnier, des clameurs formidables éclatèrent. Les femmes levaient les bras; des vieilles pleuraient; un aieul lança sa béquille au Prussien et blessa le nez d'un de ses gardiens.—MAUPASSANT.	7. In an instant fifty soldiers bounded into the kitchen where peacefully slept Walter Schnaffs, and placing on his chest fifty loaded rifles, knocked him over, tied him hand and foot. . . . And all at once a big soldier fellow planted his foot on his stomach bellowing. . . . He was picked up, tied to a chair, and examined with a lively curiosity by his victors, who puffed like whales. The big soldier who was wiping his brow bawled out 'Victory.' and (he) gave the order of retreat. The population, anxious and excited, was waiting. When they perceived the helmet of the prisoner, terrific shouts burst out. The women raised their arms; the old ones wept; a patriarch threw his crutch at the Prussian and wounded the nose of one of his guards.

'lui posant sur la poitrine.' The presence of 'lui' makes *his* unnecessary.

'lui planta son pied sur le ventre.' The same is true here. Notice that 'son' refers to the 'militaire.' 'le militaire qui s'essuyait le front'—lit., *the soldier who wiped himself the brow.* The 'se' makes 'son' unnecessary.

'les femmes levaient les bras.' *The arms* is enough, as it is quite clear whose arms they raised. Notice the use of the possessives with 'béquille' and 'gardien.'

Other omissions of the article:

We saw in 'Les Djinns' that the article was omitted in the enumeration of a number of terms, and in apposition. It is also dropped in certain phrases where a noun is closely compounded with a verb, and when with a preposition a noun forms an adverbial phrase. These will be dealt with in their place.

4. **The Partitive Article.**—We have seen that as a rule French insists on the definite article preceding a term which is used generally. So, on the other hand, when a thing is referred to only in part, this also must be signified.

'Du lait!' 'Des violettes!' 'Des poissons!' 'Du saucisson!' 'De la crême!' 'Du vin!' 'De la salade!' 'Des cotelettes!' 'Du pain!' 'De l'eau!' But note that if these cries are preceded by words showing what part or quantity is referred to, then 'du,' 'de la,' 'de l',' 'des' are reduced to 'de' or 'd'' simply. Thus:

'Un pot de lait.' 'Un peu de vin.' 'Un bouquet de violettes.' 'Trop de crême.'

A few literary examples will suffice to illustrate these points.

De grands corps blancs, phlégmatiques, avec *des* yeux bleus farouches, et *des* cheveux d'un blond rougeâtre; des estomacs voraces, répus de viande et de fromage.	Huge white sluggish bodies, with fierce blue eyes, and hair of a reddish blond; voracious stomachs, crammed with meat and cheese.

Thus Taine tabulates the characteristics of our Saxon forefathers.

La fureur de la plupart des Français, c'est d'avoir *de l'esprit*; et la fureur de ceux qui veulent avoir *de l'esprit*, c'est de faire *des* livres.—MONTESQUIEU.	The madness of most of the French is to have 'wit,' and the madness of those who wish to have 'wit' is to make books.

Again, to a lover's eyes:

La noire à faire peur (est)[1] une brune adorable;	The dark 'to distraction' is a brunette adorable;
La maigre a *de la* taille et *de la* liberté. —MOLIÈRE.	The lean one has a form and a freedom in gait.

This use, however, must not be confounded with that of 'de' joined to the article and signifying simply *of the.*

De tous auteurs, il n'y en a point que je méprise plus que les compilateurs qui vont de tous côtés chercher *des* lambeaux *des* ouvrages *des* autres qu'ils plaquent dans les leurs comme *des* pièces de gazon dans un parterre.—MONTESQUIEU.	Of all authors, there is not one that I despise more than the compilers who go all round seeking shreds of the works of others, which they stick into their own as pieces of turf in a lawn.

Here the first 'des' is *some*, the next two *of the*, the last ('des pièces'), *some.*

** 5. **Verbs.**—We saw in the Introductory Chapter that the verb has endings to show

[1] 'les' and 'l'' are not the article *the*, but the pronouns *they* and *it*.

[1] I ask pardon of God and men for intercalating a word in a line of Molière.

tense, number, person, etc., and that verbs go into classes according to the endings they take.

We have already met -*e* as a common Present tense ending for 1st and 3rd persons, and -*ent* as invariably the ending of 3rd plural of the Present tense.

We have also found -*ais*, -*ait*, -*aient* as endings for the Imperfect Past tense.

A glance at Extr. 7 in the last section will show a number of forms of the Past Definite. There we find -*a* replacing the -*e* of 3rd singular Present, and -*irent*, -*erent*, in place of the -*ent* of the 3rd plural.

It is now necessary to study all these forms in full, beginning with the common but irregular verbs 'avoir' and 'être,' *to have* and *to be*.

AVOIR

Indicative — *Subjunctive*

PRESENT

j'ai	*I have*	(que) j'aie
tu as	*thou hast*	tu aies
il a	*he has*	il ait
nous avons	*we have*	nous ayons
vous avez	*you have*	vous ayez
ils ont	*they have*	ils aient

PERFECT (*Past Indefinite*)

j'ai eu	*I have had*	(que) j'aie eu
tu as eu	*thou hast had*	tu aies eu
il a eu	*he has had*	il ait eu

		ayant été	*having been*

** 'Avoir' and 'Etre'

It is not possible to find in a short space examples of both the persons and the tenses of 'avoir' and 'être.' As they are the commonest verbs, and as they are also auxiliaries, it has been thought necessary to give an example of their simplest uses in all persons of the main tenses of the Indicative. Apologies are made for the childish nature of the illustration which the limited vocabulary demands.

The example should be compared carefully with the formal conjugation of the verbs on the previous pages.

ACTE I	ACT I
Papa, Maman, Alphonse, Marie	Papa, Mamma, Alphonse, Marie
* Alph. Je suis triste. Mar. Tu es triste? Moi aussi je suis triste. Maman, Alphonse est triste. Mam. Il est triste? Il a froid peut-être. Avez-vous froid, Alphonse? Alph. Non. J'ai mal à la tête. Mam. Alors tu as besoin de la médecine. Mar. Nous avons tous les deux mal. Nous sommes tous les deux malades. Mam. Si vous êtes malades, vous avez tous les deux besoin de la médecine. Pa. Oui, ils ont besoin de la médecine. Ils sont des malades.	Alph. I am sad. Mar. Thou art sad? 'Me' too. I am sad. Mamma, Alphonse is sad. Mam. He is sad? He has cold, perhaps. Have you cold, Alphonse? Alph. No: I have headache. Mam. Then thou hast need of medicine. Mar. We have both 'ill.' We are both sick. Mam. If you are both sick, you have both need of medicine. Pa. Yes, they have need of medicine. They are sick.
Alph. J'*étais* malade. Mar. Nous *étions* malades. Alph. J'*avais* mal à la tête. Mar. Nous *avions* mal. Pa. Tu *étais* malades. Tu *avais* mal à la tête? Alph. Oui, Marie *était* malade. Mar Il *avait* mal à la tête. Mam. C'est bon ça! Ils *étaient* malades. Ils *avaient* mal.	Alph. I *was* sick. Mar. We *were* sick. Alph. I *had* headache. Mar. We *had* 'ill.' Pa. Thou *wast* sick. Thou *hadst* headache. Alph. Yes, Marie *was* sick. Mar. He *had* headache. Mam. That's all very well. They *were* sick. They *had* 'ill.'

ACTE II	ACT II
Alph. Tant pis. Je serai bientôt guéri. Mar. Nous serons contents. Je n'aurai plus mal à la tête. Mar. Nous n'aurons pas besoin de la médecine. Mam. Oui, mais tu *auras* la médecine. Papa! N'est-ce pas qu'ils auront la médecine? Pa. Oui. Ils l'auront, et ils seront guéris. Mes enfants, vous serez guéris.	Alph. Bad luck. I shall be soon cured. Mar. We shall be glad. I shall have no more headache. Mar. We shall have no need of medicine. Mam. Yes, but you *will have* the medicine. Papa, is it not that they will have the medicine? Pa. Yes. They will have it, and they will be cured. My children, you will be cured.

ACTE III	ACT III
Mar. J'ai eu la médecine. Alph. Tu l'as eu? Elle a été très atroce? Mam. Alphonse! Marie a été sage. N'est-ce pas, Marie? Tu as été sage? Mar Oui, j'ai été sage. Mam. Elle a eu la médecine. Alph. *Maintenant* nous l'avons eu. Nous avons été sages. Pa. Vous l'avez eu? Vous avez été sages? Mam. Oui, ils ont été sages, et ils ont eu la médecine. Maintenant au lit.	Mar. I've had the medicine. Alph. Thou hast had it? It has been atrocious? Mam. Alphonse! Marie has been good. Is it not so, Marie? Thou hast been good? Mar. Yes, I have been good. Mam. She has had the medicine. Alph. *Now* we have had it. We have been good. Pa. You have had it? You have been good? Mam. Yes, they have been good, and they have had the medicine. Now to bed.

Note that *thou* is for the most part confined to children and intimates. In the phrases 'Il a froid,' 'J'ai mal,' the French idiom differs from the English. In the latter one is said *to have cold, to have ill*, not *to be cold*, etc. Note also the idiom 'tous les deux,' *both.*

Questions are often asked in French by the inflexion of the voice, as in 'Tu es triste?'

In Act III is illustrated a double use of the Perfect tense, which is also used as a general Past. In English we should say *it was atrocious*, rather than *it has been.*

'N'est-ce pas?' *Is it not?* is a common adjunct to a question in French.

** 6. **The Regular Verbs.**—We have already shown how the verbs arrange themselves in a number of classes (or Conjugations, as they are called), and all verbs in a conjugation take the same endings to show difference of mood, tense, and person.

We see the conjugation which a verb belongs to by looking at its Infinitive. Thus these are types of the chief conjugations:

Conjugation I. Chanter, *to sing.*
II. Finir, *to finish.*
IV. Rompre, *to break.*

while there are besides two small conjugations, types of which are:

III. Recevoir, *to receive.*
IIb. Dormir, *to sleep.*

The 'recevoir' class is an awkward little conjugation of six verbs, and the 'dormir' class is really a variant of the 'finir' conjugation.

To show how these verbs agree and differ, we will give what are called their Principal Parts. They are the Infinitive, the Present tense of the Indicative, the Past Definite tense (Indicative), the Present and Past Participles. These are:

INFINITIVE.	PRES. INDIC.	PAST DEF.	PRES. PART.	PAST PART.
chanter	chante	chantai	chantant	chanté
finir	finis	finis	finissant	fini
rompre	romps	rompis	rompant	rompu
recevoir	reçois	reçus	recevant	reçu
dormir	dors	dormis	dormant	dormi

It is only in the Present and Past Definite tenses that we find really distinctive forms in each conjugation, and even then the plurals closely resemble one another, while all but the *-er* conjugation end in the singular in *-s*, *-s*, *-t*.

The Imperfect tense has the same endings in all verbs, but the question of conjugation comes in in the stem. This can always be obtained by taking the stem of the Present Participle and substituting for the termination *-ant* the following: *-ais*, *-ais*, *-ait*, *-ions*, *-iez*, *-aient*. So also the Future and the Conditional tack their endings on to the stem of the Infinitive (in some cases slightly abbreviated; see 'rompre' and 'recevoir').

TYPES OF CONJUGATIONS

PRESENT TENSE

je	tu	il	nous	vous	ils	
chante	chantes	chante	chantons	chantez	chantent	*sing.*[1]
finis	finis	finit	finissons	finissez	finissent	*finish.*
romps	romps	rompt	rompons	rompez	rompent	*break.*

Six verbs follow 'recevoir,' and seven 'dormir.'

reçois	reçois	reçoit	recevons	recevez	reçoivent	*receive.*
dors	dors	dort	dormons	dormez	dorment	*sleep.*

THE PAST DEFINITE

je	tu	il	nous	vous	ils	
chantai	chantas	chanta	chantâmes	chantâtes	chantèrent	*sang.*
finis	finis	finit	finîmes	finîtes	finirent	*finished.*
rompis	rompis	rompit	rompîmes	rompîtes	rompirent	*broke.*
reçus	reçus	reçut	reçûmes	reçûtes	reçurent	*received.*
dormis	dormis	dormit	dormîmes	dormîtes	dormirent	*slept.*

THE IMPERFECT.—*I was singing, etc.*

To show how the stem is that of the Present Participle, we place it at the head:

	je	tu	il
chantant	chantais	chantais	chantait
finissant	*finiss*-ais	finiss-ais	finiss-ait
rompant	rompais	rompais	rompait
recevant	*recev*ais	recevais	recevait
dormant	dormais	dormais	dormait

nous	vous	ils
chantions	chantiez	chantaient
finissions	finissiez	finiss-aient
rompions	rompiez	rompaient
recevions	receviez	recevaient
dormions	dormiez	dormaient

[1] To obtain the English in full for a tense of any verb, substitute that verb for 'have' in the conjugation of the latter verb (p. 245).

THE FUTURE.—*I shall sing, etc.*

Here the stem, it will be seen, is that of the Infinitive:

	je	tu	il
chanter	chanterai	chanteras	chantera
finir	finirai	finiras	finira
rompr'	romprai	rompras	rompra
recev'r	recevrai	recevras	recevra
dormir	dormirai	dormiras	dormira

nous	vous	ils
chanterons	chanterez	chanteront
finirons	finirez	finiront
romprons	romprez	rompront
recevrons	recevrez	recevront
dormirons	dormirez	dormiront

THE CONDITIONAL.—*I should sing, etc.*

To the same stem as the Future add the Imperfect endings:

chanterais	chanterais	chanterait
finirais	finirais	finirait
romprais	romprais	romprait
recevrais	recevrais	recevrait
chanterions	chanteriez	chanteraient
finirions	finiriez	finiraient
romprions	rompriez	rompraient
recevrions	recevriez	recevraient

The compound tenses may be considered apart from the question of conjugation, for as they are formed by joining an auxiliary verb to the Past Participle, the only evidence of difference in conjugation is in the differing forms of the Past Participles.

The Perfect or Past Indefinite is formed by joining the Present tense of 'avoir' to the Past Participle:[1]

j'ai	chanté	nous avons	chanté
tu as	fini, reçu	vous avez	fini, reçu
il a	rompu, dormi	ils ont	rompu, dormi

I have sung, finished, broken; or, I sang, finished, broke, etc.

This tense, as has been said, does double duty. It corresponds to the English Perfect, and it also serves as a general Past tense.

The Pluperfect is formed by joining the Imperfect tense of 'avoir' to the Past Participle:

j'avais	chanté	nous avions	chanté
tu avais	fini, reçu	vous aviez	fini, reçu
il avait	rompu, dormi	ils avaient	rompu, dromi

I had sung, finished, broken, etc.

The Future Perfect joins the Future of 'avoir' to the Past Participle:

j'aurai	chanté	nous aurons	chanté
tu auras	fini, reçu	vous aurez	fini, reçu
il aura	rompu, dormi	ils auront	rompu, dormi

I shall have sung, finished, broken, etc.

The Past Conditional joins the Conditional Present of 'avoir' to the Past Participle:

j'aurais	chanté	nous aurions	chanté
tu aurais	fini, reçu	vous auriez	fini, reçu
il aurait	rompu, dormi	ils auraient	rompu, dormi

I should have sung, finished, broken, etc.

[1] With verbs of motion, and reflexive verbs, 'être' is used instead of 'avoir.'

The Imperative Mood

The Imperative is formed as a rule from the Present Indicative, the pronouns being dropped:

[1] chante	*sing*	chantons	*let us sing*	chantez	*sing*
[1] finis	*finish*	finissons	*let us finish*	finissez	*finish*
[1] romps	*break*	rompons	*let us break*	rompez	*break*
So—reçois		recevons		recevez	
dors		dormons		dormez	

I keep the Subjunctive till later, when its use is fully explained.

Notes on Some Verbs of the First Conjugation

Verbs like 'jeter,' *to throw*, 'appeler,' *to call*, 'mener,' *to lead*, have a mute *e* in the stem; and when this is followed by another mute *e*, to avoid an awkward sound, the first *e* mute becomes grave, or achieves the same result by doubling the following consonant. This change operates in the 1st, 2nd, and 3rd singular and 3rd plural of the Present Indicative, and throughout the Future and Conditional. Examples:

je mène, tu mènes, il mène, ils mènent, je mènerai, je mènerais

When the final consonant is *l* or *t*, it is generally doubled, but there are exceptions. Thus:

je jette	tu jettes	il jette	ils jettent
but—j'achète	tu achètes	il achète	ils achètent

and 'geler,' *to freeze*, 'peler,' *to peel*, 'celer,' *to conceal*, go likewise.

In the same way verbs which have an *é* in the last syllable of the stem convert this *é* into an *è*.

j'espère, etc. j'espèrerai, etc. j'espèrerais, etc.

Again, as *g* and *c* are pronounced hard before *a*, *o*, and *u*, to preserve the soft sound which they have in the Infinitive, *g* inserts an *e* after it, and *c* takes a sign known as the cedilla, before terminations beginning with those vowels. Thus in the Present Indicative we have 'nous mangeons,' and in the Imperfect:

je mangeais	tu mangeais	il mangeait	ils mangeaient
j'avançais	tu avançais	il avançait	ils avançaient

When *y* is followed by an *e* mute it becomes *i*. Thus in the Present Indicative 'employer' becomes:

j'emploie, tu emploies, il emploie (nous employons, vous employez), ils emploient. *Future*, j'emploierai, etc. *Conditional*, j'emploierais, etc.

Note, however, that verbs in 'ayer,' 'eyer,' usually retain the *y*.

There are two verbs in the 1st conjugation with further irregularity. 'Envoyer,' besides losing its *y* in the cases indicated for 'employer,' has an irregular Future—'Enverrai,' etc. 'Aller,' *to go*, introduces other forms in the Present Indicative, which are:

je vais	nous allons
tu vas	vous allez
il va	ils *vont*

and the Future, which is:

j'irai, etc. [*Conditional*, j'irais.]

[1] This form is used in the intimate style only.

The Present Subjunctive is also irregular.

Que j'aille	Que nous allions
,, tu ailles	,, vous alliez
,, il aille	,, ils aillent

Rule of the Principal Parts

It will be noticed, typically with 'finir,' 'dormir,' 'recevoir,' that there is a certain amount of change in stem in conjugation.

Thus 'finir,' but Present Participle 'finissant.' 'Dormir,' Present Indicative 'je dors,' Present Participle 'dormant.' 'Recevoir,' but Present Indicative singular 'reçois,' Past Definite 'reçus.'

None the less verb-forms group themselves under heads, and even in irregular verbs they only fail to do so when euphony causes a change. The commonly recognised heads are:

The Infin., which gives the stem of the Future and Conditional.	The Pres. Indic. Sing., which stands alone.	The Pres. Part., which gives the Imperfect and the plural of the Pres. Indic.
The Past Definite, which gives the Imperfect Subjunctive.		The Past Participle, which gives the compound tenses.

Examples—

Finir	Finis	Finissant	Finis	Fini
Fut. Finirai	Finis	*Imp.* finissais.	*Imp. Sub.*	j'ai fini,
Con. Finirais	Finit	*Pres. Indic.*	Finisse	etc.
		Plur. Finissons, etc.		

[Note that the Imperative is not formed from the Present Indicative, but *is* the Present Indicative in certain persons, without the pronouns (except 'savoir').]

The more the learner studies this arrangement, the more will he find the way through irregular verbs simpler.

EXAMPLES OF TENSES

The Indicative

Third Singular Present Tense

L'Hirondelle	The Swallow
Ainsi elle *mange* en volant, elle *boit*,[1] *se baigne* * en volant, en volant elle *nourrit* ses petits. Elle *tourne*, elle *fait*[1] cent cercles, un labyrinthe de courbes qu'elle *croise*, *recroise* à l'infini. L'ennemi s'y *ébloult*, s'y *perd* s'y *brouille*, et ne sait plus que faire. Elle le *lasse*, l'*inquiète*; il *renonce* et la laisse non fatiguée.	Thus she eats in flight, she drinks, she bathes in flight, while flying she feeds her young. She turns, she makes a hundred circles, a labyrinth of curves, which she crosses and recrosses to infinity. The foe dazzles, loses and muddles himself in it, and knows not what to do. She tires him, harasses him; he gives up and leaves her unfatigued.

Then, addressing 'l'hirondelle' in that 2nd person singular, known to us principally in the commandments, but in French employed 'en famille' and to little ones, the author continues:

Qui donc *es-tu*, toi qui te *dérobes* toujours, qui ne *laisses* voir que tes ailes tranchantes. . . . Tu' m'*approches*, tu me *rases*, tu voudrais me toucher. Tu me *caresses* de si près, que j'*ai* au visage le vent de ton aile.	Who, then, art thou, who escapeth always, who showeth only thy cleaving wings. . . . Thou approachest me, thou grazest me, thou wouldst touch me. Thou caressest me so closely that I have in my face the wind of thy wing.

[1] Irregular.

In this 'morceau' we have a very varied choice of all the persons of the Present tense :

* Je vais, Clitophon, à votre porte ; le besoin que j'ai de vous me *chasse* de mon lit et de ma chambre. Vos esclaves me *disent* [1] que vous êtes enfermé, et que vous ne *pouvez* m'ecouter que d'une heure entière. Je *reviens* [1] . . et ils me *disent* que vous êtes sorti. Que *faites* [1] vous, Clitophon ? Vous *enfilez* quelques memoires, vous *collationnez* un registre, vous *signez*, vous *paraphrasez ;* je n'*avais* qu'une chose à vous demander, et vous n'*aviez* qu'une chose à me répondre, oui ou non. O homme important et chargé d'affaires, qui, à votre tour, *avez* besoin de mes offices, *venez* dans la solitude de mon cabinet. Je ne vous *remettrai* point à un autre jour. Vous me *trouverez* sur les livres de Platon qui *traitent* de la spiritualité de l'âme.—La Bruyère.	I go, Clitophon, to thy door ; the need I have of you drives me from my bed and from my room. Your slaves tell me that you are shut up, and that you cannot hear me for a whole hour. I return . . . and they tell me that you are gone out. What are you doing, Clitophon ? You are filling some memoirs, you collate a register, you sign, you paraphrase ; I had but one thing to ask you, and you had but one thing to answer me, yes or no. O man important and loaded with business, who in your turn have need of my help, come into the solitude of my study. I will not put you off to another day. You will find me at my leave books of Plato which treat of the immortality of the soul.
J'*admire* Dieu dans ses ouvrages, et je *cherche* par la connaissance de la verité à regler mon esprit et à devenir meilleur.	I admire God in His works, and I seek by the knowledge of truth to rule my spirit and to become better.
Reproches d'un Gentilhomme à Son Fils	Reproaches of a Nobleman to his Son
* Ne *rougissez*-vous point de mériter si peu de votre naissance ? *Etes*-vous en droit, *dites* moi, d'en tirer quelque vanité ? Et qu'*avez*-vous fait dans le monde pour être gentilhomme ? *Croyez*-vous qu'il *suffise* d'en porter les armes et le nom ? et que ce nous *soit* une gloire d'être sortis d'un sang noble, lorsque *nous* vivons en infame ? Non, non, la naissance n'*est* rien où la vertu ne l'est pas. Nous n'*avons* part à la gloire de nos ancêtres qu'autant que nous nous efforçons de leur ressembler ; et cet éclat qu'ils *repandent* sur nous, nous *impose* un engagement de suivre les pas qu'ils *tracent*. *Apprenez* [1] enfin qu'un gentilhomme qui *vit* [1] mal est un monstre de la nature ; que je *regarde* bien moins au nom qu'on signe qu'aux actions qu'on fait ; et que je ferais [1] plus d'état du fils d'un crocheteur qui serait honnête homme, que du fils d'un monarque qui vivrait comme vous.	Do you not blush to merit so little from your birth ? Are you in the right, tell me, to get from it vanity ? And what have you done in the world to be noble ? Do you believe that it is enough to bear the arms and the name, and that it is a glory to us to issue from a noble line when we live in infamy ? No, birth is nothing where virtue is not. We have no part in the glory of our ancestors but in so far as we force ourselves to resemble them ; and that splendour which they cast on us imposes on us a need to follow the steps they trace. Learn, in fine, that a nobleman who lives is a monster ; that I look a good deal less at the name one signs than at the actions one does ; and that I should make more of the son of a cobbler who was an honest man, than of the son of a monarch who lives like you.

The Present Historic

Fragment from one of the 'Oraisons funèbres' for which Bossuet was so justly famous :

Madame se meurt.[1] Madame est morte. Qui de nous ne se sentit frappé à ce coup ? Au premier bruit d'un mal si étrange, on *accourt* à Saint-Cloud de toutes parts. On *trouve* tout consterné, excepté le cœur de cette princesse. Partout on *entend* des cris ; partout on *voit* la douleur et le désespoir, et l'image de la mort. Le roi, la reine, Monsieur, toute la cour, tout le peuple, tout *est* abattu, tout *est* désesperé ; et il me *semble* que je *vois* l'accomplissement de cette parole du prophète. . . .	Madame is dying. Madame is dead. Who of us did not feel struck by this blow ? At the first rumour of so strange an ill, we rush to St. Cloud from all parts. We find all panic-stricken except the heart of that princess. Everywhere one hears cries ; everywhere one sees grief and despair, and the image of death. The King, the Queen, Monsieur, all the court, all the people, all overwhelmed, all in despair ; and it seems to me that I see the accomplishment of that saying of the prophet.

Another deathbed—that of Turenne, the opponent of Marlborough :

Je me trouble, messieurs. Turenne *meurt*. Tout se *confond :* la fortune *chancelle*, la victoire se *lasse*, la paix *s'éloigne*, les bonnes intentions des alliés se *ralentissent*, les courage des troupes est abattu par la douleur et ranimé par la vengeance. Tout le camp *demeure* immobile. Les blessés *pensent* à la perte qu'ils ont faite, et non aux blessures qu'ils ont reçues. Les pères mourants *envoient* leurs fils pleurer sur leur général mort.	I am troubled, sirs. Turenne is dying. All is in confusion : fortune reels, victory halts, peace recedes, the good intentions of the allies gives way, the courage of the troops is overwhelmed by grief and revived by vengeance. All the camp remains motionless. The wounded think of the loss they have sustained, and not of the wounds they have received. Fathers dying send their sons to weep over their dead general.

The Future

Invitation from Voltaire to one of Corneille's descendants to come and live with him :

* Nous passons plusieurs mois de l'année dans une campagne auprès de Genève ; mais vous y *aurez* toutes les facilités pour tous les devoirs de votre religion. Notre principale habitation est en France, dans un château très logeable où vous *serez* beaucoup plus commodement qu'ici. Vous *trouverez* dans l'une et dans l'autre habitation de quoi vous occuper, tant aux petits ouvrages de la main qu *pourront* [1] vous plaire, qu'à la musique et la lecture. Nous *ferons* [1] venir un maître qui *sera* très honoré d'enseigner quelque chose à la petite-fille du grand Corneille ; mais je le *serai* beaucoup plus de lui de vous voir habiter chez moi.	We pass several months of the year in an estate near Geneva ; but you will have there all facilities for all the duties of your religion. Our chief dwelling is in France, in a very habitable chateau where you will be much more at your ease than here. You will find in the one and the other dwelling something to occupy you as much as in the little handiworks which will be able to occupy you as in music and reading. We will make a master come who will be very honoured to teach something to the grand-daughter of the great Corneille ; but I shall be much more so to see you dwelling with me.

The Imperfect and the Past Definite

A Night in the Open Air

* Des jardins élèvés en terrasse *bordaient* la route. Il avait fait très chaud ce jour-là, la soirée *était* charmante, la rosée *humectait* l'herbe flétrie ; point de vent, une nuit tranquille ; l'air *était* frais sans être froid ; le soleil après son coucher avait laissé dans le ciel des vapeurs rouges dont la réflexion *rendait* l'eau couleur de rose. Les arbres *étaient* chargés de rossignols qui se *répondaient* l'un à l'autre. Je me *promenais* dans une sorte d'extase, livrant mes sens et mon cœur à la jouissance de tout cela. Absorbé dans ma douce rêverie, je *prolongeai* fort avant dans la nuit ma promenade, sans m'apercevoir que *j'étais* las Je m'en *aperçus* enfin. Je me *couchai* voluptueusement sur la tablette d'une espèce de niche enfoncée dans un mur de terrasse ; le ciel de mon lit *était* formé par les arbres ; un rossignol *était* précisement au-dessus de moi ; je m'endormis à son chant ; mon sommeil fut doux, mon	Gardens raised in terraces bordered the road. It had been very hot that day, the evening was charming, the dew moistened the withered grass ; no wind, a peaceful night ; the air was fresh without being cool ; the sun after its setting had left in the sky red vapours whose reflection made the water rose-coloured. The trees were loaded with nightingales, who answered one another. I walked in a sort of ecstasy, delivering my senses and my heart to the enjoyment of all this. Absorbed in my sweet reverie, I prolonged my walk well on into the night without perceiving that I was tired. I noticed it at length. I lay down with delight on the flat of a kind of niche hollowed out in a terrace wall ; the canopy of my bed was formed by the trees ; a nightingale was just above me ; I went to sleep to his song ; my sleep was sweet, my dreaming more so. . . . It was full day ; my

1 Irregular.

rêve le *fut* d'avantage. . . . Il *était* grand jour ; mes yeux en s'ouvrant *virent* [1] le ciel, le soleil, l'eau, la verdure—un paysage admirable. Je me *levai*, me *secouai* ; la faim me *prit* ; j'acheminai gaiement vers la ville.—ROUSSEAU.

eyes on opening saw the sky, the sun, the water, the verdure —a lovely landscape; I rose and shook myself; hunger took hold on me; I took the road gaily towards the town.

This extract, taken from early French history, also offers an excellent study of the use of the Past Definite tense. Notice how the Imperfect comes in from time to time, when not a definite act is related, but a state or condition. (Irregular verbs are referred, when necessary, to the list where they are conjugated.)

* Une longue file de cavaliers, de voitures, et de chariots de bagage *traversa* les rues de Tolède, et se *dirigea* vers la porte du Nord. Le roi *suivit* à cheval le cortège de sa fille jusqu'au pont jeté sur le Tage ; mais la reine ne *put* [1] se résoudre à retourner si vite, et *voulut* aller au delà. Quittant son propre char, elle *s'assit* [1] auprès de Galeswinthe, et, d'étape en étape, de journée en journée, elle se *laissa* entraîner à plus de cent milles de distance. À l'approche des montagnes, les chemins *devinrent* [1] difficiles ; elle ne s'en *aperçut* pas, et *voulut* aller plus loin. Mais comme les gens qui la *suivaient*, grossissant beaucoup la cortège, *augmentaient* les embarras et les dangers du voyage, les seigneurs goths *résolurent* [1] de ne pas permettre que leur reine *fît* un pas de plus. Il *fallut* [1] se résigner à une separation inévitable, et nouvelles scènes de tendresse *eurent* lieu entre la mère et la fille. . . . Avant de monter sur le char qui devait la ramener en arrière, la reine des Goths s'arrêta au bord de la route, et, fixant ses yeux vers le chariot de sa fille, elle ne *cessa* de la regarder jusqu'à ce qu'il *disparut* [1] dans l'éloignement.

A long line of horsemen, of carriages, and carts traversed the streets of Toledo, and made for the North Gate. The king followed the train of his daughter on horseback as far as the bridge thrown across the Tagus; but the queen could not resolve to return so quickly, and wished to go beyond. Leaving her own car, she seated herself by Galeswinthe, and, from stage to stage, from day to day, she let herself be carried more than a hundred miles' distance. At the approach of the mountains, the roads became more difficult; she did not perceive it, and wished to go farther. But as the people who followed her increased considerably the train, and added to the difficulties and dangers of the journey, the Gothic lords resolved not to permit that their queen should go another step. It was necessary to resign oneself to an inevitable separation, and new scenes of tenderness took place between the mother and daughter. . . . Before mounting the car which was to take her back, the queen of the Goths stopped beside the road, and, fixing her eyes on her daughter's car, she did not cease looking at it till it disappeared in the distance.

The Past Indefinite (and Perfect)

* Le propriétaire du château n'*a pensé* qu'à en sortir. Enfermé là quand il le fallait absolument pour sa sûreté ou son indépendance, il *est allé*, aussi souvent qu'il l'*a pu*, chercher au dehors ce qui lui manquait—la société, l'activité. La vie des possesseurs de fiefs s'*est passée* sur les grands chemins, dans les aventures. Cette longue série de courses, de pillages, de guerres, qui caractérise le moyen âge, *a été*, en grand partie, l'effet du genre de l'habitation féodale. . . . Ils *ont cherché* partout le mouvement social qu'ils ne trouvaient pas dans leur intérieur.

The owner of the castle only thought of getting out of it. Shut up there when it was quite necessary for his safety or his independence, he went as often as he could to seek outside that which he wanted—society and activity. The life of the possessors of the great fiefs was passed on the high roads, in adventures. This long series of hunts, pillages, and wars, which characterises the Middle Ages, was, in great part, the effect of the feudal dwelling. . . . They sought everywhere the bustle of society which they did not find at home.

Note in this passage that the Compound tense would be translated in English not by the Perfect, but by the simple Past :

The proprietor of the castle only *thought* . . . he *went* as often as he *could* . . . Life *passed* . . . This long series of expeditions *was* for the most part . . . They *sought* . . .

This brings home the fact that this tense in French is the general Past tense as well as the Perfect. Correspondingly in English the tense of *thought*, *went*, etc., is both the Past Definite and Indefinite.

Milords, je suis née reine, princesse souveraine et non sujette aux lois, proche parente de la reine d'Angleterre et sa légitime héritière. Après *avoir été* longuement et injustement détenue prisonnière en ce pays, où *j'ai* beaucoup *enduré* de peine et de mal, sans qu'on eût aucun droit sur moi, maintenant par la force et sous la puissance des hommes, prête à finir ma vie, je remercie mon Dieu d'*avoir permis* que je meure pour ma religion et devant une compagnie qui sera témoin que, bien près de ma mort, *j'ai protesté* comme je l'*ai* toujours *fait*, soit en particulier, soit en public, de n'*avoir* jamais rien *inventé* pour faire périr la reine, ni *consenti* à rien contre sa personne.—MARY QUEEN OF SCOTS.

My lords, I was born queen, a sovereign princess and not subject to the laws, a near parent of the Queen of England and her legitimate heir. After having been long and unjustly detained prisoner in this country, where I have endured much pain and ill, without their having any rights over me, now—by the force and under the power of men, (being) ready to finish my life —I thank God for having permitted that I die for my religion and before a company which will be witness that, near death, I have protested, as I have always done, whether in public or private, of never having ever invented anything to kill the Queen, nor consented to anything against her person.

In this extract the Compound Past tense (italicised) is the genuine Perfect. Note 'avoir été,' 'avoir permis,' the Perfect Infinitive.

The Conditional

This tense, or mood, as it may be also regarded, for it has two forms, a Past as well as a Present, needs some attention. It has two uses, both of which correspond more or less to the occasions on which we in English use the auxiliaries *should* or *would* ; but in French the use is far more defined, and where we would use either the Indicative simply or the *should* or *would*, in French the Conditional is obligatory. But here are some examples :

Si nous rêvions toutes les nuits la même chose, elle nous affecterait peut-être autant que les objets que nous voyons tous les jours. Si nous rêvions toutes les nuits que nous sommes poursuivis par des ennemis, et agités par des fantômes pénibles, on souffrirait presque autant que si cela était véritable.—PASCAL.

If we dreamed the same thing every night, it would affect us perhaps as much as the objects which we see every day. If we dreamed every night that we were pursued by enemies and harassed by gruesome phantoms, one would suffer almost as much as if it were true.

Si on avait pu, on aurait mis la force entre les mains de la justice.—*Id.*

If one had been able, one would have put force into the hands of justice.

Si le nez de Cléopâtre eût été plus court, tout la face de la terre aurait été changé.—*Id.*

If the nose of Cleopatra had been shorter, all the face of the world would have been changed.

Si les médicins avaient le vrai art de guérir, ils n'auraient que faire de bonnets carrés : la majesté de ces sciences serait assez véritable d'elle-même.—*Id.*

If doctors had the real art of healing, they would have nothing to do with square caps: the majesty of the knowledge would be true enough of itself.

Pour moi, j'aimerais mieux être obligé de commander une armée, que d'écrire ces terribles lignes non finies ; j'aurais la chance d'avoir un imbécile pour ennemi ; mes généraux me remplacerait : mais trouver six beaux vers !—TAINE.

For my part, I should prefer to be forced to command an army than to write those terrible unfinished lines (*i.e.* verse): I would have the chance of having a fool for an enemy : my generals would take my place ; but to make up six good stanzas !

[1] These verbs, being irregular in the form employed here, must be sought in their place in the irregular verbs.

We can very clearly deduce from these examples this rule: that the Conditional is used in connection with 'si'; but a closer observation will show us that it is not used in the same clause as 'si,' but in the opposing one—the apodosis, or following one, as it is called. This is the general rule.

In the example about the nose of Cleopatra, two constructions are mixed—Pascal was rather given this way. When the Subjunctive is used, it is supposed that the condition is very unlikely, and then the verb in both clauses is in the Subjunctive. (For examples see the Subjunctive.)

Note in the Present tense 'si' is found with not the Conditional but the Present in the following clause, and in defiance of grammarians some writers do this with the Future.

If we examine the verbs in this passage we shall find—the tares with the wheat—numerous examples of irregularities in conjugation:

* THE SAVANT AND THE PREHISTORIC SKULL

	Voici la dent d'un homme qui *vécut* au temps du mammouth, pendant les âges de glaces, dans une caverne jadis nue et desolée. . . . Cet homme ne *connaissait* que la peur et la faim . . . telle fut
Passé Déf.	la première humanité. Mais insensiblement, par de longs et magnifiques efforts, les hommes, devenus moins misérables, *devinrent* moins féroces . . . la face humaine *prit* une beauté suprême et le sourire *naquit* sur les
Prés.	lèvres de la femme. . . . Vieil homme. . . . reçois l'hommage de ma reconnaissance, car je *sens* combien je te *dois*. Je *sais* ce que tes efforts m'ont épargné de misères.
Passé Déf.	Tu ne pensais point à l'avenir, il est vrai . . . tu ne *pus* guère songer qu'à te nourrir et te cacher . . . tu *vécus* misérable; tu ne vécus pas en vain, et la vie que tu avais reçue si affreuse, tu la *transmis* un peu moins mauvais à tes enfants. Ils travaillèrent à
Passé Indéf.	leur tour. . . . Tous, ils *ont mis* la main aux arts. . . . Ils se sont tous ingeniés, et l'effort continue de tant d'esprits à travers les âges a *produit* des merveilles qui maintenant embellissent la vie.
Impf.	Et chaque fois qu'ils fondaient une art ou inventaient une industrie ils *faisaient* naître . . . des beautés morales et
P.D.	créaient des vertus. Ils donnèrent des voiles à la femme, et les hommes *connurent* le prix de la
Prés.	beauté. . . . Ainsi nous leur devons tout à ces ancêtres, tout et même l'amour.—ANATOLE FRANCE.

Here is the tooth of a man who lived at the time of the mammoth, during the ages of ice, in a cavern long bare and desolate. . . . This man knew only fear and hunger . . . such was the first humanity. But insensibly, by long and magnificent efforts, men having become less miserable, because less wild . . . the human face took on a supreme beauty, and the smile was born on the lips of woman. . . . Ancient man . . . receive the homage of my gratitude, for I feel how much I owe you. I know what your efforts have spared me of misery. You did not think of the future, it is true . . . you could hardly think but of feeding and hiding yourself . . . you lived wretchedly; you did not live in vain, and life that you received so rightful, you passed (it) on to your children a little less evil. They laboured in their turn. All put their hand to the arts. All contrived, and the effort, continued by so many minds through the ages, has produced the marvels which now adorn life. And each time that they founded an art or invented an industry they made moral beauties appear and created virtues. They gave to woman her robes, and men learned the price of beauty. . . . Thus we owe them all, these ancestors—all, even love.

When we examine the verbs in this piece, we readily recognise the following:

INFINITIVE. 'Songer,' 'nourrir,' 'cacher.'
IMPERFECT. 'Inventaient,' 'créaient,' 'fondaient,' 'pensais.'
PRESENT. 'Reçois,' 'sens,' 'embellissent,' 'devons.' 'Devons' belongs to the 'recevoir' class, while 'embellissent' follows 'finissent' (INFINITIVE 'embellir,' like 'finir'), and 'sens' is of the 'dormir' class (INFINITIVE 'sentir,' as 'dormir').
PAST DEFINITIVE. 'Travaillèrent' and 'donnèrent' are obviously of the 'chanter' class.
TENSES COMPOUNDED WITH PARTICIPLES. 'Ont épargnés' and 'sont ingeniés' follow 'chanter'—so also 'desolée'—while 'avais reçu,' is a part of 'recevoir.'

But there are quite a number of verbs which leave us in the dark. Even to look up a verb we must know its Infinitive stem; and it is just in the stem that we suspect these specimens:—

IMPERFECT	PAST DEFINITE		PAST PART.	
connaissait	[vécut]	devinrent	mis	'Sais,' we see,
	prit	connurent	produit	is Present by the
	pus		devenu	sense.
	transmis			
	[naquit]			

[Vécut and naquit are anomalies rather than irregularities.]

Change of stem, then, is the main source of irregularity, as we have already seen in the case of 'recevoir' and 'dormir.'

'Recevoir.' Present Indicative 'reçois'; plural 'recevons'; Past Definite 'reçus.'
'Dormir.' Present Indicative 'dors'; plural 'dormons'; Present Participle 'dormant,' not 'dormissant.'

But irregular verbs usually obey the Principal Part Rule (page 248). If they do not, then a new source of irregularity arises. So it is a saving of time to know the principal parts of irregular verbs, as we shall then see what is to be memorised and what may be inferred. We give it for these verbs:

INFINITIVE.	PRES. SING.	PRES. PART.	PAST DEF.	PAST PART.
connaître	connais	connaissant	connus	connu
faire	fais	fais-ant	fis	fait
prendre	prends	prenant	pris	pris
pouvoir	peux	pouvant	pus	pu
de-venir	-viens	-venant	-vins	-venu
produire	produis	produisant	produisis	produit
savoir	sais	[savant]	sus	su
trans-mettre	mets	mettant	mis	mis

We can see from these examples how a verb is irregular. 'Connaître' changes its stem in the Past Definite and Past Participle. The plural of the Present Indicative is 'connaiSSons,' etc., following the Present Participle 'ConnaiSSant.' It also inserts a circumflex where *s* is wanting.

'Faire' has an irregular Past Definite and Past Participle, and adds *-s* to the stem *fai-*. Its Future is 'ferai,' not 'fairai,' which is a breach of the Principal Part Rule.

'Pouvoir' is highly irregular, though it follows 'recevoir' in the main. Its Future is irregular ('pouvrai' has naturally become 'pourrai').

'De-venir' has an irregular Future, 'deviendrai,' and 'viens' is also the stem of the Present Indicative singular. Its Past Participle is also irregular—'venu,' not 'veni.'

'Produire,' like 'faire,' introduces an *-s* at

the end of its stem. It also has a Past Participle ending in *-t*—a common irregularity.

'Savoir' does its best to follow 'recevoir,' but has an irregular Future ('savrai' has become 'saurai').

'Transmettre' loses one *-t* in the Present Indicative singular, and changes the stem in the Past Definite and Past Participle.

** 7. **Irregular Verbs.**—We now give a list of irregular verbs with the tenses arranged under the heads of the so-called Principal Parts. We will first take the commonest verbs and those the forms of which will be most difficult to recognise. The Conditional will not be given, as its stem is always the same as that of the Future. Note that the plural of the Present Indicative is ranged under the head of the Present Participle, but that in the 3rd person it often goes back to the singular stem. The Imperfect follows the Present Participle in its stem in every case but one ('savoir'), and the Imperfect Subjunctive invariably forms its stem as does the Past Definite. We give the Past Participle with the auxiliary forming the Past Indefinite, as that auxiliary is sometimes 'avoir,' sometimes 'être.'

For 'aller' and 'envoyer,' see notes to the conjugation in *-er*.

INFINITIVE	PRES. IND. SING.	PRES. PART.	PAST DEF.	PAST PART.
courir, *to run*		*courant*	*courus*	J'ai *couru*
Fut. *courrai*		Imp. *courais*		
	cours	Plur. courons		
	cours	courez		
	court	courent	courusse	
Present Subjunctive	coure, coures, coure, courions, couriez, courent.			
mourir, *to die*		*mourant*	*mourus*	Je suis *mort*
Fut. *mourrai*		Imp. mourais		
	meurs	mourons		
	meurs	mourez		
	meurt	*meurent*	mourusse	
tenir, *to hold*		*tenant*	*tins*	J'ai *tenu*
Fut. *tiendrai*		Imp. tenais		
	tiens	tenons		
	tiens	tenez		
	tient	*tiennent*	tinsse	
Present Subjunctive	tienne, tiennes, tienne, tenions, teniez, tiennent. So 'venir,' but 'je suis venu.'			
pouvoir, *to be able*		*pouvant*	*pus*	J'ai *pu*
Fut. *pourrai*		Imp. pouvais		
	peux	pouvons		
	peux	pouvez		
	peut	*peuvent*	pusse	
Present Subjunctive	puisse, puisses, puisse, puissions, puissiez, puissent.			
savoir, *to know*		*savant* [1] *sachant*	*sus*	J'ai *su*
Fut. *saurai*		Imp. *savais*		Note. Imperative, *sache*,
	sais	*savons*		*sachons*,
	sais	*savez*		*sachez*.
	sait	*savent*	susse	
Present Subjunctive	sache, saches, sache, sachions, sachiez, sachent.			
voir, *to see*		*voyant*	*vis*	J'ai *vu*
Fut. *verrai*		Imp. voy-ais		
	vois	voyons		
	vois	voyez		
	voit	*voient*	visse	

[1] This form is only used as an adjective.

INFINITIVE	PRES. IND. SING.	PRES. PART.	PAST DEF.	PAST PART.
vouloir, *to will*		*voulant*	*voulus*	J'ai *voulu*
Fut. *voudrai*		Imp. voulais		
	veux	voulons		
	veux	voulez		
	veut	*veulent*	voulusse	
Present Subjunctive	veuille, veuilles, veuille, voulions, vouliez, veuillent.			
boire, *to drink*		*buvant*	*bus*	J'ai *bu*
Fut. boirai		Imp. buvais		
	bois	buvons		
	bois	buvez		
	boit	*boivent*	busse	
Present Subjunctive	boive, boives, boive, buvions, buviez, *boivent*.			
connaître, *to know*		*connaissant*	*connus*	J'ai *connu*
Fut. connaîtrai		Imp. connaissais		
	connais	connaissons		
	connais	connaissez		
	connait	connaissent	connusse	
Present Subjunctive	connaisse, connaisses, connaisse, connaissions, connaissiez, connaissent.			
craindre, *to fear*		*craignant*	*craignis*	J'ai *craint*
Fut. *craindrai*		Imp. craignais		
	crains	craignons		
	crains	craignez		
	craint	craignent	craignisse	
Present Subjunctive	craigne, craignes, craigne, craignions, craigniez, craignent.			
écrire, *to write*		*écrivant*	*écrivis*	J'ai *écrit*
Fut. écrirai		Imp. écrivais		
	écris	écrivons		
	écris	écrivez		
	écrit	écrivent	écrivisse	
Present Subjunctive	écrive, écrives, écrive, écrivions, écriviez, écrivent.			
faire, *to make, do*		*faisant*	*fis*	J'ai *fait*
Fut. *ferai*		Imp. faisais		
	fais	faisons		
	fais	*faites*		
	fait	*font*	fisse	
Present Subjunctive	*fasse, fasses, fasse, fassions, fassiez, fassent.*			
prendre, *to take*		*prenant*	*pris*	J'ai *pris*
Fut. prendrai		Imp. prenais		
	prends	prenons		
	prends	prenez		
	prend	*prennent*	prisse	
Present Subjunctive	prenne, prennes, prenne, prenions, preniez, prennent.			
vivre, *to live*		vivant	*vécus*	J'ai *vécu*
Fut. vivrai		Imp. vivais		
	vis	vivons		
	vis	vivez		
	vit	vivent	vecusse	
Present Subjunctive	vive, vives, vive, vivions, viviez, vivent.			
vaincre, *to conquer*		*vainquant*	*vainquis*	J'ai *vaincu*.
Fut. vaincrai		Imp. vainquais		
	vaincs	vainquons		
	vaincs	vainquez		
	vainc	vainquent	vainquisse	
Present Subjunctive	vainque, vainques, vainque, vainquions vainquiez, vainquient.			

Below are the less irregular verbs. They are given under the same headings as the others, and only the parts are given about which there is likely to be any doubt. The forms not given can be obtained by the usual rules. It has not been considered necessary to give the Present tense in full, as in practically all cases the singular is identical throughout except for the ending, which is *-is*, *-is*, *-it* if the 1st person is *-is*, and *-s*, *-s*, *-t* if the 1st person is *-s*. Sometimes the first person is *-x*. Then instead of *s*, *-s*, *-t* we

have *-x*, *-x*, *-t*. In the plural, if there is any departure from the 1st person stem it is given.

INFINITIVE	PRES. INDIC. SING.	PRES. PART.	PAST DEF.	PAST PART.
fuir, to flee	fuis	*fuyant* fuyons fuient	*fuis*	*J'ai fui*
acquérir, to acquire	acquiers	*acquérant* acquérons acquièrent	*acquis*	*J'ai acquis*
(Subjunctive acquière, acquérions, acquièrent.)				
haïr, to hate	hais	*haïssant* haïssons	*haïs*	*J'ai haï*
bouillir, to boil	bous	*bouillant* bouillons	*bouillis*	*J'ai bouilli*
faillir, to fail	faux, -x, -t	*faillant* faillons	*faillis*	*J'ai failli*
vêtir, to clothe	vêts	*vêtant* vêtons	*vêtis*	*J'ai vêtu*
mouvoir, to move	meus meuvent	*mouvant* mouvons		*J'ai mu*
pleuvoir, to rain	pleut	*pleuvant*	*il plut*	*Il a plu*
pourvoir, to foresee	pourvois	*pourvoyant* pourvoyons pourvoient	*pourvus*	*J'ai pourvu*
asseoir, to seat	assieds, -s assied	*asseyant* asseyons	*assis*	*J'ai assis*
(Subjunctive asseye, asseyions. Future assiérai.)				
conclure, to conclude	conclus	*concluant* concluons	*conclus*	*J'ai conclu*
mettre, to put	mets	*mettant* mettons	*mis*	*J'ai mis*
couvrir, to cover		*couvrant* couvrons	*couvris*	*J'ai couvert*
ouvrir, to open		*ouvrant*	*ouvris*	*J'ai ouvert*
souffrir, to suffer		*souffrant*	*souffris*	*J'ai souffert*
offrir, to offer	offre	*offrant*	*offris*	*J'ai offert*
cueillir, to pluck *cueillerai* (Fut.)	cueille	*cueillant* cueillons	*cueillis*	*J'ai cueilli*
assaillir, to assail	assaille	*assaillant* assaillons	*assaillis*	*J'ai assailli*
dire, to say	dis	*disant* disons, dites disent	*dis*	*J'ai dit*
lire, to read	lis	*lisant* lisons	*lis*	*J'ai lu*
rire, to laugh	ris	*riant* rions	*ris*	*J'ai ri*
plaire, to please	plais plaît	*plaisant* plaisons	*plus*	*J'ai plu*
confire *suffire*	confis	*confisant* confisons	*confis*	*J'ai confit* *J'ai suffi*
(*confire* = to preserve, *suffire* = to suffice.)				
coudre, to sew	couds	*cousant* cousons	*cousis*	*J'ai cousu*
moudre, to grind	mouds	*moulant* moulons	*moulus*	*J'ai moulu*
suivre, to follow	suis	*suivant* suivons	*suivis*	*J'ai suivi*
vaincre, to conquer	vaincs vainc	*vainquant* vainquons	*vainquis*	*J'ai vaincu*
(Subjunctive vainque.)				
battre, to beat	bats	*battant* battons	*battis*	*J'ai battu*

** 8. **The Negative and the Interrogative.**—There are still two general uses of the verb to be explained: when it makes a negative statement, and when it asks a question. It is possible that these two may be combined. Both uses are quite simple, and a few instances will suffice to illustrate them.

Nous aimons toujours ceux qui nous admirent, et nous
We love always those who admire us, and we
n'aimons pas toujours ceux que nous admirons.
do not like always those whom we admire.

La vertu n'irait pas si loin, si la vanité ne lui tenait (pas
Virtue would not go so far if vanity did not keep it
compagnie.
company.

Here we have examples, as we already saw in the introductory lesson, of the fact that it takes two words to make a negative—'no,' the genuine negative, and 'pas,' or some other complementary word.

Note the place of these two words: they enclose the verb.

Nous N'aimons PAS ceux qui nous admirons.
La vertu N'irait PAS si loin.

This is their normal position. If a personal pronoun object comes before the verb, then it also is included between the negatives.

Je NE vous ai jamais vu.
I have never seen you.

In a question the negative words maintain same place, although the verb and pronoun are inverted.

Turpin, N'as-tu RIEN vu dans le fond du torrent?
Turpin, hast thou seen nothing in the torrent bed?

Notice here also the place of the negatives when the verb is composed of an auxiliary and a participle. The auxiliary is looked on as the verb, the participle is only a complement. The negatives enclose the auxiliary. Sometimes the complementary negative word will be found in another part of the sentence.

Thus in the phrase 'Rien ne va plus,' *Nothing goes (any) more*, the complementary word is 'rien,' which is here the subject of the sentence, and so stands at its head.

Both negative particles usually stand before an Infinitive, as one is continually reminded in French railway carriages: 'Ne pas se pencher en dehors.'

We have seen that the commonest negative complement is 'pas.' This really means *a pace*, and it would be used with verbs of motion

originally. There were other complements—'goutte,' *a drop*; 'mie,' *a crumb*—which would be used when appropriate, but 'pas' has gradually ousted them. We have a somewhat similar use in English when we say, *Not a bit, Not a scrap.*

But there are times when the complementary of the negative has a definite use. We have already had two instances, 'jamais' and 'rien.' Here is the list:

Jetez mes cendres dans le Rhone; je *n'ai jamais* visité Marseilles.
Throw my ashes into the Rhone; I have never visited Marseilles.

On *ne* donne *rien* si libéralement que ses conseils.
One gives nothing so liberally as advice.

Si nous *n'*avons *point* d'orgueil nous ne nous plaindrons pas de celui des autres.
If we have no pride we do not complain about that of others.

*Rien n'*empeche tant d'être naturel que le désir de le paraître.
Nothing prevents so much being natural as the wish to be so.

Le style *n'*est *que* l'ordre et le mouvement dans ses pensées.
Style is only the order and the action one puts into one's thoughts.

Tous les preux étaient morts, mais *aucun n'*avait fui.
All the heroes were dead, but none had fled.

C'est pour *ne pas* avoir assez réfléchi sur son objet qu'un homme d'esprit *ne sait* par où commencer. Il aperçoit à la fois un grand nombre d'idées, et comme il ne les a NI comparées, NI subordonnées, *rien ne* le détermine à préférer les uns aux autres.
It is from not having thought enough on his subject that a man of brains does not know where to begin. He perceives at once a great number of ideas, and as he has neither compared nor subordinated them, nothing determines him to prefer one to others.

We see from these examples that:

'ne . . . rien' signifies *nothing.*
'ne . . . point' „ *none.*
'ne . . . que' „ *only* (*no, but*)
'ne . . . jamais' „ *never.*

'Aucun' is the adjective complementary to the negative. Here it is used as a pronoun.

Notice that *nor . . . nor* is 'ni . . . ni,' and also that 'sait' does not take a complementary—a property it shares with 'oser' and 'pouvoir.'

The Verb Interrogative

This will be best shown by the partial conjugation of a few verbs. Attention should be paid to the difference when a noun is the subject and when a pronoun:

parlé-je français, parlez-vous français, parle-t-il français? parlons-nous français, parlent-ils français?

Note the accent introduced on to the last *e* of 'parlé-je,' and the *t* intercalated in 'parle-t-il.' Both are for euphonious reasons.

Ex.—Mon frère, assiste-t-il à cette conférence? Non. Mon frère, a-t-il assisté à cette conférence? Mon frère, assistera-t-il à cette conférence?
Ai-je bien dormi, avez-vous bien dormi, avons-nous bien dormi, ont-ils bien dormi, etc. etc.

Frequently the question is asked by this formula:

Est-ce que vous parlez français, mademoiselle?
Is it that you speak French, Miss?
Oui, monsieur. Est-ce que monsieur est un étranger (*foreigner*)?

This style may be specially recommended to a foreigner, as it does away with the necessity of inverting the pronoun and the verb, a process often involving some confusion in the mind of the beginner.

It is not infrequent to find the question conveyed by the inflexion of the voice. Thus mademoiselle above might have said simply:

Monsieur est étranger, sans doute?

The Interrogative Negative somewhat more formidable. Here are some cases with 'dire,' *to say.*

Ne dis-je pas? ne dis-tu pas? ne disons-nous pas? ne dites-vous pas? ne disent-ils pas? Mon oncle, ne dit-il pas? mes tantes, ne disent-elles pas?

And when a pronoun object interposes this can be very awkward.

Je dis toujours — Quoi? Qu'est-ce que vous dites toujours? J'ai dit toujours—Oui, oui, oui, oui; vous l'avez déjà dit. Qu'est-ce que je vous ai déjà dit?—Mais ce que vous avez dit?—Je ne vous ai jamais dit—Vous ne m'avez jamais dit.—Je vous dis que je ne vous ai jamais dit quoique ce soit.—Me dites-vous, ou ne me dites-vous pas ce que vous m'avez dit?—Vous l'ai-je jamais dit?—Mais ne me l'avez-vous pas dit cent fois?	I always say — What? What is it that you always say? I have always said—Yes, yes, yes, yes; you have said it already—What have I said to you already?—Why, what you have said?—I have never said to you—You have never said to me—I tell you that I have never said to you anything whatever.—Do you say to me or do you not say to me what you have said?—Have I ever said to you?—But have you not said it to me a hundred times?

But here it is the reason rather than the knowledge of verb forms which gives out.

9. The Passive.—By reason of its compound form the Passive is rather avoided in French. We will see presently how it can be avoided, and content ourselves at present with seeing how it is used.

Soldats — says Napoleon — vous n'avez rien fait, puisqu'il vous reste encore à faire. Les cendres des vainqueurs des Tarquins *sont* encore *foulées* par les assassins de Basseville. *Vous étiez dénués* de tout au commencement; *vous êtes* aujourd'hui abondamment *pourvu.* Les plus grands obstacles *sont franchis*, sans doute; mais vous avez encore des combats à livrer.	Soldiers, you have done nothing, since there still remains something to do. The ashes of the vanquishers of the Tarquins are still trampled on by the assassins of Basseville. You were stripped of everything at the beginning; you are to-day abundantly provided for. The greatest obstacles are cleared, doubtless: but you have still combats to engage in.

We see from this that, as in English, the Passive is composed of the Past Participle of the verb following the verb *to be*, 'être.'

** **10. The Reflexive Verb.**—In reading these following lines we shall notice repeatedly a peculiarity about the verbs which has perhaps already given some slight occasion of wonder:

* Sur ce même fond anglais se peignait au Nord des nuances toutes contraires. C'est dans les colonies anglaises du Nord que se sont combinées les deux ou trois idées principales qui aujourd'hui forment les bases de la théorie sociale des Etats-Unis. Les principes de la Nouvelle-Angleterre se sont d'abord répandus dans les Etats voisins; ils ont fini, si	On this same English background were depicted in the north quite different shades. It is in the English colonies of the north that are brought together the two or three principal ideas which form to-day the base of the social theory of the United States. The principles of New England spread first in the neighbouring states: they finished, if I

je puis m'exprimer ainsi, par pénétrer la confédération entière. . . . Les émigrants qu vinrent s'établir sur les rivages de la Nouvelle Angleterre appartenaient tous aux classes aisées de la mère patrie. Leur réunion presenta le singulier phénomène d'une société où il se trouvait ni riches ni pauvres. Tous avaient reçu une éducation assez advancée, et plusieurs d'entre eux s'étaient fait connaître en Europe par leur talents et leur science. Les autres colonies avaient été fondées par des aventuriers sans famille; les émigrants de la Nouvelle Angleterre se rendaient au desert accompagnés de leurs femmes et de leurs enfants. . . . Ils s'arrachaient aux douceurs de la patrie pour obéir à un besoin purement intellectuel; en s'exposant aux misères de l'exil, ils voulaient faire triompher une idée.—TOCQUEVILLE.

may say so, by penetrating the whole confederation. The emigrants who came to establish themselves on the shores of New England all belonged to the well-to-do classes of the mother country. Their union presented the singular phenomenon of a society in which were neither rich nor poor. All had received a fairly advanced education, and several of them had made themselves known in Europe by their talents and their knowledge. The other colonies had been founded by adventurers without families: the colonists of New England went into the desert accompanied by their wives and their children. They tore themselves from the sweetness of the homeland in obedience to a purely intellectual need; in exposing themselves to the miseries of exile they wished to make an idea triumph.

We find 'se poignaient,' *there depicted themselves*; 'se sont combinés,' *were combined* (lit. *combined themselves*); 'se sont répandus,' *spread themselves*; 'je puis m'exprimer,' *I can express myself*. Later we have 's'établir,' *to establish themselves*; 'se trouvait,' *were found* (lit. *found themselves*); 's'étaient fait,' *had made themselves*; 'se rendaient,' *repaired*; 's'arrachaient,' *tore themselves*; 's'exposant,' *exposing themselves*.

What is the sum of what we learn from these examples? First of all, this, that the reflexive —*self, selves*—is much more used in French than English. Sometimes it is as a substitute for the passive ('se sont combinés'), and sometimes there does not seem any need for the reflexive at all (a French tooth-powder 'instructions for use' tells one, for example, to 'se rincer la gorge et de se gargariser'). It is, in fact, especially with the parts of the body that the reflexive is used. *Cp.* 'se moucher,' *to wipe one's nose*; 'se boucher les oreilles,' *to stop the ears*; 'se laver,' *to wash*; 'se peigner,' *to comb* (*the hair*).

It will have been noticed that the auxiliary is 'être,' not 'avoir,' as with a passive verb; but the participle agrees with the pronoun object, not with the subject, and then only if it is the direct object. Thus it would be 'elle s'est lavé les mains,' but 'elle s'est lavée,' the reflexive in the first place being only indirect object.

** 11. **The Participles.**—The Past Participle is used, as we have already seen, to form the compound tenses of the verb, in conjunction with the auxiliaries 'avoir' and 'être.' Beyond this the participles have two uses: (1) simply as adjectives; (2) to form participial phrases. In this latter use there is still some difference according to whether the use is chiefly adjectival or chiefly verbal. The Present Participle shows this difference by agreeing or not agreeing with the noun to which it refers. Here are some instances:

chanté	fini	reçu	dormi	rompu
chantant	finissant	recevant	dormant	rompant

* Le vaste bateau glissait, jetant sur le ciel, qui semblait ensémencé d'étoiles, un gros serpent de fumée noire: l'eau agitée par l'helice remuait tant de clartés qu'on eût dit de la lumière bouillant. Nous étions là, silencieux, admirant, l'œil tourné vers l'Afrique. . . . Alors un grand homme à figure brûlée, un de ces hommes qu'on sent avoir traversé de longs pays inconnus, au milieu de dangers incessants et dont l'œil tranquille semble garder quelque chose des pays étranges qu'il a vus; un de ces hommes qu'on devine trempés dans le courage.—MAUPASSANT.

The huge boat glided, throwing across the sky, which seemed sewn with stars, a huge serpent of black smoke: the water disturbed by the screw stirred up so many gleams, that (it seemed like) a boiling light. We were there, silent and admiring, the eye turned towards Africa. Then a tall sunburnt man, one of those men who one feels has travers d wide and unknown lands, in the midst of incessant dangers, and whose steady eye seems to retain something of the strange lands he has seen: one of those men who one divines to be steeped in courage.

'jetant,' 'ensémencé,' 'agitée,' 'bouillant' are all semi-verbal; 'admirant' and 'tourné' are verbal—or predicative, as it is called, *i.e.* the participle is used instead of a verb to lighten the phrase and to make the main thread more distinct. 'brûlée' is purely adjectival; 'traversé' forms with 'avoir' the Past Infinitive; 'inconnu' is adjectival, as is 'incessants.' '*vus*' is, you will notice, plural. It is so because the object of the verb is a pronoun and precedes the participle. This use will be frequently met, but it is not worth much attention, as it is now allowed to make the participle not agree even under these conditions. 'trempés' is predicative. It will be noticed that 'bouillonant' does not agree with 'lumière,' which is feminine; this is because it is predicative. So in the same way 'admirant' is not plural, although it refers to *we*.

Past Participles

This extract should furnish all the material we require on the Past Participle:

La nature paraît avoir négligé certains animaux, qui par imperfection d'organes sont condamnés à endurer la souffrance, et destinés à éprouver la penurie. Enfants disgraciés, nés dans le denûment pour vivre dans la privation. . . . Le héron nous presente l'image d'une vie de souffrance. N'ayant que l'embuscade pour tout moyen d'industrie il passe des heures immobile au point de laisser douter si c'est un être animé . . . il paraît comme endormi, posé sur une pierre, le corps presque droit, le cou replié le long de la poitrine, la tête et le bec couchés entre les épaules, et s'il change d'attitude c'est pour en prendre une encore plus contrainte en se mettant en mouvement.—BUFFON.

Nature seems to have neglected certain animals, who by the imperfection of (their) organs are condemned to endure suffering, and doomed to experience want. Ill-favoured children, born in nakedness to live in privation . . . the heron presents to us the image of a life of suffering. Having only ambush as his sole means of labour, he passes hours motionless, so as to make it doubtful if he is even alive . . . he appears asleep, perched on a stone, the body almost upright, the neck doubled back along the breast, the head and beak couched between the shoulders, and if he changes position it is to take up one more constrained as he sets himself in motion.

Note that 'condamnés' and 'destinés,' although forming part of a finite verb, agree with their subject: this is because their auxiliary is the verb *to be*, 'être.' In this case they are

passive; but the same would be true if they were verbs of motion, which also take the verb 'être' as their auxiliary. Notice that 'enfants disgraciés, nés . . .' are absolute phrases not having a direct connection with the rest of the sentence. The phrases 'le cou replié . . . la tête et le bec couché' are somewhat similar; but they are still descriptive of the heron, which is the subject of the sentence.

'en se mettant en mouvement.' This is a use of the Participle Present not at all as an adjective, but as a substantive, as is shown by a preposition ('en') standing in front. That is the only preposition that can do so, and it is necessary to warn the student against translating the English verbal noun in *-ing* by the French seeming equivalent, when it is preceded by any other preposition. The Infinitive must always be used.

12. **The Imperative.**—The verb can, of course, be couched in the form of a command. It will then be principally in the 2nd person—that of the person addressed. The Imperative is, in fact, the 2nd singular and the 1st and 2nd plural of the Present Indicative without the pronouns. When a command is given in the 3rd person, the Subjunctive Present is used. Here are the regular Imperatives:

parle	finis	romps	dors	reçois
parlons	finissons	rompons	dormons	recevons
parlez	finissez	rompez	dormez	recevez

The only irregular Imperative is that of 'savoir,' which is 'sache, sachons, sachez.'

For some examples of the Imperative we may take the legend which Victor Hugo gives of Cain, when he fled pursued by the Eye of Conscience. After the first flight:

Sa femme fatiguée, et ses fils hors d'haleine,	His wife fatigued, and his children out of breath,
Lui dirent, '*Couchons-nous* sur la terre et *dormons*.'	Said to him, '*Let us lie* on the ground and *let us sleep*.'

Cain, however, only rouses them to further flights, till at last even he says:

'*Arrêtons-nous*,' dit-il, 'car cet asile est sur.	'Let us stop here,' said he, 'for this refuge is sure.
Restons-y; nous avons du monde atteint les bornes.'	Let us remain here; we have reached the limit of the world.'

But again the same terrible apparition makes him call out:

'*Cachez-moi*,' cria-t-il, et, le doigt sur la bouche,	'*Hide me*,' cried he, and, the finger on the mouth,
Tous ses fils regardaient trembler l'aïeul farouche.	All his children watched their haughty sire tremble.

He bids them:

'*Étends* de ce côté la toile de la tente.'	'Stretch out this side the cloth of the tent.'

Hugo again apostrophising the Guard at Waterloo:

Ils allaient, l'arme au bras, front haut, graves, stoïques.	They went, weapon in hand, head high, grave, and stoical,
Pas un ne recula. *Dormez*, morts héroïques!	Not one recoiled. Oh sleep, heroic dead!

Mirabeau when dying:

Soutiens cette tête, la plus forte dans la France.	Hold up this head, the strongest in France.

** 13. **The Infinitive.**—The verb is the word which denotes action or existence, and it commonly is used to assert that some 'person' is in that action or state. But at times it is used simply to name the action or state, without direct reference to any person at all. In other words, the action of the verb is named, and this use of the verb as a name—or noun—is called the Infinitive. It is given this name because in this use the verb is not confined to reference to a person, but is—grammatically, at any rate—free. Other uses of the verb by contrast are called 'finite.'

Its simplest use in this way is seen in Shakespear's *To sleep, perchance to dream*, 'Dormir, et peut-être rêver'; or again, 'Savoir c'est pouvoir,' *To know is to be able*. The reader will recognise this use in the following. Mirabeau at his death-bed says to his attendant:

Je mourrai aujourd'hui; il ne reste plus qu'à s'envelopper de parfums, qu'à se couronner de fleurs, qu'à s'environner de musique, afin d'entrer paisiblement dans le sommeil eternel.	I shall die to-day; there only remains to envelop oneself in perfumes, to crown oneself with flowers, to surround oneself with music, so as to enter peacefully into the eternal sleep.

Here it will be seen that the Infinitive is not the subject, as in 'savoir c'est pouvoir,' but the complement.

These extracts will complete our study of the employment of the Infinitive:

* 1. Connaître une première nature, adorer son éternité, admirer sa toute-puissance, louer sa sagesse, s'abandonner à sa volonté, n'est-ce rien qui nous distingue des bêtes?—BOSSUET.	1. To know a first nature, to adore his everlastingness, to admire his power, to praise his wisdom, to give ourselves up to his will, is this nothing which distinguishes us from the beasts?
* 2. Il a fallu six cents siècles à la nature pour *construire* ses grands ouvrages, pour *attiéder* la terre, *pour* en *façonner* la surface et *arriver* à un état tranquille; combien n'en faudra-t-il pas pour que les hommes arrivent au même point et cessent de *s'inquiéter*, de *s'agiter* et de se *detruire?*—BUFFON.	2. It has needed six hundred centuries for nature to construct its great works, to cool the earth, to shape its surface, and to reach a state of peace; how long will it need man to arrive at the same point, and to cease to distress and disquiet himself and to destroy?
* 3. Lorsqu'on prend un héron, on *peut le garder* quinze jours *sans* lui *voir chercher* ni *prendre* aucune nourriture; il rejette même celle qu'on tente *de* lui *faire avaler*: l'apathétique héron *semble* se *consumer sans languir*; il périt *sans* se *plaindre* et sans apparence de regret.—BUFFON.	3. When one takes a heron, one can keep him a fortnight without seeing him seek or take any food: he rejects even that which one seeks to make him swallow: the sluggish heron seems to consume away without pining; he perishes without complaint and without appearance of regret.
* 4. Soldats! Les phalanx républicaines, les soldats de la liberté étaient seuls *capables* de *souffrir* ce que vous avez souffert. Mais, soldats, vous n'avez rien fait, puisqu'il vous reste encore *à faire* . . . vous avez encore des combats *à livrer*, des villes *à prendre*, des rivières *à passer*. En est-il d'entre vous qui préféreraient *retourner* sur les sommets de l'Apennin et des Alpes, *essuyer* patiemment les injures de la soldatesque	4. Soldiers! The republican phalanx, the soldiers of liberty, were alone capable of suffering what you have suffered. But, soldiers, you have done nothing, since it still remains to you to do . . . you have still battles to wage, towns to take, rivers to cross. Is there one of you who would prefer to return to the summits of the Alps and the Apennines to wipe away patiently the insults of the Slav soldiery?

esclave ? Non. Tous brûlent de *porter* au loin la gloire du peuple français, tous *veulent humilier* ces rois orgueilleux qui osaient *méditer* de nous *donner* des fers, tous veulent *dicter* une paix glorieux, tous veulent, en rentrant dans leurs villages, *pour voir dire* avec fierté : J'étais de l'armée conquerante de l'Italie.—NAPOLEON.	No. All burn to carry afar the glory of the French people, all wish to humble these haughty kings who dared to think of giving us irons, all wish to dictate a glorious peace, all wish to be able to say proudly, as they return to their villages, I was of the conquering army of Italy.

In No. 1 all these Infinitives are the logical subjects of the question.

In No. 2 they are so less directly: It required six hundred years to construct, to soften, fashion, arrive. We might express the idea : The constructions of its great works required six hundred years. Notice that in French various prepositions can introduce the Infinitive. In English *to* is dedicated to this purpose. 'Cessent de s'inquiéter,' etc. Here the Infinitive serves to develop the meaning of the verb 'cessent.' It is the logical object.

In No. 3, 'On peut le garder,' 'garder' completes the idea of 'peut.' After *can* there must be *do* something or other. Here the Infinitive is almost modal, as in *will do* it is temporal.

'sans lui voir.' Here there is an important difference between the English use and the French. As we have just said, *to* is the only preposition used before the Infinitive in English. When any other preposition is used, then in English we use the more substantival verbal noun in *-ing*. We should say *without seeing*, and later *without languishing, without complaining.*

'Chercher' and 'prendre' are what are called the Accusative Infinitive : One can keep him without seeing him seek or take any food. What do you not see ? Him taking food. The phrase is the object of *see*.

'Qu'on tente de lui faire avaler.' Here, again, what does one try to do ? To make him swallow. *Try* is also a verb which requires another verb to complete its meaning. So also is 'semble': He seems to consume. *Consume* tells you what he does; it completes the idea of 'semble,' *seems*.

No. 4. The first Infinitive here is 'souffrir': 'Only the soldiers of the republic were capable of *suffering*.' *Capable of* requires a verbal noun. In English we use the verbal noun in *-ing*. In French the Infinitive can be used after any preposition : 'Puisqu'il vous reste encore à faire.' *Since it remains (for) you still to do.* This is rather a peculiar use ; it is called the Gerundive. What remains to do, or to be done, is amplified a few lines lower down : 'Combats à livrer, villes à prendre, rivières à passer.' Note that it may be also rendered by the Passive : *Towns to be taken, rivers to be passed.* 'Retourner' is the object of *prefer*. 'Essuyer' is what they would return to do. After a verb of motion the simple Infinitive is allowed, as after *seem*, 'sembler,' or, as we see a few lines ahead, after 'veulent,' *wish*. In English we say 'return *and* wipe away.' When the following verb is quite necessary to carry out the idea of the first verb, as a rule a simple Infinitive follows. When the connection is not quite so close as we see in 'brûlent de porter' and 'méditer de nous donner,' a preposition is required. The examples[1] here, with verbs of motion, practically exhaust the list of verbs followed by a simple Infinitive, with the exception of 'savoir' and 'paraître.'

Note the use of 'faire,' *do, make*, in No. 3 : 'Il rejette même celle qu'on tente de lui *faire* avaler,' *to* '*make*' *him swallow*. There is the same use in English. 'Laisser,' *to let*, is used in the same way : 'Laissez venir à moi les enfants.' As we see here, when the object of the first verb is a noun it follows the second verb.

There is another use of the Infinitive, as a form of description. We have a similar use in English : 'And me liggin' here alone' (Tennyson). Here is a description of what might be a 'down dishes' sensation in French :

'Et aussitôt Alain de s'empresser, Georgette d'accourir, et la porte de s'ouvrir. Les marchands alors de fuir, les consommateurs de trouver les boutiques closes, et tout le monde de mourir de faim. Il s'éloigne tout honteux et nous de rire.'

SUMMARY OF INFINITIVE USES

1. As a substantive : 'Dormir et peut-être rêver.'
2. Completing the idea of a verb: 'Je ne peux pas dire.' 'Veux-tu venir ?'
3. Following an adjective : 'Capable de tout même de mourir.'
4. Accusative Infinitive, instead of a finite verb phrase : 'Je le vois passer.'
5. After 'faire' : 'A faire suivre.'
6. Historic : 'Et moi de rire.'

14. **The Subjunctive Mood.**—There is no genuine equivalent in English of the French subjunctive mood, and its use can only be learned from a careful study of typical instances.

PRESENT TENSE

(Que) je	tu	il	nous	vous	ils
parle	parles	parle	parlions	parliez	parlent
finisse	finisses	finisse	finissions	finissiez	finissent
rompe	rompes	rompe	rompions	rompiez	rompent

Note that in the singular and the 3rd plural the endings are those of the *-er* conjugation, in the case of the *-ir* conjugation the final consonant of the stem being doubled. In the *-er* conjugation the endings in the singular and 3rd plural are the same as the Present Indicative. The Subjunctive is, however, usually introduced by 'que.'

Que cet instant parmi tous les instants soit benit.—ROST.

The minor conjugations make their Present Subjunctives in this way :

(Que) je	tu	il	nous	vous	ils
dorme	dormes	dorme	dormions	dormiez	dorment
reçoive	reçoives	reçoive	recevions	receviez	reçoivent

[1] Sembler, oser, pouvoir, faire, vouloir, préférer.

Imperfect Tense

(Que) je	tu	il	nous	vous	ils
parlasse	parlasses	parlât	parlassions	parlassiez	parlassent
finisse	finisses	finît	finissions	finissiez	finissent
rompisse	rompisses	rompît	rompissions	rompissiez	rompissent

Minor conjugations :

dormisse	dormisses	dormît	dormissions	dormissiez	dormissent
reçusse	reçusses	reçût	reçussions	reçussiez	reçussent

The use of this tense in the *-er* conjugation is avoided on account of the *-asse* sound, which grates on the ear. In the *Baron de Fourchevif*, by Labiche, it strikes the bogus baron as unusual when he hears his wife, who is seeking to make an impression on an artist, using this tense. 'Tiens !' he says, 'ma femme qui soigne son style.'

The other two tenses of the Subjunctive, being compound, are similar in each conjugation. They are :

The Perfect

(Que) j'ai parlé, fini, rompu, dormi, reçu, etc.
(See conjugation of 'avoir.')

The Pluperfect

(Que) j'eusse parlé, fini, rompu, dormi, reçu, etc.
(See conjugation of 'avoir.')

There remains to consider the use of the Subjunctive mood. As it has no genuine equivalent in English, we will go straight to our texts to observe it at home. Look at the following examples :

* 1. Croyez-vous que les croisades *eussent été* possibles chez un peuple qui n'eût pas été accoûtumé à cette vie errante et aventureuse ? Concevrait-on aujourd'hui un peuple de propriétaires qui tout-à-coup se déplacât, abandonnât ses propriétés, ses familles, pour aller chercher ailleurs de telles aventures ? Rien de pareil eût été possible si la vie quotidienne des possesseurs de fiefs n'eût été, pour ainsi dire, un avant-goût des croisades, s'ils ne se fussent trouvés tout prêts pour de telles expéditions.

1. Do you believe that the crusades *would have been* possible with a people which *had* not *been* accustomed to this wandering and adventurous life ? Would one conceive to-day a people of proprietors who all at once removed, abandoned their property, their families, to go (and) seek elsewhere such adventures ? Nothing similar would have been possible if the daily life of the possessors of fiefs had not been, so to speak, a foretaste of the crusades, if they had not found themselves quite ready for such expeditions.

We see here unfamiliar forms : 'eussent été,' 'n'eût pas été,' 'se déplacât,' 'abandonnât,' 'n'eût été,' 'fussent trouvés,' Reference to the conjugations of 'avoir' and 'être' will show the forms ; but what is their use ?

Let us see how they occur. In each case we see that the mood comes in a subordinate sentence : 'Croyez-vous que les croisades eussent été possibles ?' 'Concevrait-on un peuple . . . qui se déplacât, abandonnât . . .' Then we may suppose that this mood is one 'consecrated' to subordinate sentences—that is to say, sentences which are developments of the main sentence. This is usually so.

Now, the first use we have of the mood is after the question : 'Croyez-vous ?' *Do you believe ?* And the writer evidently expects you not to believe. The second is a similar use : 'Concevrait-on ?' *Could one conceive ?* That is to say, he puts both these suggestions with a considerable element of doubt. In the third instance he uses the mood in a principal sentence, but both principal sentence and the subordinate sentence which follows it ('Nothing like it would have been possible . . . if the everyday life had not been') are unlikely suppositions. There is an *if* in the case, and the supposition is negatived. Again we have doubt and unlikelihood.

2. L'Amerique est le seul pays où l'on *ait* pu assister aux developpements naturels et tranquilles d'une société et où il *ait* été possible de préciser l'influence exercée par le point de départ sur l'avenir des Etats.

2. America is the only country where one has been able to witness the natural and peaceful development of a society, and where it has been possible to fix the influence exercised by the starting-point on the future of the States.

Agrippine to her Son Nero, professing Herself willing to Die

3. Agrip. *Pourvu que* par ma mort tout le peuple irrité
Ne vous *ravisse* pas ce qui m'a tant coûté.
Ner. Hé bien, donc, prononcez ! Que voulez-vous *que je fasse ?*
Agrip. De mes accusateurs qu'*on punisse* l'audace,
Que de Britannicus on *ca me* le courroux,
Que Junie à son choix *puisse* prendre un époux.—Racine.

3. Agrip. Provided that by my death all the people enraged
Does not despoil you of what has cost me so much.
Ner. Well, then, pronounce ! What would you that I do ?
Agrip. Of my accusers that the boldness be punished,
That the anger of Britannicus be appeased,
That Junica be able to take the husband of her choice.

Boileau bewailing the Set against Molière

4. *Avant qu'*un peu de terre obtenu par prière
Pour jamais sous la tombe *eût enfermé* Molière.

4. Before a little earth obtained by prayer
For aye 'neath the tomb had enclosed Molière.

Molière went out of fashion. To gratify any natural curiosity as to what *did* happen :

"Le commandant voulait la scène plus exact.
Le vicomte indigné sortait au second acte."

5. Quoique je ne *sorte* presque jamais, j'ai une passion demésurée de connaitre tous les anciens chemins qui étaient du temps des Romains. Il y en a un près de chez moi, et je ne manque jamais d'y passer *quoiqu'il soit* incommode et qu'il m'*allonge* de plus d'une lieu.—Montesquieu.

5. Though I hardly ever go out, I have an inordinate passion for knowing all the ancient roads which were at the time of the Romans. There is one of them near my house, and I never fail to pass that way, although it is inconvenient and lengthens my journey by more than a league.

A Pious Wish of Boileau

6. Maudit *soit* le premier dont la verve insensée
Dans les bornes d'un vers renferma la pensée.

6. Cursed be the first whose insensate zeal
Confined thought to the limits of verse.

7. J'allai alors d'un pas tranquille chercher quelque lieu désert où *rien* ne montrant la main des hommes n'*annoncât* la servitude et la domination, *quelque* asile où je *puisse* croire avoir pénétré le premier et où nul importun ne *vint* s'interposer entre la nature et moi.—Rousseau.

7. I went then with a tranquil step to seek some desert place where nothing by revealing the hand of man should announce servitude and domination, some asylum where I might believe (myself) the first to have penetrated and where no importunate person should come to interpose between me and nature.

Geneva under Calvin

8. Situation unique d'alarmes continuelles. Il fallait se garder des ennemis, bien plus des amis, veiller toujours, craindre toujours. Voilà

8. A unique situation (and one) of continual alarms. It was necessary to guard oneself from enemies, even more from friends, to watch always, to

pourquoi Genève a *été* la vierge sage. Voilà pourquoi elle a été la grande école des nations. Mais pour qu'il fût ainsi il fallait qu'elle *subît* une transformation complète, qu'elle *s'abjurât* d'elle-même, que d'une ville de plaisir elle se *fît* la fabrique des saints, la sombre forge où se *forgeassent* les élus de la mort.—MICHELET.	fear always. That is why Geneva has been (*i.e.* was) the wise virgin. That is why she has been the great school of nations. But for it to be so it was necessary that she should undergo a complete transformation, that she should deny herself, that from a pleasure city she should make herself the manufacture of saints, the sombre forge where were produced the elect of death.
9. Oh, qui que vous soyez, parlez moi, je m'abhorre. Qui que vous soyez, Spectres qui m'entourez, démons qui nous voyez. HUGO.	9. Oh, whoever you may be, speak to me, I abhor myself, Whoever you may be, Spectres that surround me, demons that behold us.

In No. 2 we do not seem to have this doubt: 'America is the only country where one has been able to assert . . . where it has been possible to fix . . .' The use here is more formal. The French argue that the Indicative is the mood in which you state that *things are:* if you mention them without affirming that they are so, they look on this statement as still supposititious. If the writer had said, 'One has assisted in America alone at the natural development,' that is a statement, and so Indicative. But he says not, 'Où on a pu assister,' but something a little less. In English, if you want to render the idea, you must say, 'Where one has had the opportunity of assisting'; then you do not imply actually that one did do so. That is to say, in English, which is an analytic language, you always use words to express your meaning, and not forms, as in French, which is a more synthetic language. English, again, is not so precise. In the first example, in English we should say, 'If the possessors of fiefs had not been . . . .' We consider all the supposition has been conveyed by the *if,* which really means *gif, give, grant that,* and so we are content to assume the thing granted for a fact. The French use is, as a rule, the same after *if,* 'si'; but when the supposition is clearly unlikely, then the Subjunctive is required. If in English we feel the unlikelihood is so marked as to require being expressed in the verb, we have, as a rule, to use auxiliaries and to say, as in No. 1, 'Do you believe that the crusades would have been possible? Could one conceive a people which would displace itself, abandon its lands . . . '; or, with our greater fluidity, we might say, 'Could one conceive a people displacing itself, abandoning . . .'

But even in French the Subjunctive is not used always when a thing is mentioned without being related as a fact. It is only when it is mentioned with an element of doubt that the Subjunctive is required. And as French is a formal language, the occasions when the Subjunctive are used are rather apt to be crystallised as being after certain kinds of expressions.

The consideration of the remaining examples will give us the idea of what these expressions are.

No. 3. 'Pourvu que le peuple ne vous ravisse.' *Provided that the people does not despoil you.* Here, we see, there is a 'concession' made by the use of 'pourvu que.' The statement of the despoiling is dependent on that, and so the Indicative is evidently not the mood to use, although in English it is. *What do you wish that I should do?* says Nero. 'Que voulez-vous que je fasse?' We have already seen that the Infinitive can be used after 'vouloir.' In English we should rather say, *What do you wish me to do?* But in French *me to do* would be too clumsy a phrase, and the Infinitive can only be used if the second verb has no subject. 'Que voulez-vous faire?' would be all right, but 'Que voulez-vous me faire?' is not logical enough for the French. We shall find these differences illustrated later. Notice that Agrippine in stating what she wishes keeps in the Subjunctive: 'Qu'on punisse,' etc.

No. 4. 'Avant qu'un peu de terre eût enfermé Molière.' Has it yet done so? No; not in the statement of the writer as to what happened. (See p. 258, No. 4.) 'Avant que,' *before,* naturally does not take the mood of statement, the Indicative.

No. 5. 'Quoique je ne sorte.' The concessive 'quoique' requires the Subjunctive, as we see in the next line, 'Quoiqu'il soit incommode et qu'il m'allonge,' because it is inconvenient—if and when he does pass. The English *it may be convenient* is too strong to express the difference.

No. 6. 'Maudit soit le premier.' *Cursed be the man.* Here the Imperative borrows a person from the Subjunctive to supply one which it lacks. None the less we see that it is from another point of view the expression of a wish that something should be.

No. 7. 'Où rien n'annonçât la servitude et la domination.' What kind of a sentence is it? It is in reality a relative sentence, 'où,' *where* —*i.e.* by, at which—having a relative character. A relative clause is frequently put into the Subjunctive if it is not a mere relative of convenience —*i.e.* attributive, or adjectival.

'Où je puisse croire.' Here we should have expected the Indicative, at any rate, if the phrase had stood by itself, because 'pouvait' has a slight suggestion by itself of a thing not actually happening. (It is a similar word, *might,* which we use in English to render the idea of the Subjunctive). But the writer has already shown that the whole idea is unlikely, and so 'puisse' is attracted into the mood of the previous phrase. In the next phrase, 'Où nul ne vînt,' we have again an indefinite relative, as above. If the reader will compare this use with that shown in No. 9, he will see 'qui que' —called an Indefinite Relative—and its indefiniteness naturally makes it the typical relative, which does not state a fact, but makes a suggestion. In fact, the Indefinite Relative really asks what may be called a Scotch question.

In the last line of this quotation we have two relatives of convenience, as I have called them; 'Spectres qui m'entourez, démons qui nous voyez': they do surround him, they do see us; and the relative simply makes, as it were, the statement that they do.

No. 8. This last extract is both important and interesting. We find at first the verb 'falloir' followed by the Infinitive, and then afterwards by the Subjunctive. But it is not necessary for us to be puzzled by that. We have found 'vouloir,' *to wish* or *want*, doing the same thing, and remember that it was when it took a whole sentence to say what was wanted that the Subjunctive was needed. The same thing is true of the kindred verb 'falloir,' *it needs*, as the reader will see if he reads the extract through.

It is not necessary to repeat anything about the mood of 'forgeassent' after 'où.' Notice, however, the Subjunctive appearing after 'pour que.' We have already had an instance of this in Agrippine's speech.

And now, in conclusion, let it be said that there are signs that the French people are a little tired themselves of their Subjunctive. It tends to be used only in the Present and Past Indefinite, and there is an effort to avoid it. We have noticed that if a whole sentence is not coming after, the Infinitive can replace it after 'vouloir' and 'falloir.' The same is true of a number of other verbs; and even the conjunctions, such as 'avant que,' 'afin que,' 'pour que,' 'sans que,' may be replaced by the prepositions 'avant de,' 'afin de,' 'pour,' 'sans,' *when the subject of the following verb is the same as that of the preceding one.*

Summary of Subjunctive Uses

1. After a verb expressing doubt, or desire, or wish.
2. In a relative sentence when the statement is mentioned hypothetically and not vouched for, or if a negative has preceded the relative clause.
3. After certain conjunctions which themselves imply that it is not an Indicative statement which is being made.
4. To express a wish or a command.

** 15. **Personal Pronouns.**—It is best to memorise at once the forms given below before commencing the study of their uses.

Nom.	Acc.	Dat.	Emphatic Form
je, *I*	me, *me*	me, *(to) me*	moi
tu, *thou*	te, *thee*	te, *(to) thee*	toi
il, *he*	le, *him*	lui, *(to) him*	lui
elle, *she*	la, *her*	lui, *(to) her*	elle
nous, *we*	nous, *us*	nous, *(to) us*	nous
vous, *you*	vous, *you*	vous, *(to) you*	vous
ils, *they*	les, *them*	leur, *(to) them*	eux
elles, *they*	les, *them*	leur, *(to) them*	elles

Note.—The emphatic forms are used when the pronouns are not used in conjunction with the verb. Example:

'Me! that have been what I have been!'
Moi! qui, etc.

or after prepositions:

A moi, mes hommes!
To me, my men!

The Possessive Adjectives and Possessive Pronouns

Adjectives	Pronouns
mon, ma, mes, *my*	le mien, la mienne, *mine* Pl. les miens, les miennes
ton, ta, tes, *thy*	le tien, la tienne, *thine* Pl. les tiens, les tiennes
son, sa, ses, *his, her, its*	le sien, la sienne, *his, her, its* Pl. les siens, les siennes
notre, notre, nos, *our*	le nôtre, la nôtre, *ours* Pl. les nôtres
votre, votre, vos, *your*	le vôtre, la vôtre, *yours* Pl. les vôtres
leur, leur, leurs, *their*	le leur, la leur, *theirs* Pl. les leurs

The different forms for the different numbers and genders are due to the fact that in French the possessive adjective or pronoun takes its gender or number from the *thing possessed*, not *the possessor*, as in English.

Instances of the pronouns in their simplest forms may be found in the sections devoted to the tenses of the verbs. We will now enter on a more detailed examination of the various uses and forms of pronouns—personal, relative, interrogative, and demonstrative—with their corresponding adjectives. In the case of these latter, attention must be paid to them, not because they do not follow the general rule of adjectives, but because they do so to a more marked degree than do their English equivalents.

However, once more to our texts. Here is a passage well worth studying:

* La Conscience	The Conscience
Rentrons en *nous-mêmes;* examinons, tout intérêt personnel à part, à *quoi* nos penchants *nous* portent. *Quel* spectacle *nous* flatte le plus, celui des tourments ou du bonheur d'autrui? *Qu'est-ce qui nous* est le plus doux à faire, et *nous* laisse une impression plus agréable après l'avoir fait, d'un acte de bienfaisance ou d'un acte de méchanceté? *Pour qui vous* interessez-*vous* sur *vos* théâtres? Est-ce aux forfaits que *vous* prenez plaisir? Est-ce à *leurs* auteurs que *vous* donnez des larmes? Tout nous est indifférent, dites-*vous*, hors *notre* intérêt: et, tout au contraire, les douceurs de l'amitié, de l'humanité, *nous* consolent dans *nos* peines; et, même dans *nos* plaisirs *nous* serions trop seuls, trop misérables si nous n'avions *avec qui* les partager. S'il n'y a rien de moral dans le cœur de l'homme, d'où *lui* viennent donc ces transports d'admiration pour les actions héroïques? Cet enthousiasme de la vertu, *quel* rapport a-t-*il* avec notre intérêt privé? Pourquoi voudrais-je être Caton *qui* déchire ses entrailles, plutôt que César triomphant? Otez de nos cœurs cet amour du beau, vous ôtez tout le charme de la vie. Celui *dont* les viles passions	(Let us) come back to ourselves: (let us) examine—all personal interest apart—to what our leanings bring us. What spectacle pleases us most, that of the torments or of the happiness of another? What is it which is the nicest for us to do, and leaves us a most agreeable impression after having done it, an act of kindness or an act of evil? For whom do you interest yourself at your theatres? Is it at the villainies that you take delight? Is it to their authors that you give your tears? All is indifferent to us, you say, outside our own interest: and quite on the contrary, the sweets of friendship, of humanity, console us in our troubles: and even in our pleasures we should be too solitary, too miserable, if we had not (anyone) with whom to share them. If there is nothing moral in the heart of man, whence come to him, then, these transports of admiration for heroic actions? This enthusiasm for virtue, what relation has it with our private interest? Why should I wish to be Cato who rends his entrails, rather than Cæsar triumphant? Take away from our hearts this love of the beautiful, and you take away all the charm of life. He whose vile passions have stifled in his narrow soul these delicious sentiments, he who by force of concentrating on him-

ont étouffé dans son âme étroite ces sentiments délicieux, celui *qui*, à force de *se* concentrer au dedans de *lui* . . . le malheureux ne sent plus, *il* ne vit plus, *il* est déjà mort. Mais quelque soit le nombre des méchants sur la terre, *il* est peu de ces âmes cadavereuses devenues insensibles hors leur intérêt, à tout *ce qui* est juste et bon. Si quelque acte de clémence ou de générosité frappe *nos* yeux, *quelle* admiration, quel amour il nous inspire ! *Qui est-ce qui* ne se dit pas : *J'en* voudrais avoir fait autant ? *Il* nous importe assurément fort peu qu'un homme ait été méchant ou juste il y a deux mille ans . . . *Que me* font à *moi* les crimes de Catilina ? Ai-je peur d'être sa victime ? Pourquoi donc ai-je de *lui* la même horreur que s'il était *mon* contemporain ? *Nous* ne haïssons pas seulement les méchants parce qu'ils *nous* haïssent, mais parce qu'ils sont méchants. Non seulement nous voulons être heureux, nous voulons aussi le bonheur d'autrui ; et, quand ce bonheur ne coûte rien au nôtre, il l'augmente. Enfin, l'on a, malgré soi pitié des infortunés ; quand on est temoin de leur mal, on en souffre. Les plus pervers ne sauraient perdre tout à fait ce penchant ; souvent il les met en contradiction avec eux-mêmes. . . . Il est donc au fond des âmes un principe sur *lequel nous* jugeons *nos* actions . . . et c'est à ce principe *que* je donne le nom de Conscience.—Jean Jacques Rousseau.

self alone . . . the wretch feels no more, he lives no more, he is already dead. But whatever the number of the wicked on earth, there are few of these corpse-like souls (which have) become insensible, beyond their own interest, to all which is just and good. If some act of clemency or of generosity strikes our eyes, what admiration, what love it inspires us (with). Who does not say, Yet I would I had done as much ? It matters little indeed to us that a man has been good or bad two thousand years ago. . . . What matter to me the crimes of Catiline ? Have I any fear of being his victim ? Why, then, have I the same horror as if he were my contemporary ? We do not hate the wicked because they hate us, but because they are wicked. Not only do we wish to be happy, we wish also the happiness of others : and when this happiness costs nothing to ours, it augments it. In fine, one has, in spite of oneself, pity for the unfortunate : when one is witness of their ill, one suffers from it. The most perverse 'could not' lose altogether this inclination : often it puts them in contradiction with themselves. . . . There is, then, at the bottom of (our) hearts a principle upon which we judge our actions . . . it is to this principle that I give the name of Conscience.

We will now address ourselves to the crop of pronouns which we find in this 'morceau.' Let us take first the pronouns personal. As we know them in the nominative, they are : 'Je,' *I* ; 'tu,'[1] *thou* ; 'il,' *he* ; 'elle,' *she* ; 'nous,' *we* ; 'vous,' *you* ; 'ils,' 'elles,' *they*. In l. 1 we find 'nous-mêmes' for *ourselves*, and in l. 4 'nous' for *us* (object), while in l. 26, after numerous 'nous' = *us*, there is a 'nous serions,' *we should be*, l. 28 'nous avions,' *we had*. Going back to l. 14, we have 'vous intéressez-vous'—*i.e.* 'vous' standing for *you* as subject and object. (Note that the second *you* must be *yourself* in English.) In l. 29 we have 'il' for *it* (in French indistinguishable from *he* or *she*), and in l. 32 'lui' for *him*. But in l. 11 we have 'l''—*i.e.* 'le' for *it* (object)—which ought to be identical with *him*. True, but 'lui' here is indirect object. We have it in l. 48 after 'de.' In l. 38 there is 'je,' *I*, and in l. 68 'que me font à moi'—*me* (object), and 'moi,' *me* (after a preposition). In l. 76 we have 'ils,' *they* ; in l. 28 'les,' *them* ; and in l. 91, after a preposition, 'eux-mêmes,' *themselves*. (The plural of 'lui' (indirect object), of which we have not met an instance, is 'leur.') It will be useful for the learner to collect all the instances of each of the persons of the pronouns, tabulating them according to whether they are subject, object, indirect object, or after a preposition. The forms we have obtained so far are :

	1st Person		2nd Person	3rd Person		Fem.
	Sing.	*Plur.*	*Plur.*	*Sing.*	*Plur.*	
Subject	je	nous	vous	il	ils	*elle, elles*
Object	me	nous	vous	le	les	*les*
Ind. Object	me	nous	vous	lui	*(leur)*	*leur*
After a Prep.	moi	nous	*toi, vous*	lui	*(eux)*	*elles*

In italics are the forms not found here.

But as well as the personal pronouns we must also give an eye to the pronominal adjectives. As we have said these have a very important difference from the English. This will be perhaps best brought out by taking another sentence. 'La mérite de la femme,' said De Maistre, 'est de régler *sa* maison, de rendre *son* mari heureux, et d'élever *ses* enfants,' *The merit of woman is to rule her house, to render her husband happy, and to bring up her children.* In English we say *her* in each case, but in French it is 'son' with 'mari,' a masculine singular word, 'sa' with 'famille,' a feminine singular, and 'ses' with 'enfants,' a plural word. The rule is evidently that the possessive adjective takes its gender from the thing possessed, not from the possessor. We will now see what instances there are of these adjectives in our original passage.

In l. 3 we have 'nos penchants' (plural) ; in l. 15 'vos théâtres' (also plural) ; in l. 17 'leurs auteurs,' *their authors* (plural) ; in l. 21 'notre intérêt,' *our interest* (here singular) ; in l. 45 'son âme' (singular) ; in l. 39 'ses entrailles' (plural) ; in l. 71 'sa victime' (feminine singular) ; in l. 68 'mon contemporain' (masculine singular) ; in l. 86, 'leur mal' (masculine singular). Tabulating these, we get :

	1st Person		2nd Person		3rd Person	
	Sing.	*Plur.*	*Sing.*	*Plur.*	*Sing.*	*Plur.*
Masculine	mon	notre	*(ton)*	*votre*	son	leur
Feminine	*ma*	*notre*	*(ta)*	*votre*	sa	*(leur)*
Pl. (M. and F.)	*mes*	nos	*(tes)*	vos	ses	leurs

And we shall be justified in filling in the missing forms on the analogy of those we have discovered.

There exist, then, distinct forms for the masculine and feminine of the singular possessives, and for the plural one form for the masculine and feminine ; while of the plural possessives there is one form for the masculine and the singular, and one for the plural. (Note that it is the *-e* mute termination which prevents a distinction being shown between the masculine and feminine of 'notre' and 'votre,' while 'leur' does not take a sign for the feminine, although it does for the plural.)

We now turn to the relative and interrogative pronouns. The principal forms are : 'qui,' *who* ('l'homme qui rit,' and 'Qui va la ?') :

[1] We shall only find 'tu' in intimate language.

'que,' *whom, that* ('Fou que vous êtes'), which is also interrogative in reference to things ('Que voulez-vous ?'). We must also be prepared for the fact that French having no neuter words, such as *which, what,* these will be rendered by masculine or feminine forms. It is, however, in the relative and demonstrative forms that one finds traces of a neuter and neuter uses. And now, 'revenons à nos moutons.'

In the first three sentences of 'La Conscience' we find 'à quoi,' *to(wards) what ;* '*quel spectacle*' (interrogative adjective); '*qu'est-ce qui,*' *what is it which* (an intensive interrogative); '*pour qui,*' *for whom ;* 'aux forfaits *que* vous prenez plaisir ?' *is it to the villanies that you take pleasure ?* In l. 28 we have 'avec *qui,*' *with whom* (relative); in l. 35 '*quel* rapport'; in l. 38 'Caton *qui* déchire' (relative); in l. 40 'dont,' *of whom, whose* (relative); in l. 47, 'celui qui,' *he who* (relative); in l. 56 'tout ce *qui* est juste,' *all (that) which* (relative); in l. 60 '*quelle*' (feminine); in l. 61 '*quel*' (masculine adjective); in l. 62 '*Qui est-ce qui ?*' (again the intensive interrogative, this time used of a person: *cp.* '*Qu'est-ce qui,*' of a thing); in l. 68 '*Que* me font,' *What does it make to me ?* (interrogative); and in l. 93 a new form, '*sur lequel,*' *upon which* (relative).

Tabulating these forms, we notice that, as a rule, there is no distinction of gender in relatives or interrogatives, except in the adjectives 'quel,' 'quelle.' On the other hand, 'quoi,' *what,* shows us that there are special words to be used in a neuter sense, and a moment's reflection will tell us that there must be. 'Lequel' suggests, however, that in this form there is distinction of gender, and so perhaps of number also. Here are the forms we have obtained :

	RELATIVE	INTERROGATIVE
Subject	Qui, ce qui, *that which, he who*	Qui and Qui est-ce qui ?
Object	Que, *whom, which*	Que (referring to a thing)
After a Prep.	Qui	Quoi
Possessive.	Dont, *of whom*	*Inter. Adj.* Quel, quelle, quoi, *what* (referring to an object)

We have also one instance of another form : 'lequel' . . . un principe . . . sur lequel nous jugeons nos actions.'

It will be seen that we must reinforce these instances, as they do not altogether cover the uses of the relative and the interrogative. What, for instance, was the extent of the use of this 'lequel' ? If 'lequel' in one place presumably 'laquelle' in another, and elsewhere 'lesquels,' 'lesquelles.' Here are some further instances of 'lequel,' etc.

LES FABLES	THE FABLES
* 1. Les enfants y reconnaissent les mœurs du chien qu'il caressent, du chat dont ils s'abusent, de la souris dont ils ont peur. Pour les animaux féroces, ils y trouvent ce que leur mère en a dit, le loup dont on menacent les mauvais enfants, le renard qui rode autour du poulailler, le lion dont on leur a vanté les mœurs clémentes. Ils s'amusent singulièrement des petits drames dans *lesquels* figurent ces personnages. . . . Les plus avisés, ceux devant *lesquels* on ne dit rien impunement, vont plus loin.—NISARD.	1. The children recognise there the habits of the dog which they caress, of the cat which they misuse, of the mouse of which they are afraid. (As) for the wild animals, they find there what their mother has said, the wolf with which one threatens the naughty children, the fox which prowls around the fowl-run, the lions of whom has been exalted the manners mild (!). They amuse themselves highly with the little dramas in which these characters figure. The more wary, those before whom one does not say anything with impunity, go farther.
2. Je crois volontiers les histoires dont les témoins se font égorger.	2. I believe willingly the stories of which the witnesses get their throats cut.
3. Je viens à vous Seigneur, Père *auquel* il faut croire.—V. HUGO.	3. I come to you, Sire, Father in whom one must believe.
4. Parmi les antiquités les plus touchants du Louvre il est un morceau de marbre *sur lequel* on distingue deux jeunes filles qui tiennent à la main chacune une fleur.—A. FRANCE.	4. Among the most touching antiquities of the Louvre there is a piece of marble on which one can see two children who each hold in (their) hand a flower.
5. Il est juste que ce qui est juste soit suivi. Il est necessaire que ce qui est le plus fort soit suivi.—PASCAL.	5. It is right that that which is right be followed. It is necessary that that which is strongest be followed.

Now what can we gather from the various uses of 'lequel,' etc., in these passages ? We have 'le principe sur lequel, . . . les drames dans lesquels, . . . les (enfants), ceux devant lesquels on ne dit rien, . . . père auquel il faut croire, . . . les histoires dont, . . . un morceau de marbre sur lequel.' This is evident, that 'lequel' is used after a preposition. The fact that it is a form which shows difference of gender suggests also that it is used to remove any possible ambiguity which may arise. As a matter of fact, it must be used when the relative relates to a thing, and it is used in reference to persons when two nouns have come before, and the gender may help to show to which of these two it refers. Thus, in this sentence from Mignet, the historian, speaking of the dying Calvin :

Il se fit porter de son lit à la table autour *de laquelle* étaient ses collègues, *auxquels* il dit en entrant.	He had himself brought from his bed to the table around which were his colleagues, to whom he said on entering. . . .

Here 'à qui' might suggest that he was addressing the table, which, however, would properly be 'à laquelle.'

In the same passages we have several uses of 'dont' illustrated. In No. 1 we have 'dont on s'abusent,' in English *which one misuses,* not *of which,* as in 'dont ils ont peur,' *of which they are afraid.* Again, 'le loup dont on menace les mauvais enfants,' *with which one threatens naughty children.* In 'le lion dont on a vanté' we have *of whom one has vaunted ;* and in No. 3, 'les histoires dont les temoins,' *stories of which the witnesses.* So we may see that 'dont' is used impartially of persons and things, or of gender or number. But in this sentence we find it absent (it is still Calvin) :

Le delabrement de son estomac ne lui permettait pas de prendre en 24 heures plus d'un repas, à la suite duquel, il retournait à l'étude.	The ruin of his (digestion) did not permit him to take in 24 hours more than one meal, at the end of which he returned to study.

Why is not 'dont' used here? If it was, as 'dont' always comes after its antecedent directly, it would be 'dont à la suite'—an awkward phrase. So 'duquel' replaces 'dont' in the same way that 'lequel' does 'qui,' when there is awkwardness or ambiguity.

(*N.B.*—In the same extracts it is worth noticing the use of 'ce que,' 'ce qui.' We have in No. 1 'ce que leur mère en a dit,' and in No. 5 'ce qui est juste, . . . ce qui est le plus fort.' We see that where in English we are content with simply saying *what their mother has said*, *what is just, that which is stronger*, in French they always say *that which*, giving a word for the object and for the subject.)

** 16. **Adverbs.**—Adverbs not being subject to inflexion, do not present much material difference to their English equivalents. But we shall find it useful to notice three things about them: first, how they are commonly formed; secondly, their position in the sentence; thirdly, their meaning and its bearing on the sentence. Here are some examples:

* 1. Le style n'est que l'ordre dans les pensées. Si on les enchaîne *étroitement*, si on les serre, le style devient ferme, nerveux et concis; si on les laisse succéder *lentement*, et ne se joindre qu'à la faveur des mots, le style sera lache et traînant . . . lorsque (un écrivain) se sera fait un plan . . . les idées se succéderont *aisément*, la chaleur se répandra *partout*, et donnera de la vie à chaque expression, tout s'animera de *plus en plus*: et le style deviendra intéressant et lumineux.—Buffon.	Style is only order in (one's) thoughts. If one connects them closely, if one compresses them, the style becomes firm, nervous, and concise; if one lets them follow slowly, and only join by means of words, the style will be slack and dragging . . . when (a writer) has made a plan . . . the ideas will follow easily, warmth will spread throughout, and give life to each expression; all will be more and more animated, and the style will become interesting and luminous.
* 2. Après avoir été *longuement* et *injustement* détenue prisonnier dans ce pays, ou j'ai *beaucoup* enduré de peine et de mal, *maintenant* par la force et sous la puissance des hommes, prêté à finir ma vie . . . devant une compagnie qui sera temoin que, bien près de la mort, j'ai protesté comme je l'ai *toujours* fait, soit en particulier, soit en public, de n'avoir *jamais* rien inventé pour faire périr la reine ni consenti à rien contre sa personne.—Marie Stuart.	For translation see Verb, Present tense, p. 250.

Collecting the adverbs, we find they are: 'étroitement,' 'lentement,' 'aisément,' 'partout,' '(de) plus en plus,' 'longuement,' 'injustement,' 'beaucoup,' 'maintenant,' 'toujours,' 'jamais.' It is evident from this list that a great number of adverbs are formed by the termination *-ment*, and a little reflection will show that these are, as a rule, formed from the adjective which gives the attribute to the noun, which is here given to the verb. Adverbs, in fact, do the same thing for verbs which adjectives do for nouns. And they are like adjectives in this respect: they can be comparative or superlative. Notice that it is from the feminine of the adjective that they are formed ('étroi*te*ment,' 'long*ue*ment'). See example below:

3. Les accusations de cette sorte (impiété) étaient *fort* nombreuses à Athenes; c'est le genre de causes qu'on trouve *le plus frequemment* dans les orateurs attiques. Aristote, Aspasie, Euripède furent *plus ou moins sérieusement* inquiétés.—Renan.	Accusations of this sort were very numerous at Athens: it is the kind of case most frequently found in the Attic orators. Aristotle, Aspasia, Euripides were more or less seriously perturbed.

Harking back to the list of adverbs we got from the previous extracts, we see that, apart from being formed from adjectives, adverbs are formed (as 'par-tout,' 'beau-coup') by a compressed prepositional phrase or a noun joined to some other word and used in an adverbial sense. In fact, in Ex. 2 the difference is only one of degree, by which 'comme je l'ai toujours fait' and the following phrases are as adverbial as 'maintenant.' Both modify the verb to which they are attached.

The position of the adverb is well defined. Its normal place is after the verb. If it is not there, it should go at the head of the sentence.

Maintenant que du deuil qui m'a fait l'âme obscure Je sors, pâle et vainqueur.	Now that from the grief which has obscured my soul I come, pale but triumphant.

Adverbs must never stand in front of the verb, as they do commonly in English. In a compound tense their place is after the auxiliary and before the participle, unless they are of ungainly proportions. We have already noticed this in the negative complement—those expressions being also adverbs.

En somme, malgré les exactions des gouverneurs et les violences inséparables d'un gouvernement absolu, le monde, sous bien des rapports, n'avait pas encore été aussi heureux.—Renan.	To sum up, in spite of the exactions of governors, and the violence inseparable from an absolute government, the world, under quite a number of counts, had not been so happy before.

In the above phrase the reader will find a perfect plethora of adverbial expressions, modifying not only verbs, but, as is also their function, adjectives and other adverbs.

With regard to the meaning of adverbs, they naturally divide themselves into answers to the questions *where? when? why?* and *how?* In this latter capacity they will often call in question or considerably weaken the statement of the verb, and in consequence lead to the Subjunctive Mood. The reader can refer to the section on that mood to see this.

** 17. **Prepositions.**—Adverbs lead on to prepositions, for prepositions joined to nouns supply answers to those questions—*Where? why? when?* and *how?*—which it is the general function of adverbs to answer.

Although prepositions in French and English roughly correspond, yet the idiom of the language often demands that one preposition shall be used in one language where in the other it is a different one.

Thus we say *from time to time;* in French they say 'de temps en temps.' We say *to snatch from someone;* they say 'arracher *à* quelqu'un.'

The two prepositions with the most extensive and varied uses are 'à' and 'de.' 'De' means *of, from,* and at times *with* and *by.* Look at these lines:

* 1. Oh que si cet hiver un rhume salutaire, Guérissant *de* tous ses maux mon avare beau-père, Pouvait bien confessé, l'étendre dans un cercueil, Et remplir sa maison *d'*un agréable deuil. Que mon âme, en ce jour *de* joie et *d'*opulence, *D'*un superbe convoi plaindrait peu la depense. La mort vient *de* saisir le vieillard catarrheux, Voilà son gendre riche; en est-il plus heureux?	1. Oh that this winter a convenient cold would cure of his ills my father-in-law, and stretch him in his shroud—if he'd made a good death—and fill all his house with a comfortable regret. How my heart in that day of joy and of wealth would grudge little the cost of a grand funeral! Death has just seized the wheezing dotard, his son-in-law's rich; is he the happier for it?

Here we find special uses of 'de':

* 2. Il demandait pour grâce unique *de* prêcher, *de* mendier, *de* n'avoir rien au monde, sauf une pauvre église de Sainte-Marie-des-Anges, dans le petit champ de la Portioncule, qu'il rebatit *de* ce qu'on lui donnait.	2. He asked the single favour of preaching and begging, to have nothing in the world but a poor church of St. Marie of Angels, in the little field of the Portiunculo, which he rebuilt with what was given him.
3. La pieté n'a rien *de* faible, ni de triste, ni de gêné.	Piety knows nothing of weakness, sadness, nor want.

In No. 1 'de' follows 'guérissant,' *curing from* or *of.* 'D'un deuil' is either *with* or possibly *of* (making it *full of*). The next three 'de's' are *of.* The 'de' which follows 'vient' is a peculiar one. 'Venir de' means originally *to come from.* Thence it means *to have just done* a thing.

In No. 2 the 'de's' follow 'demander.' One asks *to* someone, *of* doing something! The reason is to be found in the radical meaning of 'demander'; it is to give a command *to* someone, the command being one *of* doing something. 'De ce qu'on lui donnait.' Here 'de' is *with.*

No. 3. This is a redundant use of 'de' *nothing (of) feeble,* etc.

Remember, also, that words denoting quantity are followed by 'de':

Dans mon coffre, tout *plein de* rares qualités, J'ai cent mille vertus en louis bien comptés.	In my coffer, all full of qualities rare, I have 100,000 virtues in well-counted Louis.

This passage, beside giving a number of the uses of 'à,' affords examples of a number of other common prepositions:

* La Révolution commença *à* se faire homme. *Pendant* la première époque du gouvernement consulaire, Bonaparte s'attacha les classes proscrites *en* les rappelant; il trouva un peuple encore agité de toutes les passions, qu'il ramena *au* calme *par* le travail, *au* bien-être *par* le retablissement de l'ordre; enfin, il força l'Europe *à* reconnaître son élévation. *Jusqu au* traité d'Amiens, il rappela dans la République la victoire, la concorde, le bien-être, *sans* sacrifier la liberté. La nation était *entre* les mains du grand homme ou du despote; il dépendait de lui de la conserver affranchie ou de l'asservir. Il aima mieux l'accomplissement de ses projets égoïstes, et il se préféra tout seul *à* l'humanité entière. Elevé *sous* la tente, venu tard *dans* la Révolution, il ne croyait ni *aux* besoins moraux qui l'avait fait naître, ni *aux* croyances qui l'avaient agitée et qui tôt ou tard devaient revenir et le perdre. Il vit un soulevement qui prenaient fin, un peuple fatigué, qui était *à* sa merci, et une couronne *à* terre, qu'il pouvait prendre.—MIGNET.	The Revolution began to mature. During the first part of the consular rule Bonaparte secured the proscribed classes by recalling them; he found a people still agitated with all kinds of passions, whom he reduced to calm by work, to well-being by the re-establishment of order; in fine, he forced Europe to recognise his rise. Till the Treaty of Amiens he revived in the State victory, peace, and happiness, without sacrificing liberty. The nation was in the hands of the great man or the despot; it depended on him to keep it free or enslaved. He preferred the carrying out of his selfish projects, and he put himself before humanity. Reared in the tent, a late-comer in the Revolution, he believed neither in the moral needs which had produced it, nor in the faith which had stirred it, and which sooner or later would return and destroy him. He saw an uprising drawing to a close, people weary and at his mercy, and a crown on the ground for him to pick up.

'à' means, in the first place, *to* and *at.* But it serves, in addition, to complete many verbs and adjectives (*cp. scissors to grind, ready to go*), as we shall see in this passage.

The first time it occurs it completes 'commença,' joining 'commença' with 'se faire.' In English, when one verb follows another, the two are always linked by *to,* unless the connection is so close as to require no linking word, as, *you can go, he must come;* in French 'à' is only one of several prepositions which can be so used. Note the other instances of this use in the passage. In 'il crut ni aux besoins ni aux croyances,' the idiom is a little different to ours. We believe *in* a thing; they believe *to*—'à une chose.'

'à terre.' This is also an idiom. We say, *on the ground.*

The commonest prepositions which we have not yet discussed are:

'après,' *after.* 'Après la pluie le beautemps,' *After the rain fine weather.*

'avant' and 'devant,' which both mean *before.* 'Avant' with time: 'avant hier,' *before yesterday;* 'avant trois heures.' 'Devant: 'Je passe devant vous.'

'chez,' *with,* or *at the house of,* as one says. 'Chez moi,' *at home.*

Il en est chez le duc, il en est chez le prince, L'ouvrage le plus plat a chez les courtisans De tout temps rencontré de zélés partisans.	'Tis so at the duke's, 'tis so with the prince. The dullest of works has among courtiers Encountered at all times the strongest upholders.

'contre,' *against.* 'Cent contre un,' *A hundred against one.* 'Le pour et le contre.'

'derrière,' *behind.* 'Derrière un mamelon la garde était masséo' (Hugo), *Behind an earthwork the guard was massed.*

'pour,' *for.* 'Avez-vous quelquechose pour moi?' *Have you something for me?*

'vers,' *towards.* 'Vers l'avenir, vers la liberté,' *Towards the future, towards liberty.*

'à travers,' *across, through.* 'A travers (de) ma chambre,' *Across my room.*

III.—IDIOMS

[For reasons of space illustrative extracts will not be given.]

Idiom of the Noun.—1. Use of *proper names.* In referring to families or individuals in the plural, in French one says, 'les Stuart' 'les Bourbon,' without making the noun plural.

2. *Capital letters* are not used in writing days, months. 'dimanche, mercredi; janvier, juin.'

3. *Time* is frequently expressed without a preposition. 'Je pars *dimanche en huit,*' *Sunday week.* 'Je rentre le soir.'

4. (*cp.* 'il y a huit jours,' 'quinze jours,' *a week, a fortnight ago*).

5. Note, 'soirée' and 'matinée' denote *evening* or *morning* in extension, with reference to duration of time. 'matin' and 'soir' connote more definitely the time or occasion.

6. Definite time is expressed by 'à'; 'à sept heures,' 'à midi.' 'Vers sept heures le soir,' *towards* 7 P.M.; 'vers minuit,' *towards midnight.*

7. Countries usually take the article. 'La France, La Grande Bretagne, Les Etats-Unis.'

8. Going to a country is expressed by 'en' simply ('Je vais en Italie'), going to a town by 'à' ('Je vais à Paris' and 'Je suis à Londres'). When the country is not a genuine proper name, 'à' is used with the articles. 'aux Indes,' *to the Indies;* 'aux Etats-Unis.'

9. In speaking of a person's occupation the article is not used. 'Il est médecin,' 'J'étais simplement matelot.'

10. Notice the adverbial. 'en bon soldat,' *acting as—in his character as—good soldier;* 'en bon garçon.'

11. But in 'en famille' the prepositional force is more marked.

Many idioms are formed by a preposition and a noun:

12. à pied, *on foot.*
13. à quatre pattes, *on all fours.*
14. au grand jour, *in broad daylight.*
15. en plein air, *in the open air.*
16. en plein mer, *on the open sea.*
17. en enfance, *in childhood.*
18. en verité, *in truth.*
19. en effet, *in fact.*
20. de notre temps, *in our time.*
21. de nos jours, *nowadays.*
22. de temps en temps, *from time to time.*
23. de jour en jour, *from day to day.*
24. dans le temps, *in the time* (past).
25. de l'autre côté, *on the other hand.*
26. une boîte *à* lettres, *a letter-box.*
27. une tasse à thé, *a teacup.* une tasse *de* thé, *a cup of tea.*
28. *aux* panaches énormes, *with huge plumes.* (A common use this.)

Idiom of Adjectives.—Remember that emphatic and many-syllabled adjectives follow the noun, and that proper adjectives do not take a capital. (For 'de' with adjectives—'ce qu'il y a de vrai,' 'de bon'—see Prepositions, 'de.') There are many adjectives in common use which form part of the stock of expressions in every French mouth. They are, as a rule, used with 'c'est' or 'il est.' Here are the commonest:

c'est vrai, *it is true.*
c'est evident, *it is evident.*
c'est certain, *it is certain.*
c'est curieux, *it is curious, strange.*
c'est triste, *it is sad.*
c'est horrible, *it is horrible.*
c'est épatant (slang), *it's stunning.*
c'est immonde, *it's beastly.*
c'est honteux, *it is shameful.*
c'est connu, *it is (well) known.*
c'est douteux, *it is doubtful.*
c'est drôle, *it is funny.*
c'est bon, *it is good.*
c'est bien, *it is well.*
c'est épouvantable, *it is awful.*
c'est ignoble, *it is disgraceful* (disgracieux is *ungraceful*).
c'est affreux, *it is frightful.*

Note the difference between 'c'est' and 'il est' in these expressions. 'Il est' is strictly impersonal, *it is.* 'C'est' is, literally, *this is* or *that is,* and consequently the thing pointed out (or demonstrated) as *this* or *that* must be immediately apparent or already expressed. When a noun is the complement, you may always say 'c'est' ('c'est dommage,' *it's a pity*); when it is an adjective, 'il' is used, if it is quite clear that a definite subject is being referred to as 'ce.' Thus 'il est evident que vous êtes ici,' but 'vous êtes ici, c'est evident.' None the less, 'c'est' seems to encroach upon 'il est.'

Idiom of the Pronoun.—Remember that in the singular and in the 3rd plural a more 'emphatic' form is used when the pronoun is away from the verb. These are: 1st, 'moi'; 2nd, 'toi'; 3rd, 'lui' (fem. 'elle'); 3rd plural, 'eux' (fem. 'elles'). Examples: 'c'est moi,' *it is I;* 'qui l'a fait'; 'lui.' The same forms are used after prepositions.

[Note that as indirect object 'lui' = *him* and *her,* 'leur' = *them* (masc. and fem.). In the emphatic form 'elle,' 'elles' must be used for *her* and *them* (fem.).]

Redundant object. In French, in answer to the question, *Are you the one?* the answer is, 'Je *le* suis.' *Did he do it?* 'Est-ce qu'il l'a fait?' 'Oui, il l'a fait.' This 'le' will sometimes turn up unexpectedly (*cp.* the Scottish *that's so*).

Idioms of the Relative.—1. There is a French expression ('Jean qui rit, et Jean qui pleure, *Jean who laughs and cries;* 'Paris qui chante,' *Singing Paris;* 'Paris qui dort,' *Sleeping Paris*) which is more often rendered in English by a participle or some other paraphrase. *e.g. London at play* would be 'London qui joue.'

2. In certain elliptical expressions a relative does double duty in French. 'Qui dort dine,' (*He*) *who sleeps dines*—the maxim on the strength of which the French army does without breakfast. So 'Qui vivra verra,' *Who lives will see.*

3. But as a rule the two components of the expression *he who* or *that which* must be expressed in French even when they would not be in English. 'Celui qui vous parle,' *He who speaks to you;* 'ce que je te demande,' *what I ask you;* 'ce qu'il a fait,' *which he did, what he did.*

4. The interrogatives 'qui' 'que' (of a thing), are reinforced frequently by 'Qui est-ce qui

(l'a fait) ?' 'Qu'est-ce qu'il a fait ?' Who did it ? What did he do ?

The Idiom of the Demonstrative.—1. In French the adjective 'ce' ('cet,' 'cette') does duty for *this* or *that* thing. Where it is necessary to distinguish between the two, this is done by adding *-ci* and *-la* to the following noun. Thus: 'dans ce cas-ci,' *in this case*; 'dans ce cas-là,' *in that case*. Plural 'ces cas-ci,' 'ces cas-là.'

2. The same distinction is made with *this* or *that* when they are pronouns by adding *-ci* and *-la* directly as suffixes. Thus: 'celui-ci, celle-ci; celui-là, celle-là; ceux-ci, ceux-là; celles-ci, celles-là.'

3. The neuter forms, 'ceci' and 'cela,' are used when the object is not so defined. 'Ceci est vraiment remarquable,' 'Cela est curieux.' In these cases, we can see, both 'ceci' and 'cela' are intensified forms of 'ce' (pronoun), whose use was explained in conjunction with adjectives.

4. Note the colloquial expression 'ça' (abbreviation of 'cela') *that*.

ça me va, *that suits me*.	ça m'est égal, *it's (all) the same to me*.
ça y est, *that's it, that's got it*.	ça ne fait rien, *that makes nothing, that does not matter*.
ça me convient, *that suits me*.	
c'est ça, c'est cela, *that is it, it is so (very well)*.	

and the ubiquitous comme ça, *like that* (*so*).

5. For 'c'est' see Idiom of Adjective.

6. 'ce' is sometimes used redundantly in French. 'Vivre seul c'est triste' *To live alone (that) is sad*. 'Vivre, c'est remplir son être,' *To live (that) is to fulfil one's being*.

7. 'ce' remains singular, although a plural complement changes 'c'est' to 'ce sont.' 'Ce sont les cadets de Gascogne.'

Idioms of the Adverb.—Remember the place of the adverb is after the verb, and in a compound tense usually before the participle.

1. Certain adverbs, however, follow the participle, as do adverbial phrases. Such are: 'hier,' *yesterday*; 'demain,' *to-morrow*; 'ici,' *here*; 'là,' *there*; 'tard,' *late*; 'tôt,' *soon*.

2. For purposes of convenience long adverbs in *-ment* also follow the participle.

3. The following are very common adverbial expressions.

4. 'peu à peu,' *little by little*; or 'petit à petit.'

5. 'beaucoup,' *much*. 'Merci beaucoup,' *Thank you very much*. You never say 'très beaucoup' in French. (Remember, when 'beaucoup' is followed by a noun, 'de' connects the two.) 'Beaucoup de fois,' *many times* (lit. *much of times*). So 'peu de fois,' *few (of) times*; 'tant de fois,' *so many times*.

6. 'combien,' *how much*, is often an interrogative adverb. 'Combien de temps y a-t-il que nous n'avons pas reçu des nouvelles de St. Petersbourg ?' *How much time is it that we have not received any news from St. Petersburgh ?* 'Combien de capitaines, et combien de marins,' *How many captains, and how many sailors ?*

7. 'jamais,' literally *ever*, is used elliptically for *never*. So 'au plus grand jamais,' *never ever*, and 'jamais de la vie,' *never in (of) the life*.

'si' as adverb means *so*. 'Si morne et si fière,' *so sad and proud*.

8. *Soon* in a general sense is 'tôt'; 'bientôt,' *presently*. 'Je me couche tôt,' *I go to bed early*.

Late is 'tard.' 'Vous travaillez tard le soir,' *You work late (in) the evening*.

'plutôt' is *sooner*, or *rather*.

9. Note the difference between 'plus que,' *more than*, in such phrases as 'Je l'aime plus que vous,' *I love him more than you*; but 'J'ai plus *de* cinquante soldats de plomb,' *I have more than fifty lead soldiers*. So 'presque,' *nearly* (*e.g.* 'presque jamais,' *nearly never*); but 'près de vingt metres,' *nearly twenty metres*.

10. There are many adverbial phrases compounded with 'tout.'

tout à fait, *altogether (entirely)*.	tout de suite, *directly*.
tout d'un coup, tout à coup, *all at once, suddenly*.	tout de même, *all the same*.
	toute à l'heure, *in a moment*.

'Tout' also = quite:

tout doucement, *quite gently*.
tout tranquillement, *quite peacefully*.

11. Distinguish between 'enfin,' *finally* (*anyhow ?*); 'à la fin,' *at the end* (*of something*); 'à fin,' *in order to*; 'au bout,' *at the end of an object* (but 'Je suis au bout de mes forces,' *I am at the end of my strength*); 'au fond,' *at bottom, fundamentally*.

12. 'bien,' *well*, is very widely used in French.

Je vois très bien, *I see very well*.	Je tenais bien la corde, *I was holding the cord well (tightly)*.
Faites bien attention, (*Now mind*), *Pay attention well*.	Vous avez bien fait, *You have done very well*.
J'ai bien vu, *I distinctly saw*.	

13. Remember that *quick* and *quickly* are both 'vite' in French.

14. These adjectives are used as adverbs in the following expressions:

sentir bon, *to smell 'good.'*	marcher droit, *to walk straight*.
parler bas, *to speak low*.	dire vrai, *to speak truly*.
coûter cher, *to cost dear*.	venir exprès, *come on purpose*.

Idioms of Verbs.—*Semi-Modal Verbs.*—1. 'devoir,' *ought*, implies obligation; 'falloir,' *to need*, necessity. 'devoir,' we may say, implies 'must' in a moral sense, which may not be carried out; 'falloir' is 'must' in the sense of 'needs must where the devil drives.' Il faut' is impersonal, but one may say 'il me faut' for *I need*. 'Il me faut une hache,' *I want an axe*.

2. 'pouvoir.' Note the expression 'ça se peut,' *that may be*. Pourriez-vous m'indiquer,' *Could you point out to me*, has some element of politeness in it. If you said 'Pouvez-vous' to a Frenchman, he *might* say 'Yes' and walk on, for you have not asked him to do it! 'Auriez-vous la bonté de,' *Would you have the goodness to*, would ensure him doing his best for you.

'veuillez,' *would you,* is a form more confined to correspondence.

3. 'vouloir.' Note the expression 'Je veux bien,' *I am quite willing—i.e. I don't mind.*

'en vouloir à quelqu'un' is *to wish (ill) to someone.* 'Je ne vous en veux pas,' *I don't bear you a grudge (for it).*

4. 'savoir' is used in the conditional to mean *be able.* 'Je ne saurais (pas) vous dire,' *I couldn't tell you.* Note, 'Que je sache,' *As far as I know.*

5. 'avoir' makes the following idioms:

avoir tort, *to (be) wrong.*	avoir froid, *to (be) cold.*
avoir raison, *to (be) right.*	avoir chaud, *to (be) warm.*
avoir honte, *to (be) ashamed.*	avoir besoin, *to (be) in need.*

'Avoir' replaces 'être' here, because 'tort,' 'froid,' 'besoin,' are nouns, not adjectives.

General.

1. 'aller,' *to go,* has semi-modal and general uses.

Future.—'Je vais le faire,' *I am going to do it.* 'Je vais vous dire,' *I will tell you.* 'Il va pleuvoir,' *It is going to rain.* This always implies a near future.

General.—'Ça va ?' *That goes? That suits?* (used as a salutation). So 'Comment allez vous,' *How do you (do)?* 'Je vais très bien.' 'Ça me va comme tout' (colloq.), *That suits me perfectly.*

2. 'se porter' is more stylish. 'Je me porte très bien.' 'Je me porte comme le pont neuf,' *I'm as fit as the new bridge.*

3. 'se tenir' is *to hold oneself.* 'Il se tient très bien.' 'Se tenir de bout,' *To stand—on end!* 'Tenir à quelqu'un, *To hold to someone,* means to think a lot of him.

4. 'penser' is *to think,* if you really think. If you only have an impression, the word is 'croire,' *believe.* 'Je crois bien,' *I suppose so.* To think seriously, or to think about, is 'songer.' To be lost in thought is to be 'songeur.' But a thinker is 'un penseur.'

5. 'savoir' is *to know, to understand.* A 'savant' is a learned man. 'Connaître' is *to be acquainted with,* though a 'connoisseur' is one who knows a thing well (Note the curious idiom: 'Je ne connais que lui,' I know him so well that *I know no one but him.*) 'Savoir-faire' is *to know how to do things,* and 'savoir' is *learning.*

6. 'venir de,' *to come from,* has acquired the meaning of *to have just done something.*

'Prendre,' *to take,* has many uses foreign to us. 'Prenez-garde!' *Take care!* 'Prendre un taxi,' *to take a taxi.* 'Prendre une tasse de thé,' *to take a cup of tea.* Or, generally, 'prendre quelque chose à manger, à boire,' *to take something to eat, to drink.*

Note the following familiar French expressions: 'faire savoir' *to (let) know;* 'faire sortir,' *to make to come out;* 'faire venir,' *to make come;* 'faire comme si on savait,' *to 'make' (act) as if one knew;* 'faire semblant,' *to pretend;* 'faire sauter' (*to make jump*), *to blow up;* 'faire faire,' *to make (someone) do;* 'ça fait,' *that makes, that amounts to.*

'Défendre,' *to forbid.* 'Défense de fumer.' (There is a place in Paris where 'Défense d'entrer' is rendered in English, *Nothing to see.*)

'constater,' *to notice, conclude, determine.*

'présenter,' *to introduce.*

'servir à' ('ça sert à'), *to be used for, to serve as.*

'se précipiter,' *to rush.*

's'empresser,' *to hasten, to be keen on something.*

's'en aller,' *to 'be off.'* 'Je m'en vais,' *I go away.*

's'endormir,' *to go to sleep.*

IV.—SOME SIMPLE RULES FOR PRONUNCIATION

1. Pronounce the vowels pure. The Continental pronunciation of the vowels is generally more defined than the English.

A is the open-mouth sound.
E is the half open-mouth sound.
I is the nearly closed mouth sound.
O is the sound of the open mouth with the lips not in their natural position for A, but rounded.
U is a sound coming from a mouth nearly closed, with the lips advanced. (Written in French OO. French U is different.)

When the mouth takes up the position for any vowel, it remains in that position while the vowel is being uttered, whereas in English the mouth begins to utter the sound as it is opening, goes on while it is in the vowel position, and when it is shifting to the next sound position. This is pronouncing the vowel impurely.

2. The second rule is a derivation of the first. It is: Form the syllables, as far as possible, consonant+vowel, consonant+vowel.

Thus 'ra-pi-di-té,' not, as in English, 're-pid-it-y.' It will be seen that of necessity it helps the vowel to be pure, if it is not made the medium of pronouncing a consonant behind and before it.

Compare the results of saying 'gé-né-ral' or 'gen'rul,' 'h'a-bi-ta-ci-on' or 'habi-tayshun.' [1]

This rule cannot be applied universally, as we see in the final syllables of 'gé-né-ral' and 'h'a-bi-ta-ci-on,' where the last syllables are *-ral, -on.* But it has produced certain important developments in French.

(i.) The common non-pronunciation of final consonants: 'blan(c),' 'pré(t),' 'chan-ge-(nt).' [Note that the final vowels which are pronounced

[1] I am necessarily using here the popular phonetic understood by every one and used boldly by all dialect writers.

are the easy ones, least likely to jar the preceding vowel, *-el*, *-en*, *-et*.]

(ii.) The *running on* of a consonant from a previous word to the initial vowel of the next word. To take an extreme case :

Nou(s) lè-sa-von-plan-té-sen-sem-bl(e).
Nous les avons plantés ensemble.

(iii.) The conservance of the *e* mute, so called, as a minimum sound, used simply as a means of voicing a previous consonant (a 'voyelle d'appui'). Compare 'abundance' with French 'a-bon-dan-ce,' where the final *e* has not entirely lost its sound.

3. The tonic accent in French—*i.e.* the accent on the syllable comes on the last syllable. Thus 'Ra-pi-di-TÉ,' not 'raPIDity,' as in English. Our method tends to huddle the other syllables round the accented one, and the other vowels get slurred in consequence. In French even the accent on a final syllable is lost in speaking and a tonic accent only survives on the final syllable of a short phrase, or at the natural pauses in a long sentence. Thus: 'Qu'avez vous FAIT ?' *What have you done?* 'J'ai perdu mes enFANTS,' *I have lost my children.* So from the point of view of diction the division between words is relatively small. It is as if the sentence were looked on as the unit, not the word.

It is this which makes French difficult to follow. It seems to glide out in an uninterrupted stream, and the listener gets left hopelessly behind. Thus, in *Le maître forgeron*, it begins: 'Combien de temps y a-t-il que nous n'avons pas reçu des nouvelles de St. Petersbourg ?' That is how it reads in the book, but on the stage it runs :

'KOn BiEn De TAn YA TIL Ke NOUs NA VOn PAs Re SU DEs NOU VEL De SEn PE TERS BOURg ?'

(For explanation of symbols see p. 271.)

The accent here will only come just before a pause; where the pause comes is dictated by the sense. Familiar conversation will make the pauses more frequent than in oratorical diction. The tonic accent may rise or fall or be level, but it falls at the end of a sentence.

If the speaker wishes to emphasize a word, this is done independent of the common tonic accent. *e.g.* 'C'est VOUS qui l'avez fait ?' 'Ce n'est PAS moi.'

It will now be advisable to deal with the vowel sounds in more detail.

In the first place, do not any longer call them 'ay,' 'ee,' 'owe,' 'you'; or, worst of all, 'aigh' or 'eye.' The very fact that they are so called in English implies a certain lawlessness and indifference to correctness, as well as being significant of the impurity and uncertainty of the English sounds. It must be remembered, in French, *a* is *a* (*cp. last*) and *o* is *o* (never as in *pop* or *moat*), and the same with all vowels. They have their distinctive sounds, and to give the wrong value to a French vowel is to play the wrong note. Now let us see what are these sounds. But it is necessary to say that each of the vowels have two forms, a *sharp* and a *flat* ('aigu' and 'grave'; or again, *shut*, 'fermé,' and *open*, 'ouvert').

'A'

'A,' as we have seen, is the typical open-mouthed sound with the mouth in its normal position. You can see the difference in 'A' flat and 'A' sharp if you compare the northern pronunciation of words such as *castle, pass, mass* with the southern. The northern is *castle* (KASSeL), with the 'A' as in *massive.* That is an English sharp 'A.' The southern sound is *castle* as if it rimed with *parcel.* That is the flat or open sound. Look in the glass as you say the two sounds, and you will see that the mouth opens more for the *parcel* 'A' than the *massive* 'A.' But in the French versions there are other things to take into account. In the flat sound the tongue must lie flat on the floor of the mouth. In the sharp sound the tongue is slightly arched, and touches the front upper side teeth, while *the lips are slightly drawn back* as for the beginning of a smile. The mouth is distinctly more open for the *flat* or *open* 'A' than for the *sharp* or *shut*. Examples:

Open A. â-me, â-ne, ma-le, bas, pas, passer.
Shut A. a-ni-mal, quatre, patte, matin.

'E'

This is the letter which English people pronounce worst. The reason is that, being the medium vowel, it lends itself to slurring and diphthongisation more than other vowels. Think of how many diphthongs in English have been reduced to an 'E': AY, EY, EIGH, AIGH, and 'A' itself if modified by a following silent 'E' (*made*). The English fault in pronouncing this vowel is the usual one. Either it is strangled at its birth, as in *pet*, where all three letters being run together the 'E' does not have room to live, or else it is continued while the mouth is taking up the position for the next letter; and as that position will probably be incompatible with the enunciation of a genuine 'E,' it becomes a diphthong. Thus 'mais' in an English mouth becomes *may* (*mei*), as can be tested if the sound is prolonged considerably.

There are at least three kinds of 'E's' to be considered: 'È' (or open), 'É' sharp (or closed), and 'E' sourd (or dull). For 'È' the mouth should be open enough to admit an ordinary lead-pencil; the tongue is in a similar position as for 'A' sharp; and, above all, the speaker must *keep the organs in the same position while the sound is going on.* If his mouth or tongue moves, he will himself hear a change in the sound, especially if he is prolonging the utterance.

Examples: MÊ, TÊ, DÊ, LÊ, KÊ, BÊ, VÊ, NÊ.

Note, 'Ê' is also represented by 'AI,' 'EI,' which in French are *not diphthongs.*

'É' sharp is formed with the mouth distinctly more closed. The space between the teeth should be wide enough to admit a half-crown (sideways). The tongue is more raised, so as to diminish the space along which the sound travels. The lips are slightly drawn back as in smiling. The *organs must be maintained in the same position.*

Examples: TÉ, SÉ, LÉ, NÉ, PÉ, MÉ; also represented -AI, -E(R).

'E' sourd (dull). This is the minimum genuine vowel. If a consonant be pronounced, and following it the sound be allowed to escape between the lips, rounded and somewhat advanced (as if one were sucking a pencil), the result will be the dull 'E.' Thus: Je, Me, Ne, Te, Se, Le.

If a genuine wholly-developed vowel sound is not produced, but only sufficient sound to produce the preceding consonant, then you have the minimum 'E' mute. This is usually ignored by phoneticians, but for an English speaker to do so brings on a considerable danger of pronouncing the consonant as an appendix to the preceding vowel, and so corrupting the latter. Moreover, this sound counts in verse and in music. In representations of popular speech the ignoring of it is marked by an apostrophe, as with us in the case of a dropped 'H.' Consequently beginners are recommended to give the sound some value, *except when it comes after a vowel* (as in 'venue') *or before a following one.* Thus the only difference between 'NU' and 'NUE' will be possibly a slight lengthening in the latter.

Examples: TÊTe, BÊTe, AISe, VASe, COMMe.[1]

'EU'

If Ê be shaped for, and then the lips are moved forward (without any movement in the jaw), the sound 'EU' will result.

If É be shaped for, and the lips then advanced, a softer version of 'EU' will be produced. These sounds have in French the spelling 'EU' ('ŒU' and 'Œ').

It will be noticed that these vowels are kindred sounds to 'E' sourd.

'O'

There are also two forms of 'O'—the 'O' in 'porte' and the 'O' in 'rose.' The former is the closed 'O,' the latter the open.

The distinctive position of the month for 'O' is the rounding of the lips. In the case of the closed 'O' the mouth is only slightly rounded; for the open 'O' it is rounded and protruded, the lips being thus brought together. In both cases the tongue is arched, more decidedly so in the case of closed 'O.'

The danger for an Englishman is to pronounce the open 'O' too short, as in *not.* It is necessary to dwell on the vowel long enough to really pronounce it. Thus: 'NO-Te.' One will notice a Frenchman speaking English make the reverse mistake: 'NO-ta Tall.'

Closed 'O' in English is in danger of being diphthongised. We say *rope, boat,* in the usual way, beginning the vowel as the mouth is opening, and continuing it as it closes, and consequently there creep in other sounds. This[1] is most marked in the Cockney 'NO' ('NAOW'). But the same tendency strikes one accustomed to the pure 'O' sound in the speech of those who would shudder to think that there was any resemblance in their diction to the Cockney.

'OU'

This vowel is habitually written in French with these two letters, but it is a single vowel. It is written in the phonetic alphabet as 'U,' but it is not pronounced as the English 'U' in *blue* or *new.* Being an 'U,' the space in the mouth is diminished by the tongue being well drawn back and arched. The lips are advanced so as to give a slight whizz to the sound, especially if it is being said with force: TOUt, TOUs, VOUs, NOUs.

Note that French comic papers make English people say 'VOO' for VOUs.'

'I'

This is the finest sound in our speech. Notice that we use it to imitate 'squeaking or whispering.' The French 'I' differs from the English in that it is produced with the tongue placed against the upper front teeth and leaving a narrow groove in the middle, along which channel, as through a pipe, this diminutive, high-pitched sound comes. The English 'I' is produced with the tongue further back against the hard palate, and in the case of words such as *it, pick, lit,* the contact is much shorter than in any French sound. Thus a Frenchman saying *It is indeed,* seems to us to say '*eet ees eended.*' The English make the opposite fault in 'il y vit.'

'U'

We saw that É and Ê had forms produced by advancing the lips ('EU' and 'EU'). The French 'U' is 'I' treated in the same way. In fact, this rule will give it: Shape for 'I,' mean to say 'I,' and then advance the lips. For practice it is well to say several times, 'I-U, I-U, I-U, I-U.'

Examples: MU, NU, LU, SU, VU, DU, BU.

[1] It is M. Passy who has banished 'E' mute from French, but as he occasionally gives it value in his phonetic script, and *then* the same value as in 'le,' 'me,' surely there is some ground for giving it that value whenever a word is mentioned by itself. M. Legouvé some years ago made a very spirited defence of 'E' mute in *Le Temps.*

[1] A Scotsman mimicking any Southerner will illustrate this. 'Aow. Do yeou think SaO?'

There remain to be considered three sounds: ' UI,' ' OI,' and ' GN ' (GNE).

' UI ' is found in ' huit,' *eight ;* ' Je SUIS,' ' LUI,' ' PUIS.' This is really the French ' U ' turned into a semi-consonant, as is ' Y ' with us ; but the mistake English people make is to shape for ' OU ' or an English ' U ' instead of for the French ' U.'

Thus we say ' OUI ' instead of ' UI.' The tongue, being in the position for our ' U,' leaves more space in the mouth than it should, and a ' W ' makes itself heard.

OI '

This is not a separate sound at all ; it is an ' A ' with a ' W ' in front, or, more strictly, with the French ' OU ' made into a semi-consonant and followed by ' A.' We are too apt to make the sound after the ' W ' rather an ' O ' than an ' A,' as in *what.*

' GN,' ' GNE,' ' IGN '

This is formed by lowering the velum as for a nasal, and checking the speech current by pressing the middle of the tongue against the hard palate, but keeping the tip of the tongue against the lower front teeth. Many French people, however, content themselves with uttering an ' N ' followed by a semi-consonantal ' I ' (or ' J ' : ' PA-Ni-ER,' ' O-Ni-ON,' or ' O-Nj-On '). A French ear will not be scandalised by a similar sound from a foreigner.

Consonants [1]

French consonants are more defined and more clearly uttered than the English. If they are pronounced slovenly they must have a bad effect on the vowels. Enounce the consonants, then, with emphasis, and avoid drawling or clipping. There are three consonants, however, to which special attention must be drawn : ' R,' ' L,' and ' L ' mouillé, as it is called.

' R '

It must be recognised, in the first place, that ' R,' properly speaking, does not exist in English. The trilled ' R ' is recognised in French, and the English learner must be careful to trill the ' R ' wherever he finds it, except in the termination *-er,* where it is mute (' premier,' ' parler '). English people must also be careful to pronounce ' R ' distinctly in places where it occurs in conjunction with another consonant. Thus in ' très ' the ' T ' and ' R ' must not be run so close together as in *tray,* but a slight separation made : ' T-REs.'

[1] Note that ' Ch ' in French never has the sound of ' TCH ' as in check, but a soft sound similar to that in ' SH ' (SHOULD).

So ' G ' is hard before ' A,' ' O,' ' U,' but soft before other vowels. The same with ' C,' unless ' C ' has a cedilla (ç), when it is soft even before ' A,' ' O,' or ' U.

In the French ' L ' the tongue must be in a much more horizontal position than in English, where it may come in contact with any part of the hard palate. A similar fault is common with ' I,' the vowel kindred to ' L.'

This brings us on to ' L' mouillé, or ' L ' following ' I ' or ' EI.'

When ' L ' or ' LLe ' is preceded by ' I,' the ' I ' is turned into a semi-consonant by pressing the tongue against the hard palate (where before it left a small space), and the breath, forcing its way through, produces a sound as in the English *Y-es.* When ' I ' occupies a subordinate position, as in ' BiEN,' ' DiEU,' the same sound is obtained.

The Nasalised Vowels

Every one is familiar with the fact that the French pronounce ' N ' (and ' M ') in an unusual manner. ' Up the Dong, certainemong nong,' is an effective caricature of the untaught Englishman's attempt to reproduce the effect. Although Montaigne writes ' ung ' for ' un,' this use has quite gone out in French. But how is this sound produced, and why does one say : ' bon,' but ' bo-nne ' ; ' un,' but ' u-ne ' ?

When a vowel is followed by an ' N ' or ' M,' and there is no immediate following consonant, that ' N ' or ' M ' is not separately pronounced, but the vowel itself is given a certain *resonance.* It is then said to be *nasalised.* This is done by placing the tongue-tip against the lower teeth and lowering the velum (or ' pin of the throat '). This adds the nasal cavity to the space in which the vowel is resonated, and the effect is to ' nasalise ' the vowel.

If a vowel follows the ' N ' or ' M,' then in the usual way that vowel forms a syllable with the consonant preceding it, and so the previous vowel, being robbed of its nasal letter, loses its nasal force.

There are four nasal sounds :

' AN,' spelt *an, am, en, em.*
' EN,' spelt *-in, -ein, -aim, -ain, (i)en.* (' I ' cannot be nasalised.)
' ON,' spelt *-on, -om.*
' ŒN,' spelt *un.* (' U ' cannot be nasalised.)

Examples :—[I here use capitals for fully pronounced letters, small *n* = *n* nasalised.]

' An.' Dans, DAn ; temps, TAn ; grand, GRAn ; sang, SAn.

' EN.' Pin, PEn ; pain, PEn ; sain, SEn ; faim, FEn ; impossible, InPOSSIBLe ; bien, BiEn ; Amiens, AMiEn. (Note, in ' pin,' ' brin,' etc., it is an ' E,' not an ' I,' which is really pronounced.

' ON.' Son, SOn ; mon, MOn ; nom, NOn ; non, NOn.

' ŒN.' Un, Œn ; brun, BRŒn.

Note that ' M ' and ' N ' nasalised are identical. Remember that, as ' Un ' is really ' Œn '

phonetically or by pronunciation, the lips must shape for 'Œ'—*i.e.* be advanced.

To avoid the ordinary English attempt at the nasal, do not let the tongue come in contact with the upper teeth as for the English 'N,' nor let the velum come in actual contact with the tongue. If you do either of these things, you will stop the breath and so *must* produce a consonant ('N' in the first case, 'NG' in the second). Take care, when a nasal is in the middle of a word, not to pronounce the 'N' after having nasalised the vowel. Thus: AnFAn, not AN-FAN; TAnTe, not TAN-Te.

Here are instances of nasals and non-nasals: innocent, I-NO-SAn; inutile, I-NU-TI-Le; incredule, In-CRE-DU-Le; imbecile, In-BE-CI-Le; BOn, but BO-Ne; brun, BROEn, but brune, BRU-Ne.

The reason for this non-nasalisation is simply this: the 'N' is required for the following syllable in accordance with the ordinary law, and so does not attach itself to the preceding vowel. 'I-NU-TI-Le,' 'BO-Ne,' are the ordinary way of dividing a word into syllables.

Below is 'Les Djinns' in a modified phonetic. The following principles are to be observed:

Tonic accent on last syllable of line. Syllables to be divided, where possible, consonant + vowel.

Consonants unpronounced are omitted. A small 'n' indicates nasalisation.

The vowel characters used are those of which the sound has been explained. ('U,' 'OU,' 'UI' = French sounds so written: 'WA' = French 'OI.') Open vowels marked with grave accent, closed vowels with acute. Small 'e' = 'E' sound: 'e' written above the line is merely the means of pronouncing the previous consonant.

Where a division is made in a line, an upward tonic accent to be made.

COURSE OF READING

To mention a few useful grammars, there are Atkins' *Skeleton Grammar* (Blackie), an almost irreducible minimum; Siepmann's *French Grammar*, a wonderful piece of compression, published by Macmillan; and a larger work, Brachet's *French Grammar* (Hachette). Professor Spiers' *French Drill* will be found very handy and useful, as will also his vocabularies.

Two useful dictionaries are Cassells' (3*s*. 6*d*.) and Gasc's (Bell & Co., 3*s*. 6*d*.).

For French authors, Dent ('Everyman') and Nelsons' are now issuing attractive French collections, while Hachette have cheap editions of all French classics.

Here is a suggested course of French reading graduated to suit beginners. These should present little difficulty after this book has been *mastered*. Daudet, *La Dernière Classe;* Hugo, *Poems, Le Bourgeois Gentilhomme;* selections from Michelet, *Jeanne d'Arc* (Blackie's 'Little French Classics,' 4*d*. each). Siepmann's *Tartarin* is an abridgement of a famous work (Macmillan 2*s*.). *Marie Claire* (Margaret Adoux) is a masterpiece written in a wonderfully simple style. *Le Champi* (George Sand), and *Fadette*, by the same author, will be appreciated by all with a taste for good things. Any of the comedies of Labiche are laughable, and Musset's little comedies (*On ne bandine pas avec l'amour, Il ne faut jurer de rien, La coupe et les lèvres, On ne saurait penser à tout*) have an undying charm. *Le livre de mon ami, Cranquebille, L'euti de Nacre,* and *Le Crime de Sylvestre Bonnard,* are good samples of the clearness and ironic charm of Anatole France. *Colomba* (Merimée) is an interesting book of the 'Carmen' style, *Maupassant* ('Edition de la jeunesse') is the best possible French reading. *The Three Musketeers* and *Chicot* (Dumas) are too well known to need more than mention.

In poetry, Hugo is of course the favourite with foreigners, but Musset, Chénier, Boileau, La Fontaine, Racine, Molière, and Corneille, given a chance, will gradually assert their empire.

Three poetic collections may be mentioned: *The Oxford Book of French Verse*, Nelsons', Gowans and Gray's. A good selection of nineteenth-century poetry is that of Henri Sensine (Pagot et Cie.).

W. CONACHER, B.A.

FRENCH LITERATURE

A. Origins to Renaissance.—French literature dates from the eleventh century. Until that time, the lack of political unity in France and the resulting want of a national language, had prevented the production of literary works of any real value. From the end of the ninth century, the dialect of the Ile de France gained steadily in importance, and became in the twelfth century the literary language of the whole country. The same period marks the first flowering time of the national genius. The mass of semi-historic, semi-legendary lore, that had been accumulating since the earliest times, crystallised in the eleventh and twelfth centuries around the persons of certain heroes, such as Arthur, Charlemagne, and Alexander the Great. Each hero became the centre of a cycle of epic poems, composed by different poets, who adapted their material to suit their particular requirements. The literary value of these productions is, with the exception of the *Chanson de Roland* and the works of Chrétien de Troyes, very small; their historic value is great. They mirror, more faithfully and clearly than any chronicle, the times in which they were written.

By the middle of the thirteenth century the epic vein had run dry; the public preferred to be amused by farces and satires, or to be morally instructed by allegories, rather than to have its imagination stirred by the recital of glowing deeds. French prose, hitherto eclipsed by Latin, began to constitute itself, in the historical works of Villehardouin and Joinville in the thirteenth, Froissart in the fourteenth, and Philip de Commynes in the fifteenth centuries. With the exception of these authors and of one poet, François Villon, no French writer of any distinction appears during the Middle Ages. The cause of this decadence seems to be mainly in the general disintegration of social and political institutions that was taking place during this period of European history. The dawn of modern civilisation came, towards the end of the fifteenth century, bringing in its wake a new intellectual and æsthetic outlook. The Italian Renaissance gave France the feeling for art; the Reformation awoke in her a desire for independence and freedom. These two influences, combined, caused the birth of modern French literature.

B. The Renaissance.—The problem that presented itself to the authors of the sixteenth century was how to evolve, from the material at their disposal, a national literature worthy to rank with that of Greece and Italy. There, on the one hand, were the classic masterpieces; on the other, the French language, unwieldy, poor in vocabulary, incapable of expressing fine emotions and lofty thoughts, and the French literature, practically non-existent, certainly offering no models worthy of imitation. The great work of the sixteenth century was, in spite of many errors, to place the language on a sure foundation, giving it amplitude and richness, and making it capable of being a channel for transmitting artistic emotion and intellectual thought. This task was accomplished partly by grammarians, partly by poets. The principles which guided the reformers are summed up in the *Défence et illustration de la langue française* (Joachim du Bellay). "Imitate the best Greek and Latin authors," is the gist of his remarks. "Live with them—soak yourself in them—make them bone of your bone and flesh of your flesh. And then produce the same forms of literature as they did in your own mother-tongue."

The result was not entirely satisfactory, and much of the work done by du Bellay and his like had to be undone. But on the whole, it is impossible to over-estimate the usefulness of their labours. They introduced all the classical poetic forms and metres; and one or two of the school, who were poets rather than grammarians, left as a legacy to succeeding generations poems worthy to rank with the best that are to be found in French literature.

Towards the end of the century, two writers, Montaigne and Amyot, produced works that are a landmark in the history of French prose. It only required a certain amount of pruning and weeding out for the French language to become a perfect instrument for the production of works of genius. This process took place between 1595 and 1615.

C. Transition to Classicism.—The transformation of the Renaissance spirit into the spirit of classicism took place during a period of about twenty years. The religious and political disturbances of the sixteenth century gave place in the seventeenth to a state of calm and order which was reflected in the literature of the period. The transition from the writings of Montaigne and Ronsard to those of Descartes, Malherbe, and Pascal was effected during the reign of Henry IV and the beginning of Louis XIII's. The importance of restraint and discipline in art was realised for the first time by Henri Balzac in prose, by Régnier and Malherbe in poetry. The latter, gifted with small poetic imagination but with a keen sense of form, paved the way for the great classic poets, Racine and Boileau. "Enfin Malherbe vint, et le premier en France, fit sentir dans les vers une juste cadence" (Boileau, *L'Art Poétique*).

The drama, which had been in the sixteenth century either purely literary and erudite or

coarse and vulgar, was placed on a new footing by Alexandre Hardy. Possessed of little literary ability, but great dramatic insight, he laid the foundations of the national drama of the seventeenth century.

D. The Age of Classicism.—The French classical period is usually regarded as the greatest in France's literary history. Never before or after the seventeenth century have so many men of genius arisen simultaneously, and never has the general standard of the work produced throughout the period been so high. This is largely due to the political and social conditions of Louis XIV's reign, which must be studied in order to appreciate the literature at its true value. Society—the society of the Court and the lesser aristocracy—played an extraordinarily important part in the determination of literary genres and style. Æsthetic problems were discussed and resolved in the Parisian salons; an Academy, protected by the Prime Minister, was established to draw up literary and grammatical rules and to compile a dictionary of the language. Thus the individual author was obliged to conform to a central authority, and express his personal conception in a form that would appeal to the general body of his contemporaries, all of whom were guided by the same canons of taste. The natural result was to suppress lyricism and to foster such branches of literature as the drama, eloquence, moral and philosophical essays, letters, and memoirs.

The tendency to draw up codes and formulate rules in literature was strengthened by the Cartesian philosophy, whose main doctrine was: "Ne recevoir jamais aucune chose pour vraie que je ne la connusse évidemment être telle" (Descartes, *Disc. de la Méthode*). The method of critical analysis, of submitting every proposition to the test of the reason, was applied consciously and unconsciously by the writers of the seventeenth century. "Aimez donc la raison" is the constant exhortation of Boileau, the critic and æsthetician of the period. The whole-hearted admiration of the classics, which the sixteenth century had left as a legacy to the succeeding age, was regulated and held in check by this unshakable belief in the reason of man. Why are the classics to be imitated? Because our reason tells us that they are true to nature, and truth to nature is essential for the production of works of beauty. By "nature" the seventeenth century meant all that is permanent, typical, normal in the universe. The passing phenomena of the natural world—the individual, eccentric, abnormal—do not belong to the domain of art.

The theories of the classical age may be found in Boileau's *Art Poetique*, and in certain of the prefaces to the plays of Molière, Corneille, and Racine. These theories led in practice to the production of works whose characteristics were balance, harmony, clearness, and naturalness. The temporary aberrations that had spoilt the literature of the first half of the century—preciosity, love of the burlesque and extravagant, imitation of Spanish bombast and Italian "concetti"—were entirely overcome as time went on. From 1660 to 1690 an even standard of excellence was maintained, and one masterpiece after another produced.

E. The Age of Rationalism (eighteenth century).—A change took place towards the end of the century. As the men of genius disappeared one by one, and no others took their place, the fine artistic perception and pure taste, that had distinguished the literary public of the Grand Siècle, were gradually blunted and coarsened. The Cartesian spirit of inquiry continued to hold sway, and little by little it invaded the domain of feeling as well as that of thought. The æsthetic enjoyment of a work of art was stifled by too great an anxiety to examine its composition. Discussion arose as to why the classics were to be admired and studied by the moderns; and since the instinctive appreciation had been lost, no satisfactory answer could be found. The *Querelle des Anciens et des Modernes* forms a bridge between the seventeenth century (æsthetic primarily and rationalistic secondarily) and the eighteenth century (rationalistic primarily, æsthetic hardly at all).

Two currents can be traced in the literature of the eighteenth century: one endeavours to continue the traditions of the preceding age, but with no comprehension of the principles that gave rise to those traditions. The other, and stronger current, rejects all tradition and authority, and relies on the power of intellect and reason to open new doors in every direction. Whenever writers followed the first current, they produced nothing of originality or interest. When they followed the second, they abandoned the domain of pure art and entered that of sociology, philosophy, or science. The great names of the century are those of Voltaire, Beaumarchais, Montesquieu, Diderot, Condorcet, Rousseau, Buffon—and the works that made them famous are philosophic letters, comedies of social and political satire, treatises on political economy and the philosophy of history, studies in natural history, science, and sociology. Thus literature had become a channel for the transmission of doctrines and ideas. In one case only do we find an intensely poetic nature, whose primary object in writing is to ease his overcharged imagination. The exception is Rousseau, a Swiss by birth, who lived an outcast from the society of his day, and who belongs in his literary tendencies to the nineteenth rather than to the eighteenth century. His chief disciple, Bernardin de Saint Pierre, has far more in common with his contemporaries than has his master. He borrows from Rousseau the love of external nature, untouched by the hand of civilisation, but there is something

artificial about the sentiment of *Paul and Virginie* that separates it from the writings of the Romanticists, to whom Rousseau undoubtedly belongs.

F. The Romantic Age.—The French Revolution put an end, for a time, to all literary activity, except of the sort that could be used as a weapon in the great combat. Then came the Empire, with the iron hand of Napoleon weighing heavily on any attempt at individualism, whether in politics or art. Eighteenth century influences continued to work, and literature continued to suffer from an excess of intellectuality. Soon, however, a fresh impetus was given to men of letters by the philosophical teaching of Victor Cousin and his school. The eighteenth century philosophers had regarded man as a product of external influences. His thoughts and sentiments were determined by the material conditions of his life, and his intellect was merely the record of his sensations. Victor Cousin, combining the ideas of his masters, Royer Collard and Laromiguière, with the doctrines of the great German philosophers, Kant, Hegel, and Schelling, affirmed the existence of a spontaneous, free principle of life, working in man and producing all the highest manifestations of human activity. Here was a conception that could inspire and stimulate the imagination, as the materialism of the previous century had failed to do. The generation born of the Revolution, and coming to manhood just as the new doctrines were taking root, turned its back on all that had gone before, and set itself to create a new æsthetic ideal. This ideal was embodied in the writings of the Romantic School. From 1820 to 1830 poetry awoke and triumphed on all sides. Man recognised himself once more as a spiritual being, bound by a mysterious bond to the invisible, eternal universe. He no longer looked on emotion as a result of certain physical causes, to be analysed and described in scientific terms. He was transfixed in awe and delight at the beauty of his own nature and of all creation; and he felt the imperative necessity of expressing his feeling in song. Lyricism was born for the second time; it had been dead since the sixteenth century. History, and literary criticism were transformed, now that they were regarded as a means of tracing, for the benefit of present and future generations, the action of that mysterious force which works through man yet independently of man. The danger of this new attitude of mind was that it tempted men to live too much in the subjective world of thought and feeling. This is proved by the fact that the drama and the novel, the most objective forms of literature, did not make much progress during the Romantic outburst. They came into their heritage in the next period—the reaction to realism and positivism.

G. Realistic Reaction.—During the Second Empire, literary inspiration was sought not in the soul of the writer, but in the objective world around him. The novelist and dramatist endeavoured to correct the vices and weaknesses of society by depicting characters and situations that corresponded in every detail with their living counterparts. The poets of the day, less richly endowed in feeling and imagination than the Romanticists, turned their attention to the perfection of form. They wrote little, but polished all their work as highly as possible. The heat had been lost—but the brilliance was perhaps greater than in the days of Lamartine, Musset, and Vigny. On the whole, the atmosphere of the Second Empire was not favourable to art. The public preferred to be amused rather than elevated, and its real interests were in the world of politics and commerce. Not until the last decade of the century did the ideal begin to reassert its claim over the real.

H. The Contemporaries.—Idealism, in the form of devotion to a Cause, a Religion, or Humanity in general, is the prevailing note in every branch of literature at the present day.

The dilettantism and intellectual aristocracy of a Renan and his disciples have been replaced by an ardent desire to take an active part in the affairs of the nation. The man of letters is also the social reformer; he no longer considers that "tout contact avec la réalité souille un peu" (Renan). In other words, the individualism of the nineteenth century is gradually being transformed into a higher collectivism, where the individual realises the debt he owes and the responsibility he bears to humanity at large. The philosophy of such men as Bergson and Bontroux is fostering in Frenchmen the desire to penetrate into the spiritual and psychic world, to understand its laws and principles, and to interpret by them the phenomena of the material universe. For the first time in modern French literature, we have mystical plays and poems, revealing the deepest spiritual understanding. And the very men who produce such work have devoted their whole energy to the present needs of their country. Charles Péguy, author of the *Mystères de Jeanne d'Arc*, died on the battle-field. Maurice Barrès and Maeterlinck are employing their literary talent in the service of the French nation. One of the greatest of French literary critics, Emile Faguet, has recently brought out a book which condemns certain characteristics of his countrymen and exhorts them to greater perseverance, stability, and decision of mind. He detects in the nation as a whole a dislike of responsibility which, if indulged in too much, must prove fatal. This may be true of the masses, but the opposite must be affirmed of the educated classes, who are realising more strongly every day the necessity of occupying themselves with the social, moral, and intellectual welfare of the nation.

COURSE OF READING

I. **Bibliographies.**—Thieme, *Guide Bibliographique* (1800–1907).—Lanson, *Manuel Bibliographique* (1500–1900).

II. **General History and Criticism.**—Lanson, *Histoire de la littérature française* (11th edition, 1909). A standard work, suggestive, stimulating, and providing in the footnotes an excellent bibliography.—Doumic, *Histoire de la littérature française.* A short, concise survey. Useful for examination, or as a first introduction to the subject.—Brunetière, *Etudes critiques ; Nouvelles études ; Les époques du théâtre français.* Miscellaneous essays dealing with a wide variety of literary questions. Everything written by Brunetière is of the highest value.—Faguet, *Études littéraires sur le* 16^{me}, 17^{me}, 18^{me}, 19^{me} *siècles ; Drame ancien, drame moderne ; Politiques et moralistes du* 19^{e} *siècle.*—Dowden, *History of French Literature.*

Pre-Renaissance.—Gaston Paris, *Tableau de la littérature française au moyen-âge.*

Renaissance, Sixteenth Century.—Tilley, *History of the French Renaissance.*—Sainte-Beuve, *Tableau de la poésie française au XVI*^{e} *siècle.* Short, but interesting, as showing the link between the Romanticists and sixteenth century poets.

Classical Age, Seventeenth Century.—Tilley, *Montaigne to Molière.*—V. Cousin, *Madame de Sablé ; La jeunesse de M*^{me} *de Longueville.* Excellent studies of Society in the seventeenth century.—Mary Duclaux, *The French Ideal.* Studies of Pascal and Fénélon as representatives of French thought. Penetrating and original.—Strowski, *Pascal,* 3 vols. The best treatment of Pascal and the evolution of religious thought in France in the sixteenth and seventeenth centuries.

Eighteenth Century.—Le Breton, *Le Roman au* 18^{me} *siècle.*—Lanson, *Nivelle de la Chaussée et la comédie larmoyante.*—Morley, *Voltaire ; Rousseau ; Diderot.* Somewhat heavy, but very sound, and giving a good general outlook.—Brunetière, *Le roman naturaliste.*

Nineteenth Century.—Strowski, *Tableau de la littérature française au* 19^{me} *siècle.* The only good general study of the nineteenth century. Full of illuminating ideas.—Brunetière, *L'évolution de la poésie lyrique au* 19^{me} *siècle.*—Paul Bourget, *Essais de psychologie contemporaine.*—Pierre Lasserre, *Le Romantisme français.* An amusing diatribe against the Romantic school. Exaggerated but interesting.—Jules Lemaître, *Les Contemporains ; Impressions de théâtre.* Spicy in matter and polished in style, but not always reliable.

III. **Special Criticism.**—Individual authors should be read, when possible, in the collection *Les Grands écrivains de la France.* The biographies and notes in this series are quite excellent. Studies by eminent men of most of the great writers exist in the series *Grands écrivains français.* The names of Brunetière, Lanson, Faguet, Strowski, Paul Stapfer stand out pre-eminent among contemporary critics and may always be consulted with advantage. Sainte-Beuve and Taine are the great literary authorities of the nineteenth century.

IV. **Anthologies and Collections.**—Constans, *Chrestomathie de l'ancien français monmerqué—Le théâtre français au moyen-âge.* With modern French versions.—Péllissier, *Anthologie des poètes français du XVI*^{e} *siècle*—Lucas, *Oxford Book of French Verse* (thirteenth to nineteenth century). *Anthologie des poètes nouveaux.* Published by Figuière, Paris. Containing the writings of the Unanimistes and other contemporary poets.—Lanson, *Choix de lettres du XVII*^{e} *siècle.*—Saintsbury, *Specimens of French Literature* (fifteenth to nineteenth century).

V. **Representative French Writers; and their Chief Works.** (*Renaissance*).—Clément Marot (1497–1544), *Epitres. Psaumes.*—Ronsard (1524–1585), *Sonnets.*—Rabelais (1495–1553 c.), *Gargantua.*—Montaigne (1553–1592), *Essais.*

Classical.—Corneille (1606–1684), *Le Cid ; Polyeucte ; Horace.*—Racine (1639–1699), *Andromaque ; Phèdre ; Esther.*—Molière (1621–1673), *Les Femmes savantes ; L'Avare; Tartuffe; Le Misanthrope.*—La Fontaine (1621–1695), *Fables.*—Boileau-Despréaux (1636–1711), *L'Art Poétique Satires II, IX, Epitres VIII, IX.*—Descartes (1596–1650), *Discours de la Méthode.*—Bossuet (1627–1704), *Oraisons funèbres.*—Fénelon (1651–1715), *Télémaque ; Lettres spirituelles.*—La Rochefoucauld (1613–1680), *Maximes.*—Pascal, (1623–1663), *Lettres Provinciales ; Pensées.*—Madame de Sévigné (1626–1696), *Lettres.*—Madame de Lafayette (1634–1693), *La Princesse de Clèves* (novel).—La Bruyère (1645–1696), *Caractères.*

Eighteenth Century.—Montesquieu (1687–1755) *Lettres Persanes ; L'esprit des lois.*—Le Sage (1668–1747), *Gil Blas* (novel).—Voltaire (1694–1778), *Lettres anglaises ; Candide* (story); *Mérope, Zaire* (dramas); *Siècle de Louis XIV* (history).—Diderot (1713–1784), *Paradoxe sur le comédien* (æsthetics); *Lettre sur les aveugles* (philosophy); *Le père de famille* (drama).—Buffon (1707–1788), *Histoire Naturelle.*—Rousseau (1712–1778), *La Nouvelle Héloise* (novel); *Le Contrat social* (sociology); *Confessions.*—Marivaux (1688–1763), *Marianne* (novel); *Le jeu de l'amour et du hasard* (comedy).—Beaumarchais (1732–1799), *Le mariage de Figaro, Le barbier de Séville.*—André Chénier (1762–1794), *Iambes, Eglogues.*—Bernardin de St. Pierre (1737–1814), *Paul et Virginie.*

Nineteenth Century.—Madame de Staël (1766–1816), *De l'Allemagne.*—Chateaubriand (1768–1848), *Génie du Christianisme.*

Poets.—Lamartine (1790–1869), *Méditations :*

Harmonies : Jocelyn.—Alfred de Vigny (1797–1863), *Poèmes antiques et modernes.*—Victor Hugo (1803–1885), *Feuilles d'Automne ; La légende des siècles* (poetry) ; *Les misérables* (novel) ; *Hernani* (drama).—Alfred de Musset (1810–1857), *Les Nuits ; Rolla* (poem) ; *Lorenzaccio, On ne badine pas avec l'amour* (plays).—Theophile Gautier (1811–1872), *Émaux et camées.*—Leconte de Lisle (1820–1894), *Poèmes.*—Verlaine (1844–1896), *Poèmes.*

Critics and Historians.—Sainte-Beuve (1804–1869), *Causeries du Lundi ; Port Royal.*—Taine (1828–1893), *Histoire de la littérature anglaise.*—Renan (1823–1892), *Souvenirs d'Enfance et de jeunesse ; Études de morale et d'histoire ; Vie de Jésus.*

Novelists.—George Sand (1804–1876), *Consuelo ; La Mare au diable.*—Stendhal (1783–1842), *Le Rouge et le Noir.*—Balzac (1799–1850), *Le père Goriot ; Eugénie Grandet ; Seraphita.*—Flaubert (1821–1880), *Madame Bovary : Salammbô.*—Zola (1840–1902), *L'Assommoir ; Germinal.*—Daudet (1840–1897), *Fromont jeune et Risler aîné ; les Rois en exil.*—de Maupassant (1850–1893), *Pierre et Jean ; Contes.*

Dramatists.—Alexandre Dumas (1824–1896), *La Dame aux camélias ; le Demi-monde.*—Emil Augier (1820–1889), *Le gendre de M. Poirier.*—Henri Becque (1837–1899), *Les Corbeaux.*—Péguy (–1915), *Mystères de Jeanne d'Arc.*

Contemporaries. *Poets.*—Paul Claudel, *Cinq grandes odes ; L'Annonce faite à Marie ; l'Otage*—Vildrac, *Livre d'Amour.*—Henri de Régnier.—Francis Jammes, &c.

Dramatists.—Paul Hervieu, *La Vierge Folle ; le Dédale.*—Brieux, *La Robe rouge.*—Rostand, *L'Aiglon ; Cyrano de Bergerac,* &c.—Anatole France, *Le crime de Sylvestre Bonnard.*—Paul Bourget, *L'Etape, Le Disciple.*—René Bazin, *La Terre qui meurt.*—Romain-Rolland, *Jean-Christophe,* &c.

MARIETTE SOMAN,
Docteur d'Université.

THE ITALIAN LANGUAGE AND LITERATURE

I

ORIGIN OF THE ITALIAN LANGUAGE

The origin of the Italian language is to be traced to the numerous invasions of Italy by the barbarians, who caused the fall of the Roman Empire. The Low Latin then spoken in the Peninsula was still further spoiled by the ignorance of the invaders and by the complete oppression which the natives were subjected to, and which destroyed all learning in all the different social classes of the community. The intermingling of so many different dialects of barbarians, belonging to so many different tribes and races, with the dialects spoken at that time in Italy, was a very long process, which lasted about a thousand years—those thousand years which are known as the Dark Ages, when illiteracy was universal, even reading and writing being confined to a few monks or priests, and when even kings were unable to write or read. A patient and persevering historian, Muratori, has been able to follow the track of this gradual transformation of the Latin into the Italian language by recording it in his voluminous collection of inscriptions on the tombstones and in the churches of the different provinces of Italy during the Dark Ages. In this useful book we can find hundreds of words, now belonging to the Italian language, which were engraved during the early centuries of the Christian era. It was, however, only towards the end of the eleventh century that we can recognise the real beginnings of the new language of Italy.

The growing power on the sea of the republics of Amalfi (where the marine compass was invented), of Genoa, of Pisa, and of Venice had greatly contributed to the awakening of some of the most industrious of the Italian towns. Their commerce with the Mediterranean ports brought them a wealth which increased their power. Then came the Crusades, which further contributed to their expansion; and as most of the Crusaders had to go to the East by way of Italy, this country reaped a great harvest of money and of whatever knowledge the best men of foreign lands possessed. On their way to Palestine, or on their return from the Holy Land, the Crusaders dallied in Italy to pay a visit to Rome. Some were murdered there, like the Earl of Cornwall; others became leaders of mercenary troops, like Sir John Ackwood (L' Acuto), who served the Republic of Florence and was buried in Santa Croce, where, as in Westminster Abbey, the most famous Italians are buried.

Its Earliest Writers.—San Colombano, an Irish monk, who came to Italy towards the end of the sixth century, founded a monastery at Bobbio, and collected in its library some interesting MSS., only lately discovered there.

An Englishman, Keen, or Queen, better known under his Italian name of Alcuino (726–804), who was one of Charlemagne's most confidential advisers, founded a literary academy in Italy, which among its members included the emperor himself and several of his knights. We find other dim traces of learning through San Pier Damiano (988–1072), Lanfranco (1005–1089), San Anselmo d' Aosta (1033–1109), and Pope Alexander III, famous for having in Venice, in 1177, put his foot on the neck of a German emperor, when the latter was forced to sue for peace by the victorious Italian cities. Thus after one hundred years was repeated the shame of Canossa, where another German emperor was obliged to pass three days and three nights outside the castle of Canossa, fasting and begging another Pope's pardon, only obtained under the most dishonourable conditions.

As early as the year 1089 we find Lanfranc Archbishop of Pavia, writing letters in Italian, and Anselm, Archbishop of Canterbury and an Italian, following his example. Pier Lombardo, Archbishop of Paris in 1164, and the Viscount de Hautefort, a Provençal troubadour, both wrote in Italian some of their letters. The latter was a favourite of King Henry of England and of his son. There is from his pen a "Song against Peace," of such power as to entitle him to be called the Kipling of the twelfth century. In his old age he retired to the monastery of Dalon, where he died in 1207. Laurens calls him "Le Tyrtèe du Moyen Age."

Folquet of Marseilles, another Provençal poet, became in later life a bishop and a merciless Inquisitor, who enjoys the infamous notoriety of having destroyed the Albigenses with blood and iron, in his struggle against heresy. Another centre of reformers of the Roman Church was uprooted in Brescia, where the saintly Arnaldo was burned at the stake in 1154.

Wherever in Italy a revival of learning took place, there also rose religious reformers; but these were everywhere unsuccessful against the mighty power of the Popes of that time. To make a stand against the doctrines of Reformation in the Church, Francis of Assisi founded a monastic order, which gained overwhelming power over the minds of the ignorant Italians. The humble life of their founder gained for his followers a popularity hardly justified by their actions, which were mercilessly satirised in immortal *novelle* by the Italian *novellieri* of all the following ages. He left some writings in uncouth and illiterate Italian, that by his followers were called "poetical," and which, owing to religious bias, have secured a reputation to which they are by no means entitled. In the same century another order of monks was founded, the Dominican, which became equally popular among the Italian masses.

It would be impossible to fix a single date, or a single locality, where the Italian language was born. There were, more or less, in most Italian centres of life, men whose early efforts at the poetical expression of their feelings were only endeavours to convey them to the ladies they loved. It was love, the natural passion of life, which had to be revealed to women, who had become utterly ignorant of the Latin language, and who only knew what was so correctly called the *volgare*, the speech of the common people. This *volgare* became, therefore, the best means of communicating with one another, and of expressing oneself with some assurance of being understood. The Latin had been completely forgotten by the majority of the population, and its knowledge was limited to monks, priests, lawyers, and doctors.

As the passion of love is best expressed in poetry, poets were first in the field to make use of the new language understood by the people. But love has no particular residence in any region or town, and so it happened that love poetry was written almost everywhere in Italy. There were places where, owing to a powerful Court, or to a better-gifted writer, a more detailed record was kept of the earliest writers of that locality; and in so far we can say that at such places the first dawnings of the Italian language are to be traced. One of such places was the Court of the Emperor Frederick II in Sicily, who was himself a minor poet. The best-known men of his age, of different nationalities, flocked to his Court, where they were warmly welcomed and liberally rewarded. Even from Scotland writers travelled to Sicily to visit the Court of Frederick. Sir Michael Scott, the author of *De Secretis Naturæ*, went there, where he was lavishly rewarded for his long journey; and this, later on, may have consoled him for his unpopularity with the vulgar, who believed him a magician—a belief which in those superstitious times was equal to a sentence of death. Sir Walter Scott, a more illustrious member of that ilk, mentions the fact in his *Ivanhoe*.

To mention the names of all the minor poets, who swarmed everywhere in Italy during the earlier years of the thirteenth century, would be a useless and thankless task, their writings hardly deserving the name of poetry. Their names are only recorded to show the slow and gradual progress of the language. Among them were Guittone d' Arezzo, the author of a canzone on the battle of Montaperti; Guido Guinicelli, a native of Bologna, highly praised by Dante; Guido Cavalcanti, to whom Dante addressed a well-known sonnet; and Dino Frescobaldi.

II

THE GRAMMAR OF THE ITALIAN LANGUAGE

Having so far given a general idea of the many causes and the numerous men who contributed to the transformation of the Latin into the Italian language, we will now endeavour to describe the main peculiarities that make the latter the most perfect and at the same time the simplest of all modern languages.

The letter *h* not having any individual value in the Italian alphabet—it is used only to harden the sound of the letters *c* and *g* before *e* or *i*, or to distinguish the different meanings of 'ho, hai, ha, hanno'—we find that with only twenty letters the Italian alphabet can form all the words necessary to convey all possible thoughts to every Italian. Of a thing worth nothing at all, the Italians say that 'non vale un' acca,' *is not worth an* '*h*.'

All its letters have a single and invariable sound, never modified either by the use of the accent or by any grouping of letters, except in the case of the *gn*, which conveys a faint sound of *i* before the following vowel, and in the syllable *gli*, which has a liquid sound.

There is in Italian only one accent, from left to right; and it is not used for any variation or modification of sound, but only to denote the different meanings of a word or the loss of a final syllable. The apostrophe denotes the loss of a final vowel.

All Italian words, with few and unimportant exceptions, end with a vowel.

The sibilant letter *s* is never found between two consonants. The only words in which the letter *s* is found between two consonants are the following: conscio, *conscious*; constare, *to result*; constatare, *to prove*; inscrutabile, *inscrutable*; insperato, *unhoped for*; instabile, *unstable*; instare, *to insist*. These exceptions are due to the fact that, if the consonant preceding the *s* were dropped, the word would have a different meaning.

The five vowels are pronounced in complete accord with the natural formation of the glottis. The letter *a* can only be sounded with the throat wide open, whilst the sound of the other four vowels is obtained by closing it gradually, as in the following:

a in the English word *father*.
e " " *bet*.
i " " *bit*.
o " " *not*.
u as the *oo* in the English word *boot*.

As for what grammarians call the double sound of the *e* and *o*, we need not take any notice of it here, its use being in many cases undecided, and the variation in the sound being in most cases too infinitesimal to be noticed by foreigners.

Of the Shifting Diphthong.—Although there is no real diphthong in the Italian language, there are some combinations of vowels which appear occasionally, whenever the principal stress in the pronunciation of that word is shifted from one to another syllable—*i.e.* the extra vowel appears with the appearance of the stress on that syllable, and disappears with the shifting of the stress to another syllable, as in the following verb, 'sonare,' *to play*:

io suono, *I play*	noi soniamo, *we play*
tu suoni, *thou playest*	voi sonate, *you play*
egli suona, *he plays*	eglino suonano, *they play*

So also the noun 'sonata,' from 'suono.'

allievo, *pupil*	allevare, *to educate*
bandiera, *flag*	banderuola, *little flag*
buono, *good*	bontà, *goodness*
cieco, *blind*	cecità, *blindness*
cielo, *sky*	celeste, *light blue*
coscienza, *conscience*	coscenzioso, *conscientious*
cuoio, *leather*	coriaceo, *leathery*
cuore, *heart*	coraggio, *courage*
duolo, *grief*	dolore, *sorrow*
fiero, *fierce*	feroce, *ferocious*
fuoco, *fire*	focolare, *fireplace*
giuoco, *play*	giocare, *to play*
lieto, *joyful*	letizia, *joy*
lieve, *light*	levità, *levity, lightness*
nuovo, *new*	novità, *novelty*
piede, *foot*	pedata, *kick*
pietra, *stone*	petraia, *stone-quarry*
ruota, *wheel*	rotaia, *railway track*
scienza, *science*	scenziato, *scientist*
scuola, *school*	scolare, *scholar*
Siena, *Sienna*	senese, *native of Sienna*
uomo, *man*	ometto, *little man*
uovo, *egg*	ovale, *oval*

Thus also with some verbs ending in *ere*:

io presiedo, *I preside*	noi presediamo, *we preside*
tu presiedi, *thou presidest*	voi presedete, *you preside*
egli presiede, *he presides*	eglino presiedono, *they preside*

This shifting, however, does not take place (*a*) when the *i* represents a letter in the root-word, and is not an amplification of the *e*, as in 'pieno (plenus),' *full*, 'pienezza,' *fullness*; (*b*) before *ng*: 'io vengo,' *I come*; 'to vieni'; 'egli viene,' &c.

Italian nouns being derived bodily from the ablative of the Latin, and there being no declension or other modification of the noun itself in Italian, its different cases are expressed by prefixing to it a preposition, with or without a definite or indefinite article. There being only two genders in the language, there are only two articles: 'il' for the masculine singular ('i' for the masculine plural), 'la' for the feminine singular ('le' for the feminine plural). As there are words which begin with an *s* followed by a consonant, to avoid that sibilant being placed between the *l* of the masculine definite article 'il' and another consonant, yet another form of that article has been invented—*i.e.* 'lo,' whose plural is 'gli.' All the above articles are rendered into English by *the*.

The indefinite Italian article is 'uno' for the masculine, and 'una' for the feminine, written also as 'un' and 'un',' rendered into English by *a, an, one*.

Although we mentioned above that all Italian words end with a vowel, if this final vowel is preceded by an *l, n*, or *r* it may be dropped, and we can write 'ben' for 'bene,' 'ciel' for 'cielo,' and 'far' instead of 'fare.' When the final vowel is preceded by *ll, rr*, or *nn*, whenever we like to drop the final vowel we must also eliminate one of the double consonants that precedes it, and write 'bel' for 'bello,' 'dan' for 'danno,' and 'por' for 'porre.' Moreover, such elimination is not to be replaced by an apostrophe. Feminines have not this advantage, the eliminated final having to be replaced by the apostrophe, as in other words.

There are cases in which the article may precede the preposition, as in 'quantunque noioso gli fosse il da lui dipartirsi,' 'all' ombra dell' agli inferi transito sposo,' 'and 'le più d' una sorte prodezze.'

There are cases in which the English indefinite article is omitted in Italian: 'egli è ambasciatore,' *he is an ambassador*; 'due e mezzo,' *two and a half*; 'mezza oncia,' *half an ounce*; 'cento,' *a hundred*; 'mille,' *a thousand*; 'così bella donna,' *such a beautiful lady*; 'che rumore,' *what a noise*; 'Pisa, città d' Italia,' *Pisa, a city of Italy*, &c.

In the following cases the English definite article is omitted in Italian: *George the Fifth*, 'Giorgio Quinto'; *London, the capital of England*, 'Londra, capitale dell' Inghilterra.'

The beautiful word *home* has no exact equivalent in Italian; the nearest approach to its meaning being expressed by the use of the word 'casa,' *house*, without the article.

Sometimes the English indefinite article is translated into Italian by the definite article, as: 'dieci soldi la libbra," *fivepence a pound*; 'lontano le mille miglia dal crederlo,' *very far (a thousand miles) from believing it*.

Whenever a noun is used in a general sense, the definite article must always precede it in Italian, as: 'le buone azioni meritano lode,' *good actions deserve praise*.

The article must also be used with names of

countries, as: 'la cara Inghilterra,' *dear England;* 'la bella Italia,' *beautiful Italy.*

All Italian titles must be preceded by the article, as: 'il generale Smith,' *General Smith;* 'il dottor Jones,' *Doctor Jones.* But titles which are not Italian take no article, as 'Lord Plymouth.'

Except when the possessive adjective precedes the name of a relation in the singular, without any other adjective, the definite article is always used with it, as: 'la mia penna,' *my pen;* 'il suo bastone,' *his stick.*

The definite article is also used with the names of the following towns: l'Aia, *the Hague;* il Cairo; l'Havre; la Mirandola; la Mecca; la Roccella; il Vasto.

The Italian prepositions are: 'di,' *of;* 'a,' *to, at;* 'da,' *from, at the house of;* 'in,' *in;* 'su,' *upon, on, above;* 'per,' *by, through, across, because;* 'con,' *with.* Very seldom they are used before a definite article without being joined to it, as follows:

al	allo	alla	ai	agli	alle	*to the*
col	collo	colla	coi	cogli	colle	*with the*
dal	dallo	dalla	dai	dagli	dalle	*from the*
del	dello	della	dei	degli	delle	*of the*
nel	nello	nella	nei	negli	nelle	*in the*
pel	pello	pella	pei	pegli	pelle	*for the*
sul	sullo	sulla	sui	sugli	sulle	*on the*

'Per' and 'con' are, however, often written apart from the article. *Some* or *any* are rendered in Italian by the preposition 'di' with the definite article in the singular, when meaning a part of the whole, as: 'noi abbiamo del pane,' *we have some bread;* 'eglino hanno del vino,' *they have some wine.* But the article is put in the plural when numbers are mentioned, as: 'voi avete dei libri,' *you have some books;* 'io ho delle fotografie,' *I have some photos.*

There being only two genders, the masculine and the feminine, in the Italian language, all nouns, whether of persons or things, are either masculine or feminine. Masculine are all nouns ending in *o*, with the single exception of 'la mano,' *the hand.* Nouns ending in *a* are generally feminine, although nouns derived from the Greek and some others are masculine, notwithstanding their ending with an *a*, as: 'il programma,' *the programme;* 'il clima,' *the climate.* There are very few nouns ending in *i* in the singular, and no rule governs them as to their gender. Thus we have: 'la tisi'; 'il dì,' *the day;* 'la crisi'; 'il Tamigi,' *the Thames;* 'il brindisi,' *the toast.*

Of the few nouns ending in *u*, generally written with the accent, 'Gesù,' 'Perù,' 'Esaù' are masculine; all the others are feminine.

The real difficulty is to distinguish the gender of nouns ending in *-e* in the singular, since there are as many which are feminine as masculine, and no general rule can be given to help the student except the advice of consulting the dictionary.

The formation of the plural presents no difficulty. All nouns form their plural by changing their final vowel into an *i*, with the exception of the nouns that end with an *-a* in the singular and are feminine. These form their plural with the letter *e*.

The exceptions to the above general rule are these:

(*a*) Nouns of one syllable are the same in the plural as in the singular, thus: 'il re,' *the king;* 'i re,' *the kings.*

(*b*) Nouns the final vowel of which bears an accent, thus: la verità, *the truth;* le verità, *the truths.*

(*c*) Nouns ending with a consonant: lo specimen, *the specimen;* gli specimen, *the specimens:* il caos, *the chaos;* i caos, *the chaos:* il lapis, *the pencil;* i lapis, *the pencils.*

(*d*) Nouns ending with *-i* in the singular: la crisi, *the crisis;* le crisi, *the crises:* l' azzeccagarbugli, *the pettifogger;* gli azzeccagarbugli, *the pettifoggers.*

(*e*) Nouns ending in *-ie* in the singular: la specie, *the species;* le specie, *the species.* 'Loro,' *their*, is the same in the masculine and feminine, singular and plural.

Nouns with two meanings in the singular have generally a different plural for each meaning.

l' anello, *the ring, the (hair) ringlet:* gli anelli, *rings;* le anella, *ringlets.*
il braccio, *the arm, the yard-stick:* le braccia, *arms;* i bracci, *yard-sticks.*
il cervello, *brains, mind;* i cervelli, *minds;* le cervella, *brains.*
il ciglio, *the eyelid, the brink;* i cigli, *the brinks;* le ciglia, *eyelids.*
il corno, *the horn;* i corni, *horns (instrument);* le corna, *horns (of animals).*
il dito, *inch, finger;* i diti, *inches;* le dita, *fingers.*
il filo, *thread (of cloth), (of plot);* i fili, *of cloth;* le fila, *of plot.*
il fondamento, *the foundation;* i fondamenti, *abstract;* le fondamenta, *masonry.*
il frutto, *fruit;* i frutti, *results;* le frutta, *eatables.*
il gesto, *gesture;* i gesti, *gestures;* le gesta, *great deeds.*
il legno, *carriage, wood, ship;* i legni, *ships, carriages;* le legna, *firewood.*
il membro, *member;* i membri, *members;* le membra, *limbs.*
il muro, *wall;* i muri, *walls (house);* le mura, *walls of town (of fortress).*
l' osso, *bone;* gli ossi, *bones;* le ossa, *remains of the dead.*
il riso, *rice, laughter;* i risi, *rice;* le risa, *laughter.*

Although not so frequently used as in some other languages, nouns may also be compounded in Italian, but without the hyphen. Such are:

A. altalena, *see-saw;* arcibello, *extra beautiful;* andirivieni, *maze;* antipapa, *anti-pope;* avanbraccio, *forearm;* antivigilia, *two evenings before;* arcobaleno, *rainbow;* accattapane, *beggar;* alidorato, *gold-winged;* arruffapopoli, *demagogue;* azzeccagarbugli, *pettifogger;* agrodolce, *sharp sauce;* acquavite, *brandy.*

B. bassorilievo, *bas-relief;* buonamano, *tip;* battistrada, *outrider;* baciamano, *king's reception at court;* batticuore, *heart-beating;* batti-

loro, *gold-beater*; bevilacqua, *teetotaller*; bellimbusto, *fop*; bissillabo, *a word of two syllables*; barbitonsore, *barber*; buttasello, *soldier's call to horse*; barbabietola, *beetroot*; benandata, *tip (on leaving)*; benessere, *welfare*; benvenuto, *welcome*; benestante, *well-off*; beccamorti, *gravedigger*.

C. capogiro, *dizziness*; capolavoro, *masterpiece*; capobanda, *bandmaster*; capocaccia, *head-huntsman*; capofila, *No. 1 of a soldier's line*; capomaestro, *master-builder*; cartapesta, *cardboard*; cartastraccia, *wrapping-paper*; cartapecora, *vellum*; cartasuga, *blotting-paper*; crepacuore, *heart-breaking*; cantafavola, *story-teller*; capitombolo, *somersault*; cavadenti, *dentist*; chiaroscuro, *shading*; conciatetti, *roof-mender*; cavalcavia, *viaduct*; cascamorto, *a fop*; cassapanca, *linen-chest*; caldallesse, *boiled chestnuts*.

D. dominedio, *God the Lord*; dormiveglia, *dozing*.

E. ex-uffiziale, *late officer* (ex- is generally used to denote a former office or position).

F. frastuono, *hubbub*; ferravecchi, *dealer in old iron*; francobollo, *postage stamp*; fruttivendolo, *fruiterer*; fuoruscito, *exiled*; fannullone, *loafer*.

G. gabbasanti, *hypocrite*; guastamestieri, *a man of all trades and master of none*; guardaboschi, *forester*; grancassa, *big drum*; girasole, *sunflower*; girovago, *tramp*; girarrosto, *turnspit*; granturco, *maize*.

I. ippocastani, *horse-chestnuts*; interlinea, *a line between two others*.

L. lavamani, *washstand*; luogotenente, *lieutenant*.

M. mirallegro, *congratulations*; manoscritto, *MS.*; melarancia, *orange*; malcaduco, *fits*; marciapiede, *pavement*; malaccorto, *unwary*; malvolere, *ill-will*; maggiordomo, *butler*; mappamondo, *the globes*; mangiapane, *loafer*; madreperla, *mother-of-pearl*; mezzogiorno, *noon, south*; mezzanotte, *midnight*.

N. noncuranza, *carelessness*; nubifendente, *cloud-cleaving*.

O. oltremare, *beyond the sea*; oltramontano, *beyond the Alps, popish*.

P. pescivendolo, *fishmonger*; portabandiera, *flag-bearer*; portalettere, *postman*; paracqua, *umbrella*; portavoce, *megaphone*; portafoglio, *portfolio*; paravento, *screen*; passatempo, *pastime*; portasigari, *cigar-case*; pomodoro, *tomato*; pettirosso, *robin-redbreast*; pomeriggio, *afternoon*; pianoforte, *piano*.

Q. qualcosa, *something*; quadrumano, *four-handed*; quadrupedo, *four-footed*.

R. retroguardia, *rearguard*; ragnatela, *spider-web*.

S. scaldaletto, *warming-pan*; similoro, *pinchbeck*; spaccalegna, *woodman*; salvadanaro, *money-box*; santacroce, *the A B C book*; sottocoppa, *saucer*; soppanno, *lining*; semicerchio, *half a circle*; semprevivo, *evergreen*; solleone, *dog-days*; spazzacammino, *chimney-sweeper*; stuzzicadenti, *tooth-pick*; saliscendi, *door-latch*; sordomuto, *deaf and dumb*.

T. terremoto, *earthquake*; terrapieno, *embankment*; tagliaborse, *cut-purse*.

V. voltafaccia, *turncoat*; valentuomo, *worthy man*; verderame, *verdigris*.

With the help of the preposition 'da' we can express the use or fitness of a noun, as: carta da scrivere, *writing-paper*; carta da sugo, *blotting-paper*; camera da pranzo, *dining-room*; nave da guerra, *man-of-war*; nave da pesca, *fishing-boat*, &c.

Some nouns only used in the plural are: gli alari, *the andirons*; i beni, *lands and houses, landed property*; i convenevoli, *social duties*; le cerimonie, *ceremonies*; gli avi, *the ancestors*; le froge, *the nostrils*; le fattezze, *the features*; le gramaglie, *mourning clothes*; l' intemperie, *the bad weather*; i lai, *the wailings, the lays*; i lari, *the household gods*; le mollette, *the tongs*; i mezzi, *the means*; le manotte, *the handcuffs*; le muriella, *the marbles*; le nenio, *the death-watch*; i nepoti, *the descendants*; gli omei, *the wailings*; le paure, *the bogeys*; i piati, *the pleadings*; i pressi, *the neighbourhood*; i paraggi, *the fore-shore*; i paternostri, *the beads of a rosary*; i quattrini, *money*; i ruderi, *the ruins*; le secche, *sandbanks*; le stoviglie, *crockery ware*; gli usatti, *military riding-boots*; le vettovaglie, *victuals*; i vezzi, *the charms*.

The following nouns are used only in the singular: il bottino, *the booty*; l' era, *the epoch*; il Medio Evo, *the Middle Ages*; il miele, *honey*; sire, *sire*; la politica, *politics*; l' afa, *heat-wave*; l' uopo, *the necessity*; il fio, *the penalty*; la morale, *the morals*, &c.

The following nouns have an irregular plural: la eco, gli echi; il Dio, gli Dei; il bue, i buoi; il miglio, le miglia; il migliaio, le migliaia; mille, mila; lo uovo, le uova; la moglie, le mogli.

The following nouns have no masculine: la mosca, *the fly*; l' ape, *the bee*; la rana, *the frog*; la volpe, *the fox*; la pulce, *the flea*; l' aquila, *the eagle*; la pecchia, *the tick*; la zanzara, *the mosquito*; la giraffa, *the giraffe*.

The following nouns have no feminine: il leopardo, *the leopard*; il corvo, *the crow*; il coniglio, *the rabbit*; il bracco, *the pointer*; il mastino, *the mastiff*; il topo, *the rat*; il sorcio, *the mouse*; il botolo, *the cur*.

Names which form their feminine irregularly are:

Dio, *God*; la Dea.
Doge, *Doge*; la dogaressa.
il cane, *the dog*; la cagna.
il compare, *godfather*; la comare.
il gallo, *the cock*; la gallina.
il leone, *the lion*; la leonessa.
il montone, *the ram*; la pecora.
il piccione, *the pigeon*; la colomba.

il porco, *the pig ;* la troia.
il toro, *the bull ;* la vacca.
l' eroe, *the hero ;* l' eroina.

Many other nouns are made feminine by the termination *-essa,* as: barone, baronessa; poeta, poetessa; filosofo, filosofessa, &c.

The following are used indifferently in the masculine and in the feminine gender, as: 'il tigre' and 'la tigre'; 'il lepre,' *the hare,* and 'la lepre'; 'il fronte' and 'la fronte,' *the forehead;* 'il fonte' and 'la fonte,' *the fountain;* 'il' and 'la folgore,' *the thunderbolt;* 'il' and 'la carcere,' *the prison;* 'il' and 'la gregge,' *the flock.*

However, some nouns change their meaning with the change in their gender, thus:

il capitale, *the capital (money)*	la capitale, *the capital (city)*
il consorte, *the husband*	la consorte, *the wife*
il fine, *the aim, the purpose*	la fine, *the end*
il prigione, *the prisoner*	la prigione, *the prison*

Nouns of trees are masculine and those of fruits feminine, as: il pero, *the pear-tree;* la pera, *the pear.*

Masculine nouns ending in *a* most frequently used: artista, *artist;* atmosfera, *atmosphere;* clima, *climate;* collega, *colleague;* aforisma, *aphorism;* asma, *asthma;* auriga, *chariot-driver;* antagonista, *antagonist;* dramma, *drama;* duca, *duke;* diadema, *diadem;* dogma, *dogma;* epigramma, *epigram;* emblema, *emblem;* enigma, *enigma;* stratagemma, *stratagem;* fantasma, *phantasm;* entusiasta, *enthusiast;* giornalista, *journalist;* idioma, *idiom;* idiota, *idiot;* monarca, *monarch;* poeta, *poet;* poema, *poem;* papa, *pope;* profeta, *prophet;* pianeta, *planet;* problema, *problem;* pirata, *pirate;* programma, *programme;* prisma, *prism;* proclama, *proclamation;* satirista, *satirist;* sistema, *system;* stemma, *escutcheon;* scisma, *schism;* sofisma, *sophism.*

Nouns with a different meaning according to their different gender: il fosso, *the pit;* la fossa, *the grave:* il gambo, *the stalk;* la gamba, *the leg:* il ghiaccio, *the ice;* la ghiaccia, *the ice-field:* il grido, *the shout;* la grida, *the proclamation:* il pezzo, *the piece;* la pezza, *the cloth-patch,* &c.

In order to keep in the plural the same hard sound that the letters *c* and *g* have in the singular, with words ending in *-ca* and *-ga* the letter *h* must be inserted in the plural between the *c* and the *e* and between the *c* and the *i,* and between the *g* and the *e* and between the *g* and the *i* of their plural, thus: 'la manica,' *the sleeve,* 'le maniche'; 'la paga,' *the pay,* 'le paghe'; 'il duca,' *the duke,* 'i duchi'; the only exception to this rule being with words ending in *-ologo,* as in 'teologo,' *theologian,* 'teologi.' The word 'Mago' has the plurals 'Magi,' *Magi* and maghi, *magicians.* 'Belga,' *Belgian,* plural 'Belgi.'

Nouns ending in *-co,* if of two syllables, take an *h* in the plural, according to the general rule, to strengthen the hard sound of the *c,* thus: 'il fico,' *the fig,* 'i fichi.' 'Greco,' *Greek,* and 'porco,' *pig,* are exceptions to this rule, their plural being 'Greci' and 'porci.' Words of more than two syllables ending in *-co* generally take no *h* in the plural, which is so far formed irregularly, as 'amico,' *friend,* 'amici.' This, however, is rather a hint than a rule, because there are many exceptions to it, and several such words are written indifferently with or without the *h* in their plural, as in the words 'equivoco,' *equivocal,* 'equivoci' and 'equivochi'; 'traffico,' *traffic,* 'traffici' and 'traffichi'; 'mendico,' *beggar,* 'mendici' and 'mendichi.'

Nouns ending in *-cia* and in *-gia,* without the stress on the *i,* which in them is used only to soften the sound of the letters *c* and *g,* drop the *i* in their plural (the *c* and the *g* being soft before the termination *-e* or *-i*), thus: 'faccia,' *face,* 'facce'; 'bragia,' *red hot coal,* 'brage.'

Nouns ending in *-io,* if there is no stress on the *i,* drop the final *o* to form their plural, as 'bacio,' *kiss;* plural 'baci.' If, however, there is the stress on the *i,* the final *o* becomes a second *i* in the plural, as 'mormorio,' *murmur,* 'mormorii.'

When, however, a noun without stress on the termination *i* could be mistaken for another similar word with a different meaning, the final *o* must be changed into a second *i,* as: 'principio,' *principle;* 'principii in the plural, so as not to mistake it for the word 'principi,' plural of 'principe,' *prince;* 'beneficio,' *benefit,* plural 'beneficii'; 'benefico,' *beneficent,* plural 'benefici': 'omicidio,' *murder,* plural 'omicidii'; 'omicida,' *murderer,* plural 'omicidi': 'tempio,' *temple,* 'tempii'; 'tempo,' *time,* 'tempi': 'giudicio,' *judgment,* 'giudicii'; 'giudice,' *judge,* 'giudici,' &c.

Nouns ending in *-ore* are masculine.

Nouns ending in *-iggine, -udine,* and *-uggine* are feminine.

The great majority of nouns ending in *-ione* are feminine; but to this there are several exceptions, as: il battaglione; il bastione; il settentrione, *the north;* il padiglione, *the pavilion;* il milione, *the million;* lo scorpione, *the scorpion;* lo storione, *the sturgeon;* il campione, *the champion;* and a few others.

The present participle of many verbs may be used as a noun, as: l' amante, *the lover;* il cantante, *the singer.*

Other parts of speech which may be used also as nouns are:

The infinitive: 'Il perder tempo a chi più sa, più spiace,' *to waste time grieves most those who know most.*

The past participle: 'Dal detto al fatto c' è un gran tratto,' *there is many a slip between the cup and the lip.*

The adverb: 'Il perchè non si sa,' *the reason why is not known.*

The present participle: 'L' amante del vero,' *the lover of truth.*

The adjective: 'Tanto m' è bel, quanto a te piace,' *your pleasure is my will.*

The interjection: 'Gli omei si sentivano da lontano,' *the wailings were heard from afar.*

The gerund: 'La monacanda piangeva alla dirotta,' *the girl, who was becoming a nun, cried unceasingly.*

Nouns of Kinship.—Arcibisavolo, *great-great-grandfather;* avo or avolo, *grandfather;* bisavolo, *great-grandfather;* celibe, *bachelor;* cugino germano, *first cousin;* cadetto, *younger brother;* cugino, *cousin;* cognato, *brother-in-law;* consorte, (m.) *husband,* (f.) *wife;* compare, *godfather;* comare, *godmother;* figlio, *son;* figlia, *daughter;* figliastro, *step-son;* fratello (carnalo), *brother;* gemello, *twin-brother;* fratello uterino, *brother on the mother's side;* fratello di latte, *foster-brother;* genero, *son-in-law;* genitore, *father;* genitrice, *mother;* madre, *mother;* matrigna, *stepmother;* marito, *husband;* moglie, *wife;* nuora, *daughter-in-law;* nubile, *unmarried* (*woman*); nonno, *grandfather;* nipote, *grandson, granddaughter, nephew, niece;* prozio, *great-uncle;* pronipote, *descendant;* primogenito, *first-born;* padre, *father;* parente, *relation;* padrigno, *stepfather;* suocero, *father-in-law;* sorella, *sister;* zio, *uncle.*

Modifications of Italian Words.

On the modification of Italian words depend a great deal of the charm and beauty of the Italian language. By modifying the spelling of a word we add to its original meaning one, two, or even three adjectives. No article, preposition, conjunction, interjection, or pronoun may be modified; but all those parts of speech hardly fill up the twentieth part of an Italian dictionary. The parts of speech which may undergo one or more modifications are the noun, the adjective, the verb, and the adverb—*i.e.* the immense majority of Italian words.

The different modifications in the spelling, and consequently in the meaning, of words are numberless, and they are not all capable of modifying every word. No rules, except those of euphony, govern the employment of these modifications; and a foreigner should never attempt to use them, unless he has seen them before in black and white, since he is most likely to add a wrong modification to the word. He will be quite safe and correct in making use of the needful adjectives, and leave alone any doubtful modification. But if he wishes to make real progress in the study of the language, he should carefully copy in a note-book all the modified words which he meets with in his reading or hears in his conversation. This is indispensable, since dictionaries (except very voluminous ones) rarely register such modified words.

The student should not feel discouraged by this, but redouble his endeavours, which will be rewarded in this case by the most useful and satisfactory knowledge, that will open to him the classical works of the best writers of all periods of Italian literature.

With regard to the modification of Italian words, we must observe that the termination *-one* is always masculine, even when added to a feminine noun.

As for the additional meaning of modifications, this is sufficiently explained by their translation in the following examples:

bello, *beautiful*	bellino, *pretty*
campana, *bell*	campanello, *hand-bell*
giallo, *yellow*	giallognolo, *yellowish*
il cappello, *the hat*	il cappellino, *the small hat*
il giovine, *the young man*	il giovinotto, *a strong young man*
il letto, *the bed*	il lettuccio, *the cot*
il libro, *the book*	il libretto, *the little book, the book of words of the opera*
il libro, *the book*	il librone, *the big book*
il pittore, *the painter*	il pittoraccio, *the dauber*
il ramo, *the bough*	il ramicello, *the twig*
la casa, *the house*	la casetta, *the small house*
la porta, *the door*	il portone, *the big door, the front-door*
medico, *doctor*	mediconzolo, *quack*
poeta, *poet*	poetucolo, *poetaster*

and numberless other modifications.

Often a modification gives quite a new meaning to the word, as:

albero, *tree*	alberello, *phial*
bello, *beautiful*	belletto, *rouge*
carta, *paper*	cartuccia, *cartridge*
casa, *house*	casella, *pigeon-hole*
cavallo, *horse*	cavalletto, *easel*
cavallo, *horse*	cavallone, *sea-wave, sea-horse*
gallina, *hen*	gallinaccio, *turkey*
occhio, *eye*	occhiello, *buttonhole*
padre, *father*	padrino, *second (in a duel)*

A word already modified may take a second modification, as:

birbone, *rascal*	birbonaccio, *a very bad rascal*
campanello, *little bell*	campanellino, *a nice little bell*
casetta, *little house*	casettina, *a nice little house*
cassetta, *little box*	cassettina, *nice little box*
storiella, *short story*	storiellina, *nice little story*
tavolino, *little table*	tavolinuccio, *a very little table*

The changes in the terminations of verbs being used for their conjugation, their modification takes place after the root of the verb and before its termination—that is to say, before the last three letters of its infinitive, thus:

cantare, *to sing.*
cantarellare, *to hum in tune.*
canticchiare, *to hum out of tune.*
saltare, *to jump.*
saltarellare, *to skip.*
scrivere, *to write.*
scribacchiare, *to scrawl.*

Gender of Adjectives:

Adjectives ending in *-a* are all feminine.

Adjectives ending in *-o* are all masculine.

Adjectives ending in *-e* or in *-i*, in the singular, are both masculine and feminine. There are no adjectives ending in *-u*.

Plural of Adjectives.—All adjectives have their plural ending in *-i*, with the exception of

those ending in *-a*, which have their plural in *-e*, thus:

SINGULAR.	PLURAL.
bella, *beautiful*	belle (feminine)
cara, *dear*	care (feminine)
caro, *dear*	cari (masculine)
felice, *happy*	felici (feminine and masculine)
pari, *equal*	pari (feminine and masculine)

Formation of the Comparatives of Adjectives:

Più, *more;* meno, *less.*

Più ricco di suo fratello, *richer than his brother.*
Più ricco che non suo fratello, *richer than his brother.*
Meno dotto del padre, *less learned than his father.*
Meno dotto che non il padre, *less learned than his father.*

Così . . . come, *as . . . as.*
Così . . . che, *as . . . as.*
Tanto . . . quanto, *as . . . as.*

Così buono che gentile, *as good as kind.*
Così studioso come ubbidiente, *as studious as obedient.*
Tanto largo quanto lungo, *as long as broad.*

The superlative absoluto is formed by adding to the positive adjective the termination *-issimo.*

alto, *high*	altissimo, *very high*
amabile, *amiable*	amabilissima, *very amiable*
cara, *dear*	carissima, *very dear*
lungo, *long*	lunghissimo, *very long*

Formation of the superlative relative of adjectives:

With 'il più,' *the most,* and 'il meno,' *the least.*

Questa è la più bella camera nel collegio, *this is the most beautiful room in the college.*
Quello è il meno studioso degli studenti, *that one is the least studious of the students.*

The following comparisons are formed irregularly:

alto, *high;* superiore, *higher;* il superiore, *highest;* supremo, *very high.*
basso, *low;* inferiore, *lesser;* l' inferiore, *the least;* infimo, *very low.*
buono, *good;* migliore, *better;* il migliore, *the best;* ottimo, *very good.*
cattivo, *bad;* peggiore, *worse;* il peggiore, *the worst;* pessimo, *very bad.*
grande, *great;* maggiore, *greater;* il maggiore, *the greatest;* massimo, *very great.*
piccolo, *little;* minore, *smaller;* il minore, *smallest;* minimo, *very small.*

About the position of the adjective, whether it should come before or after the noun it qualifies, no hard-and-fast rule can be given. Usually an adjective precedes the noun if it is a shorter word, and follows it when longer.

If, however, the adjective denotes a physical quality, it must follow the noun, as 'guanti bianchi,' *white gloves;* 'cappello nero,' *black hat.* There are some adjectives which change their meaning with the change of their position, as:

cassa grande, *large box, chest*	gran cassa, *big drum*
contadino semplice, *only a peasant*	semplice contadino, *gullible peasant*
doppio amico, *mutual friend*	amico doppio, *false friend*
il figlio solo, *only the son*	il solo figlio, *the only son*
la mano stanca, *the left hand*	la stanca mano, *the tired hand*
novelle certe, *true news*	certe novelle, *some news*
questo detto, *this saying*	detto questo, (*having*) *said this*
tempi cattivi, *hard times*	cattivo tempo, *bad weather*
un uomo certo, *a real man*	un certo uomo, *somebody*
un uomo solo, *a bachelor*	solo un uomo, *only one man*
uomo dabbene, *a worthy man*	dabben uomo, *a fool*
uomo galante, *effeminate man*	galantuomo, *a gentleman*
uomo grande, *tall man*	grande uomo, *great man*

Adjectives agree with the noun in gender and number:

i cari compagni di scuola, *the dear schoolfellows.*
il caro amico, *the dear friend.*
la cara sorella, *the dear sister.*
le care memorie, *the dear memories.*

Possessive Adjectives.

SINGULAR.		PLURAL.		
MASCULINE.	FEMININE.	MASCULINE.	FEMININE.	
il mio	la mia	i miei	le mie	*my, mine*
il tuo	la tua	i tuoi	le tue	*thy, thine*
il suo	la sua	i suoi	le sue	*his, hers*
il nostro	la nostra	i nostri	le nostre	*our, ours*
il vostro	la vostra	i vostri	le vostre	*your, yours*
il loro	la loro	i loro	le loro	*their, theirs*

When they precede in the singular a noun denoting relationship, and there is no other adjective, they are used without the article: 'mio fratello,' *my brother;* 'il mio caro fratello'; 'il fratello mio.' 'Loro' is always written with the article.

The cardinal numerals are:

uno	1	trentuno	31
due	2	trentadue	32
tre	3	trentatrè	33
quattro	4	quaranta	40
cinque	5	quarantuno	41
sei	6	quarantadue	42
sette	7	quarantatrè	43
otto	8	cinquanta	50
nove	9	cinquantuno	51
dieci	10	cinquantadue	52
undici	11	cinquantatrè	53
dodici	12	sessanta	60
tredici	13	sessantuno	61
quattordici	14	sessantadue	62
quindici	15	sessantatrè	63
sedici	16	settanta	70
diciassette	17	settantuno	71
diciotto	18	settantadue	72
diciannove	19	settantatrè	73
venti	20	ottanta	80
ventuno	21	novanta	90
ventidue	22	cento	100
ventitrè	23	duecento	200
ventiquattro	24	trecento	300
venticinque	25	novecentosette	907
ventisei	26	mille	1000
ventisette	27	due mila	2000
ventotto	28	un milione	1,000,000
ventinove	29	due milioni	2,000,000
trenta	30	un miliardo	1,000,000,000

N.B.—'Uno' has the feminine 'una.' 'Mille' has the irregular plural 'mila.' 'Milione' and 'miliardo' are treated as nouns, with the plural 'milioni' and 'miliardi.'

'Tre,' when ending a numeral, takes the accent—'ottantatrè,' 83; but takes no accent when preceding another numeral, as 'trecento, tremila,' &c.

'Cento' has no plural: 'duecento,' 200; 'novecento,' 900.

The ordinal numerals are treated as adjectives, with a masculine and feminine gender, and with a singular and plural number:

primo, prima, primi, prime	1st
secondo	2nd
terzo	3rd
quarto	4th
quinto	5th
sesto	6th
settimo	7th
ottavo	8th

nono	9th
decimo	10th
undecimo	11th
duodecimo *or* dodicesimo	12th
tredicesimo *or* decimoterzo	13th
quattordicesimo *or* decimoquarto	14th
quindicesimo, decimoquinto	15th
sedicesimo, decimosesto	16th
diciassettesimo, decimosettimo	17th
diciottesimo, decimottavo	18th
diciannovesimo, decimonono	19th
ventesimo	20th
ventunesimo, ventesimoprimo	21st
ventiduesimo, ventesimosecondo	22nd

milionesimo	1,000,000th
miliardesimo	1,000,000,000th
penultimo	*last but one*
ultimo	*the last*

Except for the first of the month, the cardinal numerals are used in dates: 'Il primo aprile,' *the first of April;* 'il due agosto,' *the second of August.*

As in English, the ordinal numbers are used with the names of kings: 'Eduardo Settimo, Giorgio Quinto.' Note the elimination of the definite article.

una volta, *once*	doppio, *twofold*
due volte, *twice*	triplo, *threefold*
tre volte, *three times, &c.*	quadruplo, *fourfold, &c.*

The days of the week are:

Lunedì (*the day of the Moon,* Luna), *Monday.*
Martedì (*the day of Mars*), *Tuesday.*
Mercoledì (*the day of Mercury*), *Wednesday.*
Giovedì (*the day of Jove*), *Thursday.*
Venerdì (*the day of Venere,* Venus), *Friday.*
Sabato (*the Sabbath*), *Saturday.*
Domenica (*the day of* Dominus, *the Lord*), *Sunday.*

'Dì,' from the Latin 'dies,' means *day.*

The names of the months are:

Gennaio (*from* Janus), *January.*	June (Junius), *June.*
Febbraio, (februarius) *February.*	Luglio (Julius), *July.*
Marzo (Mars), *March.*	Agosto (Augustus), *August.*
Aprile (aper, *Spring*), *April.*	Settembre (septem), *September.*
Maggio (Majus), *May.*	Ottobre (octo), *October.*
	Novembre (novem), *November.*
	Decembre (decem), *December.*

The Roman year, beginning in March, explains the numeral names given to the last four months.

The names of the four seasons are:

Primavera, *Spring.*	Autunno, *Autumn*
Està, *Summer.*	Inverno, *Winter.*

The hours of the day are expressed by prefixing the feminine definite article to the cardinal numeral, thus:

sono le (ore) tre, *it is three o'clock.*
sono le tre e un quarto, *it is a quarter past three.*
sono le tre meno un quarto, *it is a quarter to three o'clock.*
sono le tre e mezzo, *it is half-past three o'clock.*
sono le tre e tre quarti, *it is a quarter to four o'clock.*
sono le quattro meno un quarto, *it is a quarter to four o'clock.*

A second numeral, after the one denoting the hours, states the minutes:

sono le sei e nove, *it is nine minutes past six.*
sono le sette meno otto, *it is eight minutes to seven.*

With the number *one*, the verb is naturally put in the singular:

È l' una ('ora' understood), *it is one o'clock.*

For the railway time the hours are counted up to twenty-four, from one midnight to another.

Noon is 'mezzogiorno'; and *midnight* is 'mezzanotte.'

The Auxiliary Verbs

'Essere' and 'stare' mean *to be.* 'Essere' is used when the state is permanent, 'stare' when the state is transitory. Thus: 'Io sto scrivendo,' *I am writing* (*I do not write always*); 'egli sta nell' altra camera,' *he is in the other room* (*now*); 'noi siamo alti,' *we are tall;* 'elleno sono Inglesi,' *they are English.*

In their compound tenses 'essere' and 'stare' are used together; 'stato,' the past participle of 'stare,' being added to the verbal forms of 'essere': 'Io sono stato,' *I have been;* 'ella era stata,' *she had been.* Note that the compound tenses of 'essere' are formed in Italian with *to be,* and not *to have,* as in English.

The conjugation of

avere, *to have*	essere, *to be*	stare, *to be*
Indicative Mood. Present Tense.		
io ho, *I have*	io sono, *I am*	io sto, *I am*
tu hai, *thou hast*	tu sei, *thou art*	tu stai, *thou art*
egli ha, *he has*	egli è, *he is*	ella sta, *she is*
noi abbiamo, *we have*	noi siamo, *we are*	noi stiamo, *we are*
voi avete, *you have*	voi siete, *you are*	voi state, *you are*
eglino hanno, *they have*	elleno sono, *they* (f.) *are*	elleno stanno, *they* (f.) *are*
Imperfect Tense.		
aveva, *I had*	era, *I was*	stava, *I was*
avevi, *thou hadst*	eri, *thou wert*	stavi, *thou wert*
aveva, *he had*	era, *he was*	stava, *he was*
avevamo, *we had*	eravamo, *we were*	stavamo, *we were*
avevate, *you had*	eravate, *you were*	stavate, *you were*
avevano, *they had*	erano, *they were*	stavano, *they were*
Past Definite.		
ebbi, *I had*	fui, *I was*	stetti, *I was*
avesti, *thou hadst*	fosti, *thou wert*	stesti, *thou wert*
ebbe, *he had*	fu, *he was*	stette, *he was*
avemmo, *we had*	fummo, *we were*	stemmo, *we were*
aveste, *you had*	foste, *you were*	steste, *you were*
ebbero, *they had*	furono, *they were*	stettero, *they were*

Note.—The personal pronoun is generally omitted before the verb.

Future Tense.		
avrò, *I shall have*	sarò, *I shall be*	starò, *I shall be*
avrai, *thou shalt have*	sarai, *thou shalt be*	starai, *thou shalt be*
avrà, *he shall have*	sarà, *he shall be*	starà, *he shall be*
avremo, *we shall have*	saremo, *we shall be*	staremo, *we shall be*
avrete, *you shall have*	sarete, *you shall be*	starete, *you shall be*
avranno, *they shall have*	saranno, *they shall be*	staranno, *they shall be*

CONDITIONAL MOOD.

avrei, *I would have*	sarei, *I would be*	starei, *I would be*
avresti, *thou wouldst have*	saresti, *thou wouldst be*	staresti, *thou wouldst be*
avrebbe, *he would have*	sarebbe, *he would be*	starebbe, *he would be*
avremmo, *we would have*	saremmo, *we would be*	staremmo, *we would be*
avreste, *you would have*	sareste, *you would be*	stareste, *you would be*
avrebbero, *they would have*	sarebbero, *they would be*	starebbero, *they would be*

IMPERATIVE MOOD.

abbi, *have (thou)*	sii, *be (thou)*	stii, *be (thou)*
abbia, *(let him) have*	sia, *(let him) be*	stia, *(let him) be*
abbiamo, *(let us) have*	siamo, *(let us) be*	stiamo, *(let us) be*
abbiate, *have (you)*	siate, *be (you)*	stiate, *be (you)*
abbiano, *(let them) have*	siano, *(let them) be*	stiano, *(let them) be*

SUBJUNCTIVE MOOD. PRESENT TENSE.

ch' io abbia, *that I may have*
che tu abbia, *that thou mayest have*
ch' egli abbia, *that he may have*
che noi abbiamo, *that we may have*
che voi abbiate, *that you may have*
ch' eglino abbiano, *that they may have*

ch' io sia, *that I may be*
che tu sia, *that thou mayest be*
ch' egli sia, *that he may be*
che noi siamo, *that we may be*
che voi siate, *that you may be*
ch' eglino siano, *that they may be*

che io stia, *that I may be*
che tu stia, *that thou mayest be*
ch' egli stia, *that he may be*
che noi stiamo, *that we may be*
che voi stiate, *that you may be*
ch' eglino stiano, *that they may be*

IMPERFECT TENSE.

s' io avessi, *if I had*	se io fossi,	se io stessi, *if I were*
se tu avessi, *if thou hadst*	se tu fossi,	se tu stessi, *if you were*
s' egli avesse, *if he had*	s' egli fosse,	s' egli stesse, *if he were*
se noi avessimo, *if we had*	se noi fossimo,	se noi stessimo, *if we were*
se voi aveste, *if you had*	se voi foste,	se voi steste, *if you were*
s' eglino avessero, *if they had*	s' eglino fossero,	s' eglino stessero, *if they were*

THE GERUND (used as Present Participle).

avendo, *having*	essendo, *being*	stando, *being*

PAST PARTICIPLE.

avuto, *had*	stato, *been*	stato, *been*

The Regular Verbs

The regular conjugations of the Italian verbs are three, and they are distinguished from each other by the vowel which precedes the final syllable *-re* of their infinitive.

The first vowel, *a*, denotes the verbs of the First Conjugation.

The second vowel, *e*, denotes the verbs of the Second Conjugation.

The third vowel, *i*, denotes the verbs of the Third Conjugation. Thus:

volare, *to fly*. vendere, *to sell*. servire, *to serve*.

In conjugating an Italian verb, the first thing to do is to divide its infinitive into the root and the termination. This is done by separating the last three letters of the infinitive from the preceding ones: 'vol-are,' 'vend-ere,' 'serv-ire.' The last three letters are the termination, the preceding ones are the root of the verb.

Throughout the conjugation the 'root' never changes, and is always present. The 'termination' changes throughout the whole conjugation.

CONJUGATIONS OF THE REGULAR VERBS.

INFINITIVE.

I.	II.	III.
volare, *to fly*	vendere, *to sell*	servire, *to serve*
(vol-are)	(vend-ere)	(serv-ire)

Whenever the termination is omitted here, it is like the one on its immediate left.

INDICATIVE MOOD. PRESENT TENSE.

I fly, &c.	*I sell, &c.*	*I serve, &c.*
I am flying, &c.	*I am selling, &c.*	*I am serving, &c.*
I do fly, &c.	*I do sell, &c.*	*I do serve, &c.*
vol-o	vend —	serv —
-i		
-a		
-iamo		
-ate	-ete	-ite
-ano	-ono	

IMPERFECT TENSE.

I was flying, &c.	*I was selling, &c.*	*I was serving, &c.*
vol-va	vend-eva	serv-iva
-avi	-evi	-ivi
-ava	-eva	-iva
-avamo	-evamo	-ivamo
-avate	-evate	-ivate
-avano	-evano	-ivano

PAST DEFINITE.

I did fly, &c.	*I did sell, &c.*	*I did serve, &c.*
vol-ai	vend-ei	serv-ii
-asti	-esti	-isti
-ò	-è	-ì
-ammo	-emmo	-immo
-aste	-este	-iste
-arono	-erono	-irono

FUTURE TENSE.

I shall fly, &c.	*I will sell, &c.*	*I shall serve, &c.*
I will fly, &c.	*I shall sell, &c.*	*I will serve, &c.*
vol-erò	vend —	serv-irò
-erai	—	-irai
-erà	—	-irà
-eremo	—	-iremo
-erete	—	-irete
-eranno	—	-iranno

IMPERATIVE MOOD.

do fly (thou), &c.	*do sell (thou), &c.*	*do serve (thou), &c*
vol-a	vend-i	serv —
-i	-a	—
-iamo		
-ate	-ete	-ite
-ino	-ano	

CONDITIONAL MOOD. PRESENT TENSE.

I would fly, &c.	*I would sell, &c.*	*I would serve, &c.*
I should fly, &c.	*I should sell, &c.*	*I should serve, &c.*
vol-erei	vend —	serv-irei
-eresti		-iresti
-erebbe		-irebbe
-eremmo		-iremmo
-ereste		-ireste
-erebbero		-irebbero

SUBJUNCTIVE MOOD. PRESENT TENSE.

That I may fly, &c.	*That I may sell, &c.*	*That I may serve, &c.*
che io vol-i	ch' io vend-a	ch' io serv —
che tu -i	che tu -a	che tu —
ch' egli -i	ch' egli -a	ch' egli —
che noi -iamo	che noi -iamo	che noi —
che voi -iate	che voi -iate	che voi —
ch' eglino -ino	ch' eglino -ano	ch' eglino —

IMPERFECT TENSE.

If I fled, &c. Were I to fly, &c.	*If I sold, &c. Were I to sell, &c.*	*If I served, &c. Were I to serve; &c.*
se vol-assi	se vend-essi	se serv-issi
-assi	-essi	
-assimo		-issimo
-aste	-este	-iste
	-essero	-issero

PRESENT PARTICIPLE (seldom used).

flying	*selling*	*serving*
vol-ante	vend-ente	serv-ente

PAST PARTICIPLE.

fled	*sold*	*served*
vol-ato	vend-uto	serv-ito

GERUND (generally used instead of Present Participle).

flying	*selling*	*serving*
vol-ando	vend-endo	serv-endo

Irregular verbs are very numerous in Italian—there are over seven hundred of them; but, with the exception of about a score, they have irregular terminations *only* in the 1st and 3rd person singular and in the 3rd person plural of the past definite, and in the past participle. That is to say, they are conjugated regularly throughout, and have only four irregular forms recurring in the same places.

Verbs altogether irregular are the following:

andare, *to go.*	salire, *to ascend.*
dare, *to give.*	sapere, *to know.*
dire, *to say.*	sedere, *to sit down.*
dolere, *to ache.*	spegnere, *to extinguish.*
dovere, *to be obliged.*	tenere, *to hold.*
fare, *to do, to make.*	trarre, *to draw.*
morire, *to die.*	valere, *to be worth.*
parere, *to seem.*	vedere, *to see.*
porre, *to put.*	venire, *to come.*
potere, *to be able.*	volere, *to be willing.*
rimanere, *to remain.*	

'Udire,' *to hear*, is only in so far irregular that it changes the initial *u* into *o* whenever the stress falls on it, as 'io odo, tu odi, egli ode, noi udiamo, voi udite, eglino odono,' &c. 'Uscire' changes the *u* into *e* whenever the stress falls on the initial *u*, as 'esco, esci, esce, usciamo, uscite, escono,' &c. The *o* of 'dovere' becomes *e* in the similar instance: 'devo, devi,' &c.

In the regular verbs the accent on the 3rd person singular of the past definite is explained by the suppression of the last vowel in the old and obsolete termination, as 'amò' for 'amoe,' or by the suppression of the last syllable, as 'vendè' for 'vendette.'

In the 1st and 3rd person singular of the future the accent is explained thus: 'vendere ho,' *I have to sell*, becomes 'vendere ò'; and 'venderò,' 'vendere ha,' *he has to sell*, becomes 'vendere à,' 'venderà'—the silent *h* in 'ho, hai, ha' being replaced in modern Italian by the accent.

The 'verbi servili' (used as auxiliaries) are:

dovere, potere, sapere, volere,

and their dependent verb takes in its compound tenses the auxiliary required by this verb, as illustrated by the following examples: 'Egli era dovuto andarci,' *he was obliged to go there*; 'egli avrebbe dovuto vederlo,' *he ought to have seen him.* 'Egli non sarebbe potuto partire quel giorno,' *he would not have been able to start that day*; 'egli non avrebbe potuto scrivergli,' *he would not have been able to write to him.* 'Egli non è saputo andarvi,' *he was unable to go there*; 'egli non ha saputo farlo,' *he was unable to do it.* 'Egli non è voluto andarci,' *he would not go there*; 'egli non ha voluto comprarlo,' *he would not buy it.*

Adverbs in Italian are formed by adding the termination *-mente* to the feminine form of the adjective, thus: 'piana,' *slow*; 'pianamente,' *slowly*: 'felice,' *happy*; 'felicemente,' *happily*: 'celere,' *quick*; 'celeremente,' *quickly*.

When the adjective ends with *-e*, and is preceded by an *l* or by an *r*, the final *e* is eliminated, thus: 'amabile,' *amiable*; 'amabilmente,' *amiably*: 'anteriore,' *previous*; 'anteriormente,' *previously*.

The comparative and superlative of adverbs are formed as with adjectives: 'più facilmente,' *more easily*; 'il più facilmente,' *the most easily*; 'facilissimamente,' *very easily*.

The following are irregularly formed:

bene, *well*;	meglio, *better*;	il meglio, *best*;	benissimo, *very well.*
male, *badly*;	peggio, *worse*;	il peggio, *worst*;	malissimo, *very badly.*
molto, *much*;	più, *more*;	il più, *most*;	moltissimo, *very much.*
poco, *little*;	meno, *less*;	il meno, *least*;	pochissimo, *very little.*

Adjectives may be also used adverbially without any modification, as: 'piano,' *slowly*; 'forte,' *loudly*, &c.

The Italian language is particularly abundant in idiomatic adverbial phrases, like the following:

a babbo morto, *post-obiit.*	rompicollo, *at a break-neck rate.*
a bizzeffe, *plentifully.*	a spron battuti, *at full gallop.*
a bocca baciata, *easily.*	a stento, *with difficulty.*
a braccetto, *arm-in-arm.*	a un dipresso, *nearly.*
a bruciapelo, *point-blank.*	a un pelo di, *very near.*
a capello, *exactly.*	al dì d' oggi, *nowadays.*
a cavalluccio, *pick-a-back.*	all' ingrosso, *wholesale.*
a diritto o a traverso, *by hook or by crook.*	alla barba di, *in spite of.*
a faccia tosta, *barefacedly.*	alla buon' ora, *at last.*
a fior di, *flush with.*	alla chetichella, *quietly, on the sly.*
a forza di, *by dint of.*	alla difilata, *straightway.*
a galla, *floating.*	alla fin fine, *after all.*
a giorni, *shortly.*	alla meglio, *as best one can.*
a grandi giornate, *with forced marches.*	alla peggio, *at the worst.*
a malincuore, *unwillingly.*	alle spalle di, *at the expense of.*
a marcio dispetto, *in spite of.*	bel bello, *slowly.*
a menadito, *on the fingers' tips.*	buccia buccia, *skin-deep.*
al minuto, *retail.*	da parte, *aside.*
a occhi chiusi, *blindly.*	da sè a sè, *alone.*
a occhio e croce, *freely, without payment.*	da senno, *in earnest.*
a occhio nudo, *with naked eye.*	da sezzo, *lastly.*
a picco, *sheer.*	di buon grado, *willingly.*
a piedi, *on foot.*	di buon mattino, *early in the day.*
a piene mani, *abundantly.*	di peso, *bodily.*
a più non posso, *with all one's might.*	di tanto in tanto, *now and then.*
a più potere, *with all one's might.*	fuor fuora, *through.*
a portata di, *within reach.*	giù di lì, *thereabout.*
a quattr' occhi, *tête-à-tête.*	in capelli, *bareheaded.*
	in corso di posta, *by return.*
	in media, *on the average.*

in un amen, *quickly.*	li per li, *at once.*
in un attimo, *in a twinkling.*	man mano, *gradually.*
io come io, *as for me.*	ogni tanto, *now and then.*
lemme lemme, *slowly.*	punto e basta, *enough.*

The personal pronouns already mentioned in the conjugations of the verbs are:

io, *I*	noi, *we*
tu, *thou*	voi, *you*
egli, *he*	eglino, *they* (m.)
ella, *she*	elleno, *they* (f.)

'Egli' is often written 'ei' or 'e'.' But there are others:

questo, *this man*	questa, *this woman*
questi, *these men*	queste, *these women*
cotesto, *that man*	cotesta, *that woman*
cotesti, *those men*	coteste, *those women*
quello, *that man* (yonder)	quella, *that woman* (yonder)
quelli, *those men* (yonder)	quelle, *those women* (yonder)

Also the irregular forms for the masculine singular nominative:

questi, *this man*	quegli, *that man* (yonder)
costui, *this man*	costei, *this woman*
costoro, *these men*	costoro, *these women*
cotestui, *that man*	cotestei, *that woman*
cotestoro, *those men*	cotestoro, *those women*
colui, *that man* (yonder)	colei, *that woman* (yonder)
coloro, *those men* (yonder)	coloro, *those women* (yonder)

The irregular forms 'questi' and 'quegli,' only for the nominative singular.

'Chi,' *who,* is masculine and feminine singular; and plural only with the verb 'essere.'

Other personal pronouns are:

alcuno, qualcuno, qualcheduno, *someone* (m.).
alcuna, qualcuna, qualcheduna, *someone* (f.)

alcuno, *some man*	alcuna, *some woman*
alcuni, *some men*	alcune, *some women*
taluno, *some man*	taluna, *some woman*
taluni, *some men*	talune, *some women*
ognuno, *each man*	ognuna, *each woman* (no plur.)
chiunque, *whoever* (m. and f., no plural)	
qualcuno, *some man*	qualcuna, *some woman* (no plur.)

Conjunctive personal pronouns are:

mi, *to me, me*	ci, *to us, us*
ti, *to thee, thee*	vi, *to you, you*
gli, *to him*	li, *them* (m.)
le, *to her*	le, *them* (f.)
lo, il, *him*	loro, *to them, them* (m. and f.)
si, *himself, herself*	si, *themselves* (m. and f.)
la, *her*	si, *to themselves* (m. and f.)

In conversation, or in letters, when using the 3rd person, 'Le' means *to Your Lordship, to Your Ladyship;* 'Lei' and 'La' mean *Your Lordship, Your Ladyship.*

Absolute personal pronouns are also

me, *me;* te, *thee;* lui, *him;* lei, *her;* desso, *he;* dessa, *she.*

'Che,' *who, what, which,* is the most used of all pronouns; it is masculine and feminine, singular and plural, and is used for persons and things. 'Ne,' *of him, of her, of it, of them.*

The conjunctive pronoun precedes the verb in the indicative, the conditional, the subjunctive, and the imperative negative, and is not joined to it, as 'mi vide,' *he saw me.* It follows the verb when in the imperative affirmative, the past participle, the infinitive, and the gerund, when it is always joined to the verb, as 'Datami la lettera, egli partì,' *having given me the letter, he went away.*

'Loro' is never joined to the verb.

For the sake of euphony, when two conjunctive pronouns are together, the *i* of the first is modified into an *e.* Thus, instead of writing 'mi lo disse,' *he told it to me,* you must write 'me lo disse,' and take care to remember that that 'me' has nothing to do with the accusative 'me,' but stands there for the dative 'mi,' *to me.*

The difference between 'quale' and 'il quale' is best shown thus: 'Quale libro volete?' *which book do you want?* 'Il libro, il quale volete,' *the book, which you want.* 'Quale il padre, tale il figlio,' *as the father, so the son.* 'Quali i fioretti dal notturno gelo,' *like flowerets by the night frost.* 'Qual fior cadea sul lembo, qual sulle trecce bionde,' *some flowers fell on her lap, some on her fair tresses.*

The possessive adjective may be used for the possessive pronoun: 'Vostra mercè, cui tanto si commise,' *thanks to you, to whom so much was entrusted.*

The conjunctive pronoun is used instead of the possessive adjective when it refers to a part or limb of one's body: 'Mi duole il capo,' *my head aches.* 'Si ruppe il braccio,' *he broke his arm.*

In answering questions, the pronoun agrees, if it refers to a noun, with the definite article or demonstrative adjective: 'Siete voi le sorelle di quel signore? Sì, noi le siamo,' *are you the sisters of that gentleman? Yes, we are.* But if the answer refers to an adjective, verb, or noun without the definite article, the pronoun 'lo' is used: 'È essa arrivata? Sì, lo è,' *has she arrived? Yes, she has arrived.*

Personal pronouns should not be repeated before each verb in the same sentence: 'Io leggo, scrivo e parlo tutto il giorno,' *I read, write, and speak all day.*

Personal pronouns may be repeated with the same verb: 'E quel che tu fai tu, fo similmente,' *and that which you do, I do likewise.*

'Cui,' *him* or *her, them,* or *which.* Thus: 'O anima cortese mantovana, di cui la fama,' *O courteous Mantuan soul, of whom the fame.* 'Coloro, da cui erano stati assaliti,' *those by whom they had been attacked.*

Adjectives used as pronouns are:

alquanti, *some*	pochi, *few*
assai, *very many*	troppi, *too many*
molti, *many*	tutti, *all*
parecchi, *several*	

The most important Italian conjunctions are:

acciocchè, *in order that*	nonostante, *notwithstanding*
altresì, *besides, also*	nulladimeno, *nevertheless*
anche, *also*	o, *or*
anzichè, *rather than*	onde, *so that*
benchè, *although*	per altro, *however*
cioè, *that is*	perciò, *therefore*
come, *as*	però, *however*
dacchè, *since*	purchè, *provided*
dunque, *therefore*	pure, *also, yet*
e, *and* (before a vowel 'ed')	quand' anche, *even if*
eziandio, *also*	quantunque, *although*
finchè, *until*	se anche, *even if*
ma, *but*	sebbene, *although*
nè, *nor*	se, *if*
neppure, *not even*	tuttavia, *nevertheless*

Their use is explained in the following examples: 'Nella sala vi erano signori e signore,' *in the drawing-room there were ladies and gentlemen.* 'Incontrai una donna ed un uomo,' *I met a woman and a man.* 'Ella è tanto bella come buona,' *she is as beautiful as she is good.* 'Me ne ricorderò finchè vivo,' *I shall remember it as long as I live.* 'Il portalettere mi portò non solo otto lettere, ma anche due involti,' *the postman brought me not only eight letters, but also two packages.* 'Mi prestò il libro, onde lo leggessi,' *he lent me the book, so that I might read it.* 'Mi diede la nuova, acciocchè ne profittassi,' *he gave me the news, in order that I might profit by it.* 'Quand' anche mi promettesso restituirmelo, io non glielo presterei,' *even if he were to promise me to return it, I would not lend it to him.* 'Hai il giornale, dunque leggilo,' *you have the newspaper, therefore read it.* 'Lo leggerei, però non ho tempo,' *I would read it, but I have no time.* 'Non ho molto danaro, tuttavia gli presterò quanto mi domanda,' *I have not much money, nevertheless I shall lend him what he asks.* 'Queste sono quattro lire sterline, cioè cento lire italiane,' *these are four pounds sterling, that is one hundred Italian lire.* 'O vieni meco, o me ne vado solo,' *either come with me, or I shall go alone.* 'Se me le dessi, te lo restituirei,' *if you were to give it to me, I would return it to you.* 'Benchè (sebbene) sia ignorante, è ricco,' *although he is ignorant, he is rich.* 'Purchè lo voglia, glielo darò,' *provided he wants it, I shall give it to him.* 'Quantunque sia vecchio, ama divertirsi,' *although he is old, he likes to amuse himself.* 'Non glielo darò, nè per danaro, nè senza,' *I shall not give it to him, either for money, or without.* 'Sembra debole, pure è fortissimo,' *he looks weak, yet he is very strong.* 'Non lo farei neppure per sogno,' *I would not even dream of doing it.* 'Egli è mio parente, nulladimeno non ci parliamo,' *he is my relation, nevertheless we do not speak to each other.* 'Sono andato a trovarlo, ma egli non era a casa,' *I went to see him, but he was not at home.* 'La casa è non solamente grande, ma anche bella,' *the house is not only large, but also beautiful.* 'Nonostante la sua assenza prolungata, io non la dimenticherò mai,' *notwithstanding her prolonged absence, I shall never forget her.* 'Fu ucciso nella guerra, perciò la madre era addolorata,' *he was killed in the war, therefore his mother was sorrowful.* 'Ama molto la danza, per altro è studiosa,' *she is very fond of dancing, however she is studious.* 'Soffrirei tutto, anzichè rifiutarlo,' *I would suffer anything, rather than refuse him.* 'Dacchè sei qui, ti parlerò di quell' affare,' *since you are here, I will speak to you about that business.* 'Non lo prenderei, se anche me lo regalasse,' *I would not have it, even if he were to give it to me for nothing.*

Observe how nearly all conjunctions govern the verb in the subjunctive mood.

Interjections, as their name implies, are only exclamations, subject to no grammatical rule, and thus indeclinable. The most usual are:

affè, *indeed*	eh, ehi, *hallo*
ah, *ah*	evviva, *hurrah*
ahi, *helas*	fuori, *begone*
aiuto, *help*	guai, *woe*
all' erta, *on guard*	ohimè, *woe is me*
animo, *courage*	oibò, *fie*
avanti, *forward*	olà, *oh*
bene, *well*	orsù, *now then*
benone, *very well*	via, *away*
bravo, *well done*	zitto, *hush*
deh, *alas*	

'Bravo' and 'zitto,' real adjectives, may agree in gender and number with the noun they qualify.

'Aiuto, i ladri sono in casa,' *Help! thieves are in the house.* 'Affè, l' hai fatta bella,' *Indeed, you have put your foot in it.* 'All' erta, sentinella?' *What of the night, sentinel?* 'Avanti, prendiamo l' altra trincea,' *Forward, let us take the next trench.* 'Benone, il vostro esercizio è senza errori,' *Very well, your exercise has no mistake.* 'Guai ai nostri nemici,' *Woe to our enemies.* 'Oibò, non lo farei per nulla al mondo,' *Fie, I would not do it for anything in the world.* 'Orsù, partiamo, è mezzanotte,' *Now then, let us go, it is midnight.* 'Via, vattene,' *Away, be off with you.* 'Zitto, bambino, zitto,' *Hush, baby, hush.*

III

SOME USEFUL INFORMATION

Some figures of rhetoric in Italian:

alliteration	fra' diciotto e i diciannove (fradicio).
amphibology	aggirarsi *for* imbrogliarsi.
anaphora	Molto egli oprò col senno e con la mano Molto soffrì. . . .
antiphrasis	un omnibus veloce.
antonomasia	foglio *instead of* lettera.
apheresis	've *for* ove; stremo *for* estremo.
apocope	mi' *for* mio; maggio *for* maggiore.
battology	e non gli ha fatto male, non gli ha fatto.
chiasm	Ovidio è il terzo, e l' ultimo è Lucano.
diæresis	sorgono i vizi trionfando fuori.
ellipsis	andato a trovarlo, gli disse.
epenthesis	aghero *for* ago.
euphemism	s' approfittò *instead of* rubò.
hiatus	maestro, levaimi. . . .
hyperbaton	ci son restati uomini colti, che tu ti maraviglieresti.
hyperbole	infinità *instead of* gran numero.
idiotism	la peggio ruota del carro è quella che cigola.
metathesis	drento *for* dentro; isquatra *for* isquarta.
neologism	c' era tal fatta di merci.
onomatopœia	st *for* zitto.
paragoge	mene *for* me; tene *for* te.
pleonasm	a me mi pare; a te ti sta.
protasis	benchè molti la lodino, pochi l' amano.
prothesis	arricordarsi *for* ricordarsi.
sigla	ff. *instead of* facente funzione.
solecism	a riserva *for* salvo; fossimo *instead of* fummo.
syncope	opra *for* opera; cetra *for* cetera.
synecdoche	come da corda (*instead of* arco) cocca.
tautology	tra tre tremendi pericoli.
trope	due Soli *instead of* due occhi.

Some abbreviations:

Aff.	Affezionato.
Aff^mo	Affezionatissimo.
A.S.A.	A Sua Altezza.

via scorciatoia, a *short-cut.*
volesse il Cielo, *would to Heaven.*

Some English proverbs with their Italian equivalents.

The rich man has always plenty of friends.
Abbi pur fiorini, che troverai cugini.

A wise man is seldom wrong.
A ben s' appiglia, chi ben si consiglia.

Where there is a will, there is a way.
A buona volontà, non manca facoltà.

A word is enough to the wise.
A buon intenditor, poche parole.

A bad workman dislikes his tools.
A cattivo zappatore, ogni zappa gli è pesore.

Do not look a gift horse in the mouth.
A caval donato non si guarda in bocca.

To give advice is always very easy.
A chi consiglia, non duole il capo.

Hunger is the best sauce.
A chi è affamato, ogni cibo è grato.

The evil-doer never prospers.
A chi mal fa, mal va.

Still waters run deep.
Acqua cheta rovina i ponti.

A lost opportunity never returns.
Acqua passata non macina mulino.

Love is blind.
Affezione accieca ragione.

Charity begins at home.
Aiuta i tuoi, e gli altri se tu puoi.

A friend in need is a friend indeed.
Al bisogno si conosce l' amico.

A servant needs patience, whilst his master needs prudence.
Al servo pazienza, al padrone prudenza.

God's love is our best guide.
Ama Dio, e non fallire.

Faint heart never won fair lady.
Amante non sia, chi coraggio non ha.

Even a worm will turn.
Anche la mosca ha la sua collera.

Build a golden bridge for a flying enemy.
A nemico che fugge, ponte d' oro.

There is no place like home.
A ogni uccello, suo nido è bello.

Every little makes a mickle.
A quattrino a quattrino, si fa il fiorino.

Enough is as good as a feast.
Assai è ricco a chi non manca.

Speech is silvern, silence golden.
Assai sa chi non sa se tacer sa.

He calls the tune who pays the piper.
Attacca l' asino dove vuole il padrone.

Strike the iron when hot.
Batti il chiodo quando è caldo.

What cannot be cured must be endured.
Bisogna fare di necessità virtù.

Live, and let live.
Bisogna vivere, e lasciar vivere.

Good wine needs no bush.
Buon vino non vuol frasca.

A barking dog does not bite.
Can che abbaia non morde.

There is no place like home.
Casa mia, casa mia,
Per piccina che tu sia,
Tu mi sembri una badia.

Love me, love my dog.
Chi ama me, ama il mio cane.

He who seeks, finds.
Chi cerca trova, e chi dorme non piglia pesci.

Forewarned, forearmed.
Chi è avvisato, è armato.

Give a dog a bad name, and then hang him.
Chi è diffamato, è mezzo impiccato.

Marry in haste, repent at leisure.
Chi erra in fretta, piange adagio.

The best help is self-help.
Chi fa per sè, fa per tre.

More haste, less speed.
Chi ha fretta, indugi.

Health is wealth.
Chi ha la sanità, è ricco e non lo sa.

Do not put off till to-morrow what can be done to-day.
Chi ha tempo, non aspetti tempo.

Sow the wind, and reap the whirlwind.
Chi mal semina, mal raccoglie.

The leopard cannot change its spots.
Chi nasce lupo, non muore agnello.

Look before you leap.
Chi non guarda, non vede.

Nothing venture, nothing gain.
Chi non risica, non rosica.

Grasp all, lose all.
Chi più abbraccia, meno stringe.

First come, first served.
Chi prima arriva, prima macina.

God helps those who help themselves.
Chi s' aiuta, Dio l' aiuta.

Slow and sure.
Chi va piano, va sano e va lontano.

With nothing, nothing is done.
Col nulla non si fa nulla.

Everything comes to those who wait.
Col tempo e colla paglia si maturano le nespole.

Short accounts make good friends.
Conti spessi, amicizia lunga.

Forewarned, forearmed.
Cosa prevista, mezza provvista.

May God protect me from those I trust,
For I shall guard myself from those I mistrust.
Dai miei amici mi guardi Dio,
Chè dai nemici mi guarderò io.

There is many a slip between the cup and the lip.
Dal detto al fatto, c' è un gran tratto.

Knowledge is wealth.
Dal sapere vien l' avere.

A man is known by the company he keeps.
Dimmi con chi tu vai, e ti dirò che fai.

There is no smoke without fire.
Non c' è fuoco senza fumo.

Do your duty and shame the devil.
Fa il dovere, e non temere.

Murder will out.
Gran peccato non può star celato.

Good wine needs no bush.
Il buon vino non ha bisogno di frasca.

The devil is not so black as he is painted.
Il diavolo non è brutto quanto si dipinge.

To lose time grieves most those who know most.
Il perder tempo a chi più sa più spiace.

Far from sight, far from mind.
Lontan dagli occhi, lontan dal cuore.

Appetite is the best sauce.
L' appetito non vuol salsa.

Misfortunes never come alone.
Le disgrazie non vengono mai sole.

The idle man is always in need.
L' ozioso è sempre bisognoso.

Man proposes, and God disposes.
L' uomo propone, e Dio dispone.

A bird in the hand is worth two in the bush.
Meglio un uovo oggi che una gallina domani.

It is not all gold that glitters.
Non è tutt' oro quel che riluce.

Every dog has its day.
Ogni granchio ha la sua luna.

There is no rose without thorn.
Ogni rosa ha la sua spina.

Do in Rome as the Romans do.
Ovunque vai, fa come vedrai.

Speech is silvern, silence golden.
Parla poco e ascolta assai,
E giammai non fallirai.

Penny saved, penny gained.
Quattrino risparmiato, quattrino guadagnato.

A rolling stone gathers no moss.
Sasso che non sta fermo, non vi si ferman mosche.

Different meanings of words :

abitato, *inhabited*	vestito, *dressed*
abusare, *to abuse*	biasimare, *to blame*
accanto, *by the side*	accosto, *close*
accentare, *to put an accent*	accentuare, *to put the stress*
acuto, *sharp*	aguzzo, *pointed*
adatto, *apt*	addato, *aware, used to*
affittare, *to let (land)*	appigionare, *to let (house)*
agro (n.), *land*	agro (adj.), *sour*
aio, *tutor*	tutore, *guardian*
albero, *tree*	alberello, *phial*
allora, *then*	alloro, *laurel*
amo, *fish-hook*	amo, *I love*
anima, *soul*	animo, *courage*
appiccare, *to hang up*	impiccare, *to hang (a man)*
appresso, *afterwards*	presso, *near*
ardere, *to burn*	ardire, *to dare*
assorbito, *absorbed*	assorto, *enrapt*
astratto, *abstract*	distratto, *distracted*
attimo, *smallest amount of time*	atomo, *smallest amount of matter*
avanti, *before* (time)	davanti, *before* (place)
avvisare, *to warn*	consigliare, *to advise*
baffuto, *with mustachios*	paffuto, *puffy*
balla, *bale*	palla, *ball*
balena, *whale*	baleno, *lightning*
banda, *band*	bando, *proclamation, banishment*
baro, *card-sharper*	barone, *baron*
battaglia, *battle*	battaglio, *bell-clapper*
battere, *to beat*	combattere, *to fight*
bocca, *mouth*	boccia, *flask*
bicchiere, *glass (drinking)*	vetro, *glass (pane)*
bisogna, *business*	bisogno, *want*
boia, *hangman*	buoi, *oxen*
braccio, *arm*	bracco, *hound*
breve, *short (time)*	corto, *short (space)*
busta, *envelope*	busto, *corset, bust*
caffettiera, *coffee-pot*	caffettiere, *coffee-house keeper*
calle, *lane*	callo, *corn*
canape, *tow*	canapo, *rope*
capello, *hair*	cappello, *hat*
capitale (m.) *capital (money)*	calitale (f.), *capital (city)*
carica, *office*	carico, *laden*
cattività, *captivity*	cattiveria, *wickedness*
cavalletta, *locust*	cavalletto, *easel*
cavallo, *horse*	cavaliere, *knight*
celibe, *bachelor*	nubile, *spinster*
cera, *wax*	cero, *taper*
chiave, *key*	chiavistello, *lock*
ciglio, *eyebrow*	cipiglio, *frown*
colle, *hill*	collo, *neck*
colpa, *fault*	colpo, *blow*
condotta, *behaviour*	condotto, *drain*
consiglio, *advice*	concilio, *council, ecclesiastical*
contadino, *peasant*	concittadino, *fellow-citizen*
contesa, *quarrel*	contessa, *countess*
copia, *copy*	coppia, *couple*
corte, *court*	cortile, *courtyard*
corsa, *race (horse)*	corso, *racecourse*
costa, *coast*	costo, *cost*
curato, *parson*	vicario, *curate*
deforme, *deform*	difforme, *different*
dianzi, *before* (time)	dinanzi, *before* (place)
difendere, *to defend*	proibire, *to forbid*
dipoi, *afterwards*	dopo, *since*
dire, *to say*	parlare, *to speak*
distogliere, *to distract*	divertire, *to amuse*

zucchero, *sugar*	sughero, *cork*

Some verbs which appropriately express the actions of animals :

L' asino raglia.
Il bue mugghia, muglia, muggisce.
Il cane abbaia, latra, guaisce, ringhia, scodinzola, uggiola.
Il cavallo nitrisce, scalpita.
Il corvo gracchia.
L' elefante barrisce.
Il falco strido.
La gallina croccia, chiocciola, gracida, pigola, ruspa, ruzzola, schiamazza, starnazza.
Il gallo canta.
Il gatto miagola, gnaula.
L' insetto ronza, pinza.
Il leone ruggisce.
Il lupo ulula, urla.
La mosca ronza.
L' oca grida.
Il pappagallo squittisce.
La pecora bela, bruca.
Il pesce guizza.
Il pipistrello zirla.
Il porco grugnisce.
La rana gracchia, gracita.
La scimmia grida.
La serpe sibila.
L' uccello canta, garrisce, cinguetta.
L' uomo parla.
Il vento tira, trae, spira, poggia.

IV

SIX CENTURIES OF ITALIAN LITERATURE

At the beginning of this sketch we have endeavoured to explain how the Italian language was gradually developed from the Latin, in the

course of many centuries, until it reached its highest perfection in the writings of Dante. After the Trecento (1275–1375) there was a period of nearly a century, during which took place a certain revival of Latin and Greek studies almost everywhere throughout Italy. The fall of Constantinople, which brought to Italy numberless refugees with an immense number of Greek manuscripts, contributed powerfully to this revival. During this period, named the Quattrocento (1375–1475), hardly any important work was written in Italian, the learned men having resumed the expression of their ideas in the Latin language, which they wrongfully believed to be a better medium of diffusing knowledge than the Italian, unmindful of the fact that by the use of Latin they limited to a small circle of men truths which would otherwise have reached a far larger number of readers.

Some minor but more popular writers continued, however, the work of the Trecento, by their chronicles, short stories, imaginary lives of saints, and books of travel. Among those who wrote in Italian were Agnolo Pandolfini, Leon Battista Alberti (the earliest writer on fine arts), Luigi Pulci (the great humorist), Angelo Poliziano, and Lorenzo de' Medici.

It was, however, in the glorious Cinquecento (1475–1575) that Italian literature and Italian fine arts reached their highest point of greatness and refinement. The art of printing was then spread nearly everywhere in Italy, Aldo Manuzio having brought it at Venice to a perfection that was never surpassed in later times. Naturally this contributed wonderfully to the general diffusion of knowledge.

In Michelangelo (1475–1564), Leonardo (1452–1519), Benvenuto Cellini (1500–1570) and Vasari (1512–1574), we find the most wonderful examples of the rare union of literature and art in the same great men, and in the highest perfection.

Michelangelo's poetry, especially the sonnets to Vittoria Colonna, the gifted widow of the Marquis of Pescara, Commander-in-Chief of the troops of the Emperor Charles V in Italy and hero of the battle of Pavia, in which he made prisoner Francis I, King of France, are full of sweet tenderness as well as of platonic love, and bear comparison with the best of Petrarca. His private correspondence, which fills two large volumes, gives us a correct insight into the private lives of the artists and statesmen of that time.

Leonardo's *Trattato della Pittura* is an invaluable and very useful work on the art of painting, and is among the best classics of the Italian literature.

Benvenuto Cellini wrote his *Vita*, the best autobiography ever written in any language, which has been translated into German by Goethe, and into English by Roscoe. There is no more entertaining book, nor any which shows more vividly the daily life of artists in the sixteenth century. It has, moreover, the merit of telling the truth, even when the truth is to the disadvantage of the writer. His days at the French Court of Francis I are full of interesting political information and Court scandal.

To Giorgio Vasari, the gifted author of the *Lives of the Painters and Sculptors of the Renaissance*, we are indebted for all we know about those artists, with whom the author was personally acquainted, and whose works he discusses as an artist. Modern writers have criticised Vasari's *Lives* as those of a gossip, whilst getting from them all the real information, of which they avail themselves so freely. As a contemporary writer, and one who knew the people of whom he was writing and their artistic works, Vasari has this advantage over every other biographer of the artists of the Italian Renaissance; and since his time everyone who has endeavoured to write about them has been an ungrateful plagiarist of his biographies. Foremost among these, and most notorious, have been the German writers, who in this branch of human knowledge, as in every other, have assumed a superiority, the only foundation for which is to be found in their own presumption. The only relation which Huns have to the fine arts being that which is fully acknowledged by the civilised nations of the world, and to which their wars bear witness, being that of destroyers or looters.

Machiavelli (1469–1527), the greatest prose writer of all ages in Italy, united to the beauty of his style the deepest knowledge of the philosophy of history and statecraft, and his works have been translated into all modern languages. Guicciardini (1482–1540) was an historian of sterling literary merit. Ariosto (1474–1533) is, after Dante, the greatest Italian poet, whose imagination has hardly a rival in any other literature. He was also a great master of style, the artistic simplicity of which adds to the reading of his immortal poem pleasures hardly found in the reading of Dante. It is enough to state that, although written four centuries ago, there is not in the immense length of the *Orlando Furioso* a single word which could be called obsolete, or not be understood by any educated Italian of to-day. At the head of all Italian humoristic poets stands Berni (1497–1535), who even gave his name to this kind of poetry, called "bernesca." If he has any rival in other literatures, they can only be found among the American humorists of modern times. With all this, he is also a very refined writer, whose deep knowledge of the language can only be compared to the perfection of his style. Thus he has become one of the most popular writers among the Italian classics.

If the style of Machiavelli is perfect in its

force and clearness, that of Agnolo Firenzuola (1493–1548) is unsurpassed for its charm and wealth. His works are a mine from which all the purest and sweetest words of the language can be got with the least trouble and with the greatest pleasure. His prose is the most entertaining which is to be found in Italian literature.

This period in the history of Italy was not only glorious for the excellence of its literature. The fine arts reached in that country their highest perfection in the modern world; and no comparison can be made of their immortal works to any others than to those of Greece.

Hellenic art, the most glorious plastic manifestation of the human mind, began to decay after the fall of Hellenic independence. Under the Roman Empire this decay was slow but steady; and during the Dark Ages that followed the fall of the Roman Empire, under the Greek emperors, we find it transformed into what is called Byzantine art, which was only a dim and distorted recollection—often a mechanical reproduction—of the only plastic expression of the human mind, until in the thirteenth century the Italian Renaissance burst forth with Niccola and Giovanni Pisani, Arnolfo di Lapo, Cimabue and Giotto, the giants who mostly contributed to free mankind from the monstrous darkness of the Middle Ages. These were the men who first, with the breath of their genius, breathed life into the dead forms of the plastic arts; and, as Lord Lindsay said, "Whatever of highest excellence has been achieved in sculpture, architecture, and painting, not only in Italy, but throughout Europe, has been in obedience to the impulse they primarily gave." This awakening was not limited to architecture, sculpture, and painting. A religious upheaval was also taking place; and the Crusades had contributed their share to it. At the same time there was created in Italy a new language, which could vie with that of Greece in its beauty, and which found in Dante its greatest writer. Philosophy also began the struggle to free itself from the bonds of scholasticism, whilst Guido d' Arezzo found for music a universal language.

The awakening of the Italian people to their civil rights had preceded for some time this period, when the republics of Venice, Genoa, Pisa, and Amalfi were the most flourishing of European States. Some of the immense wealth which they accumulated was liberally spent in the foundation of hospitals and libraries, and in the building of cathedrals and town halls, which to this very day are standing monuments of the high point of progress and civilisation reached in some parts of Italy in the thirteenth century.

As in classical Greece, so in Italy at this time of the Renaissance, artists did not trouble themselves with the modern problem whether art should limit its scope to the "imitation" of Nature or extend it to its "interpretation." They were quite satisfied with following and imitating Nature as closely as possible. This idea was expressed very plainly and clearly by Dante, the great friend of Giotto, in the words:

> "Philosophy," he said, "to him who heeds it,
> Noteth, not only in one place alone,
> After what manner Nature takes her course
> From Intellect Divine, and from its art;
> And if thy Physics carefully thou notest,
> After not many pages shalt thou find,
> That this your art as far as possible
> Follows, as the disciple doth the master;
> So that your art is, as it were, God's grandchild."
> (Longfellow's translation, *Inferno*, c. XI.)

In Greece the ideal of personal beauty was wholly physical. Their academies, their schools, and their games led to a life mostly passed out of doors; and the populace of Athens sat and witnessed the gorgeous spectacles of their theatre under the blue sky of Greece, with the sunlight glinting on the snowy marbles of the vast proscenium. This out-of-door life produced results in the purely physical ideals of strength, symmetry, &c., more in men than in women; and so it came to pass that their Apollo was far superior to their Aphrodites.

Though the Romans attributed more beauty to woman, they did not limit it to their face only. The very word for beauty was "forma," implying perfection in the whole person.

Before the Renaissance, woman had never been acknowledged as the equal of man. To lift woman to the same level as man was the silent work of thirteen centuries of Christianism. The worship of the mother of Christ, in its very exaggeration, aided by the ages of chivalry, of the Crusades, of the troubadours, and by the great Italian poet, who was able to write of her: "Woman, through whom alone mankind enjoys the highest bliss in that part of heaven nearest to God" (*Inferno*, c. II), all contributed to it. Thus modern art acknowledged in woman the ideal of beauty, whether she be portrayed as a Madonna or as La Gioconda. In this new ideal the physical beauty is tempered and purified by the spiritual. Force and "forma" gave way to loveliness and charm. The ideal of beauty passed gradually from the masculine to the feminine type. To these qualities the face is the true index; and hence woman's face—its features and expression—are held as the first and most important test of beauty.

The faces limned by the Italian painters, though they may have lost the faultless regularity or the masculine severity of those of the Greeks, have gained in their new womanhood a wistful, appealing, mystical look, eloquent evidence of the higher position to which woman had been raised. As late as Botticelli, this type of beauty and this conception of it are supreme in Italian art, and the exquisite creations of that painter give the most perfect and the most wonderful expression to ideal loveliness, radiant in a glory which is almost divine.

In some of the Italian painters of the Renaissance we see a temporary reversion to the Græco-Roman theories of beauty—as, for example, in Titian, who set off the female form with all the splendour of that master's marvellous colouring and unequalled voluptuousness. This return to older forms of beauty is still more prominent later on, in the strapping Flemish beauties so frequent on the canvases of Rubens.

The tendency of subordinating the purely physical to the intellectual and emotional has gone on progressing to such a point that nowadays it is almost wholly in the face that the highest possible ideal of pure loveliness is supposed to lie.

Torquato Tasso (1544–1595) may be considered either as the last poet of the Cinquecento or the first of the Seicento (1575–1675). His poem *Gerusalemme liberata* is still very popular, and its religious subject endears it to the majority of Italians. Its style is very simple and clear; and the episodes by which it is filled are pleasant and emotional. His genius and his works are not, however, to be compared to those of Dante. or even Ariosto's; and he is correctly described as the first poet of the Italian Decadence, or the Seicento (1575–1675). He lived the most miserable and most romantic life of any poet; and of him there remain five big volumes of letters, in which he complained of his hard fate. But he has left us a real literary gem in his pastoral drama, the *Aminta*, the most beautiful in Italian literature. Chiabrera (1552–1637), a minor poet, is remarkable for the simplicity and purity of his diction. But he was, though unconsciously, the forerunner of those silly Arcadians, who made Italian poetry ridiculous in the following generation. Filicaia (1642–1707) will ever be popular in Italy for his famous and well-known sonnet *All' Italia*, translated into English by Byron. Guarini (1538–1612) is recorded as the earliest of the Secentisti, punsters and exaggerators of the oncoming decadence of the Italian literature.

Among these writers of the Seicento shines brightly the famous name of Galileo Galilei (1564–1642), who, however, owes his immortal renown to his scientific genius rather than to his literary work. The Inquisition was at the time all-powerful in the small Italian States, where it stifled every expression of truth distasteful to the Papal Court. Among its victims are to be remembered, besides Galileo, other great and well-known enemies of Popery: Giordano Bruno (1550–1600), Campanella (1568–1639), Vannini (1535–1619), and Gelesio—philosophers and theologians of note, whose works had the honour of being placed in the Roman Index of Forbidden Books.

It was in 1690 that the Academy of the Arcadians was founded in Rome, where it still flourishes. It pretended to represent the literary life of Italy, and was instead the most ridiculous association of literary nobodies ever assembled. Each member was only known by a pastoral nickname; and his duty was to write pastoral nonsense, which they called poetry, in praise of an imaginary shepherdess. And, thus bloating their babble, they passed their "literary" life, till another generation took their place to continue their useless labours. Thus the Seicento passed into the Settecento (1675–1775) without any change or improvement in Italian literature, which really did no longer exist, as it produced no literary work of any value whatever. Muratori (1672–1750) wrote in Latin his principal work, and his *Annali d' Italia* are only a bulky and useful compilation of historical documents. Vico (1670–1744) wrote his historical works, as well as Giannone (1676–1748), Tiraboschi (1731–1794), and Pietro Verri (1728–1797), in very bad Italian, without the least pretence to literary merit or even grammatical correctness.

The Ottocento (1775–1875) began when France was preparing the great revolution, which was going to have such influence on all the various fields of European civilisation. Italy was the first to feel this revival, in its literary not less than in its political life. First and foremost among the numerous writers on social science appeared Cesare Beccaria (1738–1794) with his book *Dei delitti e delle pene.* Written in a style which recalled the golden age of the Renaissance, it was most influential in spreading the new ideas. Giuseppe Baretti (1716–1789), having resided most of his life in England, tried to bring to the knowledge of his compatriots the political and social life of his adopted country in some interesting books of travel and in a famous periodical, *La Frusta;* his only reward for his lifelong efforts being his life theatened by the poniard of an assassin; and he was obliged to fly once more from Italy to the friendly shelter of England, where he had made many and very influential friends. Greatest of these were Dr. Samuel Johnson, whose biographer, Boswell, often mentions the Italian author; and Sir Joshua Reynolds, who painted Baretti's portrait, still to be seen at Holland House. Baretti deserved well of his adopted country by helping, with Fuseli and others, in founding the Royal Academy of Arts, of which he became the first secretary. His most interesting works are *Le lettere familiari* —in which he relates his journeys through the West of England and in Portugal and Spain— and an *English-Italian Dictionary.*

Galvani (1737–1798) and Volta (1745–1826) were the pioneers of electrical science, and their names are universally known, as well as their work. Vittorio Alfieri (1749–1805), a Piedmontese nobleman, who had passed his youth and manhood in travelling and in idleness, gave

the latter part of his life to learning the Italian, the Latin, and the Greek languages, and he succeeded so well in this that he was enabled to become the author of the best tragedies of which the literature of Italy can boast. Though not possessing the genius of a Shakespeare, he contrived to make them of sufficient merit to be interesting to the Italian public. He resided a long time in England, where he even fought a duel in Windsor Park with an Irish peer, Lord Ligonier. His most interesting work is his autobiography, remarkable for its outspokenness and truth-telling, and for its description of life in the various European Courts, where he was ever a welcome visitor. His *Vita* is one of those books which no student of Italian literature should miss reading.

Giuseppe Parini (1729–1799) was a poet of literary merit, whose political satire, *Il Giorno*, lashed the shameful laziness of Italians as well as it deserved. Although Metastasio (1698–1782) belongs chronologically to the Settecento, his works claim him as one of those writers who properly belong to the following century. Poet-Laureate to the Austrian Court, he wrote an immense number of occasional verses and dramas for music, all of them remarkable for the facility of their style and for the purity of their diction.

The drama had never had a popular exponent in any period of Italian literature, until Carlo Goldoni (1707–1793) wrote his ever-popular comedies. Before his time the Italian public was satisfied with listening to bad translations of French plays, as they do even to-day. But though Goldoni's 150 plays are interesting as theatrical works for their plots and naturalness, they make no pretence whatever to any literary merit; and many of them are even written in the Venetian dialect. Unfortunately for the Italian stage, Goldoni remains to this day the only dramatist of Italy.

Under the rule of Napoleon, who had founded a kingdom of Italy, which had only an ephemeral existence of a few years, Milan, its capital, was the centre of the literary world in Italy. Here Vincenzo Monti (1754–1828) was the acknowledged leader, and here he wrote his most popular poems, whose popularity was hardly more lasting than that of the ruler under whose patronage he wrote. Ugo Foscolo (1778–1827), an officer in the republican army of France, exiled by Napoleon, found in the ever-open hospitality of England a welcome refuge, and gave himself entirely to literary work. He became famous for his song, *I Sepolcri*—a short poem on classic lines, and as mournful as its subject exacted. His critical work on Dante showed a wonderfully deep knowledge of all the intricacies and etymologies of the Italian language. He was buried at Chiswick, whence his remains were, a few years ago, carried by an Italian man-of-war to Leghorn and laid in Santa Croce in Florence.

Benedetto Sestini is well known for his sentimental poem on *Pia de' Tolomei*, the subject of which is taken from one of the most pitiful tales of love mentioned in Dante's *Divina Commedia*. Carlo Botta (1766–1837) was the author of the continuation of Guicciardini's *Storia d' Italia*, and of the *Storia della Guerra dell' Indipendenza degli Stati Uniti d' America*, both works more remarkable for their style, which recalls that of the writers of the Cinquecento, than for their historical accuracy. Antonio Cesari, in his *Bellezze della Divina Commedia*, can be classed with Botta as another "purist." A better historian is General Pietro Colletta (1775–1831), who wrote the *Storia del Reame di Napoli*, interesting alike for its beautiful style and for its historical accuracy. He was the commander of the Neapolitan troops at the time of the French occupation of Naples, when Napoleon's brother-in-law, Joachim Murat, was King of Naples, and distinguished himself for his valour and statesmanship. His descriptions of the terrible earthquake of 1783, and of the brigandage ever flourishing in the southern provinces of Italy, remind one of the writings of Tacitus. Cesare Cantù, whose long life ended only a short while ago, was the most prolific of Italian historians. Besides his *Storia Universale* of one hundred volumes, enriched by many important and rare documents, his *Storia d' Italia*, and his still more important *Storia degli Eretici in Italia*, he was the author of numerous novels, amongst them *Margherita Pusterla*, and the *Novelle Brianzuole*. Although not a classic, he is one of the best writers of this period. His popularity suffered because of his stern independence from all political parties, which have been the ruin of Italy for so many centuries.

P. Emiliani-Giudici has written a good *Storia della Letteratura Italiana*, the best on that subject; Pietro Ranalli a *Storia delle Belle Arti*, with moderate success; and Pietro Villari several works on historical subjects, of which the life of *Girolamo Savonarola* is the best.

Of modern novelists, none has had the success obtained by Alessandro Manzoni (1785–1872) with his single novel *I Promessi Sposi*, of which innumerable editions have been published in Italy, and which has had the singular honour of being translated in nearly all foreign languages. Though the story it relates is very simple, it is narrated with a charm that makes its reading universally interesting. His poem *Il Cinque Maggio*, on the death of Napoleon, is his only poetical work that deserves high praise. Massimo d' Azeglio wrote *Ettore Fieramosca*, a novel which attained almost the same popularity as that of *I Promessi Sposi*, and deserves it better. The *Ricordi* of this author form a work which all Italians should read for their own improvement, as it points out the most prominent of

the many faults of their public life, to which they owe their political and moral decadence, as well as their vain dreams of hegemony in the modern world.

Cesare Balbo, who took an important part in the political reunion of Italy under the House of Savoy, wrote a *Sommario della Storia d' Italia*, in which he accomplished the extraordinary feat of including a very accurate history of all the numerous States of the Italian Peninsula, from the fall of the Roman Empire to our days, in one single volume.

Marco Visconti, by Tommaso Grossi (1791–1853) is a readable novel, describing the troublous times of the wars between the Guelfs and Ghibellines. Guerrazzi (1805–1873), a Tuscan patriot involved in the revolution of 1848, when, after being Dictator of Tuscany, he underwent a long imprisonment to satisfy the hatred of the victorious Austrians, who had their heels on the fair lands of Italy, was one of the most entertaining and cleverest authors of this period. His novels—*L' Assedio di Firenze*, *La Battaglia di Benevento*, and *L' Asino*—are written in the purest Tuscan language, overflowing with the best idioms and the sharpest wit to be found in that cradle of the language. His *Scritti politici* are indispensable to those who desire an authentic knowledge of the facts which led to the latest struggles for the liberation of Italy from the military and political yoke of Austria.

Among the numerous other writers of more or less interesting novels are: Ferrigni, better known under his *nom de plume* of "Yorick," with his *Su e giù per Firenze*, notwithstanding its Anglophobism; G. Rovetta, a most prolific writer, and author of the *Baraonda;* Ippolito Nievo, whose *Confessioni d' un Ottuagenario* are very realistic; Giuseppe Guerzoni, a secretary and soldier of General Garibaldi, of whom he wrote the best *Vita;* Renato Fucini, whose *Veglie di Neri* and *All' aria aperta* have the literary touch and home wit of his native Tuscany; Luigi Capuana, whose novels are reckoned by the score; Emilio de Marchi, a clever writer of short stories; Ghislanzoni has written readable *Racconti* and *Novelle piacevoli;* Emilio Castelnuovo, whose novels are very popular; Felice Cavallotti, the socialist, who lost his life in a political duel; G. Giacosa, a follower of the French; and, above them all, Antonio Fogazzaro. This gifted writer, some of whose novels are well known even outside Italy, was the author of *Malombra*, *Il Santo*, *Piccolo mondo antico*, *Piccolo Mondo Moderno*, and a dozen other novels. He had more literary merit than any of his contemporaries, and was the most fortunate of them all in the remunerative success of his books. He was, in fact, the only one in Italy, with one notorious exception, who ever made money by his pen. There does not exist in Italy what we call a reading public, and the publishers cannot afford to pay for works from which no return can be expected. Thus an author there is obliged to be satisfied with any little dole the publisher may be willing to grant him, after the latter has been sufficiently lucky to sell some "editions" of the book—an edition consisting generally of only 500 copies.

The Minister of Antiquities and Fine Arts in Italy, Corrado Ricci, is the foremost specialist in that country upon these important subjects, and has written many interesting volumes on the precious treasures entrusted to his care by the Italian Government. Besides his official position, there is no other living Italian who can claim higher authority in writing about Art. His finely illustrated monographs are themselves works of art, and among the most remarkable are *La Divina Commedia*, *Le Cento Vedute di Firenze Antica*, *L' Ultimo Rifugio di Dante*, &c.

An English lady, married to an Italian nobleman, the Countess Martinengo-Cesaresco, has made for herself in her new home a great reputation as the authoress of several interesting books on Italian contemporary history. Their importance and usefulness have been acknowledged. Her life of *Cavour*, her work on the *Liberazione d' Italia*, and that on the *Patriotti italiani*, are among the best monographs extant of the troublous times of Italian unification.

The two plagues which infest the southern provinces of Italy, the Camorra and the Mafia, have been described and exposed by two powerful writers, who from different points of view came to the same conclusions about them. Renato Fucini, the witty Tuscan author abovementioned, in his *Napoli ad occhio nudo* drew such horrifying and so vivid pictures of Neapolitan life that the Italian Government suppressed the book, and confiscated and destroyed all the copies it could get hold of. Even the Library of the British Museum has not a copy of it, the most remarkable book published by an Italian on the present life of the Italians. Its realistic portrayal of the true state of things concerning the Camorra and the miserable life of the Neapolitan poor, and the terrible oppression by the wealthy chiefs of the Camorra and their all-powerful influence in the appointment of senators and even of ambassadors, are revealed with a courage that does honour to the author. Another work on the same social plague in Italy is that of an Italian judge, Giulio Gaggiano, who in his *Mala Vita Napolitana* reveals the innermost secrets of that wretched organisation of crime—a task rendered easy to him by his magisterial office. Both these writers incurred the displeasure of the Government for their unwelcome revelations; and, whilst Fucini's book was destroyed, Judge

Gaggiano was dismissed from his honourable office.

Giosue Carducci enjoyed during a long life a popularity which was only justified by his laborious literary life and by his teaching in the University of Bologna. Although he has left more than twenty volumes on a varied number of subjects, they are not of such worth as to survive him for long. His *Inno a Satana* is probably the only one of his poems which may record his name to future generations. Vincenzo Gioberti (1801–1852), who had a very chequered political life, was a prolific writer on philosophical subjects, but his greatest work was *Il Gesuita Moderno*. Benedetto Croce tries in his writings to free Italy from German "Kultur," but with rather poor success.

A little book which enjoyed in this period the greatest popularity in Italy, and was translated into all European languages, was *Le mie Prigioni*, by Silvio Pellico (1788–1854). It is a simple and unadorned narration of his sufferings in the Austrian prisons on account of his political opinions. He was one of the numerous victims of Austrian rule in Italy. The book is now almost forgotten.

The writer who in the Ottocento towered above all others, and who is the only one in that century to recall to Italian students the golden days of the Renaissance in the Cinquecento, was Giacomo Leopardi (1798–1837). A cripple, and in the last years of his short life nearly blind, his activities were simply supernatural, his knowledge of the Greek, Latin, and Italian literatures amazing, his genius of the highest order. When hardly out of his childhood he wrote Greek verses, which the learned academies of Berlin and Rome praised as newly discovered works of the golden age of Greek poetry. His *Epistolario* fills two large volumes, and, unlike any other work of a similar kind, is not only the best model of letter-writing in Italian, but also interesting throughout. His *Poesie Minori* are perfect; and, among them, his song *All' Italia* is the best poem ever written of the misfortunes and miseries of that fair land, surpassing in its excellence that on the same subject written by Petrarch. His *Scritti letterari* are models of literary criticism, whilst his *Pensieri* are full to overflowing with practical moral teaching. The *Prose artistiche* show his knowledge of the fine arts to have been as deep as it was accurate, whilst his *Dialoghi* are full of wit, and the best satires ever written on the national failings of the Italians. Whilst he secured for himself one of the highest places in the literature of Italy, he was the most industrious exponent and the sternest witness to its contemporary decadence. The morals of Leopardi are above all praise, he being one of the very few among Italian authors who have not defiled their writings with a single lewd thought or an immoral word. However, as his writings are serious and oblige the reader to think, they are not popular in the common meaning of that word with a people whose principal and only aim in life is now, as it has ever been during the last four centuries, "il dolce far niente."

Italian dictionaries are many, but the best are those of Pietro Fanfani, in one large volume, which is sufficiently complete for everyday purposes. A Tuscan, Fanfani had a thorough knowledge of the language, especially as used in his native region, and his method in arranging his work is as useful as it is praiseworthy. This is therefore the Italian dictionary which can be well recommended to the student. Another one, consisting of six large volumes, is that of Niccolò Tommaseo, a splendid and laborious work, done by the single exertions and immense industry of one man, who, only after he became blind, was assisted by another editor. It bears honourable comparison with the *Oxford English Dictionary* of Dr. Murray. But the greatest of all Italian dictionaries is the *Dizionario della Crusca*. Its last edition was begun soon after the revolution of 1848, and has been going on ever since, to-day having reached the letter N; thus it is hoped that it may be completed about 1950, if nothing interferes with the present arrangements. It will take exactly one hundred years to complete—a fair period of time, though an extraordinary one, unequalled in the literary history of any nation. Some critics suggest that such procrastination is due to the fact that the members of the Accademia della Crusca, whose duty it is to prepare that dictionary, get a personal grant from the Government of £40 a year during its publication; but no such suggestion can have any foundation in fact, the academicians being the very best Italian writers now living.

There are a large number of Italian-English and English-Italian dictionaries, but the great majority of them have too many faults to deserve any recommendation. As I am obliged to mention some—those, at least, which have a smaller number of mistakes—the following will prove useful. G. Roberts' *Italian-English and English-Italian Dictionary* has the great advantage of being bound in one volume, and is published at a moderate price. That of Millhouse and Bracciforti is in two volumes, and costs twice as much as that of Roberts, though it is not twice as good. It is a witness to the superior literary merit of Giuseppe Baretti that, although his dictionary was published more than a century and a half ago, and has been reprinted without changes several times, it is still the best English-Italian and Italian-English dictionary that we have. Naturally it does not contain any English or Italian word adopted during the last 150 years; but such words, in the Italian language at least, are not very numerous.

COURSE OF READING

Although an almost complete list of all the best Italian writers has been given, it is thought that a plan for a regular Course of Study, through which a practical knowledge of Italian Literature might be acquired, would be very useful, and save the student from ruinous loss of time.

After mastering the elementary grammatical rules already given, it would be useful to study the *First Italian Reading Book*, drawn up by myself and published by Mr. Murray. It contains extracts from nearly all the best Italian prose writers, both ancient and modern, selected with the view of making the volume interesting as well as useful to the student. Its value is enhanced by the copious grammatical and syntactical notes, which fill half the volume; by the syntactical rules governing the Italian verbs; and by a complete dictionary of all the Italian words contained in the text.

More advanced students should study R. Fornaciari's *Grammatica Italiana dell' uso moderno*, the second volume of which contains a complete Syntax, illustrated by thousands of quotations from Italian classics.

As for the poetical literature of Italy, the most recent publication and the most comprehensive is the little volume containing *Le Cento Migliori Poesie*, published by Messrs Gowans & Gray of Glasgow, of which already a fourth edition has been issued. The work contains Lyrics from authors of every period from the Trecento to the present time.

For those students who, being still more advanced, can give more time to the study of this particular subject, a more extensive course would be the following:

D'Ovidio: *Grammatica storica della lingua e dei dialetti italiani.*

Manzoni: *I Promessi Sposi.* The study of this, the best novel ever published in Italy, will enable the student to become acquainted with the most modern form of Italian prose and the style most natural and acceptable to the Italian mind of the present time. Though it is sometimes ungrammatical, according to the accepted rules of the language, it is the style which best expresses modern ideas by Italians of to-day. It is, in conclusion, the Italian language as it is spoken to-day in Italy, regardless of all rules and of all writers, whether classical or not.

As an alternative to the above novel by Manzoni, we would suggest D'Azeglio's *Ettore Fieramosca*, which has the double advantage of being shorter and of being written in a more correct style.

The next object of study should be the works of Leopardi—all his collected poems, as well as his prose works. Although he flourished early in the nineteenth century, Leopardi wrote like the Italian classics of the Cinquecento. A thorough acquaintance with his works will be the best introduction to these Italian classics. He has also the advantage of presenting to the foreign student the Italian mind at its best, and the political and moral decadence of that unfortunate country in all its nakedness.

Proceeding still further towards the Renaissance, the autobiography of Alfieri, his *Vita*, would repay the reader with a very interesting subject most skilfully dealt with by the author. In it he will find a truthful and realistic description of life in Italy and in England in the eighteenth century, as left to us by no other contemporary writer.

Le Lettere familiari of Giuseppe Baretti should at this stage form the subject to be studied. They are full of information about England and Italy in the eighteenth century, and are written in a correct and easy style. The same author gave us the first Italian-English Dictionary, which is still to-day the best of all.

The *Orlando Furioso* of Ariosto and the *Gerusalemme Liberata* of Tasso should now be read. They present no difficulties whatever; and they are the best examples of Italian poetry, only inferior to Dante's *Divina Commedia.*

Il Principe and the *Istorie fiorentine* of Machiavelli will give the student the best examples of Italian prose. Of the former work there is a recent translation by myself, published in the collection of the *World's Classics*. While concise like Tacitus, Machiavelli possesses a style perfectly clear, his logic being persuasive and convincing.

The poetry of Berni, who gave his name (*bernesco*) to the humoristic poetry of Italy, should be the object of earnest study to those who wish to know the immense wealth of charming idioms possessed by the Italian language. Although often coarse, as was natural at a time when Popes witnessed the obscene plays of a Cardinal da Bibbiena in the Vatican, Berni is always moral in the best sense of the word and witty.

Cellini's *Vita* is the most interesting and entertaining book ever written in Italian. The great artist, whose literary education had been of the most elementary kind, dictated his autobiography to his favourite apprentice, who wrote it with all the peculiarities of the Florentine pronunciation of his gifted master. In it are related innumerable anecdotes of the lives of the great artists who flourished in Italy in the Renaissance, and of the courts of Rome and of Paris, where Cellini had been a welcome guest and a worried artist. His travels through Switzerland to France, his military service in the Castle of Sant' Angelo, when Rome was besieged, taken, and sacked by the army of Charles V. under the command of the Duke of Bourbon, whom Cellini asserts that he killed with a cannon-shot, are some of the events

recorded in that wonderful book, which has had the privilege of being translated into English by Roscoe and into German by Goethe.

Boccaccio's *Vita di Dante* and the greater number of his *Novelle* are the best examples of perfect prose in Italian literature. The most wonderful thing recorded in the literary history of Italy is the fact that, both in prose and in poetry, the earliest writers were absolutely the best—not one of their successors approaching, let alone surpassing, either Dante or Boccaccio.

Of the much-overrated Petrarch, to whom Italy owed the enervated and lackadaisical literature of the subsequent centuries, the only things really worth reading are the *Trionfi* and a few *Canzoni*.

We come at last to the earliest worth recording as well as to the greatest writer in Italian—to him who may be literally qualified as the creator of the Italian language—to Dante. Without mentioning his Latin works, his greatest are *La Vita Nuova*, in which he records his love for his fair neighbour, Beatrice Portinari, and his *Divina Commedia*, the sublime Poem, which placed his name on a level with those of Homer and of Shakespeare. By the time our student has proceeded so far in his Italian study, he will be able to read the Poem without the treacherous help of a translator. As, however, he will require immense information on the history, theology, astronomy, &c., of Dante's times, he will need some indispensable notes to the poem. The most useful of these will be supplied him with the translations of Cary and of Longfellow, which are also the best. The student must be earnestly warned against making use of the many works on the immortal Poem. There are more than ten thousand such books, each one of which seems to have been written rather to gain notoriety for its writer than to illustrate the Poem.

The following volumes may fittingly complete the library of the student of the Italian language and literature :—

N. Caix: *Studi di Etimologia italiana e romanza.*

C. N. Caix: *Le origini della lingua poetica italiana.*

Cesare Cantù: *Storia della Letteratura italiana.*

Baretti: *Dizionario Italiano-Inglese e Inglese-Italiano ;* or Roberts: *Dizionario Italiano-Inglese e Inglese-Italiano.*

LIST OF THE BEST ITALIAN BOOKS

Alfieri, Vittorio: *Vita, Maria Stuarda.*
Alighieri, Dante: *Vita Nuova, Divina Commedia.*
Aretino, Pietro: *Commedie.*
Ariosto, Ludovico: *Orlando Furioso, Satire.*
Azeglio, Massimo: *Ettore Fieramosca, I miei Ricordi.*
Balbo, Cesare: *Storia d' Italia.*
Baretti, Giuseppe: *Lettere familiari.*
Beccaria, Pietro: *Dei delitti e delle pene.*
Berni, Francesco: *Poesie.*
Bibbia, La Santa: *Tradotta dal Diodati.*
Boccaccio, Giovanni: *Vita di Dante, Decamerone.*
Boiardo, Matteo: *Orlando innamorato.*
Botta, Carlo: *Storia d' Italia, Guerra d' Indipendenza.*
Bruno, Giordano: *Opere italiane.*
Buonarroti, Michelangelo: *Rime e lettere.*
Cantù, Cesare: *Gli Eretici in Italia, Margherita Pusterla.*
Carducci, Giosue: *Poesie.*
Caro, Annibale: *Eneide di Virgilio.*
Cellini, Benvenuto: *La Vita.*
Cesari, Antonio: *Bellezze di Dante.*
Chiabrera: *Poesie.*
Colletta, Pietro: *Storia del Reame di Napoli.*
Compagni, Dino: *Le Cronache.*
Croce, Benedetto: *Studi storici.*
Dall' Ongaro, Francesco: *Novelle.*
De Amicis, Eduardo: *Cuore, Gli Amici.*
Della Casa: *Il Galateo.*
Emiliani-Giudici, Pietro: *Storia della Letteratura italiana.*
Filangieri, Gaetano: *Scienza della Legislazione.*
Firenzuola, A.: *Novelle.*
Fogazzaro, Antonio: *Piccolo mondo antico, Piccolo mondo moderno.*
Foscolo, Ugo: *Poesie.*
Fucini, Renato: *Napoli ad occhio nudo.*
Gaggiano, Giulio: *Mala Vita Napolitana.*
Gioberti, Vincenzo: *Scritti letterari.*
Gioia, Melchiorre: *Il Galateo.*
Giusti, Giuseppe: *Poesie, Epistolario.*
Goldoni, Carlo: *Commedie.*
Gozzi, Gasparo: *Novelle e discorsi.*
Grazzini, A. F.: *Le Cene.*
Grossi, Tommaso: *Marco Visconti.*
Guarini, B.: *Il Pastor Fido.*
Guerrazzi, F. Domenico: *Battaglia di Benevento, Assedio di Firenze.*
Guicciardini, Francesco: *Storia d' Italia.*
Leopardi, Giacomo: *Poesie, I Pensieri.*
Lippi, Lorenzo: *Il Malmantile.*
Machiavelli, Niccolò: *Il Principe, Storie Fiorentine, Discorsi.*
Manzoni, Alessandro: *I Promessi Sposi.*
Mazzini, Giuseppe: *Scritti scelti.*
Metastasio, Pietro: *Drammi.*
Monti, Vincenzo: *Aristodemo.*
Nardi, Iacopo: *Storie fiorentine.*
Nievo, Ippolito: *Confessioni di un Ottuagenario.*
Novellino, (Il).
Pandolfini: *Del Governo della Famiglia.*
Parini, Giuseppe: *Poesie.*
Pellico, Silvio: *Le mie Prigioni.*
Petrarca, Francesco: *Il Canzoniere, I Trionfi.*
Pindemonte, Ippolito: *Odissea.*
Poliziano, Angelo: *Opere volgari.*
Polo, Marco: *Libro del Milione.*
Pulci, Luigi: *Il Morgante.*

Rosa, Salvatore: *Le Satire.*
Rosini, Giovanni: *Luisa Strozzi, La Monaca di Monza.*
Sacchetti, Francesco: *Le Novelle.*
Sarpi, Fra Paolo: *Lettere.*
Savonarola, Girolamo: *Prediche.*
Sestini, B.: *Pia de' Tolomei.*
Tasso, Torquato: *La Gerusalemme liberata, Aminta.*
Tassoni, A.: *La Secchia rapita.*
Tommaseo, Niccolò: *Il Serio nel Faceto.*
Vasari, Giovanni: *Vite dei Pittori.*
Verri, Pietro: *Storia di Milano.*
Villari, Pietro: *Girolamo Savonarola.*
Vinci, Leonardo da: *Frammenti letterari, Trattato della Pittura.*
Yorick: *Su e giù per Firenze.*
Zanella: *Poesie.*

LUIGI RICCI.

THE GERMAN LANGUAGE AND LITERATURE

HISTORY OF THE GERMAN LANGUAGE

At the present day the German language is spoken in the German Empire, in Austria proper, in many provinces of the Austro-Hungarian Monarchy, in German Switzerland, in the Grand Duchy of Luxemburg, and by the upper classes in the Baltic Provinces of Russia. It belongs to the West Germanic group of the Teutonic idiom (see article on "Philology"), and falls into two main divisions: (1) The Low German, and (2) the High German dialects. The home of the former is the low-lying, flat North, whereas the latter is spoken in the mountainous districts of Central and Southern Germany. The modern literary idiom arose on Central German territory, and is therefore High German in character. Although the terms "High" and "Low" are purely geographical in origin, the term "High German" is now popularly used to describe the standard language of the "Higher Classes," the idiom of literature as opposed to the dialects of the common people. Outside the modern German Empire, the Low German dialect of Holland has developed into a literary idiom, the Dutch language, on account of the political independence of the Netherlands.

The fundamental difference between the Low German and High German dialects was caused by the so-called second or High German Shift of Consonants which affected the sounds *p*, *t*, *k*, and changed them into other consonants or consonant combinations, according to the rules given below:

1. Initially.	2. After Consonants and when Double.	3. After Vowels.
p becomes *pf*	*p* becomes *(p)f*	*p* becomes *pf*
t ,, *z*	*t* ,, *(t)z*	*t* ,, *ss*, *sz*
k remains *k*	*k* remains *k*	*k* ,, *ch*

As the original consonants are preserved in English as well as in Low German, the latter form of speech is much more like the former than High German, and it is possible to give English examples to illustrate the sound-changes of the Second Shift of Consonants:

(1) *plant*=Pflanze; *ten*=zehn; *can*=kanne. (2) *cup*=Kopf (*head*); *help*=Hülfe; *cat*=Katze (from older *catt*); *heart*=Herz; *buck*=Bock. (3) *ship*=Schiff; *eat*=essen, *sat*=sasz; *make*=machen, &c. &c.

In the history of the High German language—for the Low German and Dutch idioms do not concern us here—three periods are usually distinguished: (1) The Old High German, extending from the time of the Second Shift (about 600) to about 1100; (2) the Middle High German period, 1100–1450; (3) the Modern High German period, 1450 to the present day.

The modern literary language is the product of the third period, which begins, for practical purposes, with Luther's activity as a translator. In England, France, and other countries, the language of literature developed out of the speech of the capital. This was not the case in Germany. The history of the German language (and literature) is characterised by the lack of an abiding centre. To this very day, the constitution of the Empire provides a number of capitals; by the side of Berlin—a very young city—we find the important towns of Dresden in Saxony, Munich in Bavaria, the Free Town of Hamburg, the Rhenish metropolis of Cologne, and many more, each proudly preserving its intellectual independence. Outside the Empire, Vienna forms a centre of literary activity, and so do the large and ancient cities of German Switzerland—Basel, Zürich, and Berne.

The literary language of the twelfth century, which had its home in Swabia, did not survive the decay of chivalry. The new common idiom was "invented"—if one may use this word here—to meet the exigencies of political life; it was created, in the first instance, in the chancelleries of the various rulers throughout the old Empire. About the year 1250, people began to write letters of State, documents, and laws in the German language, which gradually ousted Latin from its pre-eminent position. At first, every prince would naturally employ the local dialect. As, however, many documents were written for the purpose of exchange, and as letters were received from other districts which served as models, the more outstanding features of the respective dialects were slowly abandoned. It also happened that the smaller courts adopted the form used in the chancellery of some more powerful neighbour. In the fifteenth century, two principal chancelleries attract our attention: that of the Elector of Saxony, and that of the Emperor. In importance they overshadow all the rest, and are alone destined to play a part in the future development of the language. The former's basis is the High German idiom spoken in "Obersachsen," the country round Meissen; the

latter represents South German speech, particularly that of Austria and Bohemia.

These two chancelleries slowly began to approach each other; the Saxon dropped certain peculiarities of its Central German character, adopting Upper German forms instead, and vice versa. Thus a tolerably uniform language was evolved. But it required the genius of a great man to transform the newly developed result of compromise into the generally accepted medium of literary intercourse. This task was performed by Luther. The great reformer wished to produce a translation of the Bible which could be understood by the people at large. For that purpose, he had to adopt a form of speech acceptable to all the inhabitants of so large and diversified a country as Germany. He deliberately chose the language of the Saxon chancellery. He, of course, found the vocabulary too limited for his purpose, and he had to draw upon all the various dialects—chiefly on his own native one, that of "Obersachsen," of Meissen, and Eisleben.

Luther's language, as it was called, soon conquered the Protestant north of Germany; it became the language of the Church, of hymns, prayer, and sermon. It was adopted for all purposes of literary expression, although in their homes the people continued to use the Low or German idiom. There were no obstacles to a general acceptance of the language of Luther's Bible in Central Germany; that part of the country was more or less the home of the new idiom.

In the South, however, "Luther's German" met with a strong resistance, chiefly in the Catholic districts of Bavaria and Austria, and also in Calvinistic Switzerland. Here in the sixteenth century, Luther's authority in linguistic matters was far from being generally recognised. Indeed, two other literary idioms existed by the side of his: (1) The South German (Bavarian), and (2) the Swiss. By degrees, however, the Central German literary language gained recognition in Switzerland, and one may say that by the year 1700 it had been generally accepted in that country.

The Catholic districts of Bavaria held out half a century longer: they were not only unwilling to abandon their native idiom, but also objected to the introduction of a language with which the name of the hateful heretic was inseparably connected.

The German standard language is not the product of one single district or locality. After Luther's time, its vocabulary was enriched by borrowings from all dialects as well as by the introduction of many foreign words, taken both from classical and modern languages. In the Romantic period, numerous words that had been lost were revived by students of mediæval literature.

Whereas unity is now attained as far as the literary language is concerned, the local dialects have by no means perished entirely. Among the educated classes, the pronunciation still varies very considerably, and in conversation many local expressions and words are used that are never written, except in familiar letters. The pure, old, genuine dialects have naturally suffered; yet the common people in many districts still speak distinct idioms, and efforts are being made in various quarters to preserve them, and even to revive interest in them among educated people.

GERMAN GRAMMAR

General Directions.—I. This brief treatise on grammar is intended to serve as an introduction to the more thorough study of the German language. The German extracts should be carefully read through and compared with the English versions. It is very important that the learner should from the very beginning endeavour to acquire an extensive vocabulary. Every word met with should be put down in a note-book, the nouns with their respective articles, the genitive singular and nominative plural forms, the verbs in the infinitive, together with the 1st person singular of the imperfect, and the past participle. For example—*Nouns:* 'der Mensch,' *man, human being*, 'des Menschen,' *of* (*the*) *man*, 'die Menschen,' (*the*) *men*;—'der Mann,' *man, male person*, 'des Mannes, die Männer';—'die Seele' (feminine), *the soul*, 'der Seele,[1] die Seelen';—'das Wasser' (neuter), *the water*, 'des Wassers, die Wasser' (or 'Wässer'). *Verbs:* 'kommen' (strong verb), *to come*, 'ich kam,' *I came*, 'gekommen,' (*have*) *come*;—'wechseln' (weak verb), *to change*, 'ich wechselte, gewechselt.'[2]

The student is advised to obtain an exercise book and put down each rule at the head of a separate page. He should then enter all passages illustrating the rule underneath as he discovers them in his reading.

In order to find out the particulars about these and other words, they should be looked up in a dictionary. Cassel's *German Dictionary* can be recommended; Langenscheidt's *Pocket Dictionary of the English and German Languages* is an excellent little work, with the pronunciation of each word indicated in a simple phonetic notation. The following grammars will prove useful to the beginner: Wilson, *Outlines of German Grammar* (Clarendon Press); Atkins, *German Skeleton Grammar* (Blackie); those wishing to make a more thorough study of the language may be referred to Eve's *German Grammar*.

[1] In the case of feminine nouns it is not necessary to put down the genitive singular, as feminine nouns never change in the singular.

[2] The past participle of weak verbs need not be put down separately, as it can be derived from the imperfect by simply omitting the final *e* and prefixing *ge*.

II. The so-called *Gothic* or *German Characters* are used throughout the Empire for the printing of newspapers, periodicals, fiction, and poetry. The Roman letters are used for ornamental purposes, and more or less generally in scientific works. The learner of German must therefore make himself familiar with the black-letter type at an early stage. This should not be very difficult, as he will be used to seeing and reading a slightly modified variant in English ornamental printing. He need not acquire the art of using *German Script*, as the Roman letters may be used in writing German. He will, however, be obliged to learn to read the former if he wishes to correspond with Germans; for the Gothic letters are used almost universally by Germans writing in their own language.

All *Nouns* are written with initial capital letters. However strange this may appear to the foreigner, he will find it useful when beginning to learn the language, for he will be able to pick out the nouns and separate them from adjectives, verbs, &c., without much trouble.

German *Punctuation* differs from English in many respects. It should be closely studied in the texts from the beginning, for it may be of great help to the translator. The rule is that complete sentences, whether principal sentences or dependent (subordinate) clauses, or infinitive clauses of more than three words with 'zu' and 'um zu,' must be separated from each other by commas.

English and German have a common origin, but English has now lost much of its former Teutonic character and structure. Many German *Peculiarities of Syntax* and *Word Order* are, however, still represented in English by isolated instances in the language of prose. They are more frequent in English obsolete, and poetic diction. On the following pages the learner's attention is drawn to cases of this kind.

First Lesson.—Read and memorise the following poem. The verbal forms are printed in italics.

For a short treatise on German pronunciation, see p. 324.

GESANG DER GEISTER ÜBER DEN WASSERN	SONG OF THE SPIRITS OVER THE WATERS
Des Menschen Seele	The soul of man
gleicht dem Wasser:	is like the water:
vom Himmel *kommt* es,	from heaven it comes,
zum Himmel *steigt* es,	to heaven it rises,
ewig *wechselnd*.	eternally changing.
Strömt von der hohen,	If [there] flows from the high
steilen Felswand	steep rocky wall
der reine Strahl,	the pure stream, [tiful spray
dann *stäubt* er lieblich	(then) it falls down like beau-
in Wolkenwellen	in cloudy waves
zum glatten Fels,	on to the smooth rock,
und leicht *empfangen*,	and lightly received,
wallt er *verschleiernd*,	it flows down
leis *rauschend*	softly (rippling)
zur Tiefe nieder.	into the depth.
Ragen Klippen	If jutting cliffs
dem Sturz entgegen,	oppose the fall, [angry
schäumt er unmutig	it leaps down foaming and
stufenweise	step by step
zum Abgrund.	into the abyss.
Im flachen Bette	In (the) level channel
schleicht er das Wiesental hin,	it creeps along the meadowy valley,
und in dem glatten See	and in the smooth lake
weiden ihr Antlitz	all stars regard their faces
alle Gestirne.	with delight.
Wind *ist* der Welle	Wind is the wave's
lieblicher Buhler;	beautiful wooer;
Wind *mischt* von Grund aus	wind stirs up from the deep
schäumende Wogen.	the foaming waters.
Seele des Menschen,	Soul of man,
wie *gleichst* du dem Wasser!	how like to the water!
Schicksal des Menschen,	Fate of man,
wie *gleichst* du dem Wind!	how like to the wind!
(GOETHE, *geschrieben* in der Schweiz im Jahre 1779.)	(GOETHE, written in Switzerland in 1779.)

III. *Notes on Grammar, Word Order, &c.—Forms of the Definite Article.*—The German language recognises *Three Genders:*

	MASCULINE.	NEUTER.	FEMININE.	PLURAL OF ALL GENDERS.
Nom.	der	das	die	die
Gen.	des[sen]		der[en]	der[en]
Dat.	dem		der	den[en]
Acc.	den	das	die	die

The article is also used as a relative pronoun (=which, who, &c.); in the latter case, four forms take an additional -*en*, as indicated above in square brackets.

l. 1. This would be in prose: 'die Seele des Menschen'; compare l. 26.

l. 2. 'gleich-t,' a weak verb, infinitive 'gleich-en.' *t*, the ending of the 3rd person singular, is added to the stem. Compare 'komm-t,' 'steig-t,' &c.

l. 3. 'vom,' contracted form of 'von dem'; similarly, 'zum'='zu dem,' 'zur'='zu der,' &c.

l. 4. The word order deviates from English: 'es' the subject follows the verb instead of preceding it. This *Inversion* takes place in the principal sentence. (1) If anything but the subject begins the sentence. Here, as most usually happens, an adverbial phrase stands at the beginning. Compare ll. 22, 24. (2) If the principal sentence is preceded by a dependent clause. Compare l. 18. The same order, of course, prevails in questions. For a fourth case of inverted order, see note to l. 6.

l. 5. 'ewig' is an adverb; adjectives may be used as adverbs without ending. Compare 'leicht,' l. 12; 'leis(e),' l. 13. In English we find *to talk loud*, &c.—'wechsel-nd,' the usual ending is -*end*, but after an unstressed *el* or *er*, the *e* is dropped.

l. 6. The adjective 'hoch' has *h* instead of *ch* in all forms of more than one syllable, except in 'der höchste,' &c., *the highest*. Compare 'der hohe Baum,' *the high tree*.

l. 6. Here we find *Inversion* without apparent reason, for the sentence is neither a question, nor does it begin with an adverb or adverbial phrase. In the present case, inversion expresses *condition*, and we must translate *if*. . . . This construction is very frequent in German (see l. 16). In English it occurs under

certain conditions only, as in "had I not held him back . . . ," "were he not my brother . . . ," &c.

l. 7. 'Felswand,' a compound; compound nouns are written in one word in German.

l. 9. 'dann' in the beginning of the sentence causes *Inversion*.

l. 10. 'Wolkenwelle(n),' another compound. Nouns that take *-en* in the plural (*weak nouns*) almost invariably end in *-en* when used as the first part of a compound. Compare l. 22. The more usual form of the noun in l. 7 is 'Felsenwand.'

l. 12. 'empfang-en,' the past participle of a *Strong Verb*, infinitive 'empfang-en.' The past participle of strong verbs always ends in *-en*. Compare English *ridden, eaten*.

l. 14. The usual form of the adjective and adverb is 'leise.'

l. 17. A certain number of *prepositions* follow the noun—*e.g.* 'dem Flusz entlang,' *along the river*; 'den Berg hinauf,' *up the mountain*.

l. 18. An adverbial formation derived from 'die Stufe,' *the step*. Compare 'gleicherweise,' *likewise*; 'glücklicherweise,' *fortunately*.

l. 25. Most nouns beginning with *Ge-* are neuter and have a collective sense: 'der Stern,' *the star*.

l. 27. The noun is used in this sense in poetry only.

ll. 31–33. Inversion caused by the preceding 'wie.'

'ge-schrieb-en,' infinitive 'schreib-en,' a strong verb, imperfect: 'ich schrieb,' *I wrote*.

Second Lesson.—*Note.*—The symbol ß (read *s–z*) is a *sharp s*, and may be rendered by *ss*. It is found for *ss* at the end of words and before *t* ('Schlösser'=*castles*, 'das Schlosz,' *the castle*), and between vowels, if the preceding vowel is pronounced long ('die Mäße,' *the measures*—'die Masse,' *the mass, quantity*).

Wir *nahmen* freundschaftlich Abschied, und fröhlich *stieg* ich den Berg *hinauf*. Bald *empfing* mich eine Waldung himmelhoher Tannen, für die ich in jeder Hinsicht Respekt *habe*. Diesen Bäumen *ist* nämlich das Wachsen nicht so ganz leicht *gemacht worden*, und sie *haben* es sich in der Jugend sauer *werden lassen*. Der Berg *ist* hier mit vielen groszen Granitblöcken *übersat*, und die meisten Bäume *muszten* mit ihren Wurzeln diese Steine *umranken* oder *sprengen*, und mühsam den Boden *suchen*, woraus sie Nahrung *schöpfen können*. Hier und da *liegen* die Steine, gleichsam ein Tor *bildend*, übereinander, und oben darauf *stehen* die Bäume, die nackten Wurzeln über jene Steinpforte *hinziehend*, und er stam Fusze derselben den Boden *erfassend*, sodasz sie in der freien Luft zu *wachsen scheinen*. Und doch *haben* sie sich zu jener gewaltigen Höhe empor *geschwungen*, und, mit den umklammerten Steinen wie *zusammengewachsen*, *stehen* sie fester als ihre bequemen Kollegen im zahmen Forstboden des flachen Landes. So *stehen* auch im Leben jene groszen Männer, die durch das Überwinden früher Hemmungen und Hindernisse sich erst recht *gestärkt* und *befestigt haben*. Auf den Zweigen der Tannen *kletterten* Eichhörnchen und unter denselben *spazierten* die gelben Hirsche. Wenn ich solch ein liebes, edles Tier *sehe*, so *kann* ich nicht *begreifen*, wie gebildete Leute Vergnügen daran *finden*, es zu *hetzen* und zu *töten*. Solche ein Tier *war* barmherziger als die Menschen, und *säugte* den schmachtenden Schmerzenreich der heiligen Genovefa.—Heine, *Harzreise*.

We took leave (of each other) in a friendly manner, and with a light heart I ascended the mountain. I was soon received by a grove of sky-high pines, for which I in every way entertain (the most reverential) respect. For to these trees growing has not been made quite so easy, and they have, in their youth, given themselves a great deal of trouble. The mountain is here sprinkled with numerous big blocks of granite, and most of the trees had been obliged to twine their roots round these stones or to split the latter, and with trouble to seek the soil from which they might derive nourishment. Here and there the stones are lying on each other, forming as it were, a gate, and on the top the trees grow, dragging their naked roots across that stone gate, and seizing the soil only at the base (foot) of the latter, so that they seem to be growing in the (open) air. And yet they have risen to that tremendous height, and as if grown into one with the encircled stones, they stand firmer than their lazy comrades in the tame forest soil of the level country. Thus stand in life those great men who have all the firmer strengthened and established themselves by subduing the (retardations and) obstacles of their youth. Amid the branches of the pines squirrels were climbing, and beneath (them) the yellow (-brown) stags (deer) quietly walked. When(ever) I see such a dear, noble animal I cannot comprehend how educated people (can) take pleasure in chasing and killing it. Such an animal was once more merciful than men, and suckled the starving *Schmerzenreich* (rich in pain) of St. Genoveva.—Heine, *Journey through the Harz Mountains*.

IV. *Study of Word Order.*—The order of words differs in principal and subordinate sentences. *Principal* sentences are such as convey in themselves an idea without the addition of another sentence. *Subordinate* sentences or clauses are such as require another, principal, sentence on which they depend, and without which they have no meaning.

Let us take the conditions in dependent clauses first.

A. The general rule is, that in *Dependent Clauses* the finite verb, *i.e.* the changeable, inflected part of the verb, comes last. In infinitive clauses, the infinitive comes last. We find the following types of dependent clauses:

(1) The ordinary (finite) verb with or without an object.

(*a*) 'laufen,' *to run*. '(Ich sehe,) daß das Pferd läuft,' (*I see*) *that the horse runs*.

(*b*) 'sehen,' *to see*. '(Er weisz es,) weil er die Tat gesehen hat,' (*He knows it*) *because he saw* (*has seen*) *the deed*.

(2) 'sein,' *to be*, and 'werden,' *to become*, with adjectives or nouns.

(*a*) '. . . weil er ein Mensch (müde) ist,' *because he is a man* (*tired*).

(*b*) '. . . dasz mein Bruder Soldat wird,' *that my brother becomes* (*a*) *soldier*.

(3) The past participle and infinitive with an auxiliary verb:

(*a*) 'werden' with a past participle, the passive voice: '. . . weil die Türe geöffnet wird,' *because the door is* (*being*) *opened*.

(*b*) '(Wir wissen,) dasz Sie gewartet haben,' (*we know*) *that you have waited*.

(*c*) '(Wir wissen,) dasz sie fortgegangen ist,' *that she has gone away*.

(*d*) Infinitives with 'können,' 'müssen,' 'sollen,' &c.: '. . . weil ich das Buch nicht finden kann,' *because I cannot find the book*.

(4) Verbs with separable prefixes go to the end of the dependent clause, and do *not* separate from their prefixes: '(Wir sahen,) wie unser Freund den Berg hinaufstieg,' *we saw how our friend ascended the mountain.*

In the infinitive clause, the 'zu,' *to*, comes between the prefix and the verb, all three being written as one word: 'vorgehen,' *to advance.* 'Friedrich befahl seinen Generalen, gegen die Festung vorzugehen,' *Frederic commanded his generals to advance against the fortress.*

B. The normal order in *Principal Sentences* is as follows:

SUBJECT.	FINITE VERB.	ADVERBS.[1]	DIRECT OR ACC. OBJ.	COMPLEMENT
Die Perser	haben	früher auf Bergen	die Sonne	verehrt.
The Persians	*have*	*formerly on mountains*	*the sun*	*worshipped.*

The *Complement* may assume *five* different forms.

(1) The complement may be completely absent:

Napoleon	gewann	im Jahre 1805	die Schlacht bei Jena.
Napoleon	*won*	*in 1805*	*the battle of Jena.*

(2) The complement may be the *Separable Prefix* of a compound verb. In the study of texts, beginners should carefully look for a possible prefix at the end of principal sentences. This prefix should be combined with the infinitive form of the finite verb, and the *compound* verb should be looked up in the dictionary. The meaning of the compound verb often is totally different from that of the original verb. Thus in the following sentence 'vorkommen' means *to occur*, whereas 'kommen' = *to come.*

(Der) Bernstein	kommt	fast nur an einigen Stellen der Ostsee	vor.
Amber	*occurs*	*almost exclusively in a few places on the Baltic.*	

(3) The complement may be the *Past Participle* of a compound tense:

Goethe	hat	in Frankfurt	seinen 'Werther'	geschrieben.
Goethe	*has*	*at Frankfurt*	*his 'Werther'*	*written.*
'Werther'	wurde	in Frankfurt		geschrieben.
'Werther'	*was*	*in Frankfurt*		*written.*
Mein Freund	ist	gestern nach Rom		abgereist.
My friend	*has*	*yesterday for Rome*		*left.*

(4) The complement may be an *Infinitive* without 'zu' after 'sollen,' 'müssen,' 'können,' 'wollen,' &c., or with 'zu' after 'sein,' 'haben,' 'wissen,' 'befehlen,' &c.:

Hannibal	wollte	in Norditalien	die Römer	überraschen.
Hannibal	*wished*	*in Northern Italy*	*the Romans*	*to surprise.*
Scipio	befahl	darauf	dem Heere	anzugreifen.
Scipio	*commanded*	*thereupon*	*the army*	*to attack.*

[1] Note that adverbs and adverbial expressions may also follow the object: 'Die Perser haben früher die Sonne auf Bergen verehrt,' &c.

Note.—The complement may consist of two past participles, as in the *Passive Construction*; in that case 'worden' (from 'werden') goes to the end: 'Die Römer waren bei Cannae von Hannibal besiegt worden,' *the Romans had been beaten by Hannibal at Cannae.*

It may consist of past participle + infinitive; in that case the former comes last: 'Mein Freund hat mich oft ihm zu schreiben gebeten,'' *my friend has often asked me to write (to him).* In sentences of this kind, however, the infinitive may be treated as a special (infinitive) clause: 'Mein Freund hat mich oft gebeten, ihm zu schreiben.'

Note.—The verbs of mood, 'müssen,' 'wollen,' &c. (see p. 313), and the verbs 'lassen,' *to let, allow, make to*; 'sehen,' *to see*; 'hören,' *to hear*, change the past participle into the infinitive, when the past participle is connected with another dependent infinitive. Instead of 'Sie hat nicht kommen gewollt,' it is correct to say, 'Sie hat nicht kommen wollen,' *she did not wish to come.* Similarly, 'Er hat das Buch binden lassen' (instead of 'gelassen'), *he has had the book bound.* When combinations of this kind occur in dependent clauses, the rule that the auxiliary, *i.e.* the finite verb, comes last is broken. The auxiliary precedes the two infinitives: 'Wir denken, dasz er den Brief nicht hat schreiben wollen,' *we think that he did not wish to write the letter.*

(5) The complement may be an *Adjective* or *Noun* after 'sein,' 'werden,' or other verbs:

Das Wetter	war	vergangenen Sommer	sehr warm.
The weather	*was*	*last summer*	*very warm.*
Die Stadt	lag	nach der Beschieszung	wie tot.
The town	*lay (was)*	*after the bombardment*	*as dead.*

(6) There are several stereotyped phrases consisting of verbs and substantives with prepositions or adjectives, which are treated as if the substantives or adjectives were the prefixes of separable verbs (see No. 2 above). Examples: 'zu Grunde gehen,' *to perish*; 'Die Expedition ging vor zwei Jahren im Polareis(e) zu Grunde (zugrunde),' *the expedition perished in the polar ice two years ago*; 'zu Stande bringen,' *to accomplish*; 'um Rat fragen,' *to ask for advice, to consult*; 'still stehen,' *to stand still*—'Der Zug stand plötzlich auf offener Strecke still,' *the train suddenly stopped in the open*; 'fest halten,' *to hold fast, to cling to.*

C. *Inversion in Principal Sentences.*—When for some reason or other the normal order (subject—finite verb) is broken—that is to say, when subject and finite verb change places, so that the latter precedes the former—we call this process *inversion.* Its extremely frequent occurrence may cause some difficulty to beginners.

(1) Inversion is found—as in English—in the *Interrogative Sentence*: 'Haben Sie London besucht?' *have you visited London?* 'Liegen

die Bücher auf dem Tisch ?' *do the books lie on the table ?*

Note that in the German question the auxiliary 'tun,' *to do*, is *not* used.

(2) If *Anything but the Subject* begins the sentence, the subject comes *after* the finite verb. The principal cases belonging here are enumerated below.

(*a*) An *adverb or adverbial phrase* may cause inversion: 'Gestern las ich Schillers Räuber,' *yesterday I read Schiller's 'Robbers.'* 'Trotz der Sommerhitze muszten die Schnitter weiter arbeiten,' *in spite of the heat the reapers were obliged to continue working.* 'Gewaltig schlug Siegfrid auf den Ambosz,' *Siegfrid powerfully struck the anvil.*

Note.—The five conjunctions, 'allein,' *however;* 'denn,' *for;* 'sondern,' *but;* 'und,' *and;* 'oder,' *or;* 'aber,' *but;* 'nämlich,' *namely, for,* do *not* affect the order of the principal sentence: 'Denn Shakespeare war ein gröszerer Dichter als Marlowe,' *for Shakespeare was a greater poet than Marlowe.*

(*b*) Any part of the sentence placed at the beginning *for emphasis* causes inversion: 'Die angenehme Nachricht hat man ihm gestern nicht mitgeteilt,' *the happy news one did not communicate to him yesterday* (they did not tell him the happy news yesterday).

(*c*) If the principal sentence is preceded by a *Dependent Clause*, inversion takes place. In most cases, the clause is simply an elaboration of an adverbial phrase: 'Wenn der Frühling kommt, schmilzt der Schnee in den Tälern,'' *when spring comes, the snow melts in the valleys.* 'Als Elisabeth gestorben war, wurde Jakob ihr Nachfolger,' *when Elizabeth had died, James became her successor.* 'Weil diese Bäume zu viel Schatten geben, will der Besitzer sie abhauen,' *because these trees give too much shadow the owner intends to cut them down.*

(3) Inversion may express *Condition* or *Supposition*, as in the following cases: 'Wäre (*subjunctive*) Schiller nicht aus Stuttgart geflohen, so hätte er vielleicht das Schicksal Schubarts geteilt,' *if Schiller had not fled from Stuttgart he might perhaps have shared the fate of Schubart.* 'Besäsze England noch seinen früheren Waldreichtum, so wäre dies für die Nation von groszem Werte,' *if England still possessed its former wealth of words, this would be of great value to the nation.*

Note.—In the above the rules governing the relative position of subject and verb have been discussed chiefly. The position of the other parts of the sentence is less strictly regulated, and the beginner will soon learn where to place them by the careful study of texts.

V. *Notes on the Second Extract.*

l. 1. 'nehmen,' *to take;* 'ich nahm, *I took;* 'genommen,' *taken.*

l. 3. Infinitive: 'hinaufsteigen,' *to ascend;* 'ich stieg hinauf, hinaufgestiegen.'

l. 4. 'mich,' *me;* accusative of 'ich.' In a principal sentence, pronouns come immediately after the finite verb; if inversion takes place, they may either precede (as in the above case) or follow the subject.

l. 6. 'h. Tannen' is genitive plural.

l. 9. 'Das Wachsen,' *growing, growth;* any infinitive may be used as a neuter noun, which corresponds to the English formation in *-ing:* 'Das *Schreiben* dieses Briefes hat lange gedauert,' *the writing of this letter has taken* (*lasted*) *a long time.*

l. 12. 'ich lasse es mir sauer werden,' an idiom, literally, *I cause it* (something indefinite, or the thing just mentioned) *to become unpleasant to me;* 'mir,' dative of 'ich.'

l. 14. 'der Block'; plural, 'die Blöcke.'

l. 19. 'wo,' literally *where*, is here used as a relative pronoun = *which.* It is followed, not preceded, by prepositions, and if the latter begins with a vowel, an *r* is inserted: 'Die Feder, womit (mit der) Bismarck den Vertrag unterschrieb,' *the pen with which Bismarck signed the treaty.*

The same applies to the adverb and pronoun 'da,' *there:* 'Da ist der Wald; viele Bäume befinden sich darin (in ihm),' *there is the wood; many trees are in it.*

l. 20. Normal order: 'Sie können schöpfen.'

l. 28. 'der-selbe,' *the same;* 'derselben' is genitive singular feminine, and refers to 'die Steinpforte.'

l. 31. Inversion caused by 'doch,' not by 'und.'

l. 33. 'geschwungen,' past participle of 'schwingen.'

l. 34. 'umklammert,' past participle of 'umklammern,' used as an adjective.

l. 35. The infinitive to this past participle is 'zusammenwachsen.'

l. 42. 'das Überwinden,' infinitive used as a neuter noun.

l. 51. 'so' is not to be translated into English.

l. 53. A peculiar German construction which requires a lengthy explanation. The idiom is 'Vergnügen finden an etwas,' *to take pleasure in* (*something*). In English, this is usually followed by a verb in *-ing*, as, for instance, . . . *in chasing.* This construction in *-ing*, or rather in the corresponding *-end*, is unknown in German. Instead, there are two other possibilities: (1) The *an* (or whatever the preposition is) may be followed by the verbal noun, *i.e.* by the infinitive used as a neuter noun: 'Gebildete heute finden Vergnügen am (= an dem) Jagen dieser Tiere,' . . . *in chasing* (*of*) *these animals.* (2) More frequently, however, the preposition is prefixed by

'da(r)' and put in the principal sentence, the second verb being given in a separate infinitive or 'dasz' clause, as in the text. Examples: 'sich verlassen auf, *to rely upon.* 'Sie können sich darauf verlassen, dasz ich kommen werde,' *you can rely on my coming* (*that I shall come*); or, 'Sie können sich auf mein Kommen verlassen.'—'hören von,' *to hear about.* 'Wir haben nichts davon gehört, dasz er uns besuchen will,' *we have heard nothing of his intention to visit us.* The alternative construction is clumsy, but not impossible: 'Wir haben nichts von seinem uns Besuchen wollen gehört.'

l. 57. 'als' is used after the comparative =*than.*

l. 58. 'schmacht-end,' present participle to 'schmachten,' *to starve,* used as an adjective.

Note.—Make a close study of the word-order in the following two passages.

Third Lesson.—The two subjoined extracts form a complete contrast, both in style and vocabulary. The first is couched in extremely simple and homely language; the second is characteristic of Schiller's ponderous, somewhat artificial prose.

Als der Tag anbrach, noch ehe die Sonne aufgegangen war, kam schon die Frau und weckte die beiden Kinder: "Steht auf, ihr Faulenzer, wir wollen in den Wald gehen und Holz holen." Dann gab sie jedem ein Stückchen Brot und sprach: "Da habt ihr etwas für den Mittag, aber eszt's nicht vorher auf, weiter kriegt ihr nichts." Gretel nahm das Brot unter die Schürze, weil Hänsel die Steine in der Tasche hatte. Danach machten sie sich alle zusammen auf den Weg nach dem Wald. Als sie ein Weilchen gegangen waren, stand Hänsel still und guckte nach dem Haus zurück und tat das wieder und immer wieder. Der Vater sprach: "Hänsel, was guckst du da und bleibst zurück; habe acht und vergisz deine Beine nicht." "Ach Vater," sagte Hänsel, "ich sehe nach meinem weiszen Kätzchen, das sitzt oben auf dem Dach und will mir Ade sagen." Die Frau sprach: "Narr, das ist dein Kätzchen nicht, das ist die Morgensonne, die auf den Schornstein scheint." Hänsel aber hatte nicht nach dem Kätzchen gesehen, sondern immer einen von den blanken Kieselsteinen aus seiner Tasche auf den Weg geworfen.

Als sie mitten in den Wald gekommen waren, sprach der Vater: "Nun sammelt Holz, ihr Kinder, ich will ein Feuer anmachen, damit ihr nicht friert." Hänsel und Gretel trugen Reisig zusammen, einen kleinen Berg hoch. Das Reisig ward angezündet, und als die Flamme recht hoch brannte, sagte die Frau: "Nun legt euch ans Feuer, ihr Kinder, und ruht euch aus, wir gehen in den Wald und hauen Holz. Wenn wir fertig sind, kommen wir wieder und holen euch ab."—Aus *Grimms* '*Märchen.*'

At daybreak (when day began), even before the sun had risen, the woman came and roused the two children: 'Get up, (you) laggards, let us go into the forest to fetch food.' Then she gave (to) each a small piece of bread and said: 'Here is something for (your) dinner, but don't eat it (up) before; you will get nothing else (further).' Gretel carried the bread under her apron, because Hänsel had the stones in his pocket. After that they started all together for the forest. When they had walked a short while, Hänsel stopped and looked back at the house, and did this again and again. The father said: 'Hänsel, what are you looking for, and why do you lag behind? Take care, and do not forget that you have legs.' 'Oh, father,' said Hänsel, 'I am looking at my little white cat, which is sitting high upon the roof and wishes to say good-bye to me.' The woman said: 'Fool, that is not your little cat, it is the morning sun, which shines on the chimney-top.' But Hänsel had not been looking at the kitten, but (had) each time dropped one of the shining pebbles from his pocket on the road.

When they had come (right) into the middle of the forest the father said: 'Now (go and) gather wood, you children; I mean to light a fire, so that you may not be cold.' Hänsel and Gretel collected dead wood (a heap) as high as a small mountain. The dead wood was lighted, and when the flame was burning very high the woman said: 'Now lie down by the fire, (you) children, and rest; we are going into the forest to cut wood. When we have finished, we (shall) come back and fetch you.'—From *Grimm's* '*Fairy Tales.*'

VI. *Notes and Explanations.*—l. 1. 'als,' *when,* is used in connection with a single act *in the past;* 'wenn'=*when,* is used of recurring actions, to describe a habit, &c.—'z.B.' (*e.g.*), 'Wenn der Tag anbrach, kam die Frau,' *regularly at daybreak.* . . .

l. 3. The usual meaning of 'schon' is *already;* in many cases, however, it only slightly modifies the meaning of the whole sentence, and cannot be translated literally. In the present case it emphasizes the word 'noch,' *even* (l. 1).

l. 9. 'Stück-chen,' the diminutive of 'Stück,' *piece.* Diminutives are formed by adding *-chen* to the stem; all diminutives are neuter. If the vowel of the stem is *a, o, u,* or *au,* the addition of *-chen* causes 'mutation'—*i.e.* the vowel is changed into *ä, ö, ü,* or *äu.* In Southern German the diminutive suffix *-lein* is used with the same effect. Formations in *-lein,* or *-el, -le* (short for *-lein*), are often met with in poetry. 'Beispiele,' *examples:* 'der Garten,' *the garden,* 'das Gärtchen'; die Flasche,' *the bottle, flask,* 'das Fläschchen'; 'das Brot,' *the bread,* 'das Brötchen,' *the roll;* 'Hans,' short for 'Johannes,' 'Hänsel,' &c.

l. 12. 'Mittag,' *noon,* for 'Mittagessen,' *dinner.*

l. 12. 'eszt's,' contracted form of 'eszt es.'

l. 13. 'weiter' is put at the head of the sentence for emphasis; it belongs to the last word: 'nichts weiter,' *nothing further.*

l. 17. 'da-nach' (compare V). 'da' is a kind of relative which refers to the whole preceding sentence—*after this.*

ll. 18, 19. 'sie machten sich auf den Weg,' *they started.* 'sich' is the reflexive pronoun, which is used much more extensively in German than in English.

l. 21. 'sie waren gegangen,' *they had walked.* Verbs expressing motion and change of locality are conjugated with 'sein,' *to be,* and not 'haben,' *to have*—*e.g.* 'Ich bin mit der Eisenbahn gefahren,' *I* (*have*) *travelled by rail.* Other verbs belonging here are: 'laufen,' *to run;* 'fliegen,' *fly;* 'springen,' *jump;* 'fallen,' *fall.* Reflexive verbs, however, are always conjugated with 'haben': 'Wir haben uns gedreht,' *we have turned.*

l. 25. 'immer,' *ever,* cannot here be translated literally.

l. 32. 'die Katze,' *cat.*

l. 42. 'sondern' and 'aber' are both translated in English *but.* (*a*) 'sondern' is only used

after a negative in direct contradiction of what goes before: 'Er hat das Geld nicht verloren, sondern verschenkt,' *he has not lost the money but given (it) away.* (*b*) 'aber' is used in all other cases.

ll. 53, 54. '[das]einen kleinen Berg hoch [war]'; the words in square brackets may be left out.

l. 55. 'ward,' obsolete and poetic form of 'wurde.'

l. 57. 'brannte'; infinitive 'brennen,' *to burn.*

l. 60. 'sich ausruhen,' a reflexive verb = *to rest (oneself)*; 'euch' belongs to the nominative 'ihr,' *you* (2nd person plural).

l. 62. 'wenn' = *when*, said of the present or future. Compare 'als,' l. 1, and *note.*

l. 64. 'abholen,' *to fetch (away).*

Nichts scheint abenteuerlicher zu sein, als einen Seeplatz, der aufs vortrefflichste befestigt war, erbern zu wollen, ohne seinen Hafen einzuschlieszen. Wallenstein, der noch nie einen Widerstand erfahren, wollte nun auch die Natur überwinden und das Unmögliche besiegen. Stralsund, von der Seeseite frei, fuhr ungehindert fort, sich mit Lebensmitteln zu versehen und mit neuen Truppen zu verstärken; nichtsdestoweniger umzingelte es Wallenstein zu Lande und suchte durch prahlerische Drohungen den Mangel gründlicher Mittel zu ersetzen. "Ich will," sagte er, "diese Stadt wegnehmen, und wäre sie mit Ketten an den Himmel gebunden."

Der Kaiser selbst, welcher eine Unternehmung bereuen mochte, wovon er sich keinen rühmlichen Ausgang versprach, ergriff mit Begierde die scheinbare Unterwürfigkeit und einige annehmliche Erbietungen der Stralsunder, (um) seinem General den Abzug von der Stadt zu befehlen. Wallenstein verachtete diesen Befehl und fuhr fort, den Belagerten durch unablässige Stürme zuzusetzen. Da die dänische Besatzung schon stark geschmolzen, der Überrest der rastlosen Arbeit nicht gewachsen war und der König sich auszer Stand befand, eine grös̈zere Anzahl von Truppen an diese Stadt zu wagen, so warf sich Stralsund, mit Christians Genehmigung, dem König von Schweden in die Arme. Der dänische Kommandant verliess die Festung, um einem schwedischen Platz zu machen, der sie mit dem glücklichsten Erfolge verteidigte. Wallensteins Glück scheiterte vor dieser Stadt, und zum erstenmal erlebte sein Stolz die empfindliche Kränkung, nach mehreren verlornen Monaten, nach einem Verlust von 12,000 Toten, seinem Vorhaben zu entsagen. Aber die Notwendigkeit, in welche er diese Stadt gesetzt hatte, den schwedischen Schutz anzurufen, veranlaszte ein enges Bündnis zwischen Gustav Adolf und Stralsund, welches in der Folge den Eintritt der Schweden in Deutschland nicht wenig erleichterte.—SCHILLER, *Geschichte des Dreiszigjährigen Krieges.*

Nothing seems (to be) more foolhardy than to intend to take a naval fortress which was fortified in the most effective (splendid) fashion, without closing its harbour. Wallenstein, who (had) never before met with opposition, now wished to overcome nature (herself) and to conquer the impossible. Stralsund, free towards the sea, continued without interference to provide itself with food and to strengthen itself with new troops; notwithstanding (in spite of) this, Wallenstein surrounded it on land, and tried by means of boastful threats to counterbalance the lack of effective means. 'I intend,' he said, 'to take this town, even if it were bound to the sky with chains.'

The Emperor himself, who perhaps regretted an enterprise of which he did not expect the success to be creditable, with eagerness seized upon the apparent submissiveness and a few acceptable offers of the Stralsund citizens to command his general to retreat from the town. Wallenstein disregarded (despised) this order, and continued to harass the besieged by uninterrupted assaults. As the Danish army of occupation was already greatly diminished (melted), (and as) the remainder was not equal to the incessant effort, and as the king was unable to risk a larger number of troops for the sake of this town, Stralsund threw itself into the arms of the King of Sweden with the consent of Christian. The Danish commander left the fortress in order to make room for a Swedish one, who defended it with the happiest success. Wallenstein's fortune foundered before this town, and for the first time his pride experienced the painful shock, to (have to) give up his intention after several lost months, after the loss of 12,000 dead. But the necessity in which he had placed this town to invoke (the) Swedish aid, caused a close union between Gustavus Adolphus and Stralsund, which in the immediate future facilitated the entry of the Swedes into Germany not a little.—SCHILLER, *History of the Thirty Years' War.*

VII. *Notes and Explanations.*—l. 2. 'als' *than*, after a comparative.

l. 3. 'auf(da)s vortrefflichste' = *in the most effective manner;* a German idiom. Example: 'Der Bauer bewirtete seine Gäste aufs beste,' *the farmer feasted his guests in the best (possible) style.*

l. 8. Insert 'hatte' after 'erfahren.' In a dependent clause, the auxiliary 'haben' or 'sein' is sometimes omitted. But this is no longer considered good style.

l. 9. 'auch' = *also;* 'auch die Natur' = *even nature, nature herself.*

l. 12. '[das] von der Seeseite frei [war]'—'das' and 'war' are left out. The expression is an abbreviated dependent (relative) clause, which accounts for the peculiar position of the adjective 'frei,' the *complement.* (Compare IV, B (5).)

l. 18. The accusative object 'es' comes between the verb and the subject noun.

l. 29. 'Er versprach sich keinen rühmlichen Ausgang von der Unternehmung,' literally, *he did not promise himself a creditable result from the enterprise.*

l. 46. 'war' does duty for both preceding dependent clauses.

l. 47. 'auszer' = *outside;* 'auszer Stande,' literally, *outside the position.*

l. 55. 'einem schwedischen [Kommandanten]'; every adjective may be used as a noun, without the addition of 'einer,' *one.*

l. 68. 'in welche' = 'in die,' *in(to) which.* In modern German, it is more usual to say 'worin.' (Compare V. l. 19, and *note.*)

l. 71. 'lassen,' *to let, allow—cause.* Imperfect 'ich liesz,' past participle 'gelassen,' a strong verb. The compound 'veranlassen,' *to cause,* forms its imperfect and past participle by adding *t* to the stem—it is a weak verb: 'veranlaszte,' 'veranlaszt.'

l. 74. 'welches' = 'das,' *which.*

VIII. *The Verb.*—The German Verb has only two Simple Tenses, the Present and the Imperfect (or Past):

> **ich laufe,** ***I run, am running.***
> **er wählt,** ***he chooses.***
> **ich lief,** ***I ran, was running.***
> **er wählte,** ***he chose.***

There are three *Auxiliary Verbs,* by means of which the compound tenses are formed:

(1) 'haben,' *to have;* 'er hat gewählt,' *he has chosen.*

(2) '**sein**,' *to be*: 'sie ist gelaufen,' *she has run.*

(3) '**werden**' is used to form the passive voice, with the past participle, and the future, with the infinitive of any verb. '**werden**,' as an independent verb, means *to become*, and is connected with a noun or adjective:

> 'Wir werden bestraft,' *we are (being) punished.*
>
> 'Er wird kommen,' *he will come.*
>
> ['Die Stadt wird gröszer,' *the town grows larger.*]

Note.—The past subjunctive of 'werden' ('ich würde') is used to form a tense often called *Conditional.*

> 'Er würde mich besuchen . . .,' *he would visit me.* . . .

Apart from the auxiliary verbs, three main classes may be distinguished:

(1) *Weak Verbs*, which form their imperfect and past participle by adding *t* to the infinitive stem (the changes are *weak* or *small*):

> leb-en, *to live*, leb-te, ge-leb-t.

(2) *Strong Verbs*, which form their imperfect and past participle by a change of the stem vowel (the changes are *strong* or *considerable*):

> stehl-en, *to steal*, stahl, ge-stohl-en.

(3) The so-called *Verbs of Mood*, which are irregular and show the distinctive features of both the strong and weak conjugations:

> müss-en, ich musz, *I must*, musz-te, ge-musz-t.

IX. *The Auxiliary Verbs.*—Note that 'haben' is a weak verb, with the irregular change of *bt* to *tt* in the imperfect, and with a mutated vowel (*ä* for *a*) in the imperfect subjunctive; 'sein' is quite irregular, containing three different roots; 'werden' is a strong verb, with weak forms in the singular of the imperfect.

INFINITIVE: hab-en, *to have*; sein; werden.
PRESENT PARTICIPLE: hab-end, *having*; seiend; werdend.
PAST PARTICIPLE: ge-hab-t, *had*; gewesen; (ge)worden.

Note.—If the present participle of 'werden' is used for forming the passive voice, it loses the prefix *ge*: 'Er ist geschlagen worden,' *he has been beaten.*

		INDICATIVE.			SUBJUNCTIVE.		
		PRESENT.					
	ich	habe	bin	werde	habe	sei	werde
he *she* *it*	sie es	hat	ist	wird			
thou	du	hast	bist	wirst	habest	seiest	werdest
we *they* *you*[1]	wir sie Sie	haben	sind	werden	haben	seien	werden
you	ihr	habt	seid	werdet	habet	seiet	werdet
		IMPERFECT.					
	ich sie	hatte	war	wurde (ward [1])	hätte	wäre	würde
	du	hattest	warst	wurdest (wardst [2])	hättest	wärest	würdest
	wir sie	hatten	waren	wurden	hätten	wären	würden
	ihr	hattet	wart	wurdet	hättet	wäret	würdet

1 These old forms are now used in the higher style only.
2 Polite form of address.

PERFECT.

ich habe gehabt, *I have had*	ich habe gehabt, &c.
ich bin gewesen, *I have been*	ich sei gewesen, &c.
ich bin (ge)worden, *I have become*	ich sei (ge)worden, &c.

PLUPERFECT.

er hatte gehabt, *he had had*	er hätte gehabt, &c.
er war gewesen, *he had been*	er wäre gewesen, &c.
er war (ge)worden, *he had become*	er wäre (ge)worden, &c.

FUTURE.	CONDITIONAL.
I. ich werde { haben, *I shall have* / sein / werden	ich würde { haben, *I should have* / sein / werden
	ich würde { gehabt haben, *I should have been* / gewesen sein / (ge)worden sein

IMPERATIVE: habe, *have (thou)*; sei; werde
er habe, er soll haben, &c., *let him have*
laszt uns haben, &c., *let us have*
habet, *have (you)*; seit; werdet
haben Sie; seien Sie; werden Sie [1]

X. *The Weak Verb.*—The stem of a verb is obtained by removing the final *-en* of the infinitive. The various endings—the same as for 'haben'—may then be added to the stem. Examples: 'leb-en,' *to live*; 'sag-en,' *to speak, say*; 'reis-en,' *to travel*; 'druck-en,' *to print*; 'drück-en,' *to press*; 'wart-en,' *to wait*, &c. &c.

Note.—All simple derivative verbs are regular; as 'heilgen,' *to sanctify*, from 'heilig,' *holy*; 'marschieren,' *to march*, from 'Marsch,' &c.

> reis-en, *to travel*; reis-end, *travelling*; ge-reis-t, *travelled.*

PRESENT.	IMPERFECT.
ich reis-e / er reis-t	reis-t-e
du reis-(e)st	reis-t-(e)st
wir / sie reis-en	reis-t-en
ihr reis-(e)t	reis-t-et

The SUBJUNCTIVE has the same forms as the indicative, with the exception of the 3rd pers. sing. pres., which has *-e* instead of *-t*: 'er reis-e.'

PERFECT { ich bin gereist / ich habe gespielt } *I have* { *travelled* / *played*

PLUPERFECT { ich war gereist / ich hatte gespielt } *I had* { *travelled* / *played*

FUTURE { I. ich werde reisen / II. { ich werde gereist sein / ich werde gespielt haben

CONDITIONAL { I. ich würde reisen / II. { ich würde gereist sein [2] / ich würde gespielt haben

IMPERATIVE: reis-e, *travel (thou)*; er reis-e, *let him travel*; laszt uns reisen, *let us travel*; reis-en Sie, *travel.*

Note.—If the stem ends in *d* or *t*, add *et* instead of *t*: 'antworten,' *to reply*; 'er antwort-et,' 'ihr antwort-et'; and so throughout the imperfect: 'ich antwort-et-e.' The past participle is 'ge-antwort-et.'

Similarly, stems ending in *s*, *sch*, sometimes insert *e* before *s* of the ending, as 'du reisest,' instead of 'du reist.'

A small number of weak verbs change the vowel *e* of the present to *a* in the imperfect and past participle: 'brennen,' *to burn*, 'brannte, gebrannt'; 'senden,' *to send*, 'sandte, gesandt';

1 For the forms of *polite address*, the corresponding forms of the subjunctive are used.
2 The Conditional II may also be rendered by 'ich hätte gespielt,' 'ich wäre gereist.'

'wenden,' *to turn*, 'wandte, gewandt.' 'Sendete' and 'wendete' are, however, also found.

Denken, *to think*, dachte, gedacht; bringen, *to bring*, brachte, gebracht—are quite irregular.

XI. *The Strong Verb* has the same endings as the weak verb in the *Present*. In the *Imperfect*, the 1st and 3rd persons singular indicative are without any ending. Otherwise, the terminations are the same as for the weak verb.

Note, however, that in the *2nd* and *3rd persons present indicative* the vowel sometimes changes: *a* becomes *ä*; *e*, if long, becomes *ie*; *e*, if short, becomes *i*; *au* becomes *äu*; *o* becomes *ö*. Examples:

ich grabe, *I dig*; er gräbt.
ich stehle, *I steal*; er stiehlt.
ich treffe, *I hit, meet*; er trifft.
ich laufe, *I run*; er läuft.
ich stosze, *I push*; er stöszt.

The *Subjunctive Imperfect* is usually formed by changing the vowel and adding the endings of the weak subjunctive imperfect. (Compare the corresponding forms of 'haben,' 'hätte,' &c.) 'lesen,' *to read*; 'ich las'—'ich läse,' *I read*, &c.

The *Past Participle* always ends in *-en* (as the infinitive), and has the prefix *ge*.

The student should obtain a list of strong verbs and memorise the most important among them. It is impossible to tabulate all the possible vowel changes here; nor can we discuss all the irregularities of strong verbs. We must confine ourselves to noting a few typical cases.

INFINITIVE.	3rd PERS. SING.	IMPERFECT.	PAST PART.
befehlen, *command*	er befiehlt	befahl	befohlen
beiszen, *bite*	er beiszt	bisz	gebissen
biegen, *bend*	er biegt	bog	gebogen
binden, *bind*	er bindet	band	gebunden
bitten, *ask (for)*	er bittet	bat	gebeten
brechen, *break*	er bricht	brach	gebrochen
essen, *eat*	er iszt	asz	gegessen
fahren, *go, drive (in a vehicle)*	er fährt	fuhr	gefahren
fallen, *fall*	er fällt	fiel	gefallen
finden, *find*	er findet	fand	gefunden
fliegen, *fly*	er fliegt	flog	geflogen
geben, *give*	er gibt	gab	gegeben
gehen, *go*	er geht	ging	gegangen
halten, *hold*	er hält	hielt	gehalten
kommen, *come*	er kommt	kam	gekommen
lassen, *let, allow*	er läszt	liesz	gelassen
liegen,[1] *lie*	er liegt	lag	gelegen
nehmen, *take*	er nimmt	nahm	genommen
rufen, *call*	er ruft	rief	gerufen
schlagen, *beat*	er schlägt	schlug	geschlagen
schneiden, *cut*	er schneidet	schnitt	geschnitten
sehen, *see*	er sieht	sah	gesehen
sitzen,[1] *sit*	er sitzt	sasz	gesessen
tun, *do*	er tut	tat	getan
wissen, *know*	ich weisz er weisz wir wissen	wuszte	gewuszt

XII. *The Verbs of Mood*, or Modal Auxiliaries, are, unlike their English equivalents, fully conjugated; they possess an infinitive, past participle—in short, they are complete verbs. They usually do not convey a clear meaning by themselves, but give certain modifications to a *real* verb. They express the *possibility, necessity, lawfulness, willingness*, or *permission* of the real verb with which they are connected.

The verbs of mood have a very irregular conjugation. The student should carefully examine the meaning and application of their various forms in the texts. As they have a perfect conjugation, their use in German greatly differs from that of the English modal auxiliaries.

The verbs of mood usually exhibit different vowels in the singular and plural of the present. They form the imperfect and past participle by means of *t*. The present is conjugated like the imperfect of a strong verb.

INFINITIVE.	INDICATIVE. PRESENT.	SUBJUNCTIVE. PRESENT.	
(1) können, *I can, may, am able to.*	kann	könne	PAST PART. gekonnt. PERF. ich habe gekonnt. PLUPERF. ich hatte gekonnt. FUTURE. ich werde können (ich werde gekonnt haben). COND. ich würde können (ich würde gekonnt haben).
	du kannst	könnest	
	wir sie können Sie	können	
	ihr könnt	könn(e)t	
	IMPERFECT.		
	ich konnte, &c.	könnte, &c.	

Note.—(1) The plural of the indicative present and the subjunctive present have the same vowel as the infinitive.

(2) wollen; ich will; ich wollte; gewollt—*I wish to, intend to (I will)*. The vowel *o* does *not* change to *ö* in the subjunctive imperfect.

(3) sollen; ich soll; ich sollte; gesollt—*I am to, I ought (I shall)*.—*o* does not change to *ö*.

(4) müssen; ich musz; ich muszte; gemuszt—*I have to, must*.—*u* becomes *ü* in the subjunctive imperfect.

(5) mögen; ich mag; ich mochte; gemocht—*I like (to), I may*.—*o* becomes *ö*.

(6) dürfen; ich darf; ich durfte; gedurft—*I am allowed to, I may*.

Note 1.—After an infinitive, the past participle of the modal auxiliaries takes the form of the infinitive: 'Er hatte nicht schreiben sollen' (*not* 'schreiben gesollt'), *he had not been allowed to write*, or *he ought not to have written*.

The same applies to the verbs 'lassen,' *to let, allow, cause*; 'sehen,' *to see*; 'hören,' *to hear*: 'Er hat mich nicht singen hören,' *he did (has) not heard me sing*.

In a dependent clause, the auxiliary accompanying two such 'infinitives,' contrary to the usual rule, *precedes* the latter: 'Er weisz, dasz er nicht hätte zurückkommen dürfen,' *he knows that he was not allowed to return*.

XIII. *Separable and Inseparable Verbal Prefixes*.—This is one of the most difficult chapters of German grammar, as it is impossible to define the general meaning of each prefix.

There are three classes of prefixes: *Preposi-*

[1] The corresponding weak verbs are: 'legen,' *to put (down), place*; 'setzen,' *to put down, to sit down* = 'sich setzen.' Imperfect, 'legte,' 'setzte.'

tions, usually separable; *Prefixes proper*, inseparable and containing the vowel *e*, which is unstressed; and *Nouns*, usually separable. The compound verbs may be divided into five sections, according to whether the prefixes are separable or not. (Compare IV, B (2).)

A. *Verbs Singly Compounded Separable.*

absetzen, *to depose.* Ich setze ab; weil ich absetze.

emporheben, *to lift up.* Er hob empor.

wegbleiben, *to stay away.* Er ist weggeblieben.

Other prefixes belonging here are: *an-*, *auf-*, *aus-*, *bei-*, *bevor-*, *hin-*, *her-*, *ein-*, *fort-*, *mit-*, *nach-*, *nieder-*, *vor-*, *weg-*, *zurück-*, &c. &c.

Rules: Except in the infinitive and the two participles the prefix is separated from the verb and goes to the end, *in the principal sentence.*

In a dependent clause, however, verb and prefix together go to the end.

The *zu* of the infinitive is inserted between prefix and verb.

In the past participle, *ge-* is inserted between prefix and verb.

The separable prefixes have the main stress. *Illustrations:* 'Der Hund lief hinter dem Hasen her,' *the dog ran after the hare;* 'Der Jäger bemerkte, dasz der Hund hinter dem Hasen herlief,' *the sportsman noticed that the dog was running after the hare;* 'Der Jäger befahl dem Hund, hinter dem Hasen herzulaufen,' *the sportsman ordered the dog to run after the hare;* 'Der Hund ist hinter dem Hasen hergelaufen,' *the dog ran (has run) after the hare.*

B. *Verbs Singly Compounded Inseparable.*—These verbs are formed by prefixing either *be-*, *er-*, *ver-*, *ent-*, *emp-*, *zer-*, and *misz-*, *hinter-*, *wi(e)der-*. *Examples:* 'beweisen,' *to prove;* 'entehren,' *to dishonour;* 'empfangen,' *to receive;* 'erhalten,' *to receive, to preserve;* 'hintergehen,' *to deceive;* 'miszfallen,' *to displease;* 'vergehen,' *to vanish, pass away;* 'widerraten,' *to dissuade (counsel against);* 'zerstreuen,' *to disperse.*

These particles are unaccented ('erlau′ben,' *to permit*), and *never disjoined from the verb.* These verbs *do not take ge-* in the past participle, and the *zu* stands before the compounds *separately*, as before simple verbs.

Illustrations: 'Der Feind zerstörte die Stadt,' *the enemy destroyed the town;* 'Die Stadt wurde zerstört,' *the town was destroyed;* 'Die Römer beabsichtigten, Karthago zu zerstören,' *the Romans intended to destroy Carthage.*

C. *Verbs Separable and Inseparable.*—The prefixes of these verbs are prepositions, with the exception of 'wieder,' *again*—viz. 'durch,' *through;* 'über,' *over;* 'um,' *round;* 'unter,' *under;* 'voll,' *full.* These prefixes are *separable* when they retain the full meaning of the independent preposition. They are *inseparable* when they only slightly modify the meaning of the verb, or are used in a figurative sense. In the latter case they are unstressed.

Examples: 'ü′bersetzen,' *to cross a river;* 'überse′tzen,' *to translate.* 'Schlegel hat die Dramen Shakespeares ins Deutsche übersetzt,' *Schlegel has translated Shakespeare's dramas into German;* 'Der Fährmann hat heute mehr als hundert Menschen übergesetzt,' *the ferryman has carried across more than a hundred people to-day.*

D. *Verbs Doubly Compounded.*—Verbs belonging here have a compound prefix, as "hervorbringen,' *to produce;* 'anerkennen,' *to acknowledge.* If the second part of the prefix is separable, both are detached; if the second is inseparable, the first only is disjoined.

Examples: 'herunterfallen,' *to fall down.* 'Plötzlich fiel ein Stein herunter,' *suddenly a stone fell down;*—'vorbehalten,' *to reserve.* 'Er behielt sich den Entschlusz vor,' *he reserved his decision (to himself).*

E. *Verbs Compounded with Nouns.*—Of these some are separable (*a*), others inseparable (*b*).

(*a*) 'freisprechen,' *to acquit:* 'Er wurde freigesprochen'; 'gleichkommen, *to equal:* 'Nichts kommt ihm gleich'; 'stattfinden,' *to take place:* 'Das Fest findet morgen statt'; 'losreiszen,' *to tear off*, &c. &c.

(*b*) These take *ge* in the past participle like simple verbs, except those compounded with *voll-*: 'rechtfertigen,' *to justify:* 'Er hat sich gerechtfertigt'; 'handhaben,' *to handle;* 'vollziehen,' *to execute*, &c.

Fourth Lesson.

Nachdem wir einige Minuten gewartet hatten, trat Goethe zu uns herein und begrüszte uns freundlich. "Ich darf Sie geradezu in deutscher Sprache anreden," wendete er sich an Herrn Hutton (einen englischen Ingenieur-Offizier), "denn ich höre, Sie sind im Deutschen schon recht bewandert." Dieser erwiderte hierauf mit Wenigem freundlich, und Goethe bat uns darauf, Platz zu nehmen.	After we had waited a few minutes, Goethe joined us and greeted us cordially. 'I presume I may address you in German,' he said to Mr. Hutton (an English engineer officer), 'as I hear you are already well versed in our language.' The latter replied to this in a few polite words, and Goethe than asked us to be seated.
Die Persönlichkeit des Herrn H. muszte auf Goethe einen guten Eindruck machen, denn seine grosze Liebenswürdigkeit und heitere Milde zeigte sich dem Fremden gegenüber heute in ihrer wahren Schönheit. "Sie haben wohl getan," sagte er, "dasz Sie, um deutsch zu lernen, zu uns herüber gekommen sind, wo Sie nicht allein die Sprache leicht und schnell gewinnen, sondern auch die Elemente, worauf sie ruht, unsern Boden, Clima, Lebensart, Sitten, gesellschaftlichen Verkehr, Verfassung und dergleichen mit nach England hinüber nehmen."	The manners and appearance of Mr. H. must have made a good impression on Goethe, for his great kindness and mild serenity were to-day manifested towards the stranger in their real beauty. 'You did well,' said he, 'to come hither (across the sea) to learn German, for here you will easily and quickly acquire not only the language, but also the elements on which it rests, our soil, clime, mode of life, manners, social intercourse, constitution, and the like, (and) carry it away with you to England.'
"Das Interesse für die deutsche Sprache," erwi-	'The interest (taken) in the German language is now great in England,' replied Mr. H. 'and is becoming more general daily, so that there is now scarcely a young Englishman of good family who does not learn German.'
	'We Germans,' Goethe replied good-humouredly, 'have,

derte Herr H., "ist jetzt in England grosz und wird täglich allgemeiner, sodasz jetzt fast kein junger Engländer von guter Familie ist, der nicht deutsch lernte."

"Wir Deutsche," versetzte Goethe freundlich, "haben es jedoch Ihrer Nation in dieser Hinsicht um ein halbes Jahrhundert zuvorgetan. Ich beschäftige mich seit fünfzig Jahren mit der englischen Sprache und Literatur, sodasz ich Ihre Schriftsteller und das Leben und die Einrichtung Ihres Landes sehr gut kenne. Käme ich nach England hinüber, ich würde kein Fremder sein."—ECKERMANNS *Gespräche mit Goethe, Montag, den* 10. *January* 1825.

however, been half a century before your nation in this respect. For fifty years I have been busy with the English language and literature, so that I am very well acquainted with the writers and the (mode of) life and the administration of your country. If I went over to England, I should be no stranger (there).—ECKERMANN'S *Conversations with Goethe, Monday, January* 10, 1825.

XIV. *Notes and Explanations.*

l. 5. 'geradezu,' *straight off, without hesitation.*

l. 13. 'mit Wenigem,' dative of 'das Wenige,' from 'wenig,' *little* (of quantity, not size).

l. 16. 'Platz nehmen,' *to sit down.*

l. 22. 'sich zeigen,' *to show, manifest oneself.* The German reflexive verbs may often be rendered into English by the passive voice.

l. 23. 'gegenüber,' *opposite, towards, against,* is a preposition that may *follow* the noun. (Compare 'den Berg hinauf,' *up the mountain.*)

l. 33. 'wo(r),' literally *where,* used as a relative.

l. 34. 'Lebensart,' *mode of life.* 'Das Leben,' *life,* an infinitive used as a noun. Nouns of this kind, when used as the first part of a compound, take *s:* 'die Schaffenskraft,' *creative power;* 'Essenszeit,' *dinner-time,* &c. &c.

l. 37. 'dergleichen,' genitive plural of 'der-, die-, das-gleiche,' &c., *the like.*

l. 37. 'nach' = *to,* is used with reference to names of localities and countries: 'Wir werden im nächsten Jahre nach Berlin, nach Norwegen, nach den Alpen reisen, *next year we shall go to Berlin, to Norway, to the Alps.*

l. 51. 'Ihrer Nation,' dative singular; literally, *to your nation.*

l. 52. 'um' before numerals = *for, by.*

l. 53. 'sich beschäftigen mit,' *to occupy oneself with, to be busy with,* another reflexive verb.

l. 61. 'käme ich,' *if I came, were I to come.* The subjunctive is used in German to express irreality—'Goethe never went to England.'

A Prose Exercise.—The following passage is an excellent example of good, descriptive prose. It certainly has its difficulties, but the patient student will be rewarded by the exceptional fluency of diction and beauty of style.

Der Berg Athos mit dem gegenüberliegenden Küstenstrich des makedonischen Erzgebirges, möchte man glauben, sei eigentlich die Urheimat des Kastanienbaumes: nirgends, selbst in Kolchis, treibt er in solcher Fülle und Üppichkeit aus der Erde hervor: nirgends ist sein Blatt so hell und warmgrün, seine Frucht so süsz, sein Wuchs so riesenhaft, die Fortpflanzung so rasch und wucherisch wie hier. Man denke ja nicht an die Magerkeit der Baumwälder in Südeuropa, oder gar an die langweilige Symmetrie und feingebürstete Ordnung unserer Hof- und Kunstgehege. Auf Hagion-Oros ist freie Wildnis und kunstloses, von der Wurzel an heiter und breit belaubtes liebliches Dickicht in verschlungenen Pfaden, durch die Meisterhand der Natur für die Lust menschlichen Sinnes gepflanzt und aufgezogen. Wie es nur überall rankt und sproszt und in geiler Üppigkeit aus dem Boden dringt, ein kühnes unsterbliches Pflanzengeschlecht mit urweltlicher Kraft vom zarten, gestern geborenen Zweiglein bis zum strotzenden Strauch und durch alle Zeit- und Lebensskalen hinauf zum Mannesalter, zum Säcularbaum, zum antediluvianischen Kolosz.—J. P. FALLMERAYER, *Der heilige Berg Athos—Schilderung.*

One is tempted to believe that Mount Athos, with the coast-line of the Macedonian Iron Mountains lying opposite, really is the original home of the chestnut-tree: nowhere, not even in Colchos, does it burst out of the soil in such abundance and luxuriousness; nowhere is its leaf so bright and of so warm a green, its fruit so sweet, its size (growth) so gigantic, (the) propagation so quick and rank. One should by no means think of the meagreness of the tree-forests in Southern Europe, or still less of the tedious symmetry and well-brushed order of our court and artificial groves. On Hagion-Oros one finds an unbridled wilderness and untrained beautiful thickets, with pleasant and broad leaves growing (on the stems) from the root upwards, traversed by winding paths, planted and reared by the master-hand of Nature for the enjoyment of the human mind. How (the plants) everywhere stretch and sprout, and burst out of the soil in rank luxuriousness, a bold immortal race of plants with primeval force, from the tender young shoot born yesterday to the sturdy bush, and up through all scales of time and life to full age, to the secular tree, to the antediluvian colossus.—J. P. FALLMERAYER, *The Holy Mountain of Athos—Description.*

XV. *Notes and Explanations.* l. 5. 'man möchte glauben,' *one might believe*—better, *one is tempted to believe.* Here the subjunctive ('möchte,' instead of 'mochte') expresses a possibility, supposition, slight doubt.

l. 5. 'sei,' *be,* the subjunctive of 'sein.' The subjunctive is regularly used in *Indirect Speech* when the actual words of the original speaker (or thinker) are not quoted, but are merely reported.

Direct Speech: Karl V sagte: 'Ich will nicht länger regieren,' *Charles V said: 'I will rule no longer'*; Viele glauben: 'Dieser Wald ist die Heimat des Kastanienbaumes,' *many think: 'This wood is the home of the chestnut-tree.'*

Indirect Speech: Karl V (der Fünfte) sagte, er wolle nicht länger regieren.—Viele glauben, dieser Wald sei (*or* wäre) die Heimat des Kastanienbaumes.

l. 7. On account of the immediately preceding negative, 'nirgends,' 'nicht' is left out after 'selbst.' The latter = *even;* another word for *even* in the present sense is 'sogar.'

l. 10. The suffixes *-heit* and *-keit* are used to form abstract nouns from adjectives.

l. 12. 'warmgrün,' *of a warm green colour.*

l. 17. 'man denke;' the subjunctive expresses a modest wish, which, however, is here intensified by the following "ja."

l. 21. 'fein' = *nicely, well.*

l. 22. **'Hof' and 'Kunst' are both prefixes to 'Gehege,'** *park, grove.*

l. 27. Here we have a typical German construction, a past or present participle ('belaubt') used as an adjective *before the noun.* In cases of this kind the English order of words is completely inverted: 'Die hölzerne, von Cæsar im Jahre 40 über den Rhein gebaute Brücke,' *the* (1) *wooden* (2) *bridge* (7) *thrown* (6) *over the Rhine* (5) *in* 40 (4) *by Cæsar* (3).—Der herrliche, von der Königin Elisabeth gepflanzte Baum.

l. 28. 'verschlungen,' *interlaced,* past participle of 'verschlingen' (which also means *to swallow!*).

l. 31 ff. The past participles 'gepflanzt' and 'aufgezogen' go to the end of the phrase, which is an abbreviated dependent (relative) clause.

l. 32. 'es,' *it,* used impersonally for something that defies exact definition: nature, the principle of growth. The 'nur' cannot be translated literally: *Only look, how everything is sprouting. . . .*

l. 35. 'dringen, drang, gedrungen,' *to push forward, force one's way.*

l. 37. The prefix 'ur-' means *original, primeval.*

l. 38. 'vom . . . bis zu,' *from . . . to.*

XVI. *The Declension of Nouns.*

A. *The Genders.*—In English, animate beings are, according to their natural sex, either masculine or feminine; inanimate objects and ideas, with a few exceptions, neuter. This is not the case in German; several names of animate beings are of the neuter gender; inanimate objects and abstract ideas, either masculine, or feminine, or neuter—in a word, the German language still retains the old and, be it confessed, senseless institution of *Grammatical Gender.* Of most words, a knowledge of the gender is to be acquired only by experience. A few general rules will be given below.

(1) All names and appellations of males are masculine, those of females feminine, as: der Mann, *the man;* der König, *the king;* die Mutter, *the mother,* &c. All diminutives in *-chen* or *-lein* are neuter: das Männchen, *the little man, dwarf;* das Fräulein, *the young (unmarried) lady.* Das Weib, *the woman,* is neuter.

(2) There exist, besides the sexual denomination of individuals, a number of appellatives for the whole species of certain (domestic) animals, which are neuter: das Pferd, *the horse;* der Hengst, *the stallion;* die Mähre, *the mare;* das Rind, der Stier, *bull;* die Kuh, *cow.* Compare also: der Knabe, *boy;* das Kind, *child* (like—das Kalb, Füllen,' *calf, foal*); but: 'das Mädchen,' *girl,* because it is a diminutive. *Note:* der Mensch, *the human being* (in general); der Mann, *man, male person.*

(3) The termination *-in* (inflected forms *-innen*) is given to certain names of animated beings and titles to denote the feminine gender: der König, *king,* die Königin, *queen;* der Freund—die Freundin, (*male and female*) *friend;* der Herzog, *duke,* die Herzogin, *duchess;* der Schäfer—die Schäferin, *shepherd(ess)*; der Engländer, *the Englishman,* die Engländerin, *the Englishwoman* (but: der Deutsche, *the German,* die Deutsche); der Wolf, *wolf,* die Wölfin, &c. &c.

(4) Of the *Masculine Gender* are the names of winds, seasons, months, and days: der Nordwind; der Frühling, *spring;* der Sommer, Winter; der Januar, Februar, Mai, &c.; der Montag, *Monday.* 'Das Jahr,' *the year,* is neuter, and consequently 'das Frühjahr, a synonymous term for 'der Frühling,' is also neuter. 'Die Jahreszeit,' *the season* (literally, *the time of the year*), is feminine, because the last component part, 'Zeit,' *time,* is of that gender. It is a general rule that the second element of a compound noun determines the gender.

(5) Of the *Feminine Gender* are all substantives of more than one syllable ending in *-ei, -heit, -keit, -schaft, -ung:* die Bäckerei, *baker's shop;* Heuchelei, *hypocrisy;* Freiheit, *freedom, liberty;* Freundschaft, *friendship;* Hoffnung, *hope.* 'Das Geschrei,' *clamour, noise,* forms an exception.

(6) Of the *Neuter Gender* are the names of metals and names of towns and countries: das Eisen, *iron;* Blei, *lead;* Kupfer, Gold, Silber. The names of countries and towns are without the article when they stand alone. They take the neuter article, when qualified by an adjective or a following genitive: Frankreich, *France;* das südliche Frankreich, *Southern France:* das England Karls II; das neue Berlin, *new Berlin.*

Note.—Some names of countries *always* have the article: die Schweiz, *Switzerland;* die Türkei, die Normandie; das Elsasz, *Alsatia.*

All collective nouns beginning with *Ge-* are neuter: das Gebirge, *the range of mountains* (compare—der Berg, *the mountain;* das Gebiet, *the region, territory.* 'Die Geschichte,' *history, story,* is feminine.

(7) In several words the gender marks a difference of signification; the most common examples are:

der Band, *volume (book).*	das Band, *ribbon, bond.*
der Erbe, *heir.*	das Erbe, *inheritance.*
der Heide, *pagan.*	die Heide, *heath.*
die Mark, *mark (coin).*	das Mark, *marrow.*
der Schild, *shield.*	das Schild, *sign (of a house), signboard.*
der See, *lake.*	die See, *sea.*
der Tor, *fool.*	das Tor, *gate.*

B. *The Declensions.*[1]—The German language distinguishes four cases. The *Nominative* is the ordinary form of the word, and is used in the first part of the sentence, as the *active element*

[1] The declension of German nouns (and adjectives) presents considerable difficulty to the foreign student. The obstacles, however, may be overcome by application and constant practice.

on which the verb depends. The *Accusative* is used in the second part of the sentence as the *passive element*. The *Genitive* usually expresses *possession*, the *Dative* a relation :

Der Mensch (*nom.*) ist nicht immer dem Geber (*dat.*) für das Geschenk (*accus.*) dankbar, *man is not always grateful to the giver* (*dat.*) *for the gift ;* Sogar die Krone (*nom.*) des Königs (*gen.*) muszte dem Feinde (*dat.*) übergeben werden, *even the crown of the king had to be given up to the enemy ;* Im Walde sahen wir keinen Menschen, *we saw no living being in the wood.*

Note.—The genitive habitually stands after certain verbs, without expressing possession : 'Wir erinnern uns des schönen Buches (*gen.*),' *we remember the beautiful book.*

In numerous cases, the genitive is used independently in an adverbial sense : 'morgens,' *in the morning ;* 'abends, mittags,' *in the evening, at noon ;* 'eines Tages,' *one day*, &c. &c.

(*a*) *The Weak Declension* owes its name to the fact that only one change is possible, namely, the addition of *n* or *en*. No neuter nouns belong to this declension.

SINGULAR MASCULINE.		FEMININE.	PLUR. BOTH GENDERS.	
Nom.	der Bote, *messenger*	die Gabe, *gift*	die	Boten, Gaben
Gen.	des Boten	der Gabe	der	
Dat.	dem Boten	der Gabe	den	
Acc.	den Boten	die Gabe	die	

(1) Here belong all masculine nouns of more than one syllable ending in *-e*, and a few masculines that have lost *-e* in the nominative singular, as : 'Fürst,' *prince ;* 'Soldat,' *soldier ;* 'Mensch,' *human being ;* 'Herr : der Herr, des Herren,' &c.

Note that a small number of nouns in *-e* belong to another class (see below).

(2) Most feminine nouns belong here, among which may be mentioned all ending in : *-e, -heit, -keit, -ei, -schaft, -ung, -in, -ie, -ik, -ion, -tät.*

(*b*) *The Strong Declension* uses various endings in the formation of cases.

(1) The nominative plural is without ending. *Examples :* der Esel, *ass ;* der Hammer, *hammer ;* das Messer, *knife*.

SINGULAR MASCULINE.		NEUTER.	PLUR. BOTH GENDERS.
Nom.	der Esel, Hammer	das Messer	die Esel, Hämmer, Messer
Gen.	des Esels, Hammers	des Messers	der Esel, Hämmer, Messer
Dat.	dem Esel, Hammer	dem Messer	den Eseln, Hämmern, Messern
Acc.	den Esel, Hammer	das Messer	die Esel, Hämmer, Messer

The only feminine nouns belonging here are 'die Mutter,' *mother ;* 'die Tochter,' *daughter*. They do not change in the singular (no *s* in the genitive), and change the vowel in the plural : 'die Mütter, Töchter,' *mothers, daughters.*

Here belong all masculine nouns in *-el, -en, -er*, and the isolated 'der Käse,' *cheese*, 'des Käses, die Käse,' &c. Only about twenty change the vowel in the plural. The most important among the latter are : Vater, Väter, *father ;* Apfel, Äpfel, *apple ;* Bruder, *brother ;* Vogel, *bird ;* Garten, *garden ;* Ofen, *stove, oven ;* Hafen, *harbour ;* Acker, *field ;* Nagel, *nail ;* Mantel, *mantle.*

A large number of neuter nouns belong to this declension—namely, all ending in *-el, -er, -chen, -lein ;* all collectives with initial *Ge-* and ending in *-e ;* and all infinitives (in *-en*) used as nouns. The neuter nouns never modify the vowel in the plural, except 'das Kloster,' *monastery, nunnery*—'die Klöster.'

A few masculine nouns have lost *-n* in the nominative singular, but preserve it in the other cases : der Name, *name*, des Namens, dem Namen, den Namen ; die Namen, &c. So : der Funke, *spark ;* der Gedanke, *thought ;* Glaube, *belief, faith ;* Friede, *peace ;* Haufe, *heap ;* Same, *seed ;* Wille, *will ;* 'Der Fels,' *rock*, has lost both *n* and *e*, and the same applies to the neuter 'das Herz,' *heart*, which is declined as follows : Herz, Herzens, Herzen, Herz ; *plural :* Herzen.

(2) The nominative plural ends in *-e*.

(*aa*) MASCULINES.

SINGULAR.			PLURAL.
Nom.	der Tag, *day*	Flusz, *river*	die Tage, Flüsse
Gen.	des Tages	Flusses	der Tage, Flüsse
Dat.	dem Tag(*e*)	Flusse	den Tagen, Flüssen
Acc.	den Tag	Flusz	die Tage, Flüsse

The majority of masculine nouns follow this declension. Most of them change the vowel in the plural, except the following : Abend, *evening ;* Arm, *arm ;* Besuch, *visit(or)* ; Versuch, *attempt ;* Hund, *dog ;* Huf, *hoof ;* Monat, *month ;* Mond, *moon ;* Pfad, *path ;* Punkt, *point ;* Schuh, *shoe ;* Verlust, *loss*, and a few others.

(*bb*) FEMININES.

SINGULAR.	PLURAL.
die, der, der, die Faust	die, der, die Fäuste
	Dat. den Fäusten

All nouns of this class modify the vowel in the plural. Here belong a number of monosyllables, such as : die Bank, *bench, seat* (the plural of 'die Bank,' *bank*, is 'Banken') ; Frucht, *fruit* (this is the singular—'eine Frucht, *a fruit ;* the collective term *fruit* is rendered by 'das Obst') ; Hand, *hand ;* Kraft, *power, force ;* Kuh, *cow ;* Kunst, *art ;* Macht, *might, power ;* Maus, *mouse ;* Nacht, *night ;* Stadt, *town ;* Wand, *wall ;* Wurst, *sausage ;* and all feminines in *-kunft* and *-nis :* 'die Einkunft,' *revenue*, usually employed in the plural, 'Einkünfte' ; 'die Kenntnis,' *knowledge.*

(*cc*) *Neuters.*—They are declined exactly like the masculine 'Tag' above : das Fest, des Festes, dem Fest(e), das Fest, *festival. Plural :* die Feste, der Feste, den Festen, die Feste.

Here belong some nouns with initial *Ge-* that do *not* end in *-e*, as : das Geschäft, *business, shop ;* das Gesetz, *law*. Further, a considerable

number of monosyllables, as: Bein, *leg;* Heft, *exercise book;* Haar, *hair;* Heer, *army;* Jahr, *year;* Pferd, *horse;* Reich, *empire;* Recht, *right;* Schiff, *ship;* Schwein, *pig;* Spiel, *play;* Stück, *piece;* Tier, *animal;* Ziel, *aim, goal.*

(3) The nominative plural ends in *-er*. There are no feminine nouns in this class. The addition of *-er* in the plural always causes modification of the vowel, where possible: *a—ä, o—ö, u—ü, au—äu.*

	Singular.		Plural.	
	Masc.	Neut.	Masc.	Neut.
Nom.	der Wald	das Feld	die Wäld*er*	Feld*er*
Gen.	des Wald*es*	Feld*es*	der Wäld*er*	Feld*er*
Dat.	dem Wald(*e*)	Feld*e*	den Wäld*ern*	Feld*ern*
Acc.	den Wald	das Feld	die Wäld*er*	Feld*er*

Here belong masculines, as: der Mann, die Männer, *man;* Geist, *spirit, ghost;* Gott, *God;* Wurm, *worm;* Leib, *body;* Rand, *edge;* Bösewicht, *villain.*

Neuters, as: das Bad, die Bäder, *bath;* das Band, *ribbon;* Bild, *picture;* Blatt, *leaf, sheet of paper;* Brett, *board;* Buch, *book;* Dorf, *village;* Fasz, Fässer, *barrel;* Glas, *glass;* Kind, *child;* Rad, *wheel;* Tal, *valley;* Volk, *nation;* Wort, *word;* and a large number of common monosyllables. A few words with initial *Ge-* also belong here, as: Gesicht, *face;* Geschlecht, *race, generation—gender, sex.*

(*c*) *The Mixed Declension* shows strong forms in the singular, weak forms in the plural.

Singular Masculine: der Schmerz, *pain;* See, *lake;* des Schmerzes, Sees; dem Schmerz(e), See; den Schmerz, den See. *Plural:* die Schmerzen, See(e)n, &c.

So also: Bauer, *peasant;* Staat, *state;* Untertan, *subject;* Nachbar, *neighbour;* Dorn, *thorn;* Stiefel, *boot;* and a few others. Also a small number of foreign nouns: 'Doktor, Professor, Insekt.' Note the change of accent in 'Dokto'r, Dokto'ren.'

Singular Neuter: das Bett, *bed;* Auge, *eye;* des Bettes, Auges; dem Bett(e), Auge; das Bett, Auge. *Plural:* die Betten, Augen, &c.

So also: Ende, *end;* Ohr, *ear (for hearing);* Hemd, *shirt.*

Appendix: Declension of Foreign Nouns.—It is impossible to enumerate the various rules affecting the declension of foreign nouns. We must content ourselves with giving a few examples:

Singular.	Plural.	Singular.	Plural.
das Fossil	die Fossilien	der Major	die Majore
das Mineral	die Mineralien	die Familie	die Familien
das Gymnasium	die Gymnasien	der Kanal	die Kanäle
die Krisis	die Krisen	das Programm	die Programme
das Billet	die Billets	der Chara'kter	die Charakte're
der Lord	die Lords	der General	die Generale *or* Generäle)

Notes on the Declensions

(1) The dative plural always ends in *-en*, or in *-n* after *l* and *r*.

(2) Feminine nouns never change in the singular.

(3) The nominative, accusative, and genitive plural are always alike.

(4) There are no neuter nouns belonging to the weak declension, and no feminine nouns forming the plural in *-er*.

(5) Nominative and accusative are always alike, except in the case of masculine nouns following the weak declension.

(6) Masculine and neuter nouns belonging to the strong declensions may or may not take *-e* in the dative singular. Nouns ending in *-el*, *-en*, or *-er*, however, never take *-e*.

Fifth Lesson.—The English version of the following passage is more or less literal, but the student should endeavour, after careful study of the German text, to produce a really *good* translation.

Friedrich war ein sehr eigentümlicher Mensch. Mit seinem ungeheuren Kosackenbarte und groszen düsteren Augen hatte er ein treffliches Modell zu einem Bilde meines Vaters abgegeben, das den König Saul darstellte, über den der böse Geist vom Herrn kommt. Doch wohnte in ihm vielmehr ein Geist, der keine Fliege kränken, viel weniger geneigt sein konnte, den frommen Harfenspieler David zu töten, ein sehr zarter, kindlicher Sinn, den Kinder und kindliche Naturen leicht erkannten, mit denen er daher auch gern und zutraulich verkehrte. Im allgemeinen war er menschenscheu, zog sich auf sich selbst zurück und hatte sich der Einsamkeit ergeben, die je länger, je mehr seine Vertraute wurde, und deren Reize er in seinen Bildern zu verherrlichen suchte.	Friedrich was a very peculiar being. With his enormous Cossack beard and large dark eyes he had served as (formed) an excellent model for a picture of my father which represented King Saul, who is seized by the evil spirit sent by the Lord. However, there dwelt in him rather a spirit that was unable to injure a fly, and that was much less inclined to kill the pious harp-player David—a very tender, childlike mind, which children and child-like natures easily recognised, with whom he therefore liked to associate. In general he avoided human society, retired into his own self, and had devoted himself to Solitude, who as time went on became more and more his confidante, and whose charms he sought to glorify in his pictures.
Dergleichen Bilder waren früher nicht gewesen und werden schwerlich wieder kommen, denn Friedrich war ein Einundeinzigster in seiner Art, wie alle wirkliche Genies. Es ist schade, dasz man Kunstwerke nicht beschreiben kann; man kann eben nur ihren Stoff andeuten, und es war sonderbares Zeug, was Friedrich malte. Nicht paradiesische Gegenden voll Reichtum und lachender Pracht, wie Claude sie liebte, und alle diejenigen gern sehen, die nur Stoff und Machwerk ansehen. Sehr einfach, ärmlich, ernst und schwermutsvoll, glichen Friedrichs Phantasien vielmehr den Liedern jenes alten Keltensängers, deren Stoff nichts ist als Nebel, Bergeshöhe und Heide. Ein Nebelmeer, aus dem eine einsame Felsenkoppe ins Sonnenlicht anfragt, ein öder Dünenstrand im	Pictures like these had not existed before, and will hardly return, for Friedrich was the one and only one of his kind, like all real geniuses. It is a pity that one cannot describe works of art; for it is only possible to indicate their subject, and what Friedrich painted was queer stuff. Not paradisical landscapes full of wealth and smiling splendour, such as Claude loved, and all those like to see who only regard subject and execution. Very simple, bare, serious, and full of melancholy, Friedrich's fancies resembled rather the songs of that old Celtic singer whose subject consists of nothing but mist, mountain-top, and heath. A sea of mist from which a solitary rocky summit searches for the sunlight, a barren coastline with dunes in moonlight, the fragments of a 'Greenlander' in the polar ice—such and such-like were the subjects which Friedrich painted, and which he knew how to inspire a peculiar life. My special favourite among these pictures was a young, little fir-tree in a wild

Mondschein, die Trümmer eines Grönlandfahrers im Polareise—so und ähnlich waren die Gegenstände, die Friedrich malte, und denen er ein eigentümliches Leben einzuhauchen wuszte.

Mein besonderer Liebling unter diesen Bildern war ein junges Kiefernbäumchen im wirbelnden Schneewetter. Dichter Schnee lag oben darauf und fuszhoch darum herum. Darunter aber, im Schutz des Nadeldaches, war es sehr heimlich, da war der Schnee nicht hingekommen, da schliefen die Kinder des vergangenen Sommers, Heidekraut und welke Halme und ein Paar zusammengekrochene Schneckenhäuschen, im tiefsten Frieden. Das war das ganze Bild.—WILHELM V. KÜGELGEN, *Jugend-Erinnerungen eines alten Mannes.*

storm. Thick snow was lying on its top and a foot high all round. Underneath, however, in the shelter of the roof of needles, it was very snug; there the snow had not penetrated, there slept the children of last summer, heather and faded stalk and a few snails' houses that had crept together, (all) in perfect peace. This was the whole picture.—WILHELM V. KÜGELGEN, *An Old Man's Reminiscences of His Youth.*

Note.—Mako a special study of the compound nouns in tho above passage. Note the following general rules. Words used as the first part of a compound noun usually (1) take *-en* when they belong to tho weak declension: 'Harfenspieler, Kosackenbart'; (2) words belonging to tho strong declension may take *-s*: 'Bergeshöhe,' but compare 'Nebelmeer'; (3) feminine words in *-ung*, *-heit*, *keit*, take *-s*: 'Einigkeitsbestrebungen,' *efforts towards union*; 'Verhaltungsregeln,' *rules of conduct*, &c.

XVII. *Notes and Explanations.*

l. 14. 'konnte' belongs to both 'kränken' and 'geneigt sein.'

l. 20. 'denen' refers to 'Kinder und kindliche Naturen.'

l. 26. 'je . . . je,' *the . . . the*.

28. 'deren' refers to 'Einsamkeit.

31. 'dergleiches,' a genitive plural.

35. 'einundeinzig,' literally, 'one and only.'

40. 'eben' qualifies 'nur,' and cannot be translated literally.

l. 45. 'voll Reichtum,' *full of wealth*; observe the absence of any connecting word: 'Eine Flasche voll Wein,' 'Ein Korb voll Obst,' *a basketful of fruit*. The use of the genitive after 'voll,' as in 'lachender Pracht,' is now rare.

l. 48. 'gern sehen,' *to like to see*: 'Wir lesen gern deutsche Bücher,' *we like to read German books*. The comparative of the adverb 'gern' is 'lieber,' the superlative 'am liebsten.' 'Friedrich malte lieber einfache Bilder als (*than*) paradiesische Landschaften (*landscapes*),' *to like better*; 'Er malte am liebsten schwermütige Bilder,' *he liked best to paint melancholy pictures*.

l. 51. 'gleichen,' *to be like, similar*—'glich, geglichen.'

l. 54. 'Unter dem "Keltensänger" versteht der Verfasser Ossian, dessen Werke auch in Deutschland viel bewundert wurden,' *by 'Celtic bard' the author means Ossian, whose works were much read even in Germany.*

Note that in many cases the first part of a German compound is best translated into English by an adjective: 'die Naturgeschichte,' *natural history*; 'der Reichskanzler,' *imperial chancellor*.

l. 59. 'ins' = 'in das.'

l. 62. 'Grönlandfahrer,' *a vessel sailing to (and from) Greenland.*

l. 71. 'im' = 'in dem.'

l. 74. 'darum herum,' *round* (*it*—da) *about.*

l. 83. 'zusammenkriechen, kroch, gekrochen.'

l. 84. 'Häus-chen,' *little house*; pronounce *s-ch*, and not *sch*.

'v.' = 'von.' This particle before a name indicates that the bearer belongs to the nobility.

XVIII. *Pronouns.*—Pronouns are words used for nouns. Personal pronouns are words used for names of persons and things: 'ich,' *I*; 'du,' *thou*; 'Sie,' *you*, &c.

Reflexive pronouns are used for names of persons or things, when they are the objects of an action expressed by a verb, and identical with the subjects: 'Ich lehre mich (selbst),' *I teach myself*; 'Sie wundern sich,' *you wonder*, &c.

A. *Personal Pronouns.*

	FIRST PERSON.		SECOND PERSON (FAMILIAR).		SECOND PERS. (POLITE).
	SING.	PLUR.	SING.	PLUR.	SING. AND PLUR.
Nom.	ich, *I*	wir, *we*	du, *thou*	ihr, *you*	Sie, *you*
Gen.	meiner	unser	deiner	euer	Ihrer
Dat.	mir	uns	dir	euch	Ihnen
Acc.	mich	uns	dich	euch	Sie

THIRD PERSON.

	SINGULAR.			
	MASC.	NEUT.	FEM.	PLUR. OF ALL GENDERS.
Nom	er, *he*	es, *it*	sie, *she*	sie, *they*
Gen.	seiner		ihrer	ihrer
Dat.	ihm		ihr	ihnen
Acc.	ihn	es	sie	sie

The usual form of *polite address* is 'Sie,' the 3rd person plural, with a capital letter. The familiar 'du' is used in addressing children, relatives, and intimate friends. The plural 'ihr' is used in addressing more than one of such persons as would individually be addressed as 'du.' In country districts, the plural 'Ihr' is occasionally used as the form of polite address, in speaking to one or more persons.

Beginners should always bear in mind that the gender of inanimate objects varies, and that in speaking of them the corresponding pronouns must be used: 'Wissen Sie wo meine Uhr ist? Ich habe *sie* nicht gesehen,' *do you know where my watch is? I have not seen it.*

Note.—Very often 'da' is used in place of a pronoun in connection with a preposition. 'da' or 'dar' (the latter before a vowel) always *precedes* the preposition: 'Der Schlüssel: Ich habe damit (= mit ihm) die Türe geöffnet,' *the*

key : I have opened the door with it. These formations are much more extensively used than the English corresponding *thereby, therewith.* Instead of 'da,' 'wo' also may be used.

B. *The Interrogative Pronoun.*

(1) 'wer ?' *who ?* 'was ?' *what ?*

	Masc.	Fem.	Neut.	
Nom.	wer		was	was für ein (eine, ein)? *what sort of?*
Gen.		wessen		
Dat.		wem		
Acc.	wen		was	

(2) 'welcher ?' *which ? what ?* is also used as a relative pronoun, and has the endings of a strong adjective (see No. XIX). For the relative pronoun 'der,' see No. III.

C. *Possessive Pronouns* (or adjectives).—mein, *my ;* dein, *thine ;* sein, *his* (masculine and neuter) ; ihr, *her ;* unser, *our ;* euer, *your ;* ihr, *their, your* (polite).

Their inflexions are the same as those of the strong adjectives (No. XIX), with the following exceptions. The usual endings *-er* of the nom. sing. masc., and *-es* of the nom. and acc. sing. neut. are dropped : 'sein Buch,' *his book ;* 'seine Feder,' *his pen.*

The *-er* or *-es* is restored when the pronoun stands by itself : 'Ihres (*viz.* Buch) ist nicht so klein wie dieses.'

D. *The Indefinite Article.*—'ein,' *a, one,* has the same endings as the possessive pronouns, and is subject to the same exceptions. The same applies to 'kein,' *no, none ;* 'kein Mensch,' *no man ;* 'keiner ist gekommen,' *no one has come.*

E. *Reflexive Pronouns :* ich—mich, *I—myself ;* du—dich ; er, sie, es—sich ; wir—uns, ihr—euch ; sie, Sie—sich.

'Wir waschen uns,' *we wash ourselves.* The use of the reflexive pronoun is more extensive in German than in English : 'sich wundern,' *to wonder ;* 'sich irren,' *to be mistaken ;* 'sich bezahlen,' *or* 'sich bezahlt machen,' *to pay* (i.e. *to be remunerative*) ; 'sich erinnern' (+genitive), *to remember,* &c.

'Erinnern Sie sich unserer Unterhaltung ?' *do you remember our conversation ?* 'Sie irrte sich in der Nummer, *she made a mistake about the number ;* 'Wir wundern uns über nichts mehr,' *we wonder about nothing.*

The reflexive pronouns *myself,* &c., must not be confounded with the indefinite *myself,* &c., in *I myself,* which is expressed in German by 'selbst' ; 'Er hat mir selbst geschrieben,' *he wrote me himself.*

F. *Demonstrative Pronouns.*—'dieser, diese, dieses' (or 'dies'), *this* (*one*), and 'jener, jene, jenes,' *that* (*one*), are declined like a strong adjective.

'derjenige,' *the one,* and 'derselbe,' *the same,* are declined like the article and a weak adjective. *Genitive :* 'desjenigen, derjenigen,' &c.

G. *Indefinite Pronouns.*—'man,' *one,* has the genitive 'eines,' dative 'einem,' accusative 'einen,' possessive adjective 'sein.'

'jedermann,' *everybody,* has the genitive 'jedermanns'—'jemand,' *anyone ;* 'niemand,' *no one,* end in *s* in the genitive. The other cases are the same as the nominative.

Observations on Some Pronouns.—The definite article is used instead of a possessive pronoun when the sense of the sentence cannot be mistaken : 'Ich werde das Buch in die Tasche stecken,' *I shall put the book into my pocket ;* 'Er hat den Hut in der Hand,' *he has his hat in his hand.*

The reflexive or the dative of the personal pronoun is often used where the English language employs the possessive : 'Er hat sich in den Finger geschnitten,' *he has cut his finger ;* 'Der Beamte gab es ihm in die Hand,' *the official put it into his hand.*

Sixth Lesson.—The German passage printed below is an exact translation of the English original.

Unterdessen brachte dieses dämonische Drama für Schillers Ruhm die entgegengesetztesten Ergebnisse hervor. Bei der männlichen Jugend Deutschlands wurde es mit durchaus alleinstehender Begeisterung aufgenommen, obgleich es vollkommen unwahr ist, dasz es einige Männer von Rang und glänzenden Aussichten (wie eine landläufige Fabel behauptete) dazu trieb, Karl Moor nachzuahmen, indem sie Räuber wurden. Andrerseits war das Drama zu gewaltig angelegt, um nicht in jedem Falle Seine Durchlaucht den Herzog von Würtemberg beunruhigt zu haben ; denn es liesz auf einen äuszerst revolutionären Geist und auf die höchste Kühnheit des Eigenwillens schlieszen. Aber neben diesem allgemeinen Grund zum Tadel erhob sich ein besonderer in einer so entfernten Gegend, dasz diese einzige Tatsache dazu dienen mag, die Ausdehnung sowohl als auch die Stärke des hervorgebrachten Eindrucks zu bezeugen. Das hand Graubünden war von Spiegelberg, einem der Räuber, das 'Diebsathen' genannt worden. Hierauf reichten die Amtleute jenes Landes beim Herzog eine Klage ein ; und nachdem Seine Durchlaucht Schiller zu sich gerufen und streng getadelt hatte, erliesz er den Befehl, dasz dieser gefährliche junge Student sich fortan auf seine medizinischen Studien beschränken sollte.	Meantime this demoniac drama produced very opposite results to Schiller's reputation. Among the young men of Germany it was received with an enthusiasm absolutely unparalleled. though it is perfectly untrue that it excited some persons of rank and splendid expectations (as a current fable asserted) to imitate Charles Moor in becoming robbers. On the other hand, the play was of too powerful a cast not in any case to have alarmed his serenity the Duke of Würtemberg ; for it argued a most revolutionary mind, and the utmost audacity of self-will. But, besides this general ground of censure, there arose a special one in a quarter so remote that this one fact may serve to evidence the extent as well as extensity of the impression made. The territory of the Grisons had been called by Spiegelberg, one of the robbers, 'the Thief's Athens.' Upon this the magistrates of that country presented a complaint to the Duke ; and his Highness, having cited Schiller to his presence, and severely reprimanded him, issued a decree that this dangerous young student should henceforth confine himself to his medical studies.
Die nun folgende Bedrückung Schillers weist solch ausserordentliche An-	The persecution which followed exhibits such extraordinary exertions of despotism, even for that land of irresponsible power, that we must presume the Duke to have relied more upon the hold which he had upon Schiller through his affection for parents so absolutely dependent on his Highness's power than upon any laws, good or bad, which he could have pleaded as his warrant. Germany, however, thought otherwise of the new

wendungen des Despotismus auf, selbst für jenes Land unverantwortlicher Macht, dasz wir annehmen müssen, der Herzog habe sich mehr auf die Gewalt verlassen, die er durch dessen Liebe zu so von Seiner Durchlaucht Macht abhängigen Eltern hatte, als auf irgend welche Gesetze, gute oder schlechte, die er zu seiner Rechtfertigung hätte anführen können. Deutschland jedoch dachte anders über das neue Trauerspiel als der durchlauchtige Kritiker von Würtemberg: es wurde mit gewaltigem Beifall in der benachbarten Stadt Mannheim aufgeführt; und dorthin begab sich heimlich der junge Dichter aus einem höchst entschuldbaren Interesse an seinem eigenen Schauspiel. Bei seiner Rückkehr wurde er fest gesetzt. Und da Schiller jetzt von der Tyrannei des Herzogs gründlich angewidert und mit einigem Grund darüber in Besorgnis gesetzt war, entwich er schlieszlich nach Mannheim, indem er die in Stuttgart durch den Besuch eines ausländischen Fürsten verursachte Verwirrung benutzte.—SCHILLERS *Räuber*.

tragedy than the serene critic of Würtemberg: it was performed with vast applause at the neighbouring city of Mannheim; and thither, under a most excusable interest in his own play, the young poet clandestinely went. On his return he was placed under arrest. And soon afterwards, being now thoroughly disgusted, and, with some reason, alarmed by the tyranny of the Duke, Schiller finally eloped to Mannheim, availing himself of the confusion created in Stuttgart by the visit of a foreign prince.—SCHILLER'S *Robbers*.

XIX. *Notes and Explanations.*—l. 4. 'entgegengesetzt,' from 'entgegensetzen,' *to oppose*, is used as an ordinary adjective.

l. 17. 'indem sie Räuber wurden,' *in becoming robbers.* Note the method of translating the present participle in *-ing* by a dependent clause.

l. 24. The verb is: 'es läszt schlieszen auf . . .'

l. 33. 'dienen zu,' *to serve for.* Note the construction with 'dazu,' followed by an infinitive clause.

l. 39. 'einem . . .'; the apposition in the same case (dative) as the word to which it belongs ('Spiegelberg'). Compare l. 20.

l. 80. 'höchst entschuldbar,' *most excusable.* The word *most* does not indicate the superlative, but is merely used as an adverb qualifying *excusable.* We cannot therefore translate '(am) entschuldbarsten.' In cases of this kind, *most* may be translated: 'höchst' = *in the highest degree;* 'äuszerst' = *extremely;* 'durchaus' = *thoroughly,* &c. Compare l. 23.

l. 94. This peculiar German construction is explained elsewhere. See No. XV, l. 23.

XX. *The Adjective.*—Almost all the original adjectives are monosyllables, as: jung, *young;* alt, *old;* grosz, *great, large, tall;* arm, *poor;* hart, *hard;* dick, *thick;* fest, *firm.*

Some are formed by means of the prefixes *ge-* and *be-*: bequem, *convenient;* gerecht, *just;* geheim, *secret;* genau, *exact.*

Numerous adjectives are derived from other words by means of certain terminations—(1) *-ig:* fleiszig, *industrious;* günstig, *favourable;* salzig, *salt, briny;* ruhig, *quiet.* (2) *-isch:* französisch, *French;* himmlisch, *heavenly.* (3) *-lich:* wörtlich, *liberal;* kindlich, *filial.* (4) *-bar:* furchtbar, *dreadful;* dankbar, *grateful.* (5) *-sam:* biegsam, *pliable.* (6) *-haft:* meisterhaft, *masterly;* krankhaft, *diseased.* (7) *-en* and *-ern,* denoting the material of which a thing consists, as: golden, seiden, eisern, hölzern, *golden,* &c., derived from—Gold; Seide, *silk;* Eisen, *iron;* Holz, *wood.*

These are the most frequent terminations. The addition of *-ig,* *-isch,* and *-lich* often causes a change of vowel in the root syllable: 'das Land—ländlich,' *rural.*

The German language possesses numerous compound adjectives, the first component of which is either a substantive, or adjective, or numeral, or verb, as: geistreich, *talented;* dunkelblau, *dark-blue;* dreiteilig, *of three parts, triple;* liebenswürdig, *amiable.*

A. *The Declension of Adjectives.*—Adjectives, when not immediately preceding a noun, real or understood, are invariable:

Der Baum
Die Pflanze } ist grün.
Das Gras

Adjectives are declined when they are used before a substantive. In this case they may stand before the substantive either alone ('schöner Garten,' *beautiful garden*), or they are preceded by an article ('der schöne Garten'), or a pronoun ('sein schöner Garten'), or by a numeral ('ein schöner Garten').

When preceding a noun, adjectives are treated in three different ways:

(*a*) *The Strong Declension* is used when the adjective is *not* preceded by any pronoun. The endings for the various cases are the same as for 'der' and 'dieser.'

	SINGULAR.			PLURAL.
	MASC.	NEUT.	FEM.	ALL GENDERS.
Nom.	-er	-es	-e	-e
Gen.	-es		-er	-er
Dat.	-em		-er	-en
Acc.	-en	-es	-e	-e

It is now usual, however, to change the *-s* of the genitive singular into *-n* if the noun belongs to the strong declension: 'guten Muts sein' (instead of 'gutes Muts'), *to be of good cheer;* 'geraden Wegs,' *straightway;* 'heutigen Tages,' *nowadays,* &c.

(*b*) *The Weak Declension* is used after the article and all those pronouns that exhibit the endings of the strong inflexion (No. I above). The most frequent among these pronouns are: dieser, *this;* welcher, *which, what;* mancher, *many a;* jeder, *each;* jener, *that.* After these pronouns the re-occurrence of the letters *r, s, m* is avoided. In the nom. sing. masc., fem., and neut., and in the acc. sing. fem. and neut., the

adjective ends in *e*. All other cases have *en*—*i.e.* it is declined like a weak noun.

	Singular.			Plural.
	Masc.	Neut.	Fem.	all Genders.
Nom.	-e		-e	
Gen.	-en		-en	-en
Dat.	-en		-en	
Acc.	-en	-e	-e	

(c) *The so-called Mixed Declension* is used when the adjective is preceded by the indefinite article 'ein, eine, ein,' or by a possessive pronoun, 'mein, dein, sein, ihr, unser, euer, ihr, Ihr,' or by the indefinite pronoun 'kein,' *none*, which do not indicate the masculine and neuter gender in the nominative singular and in the accusative singular neuter. (Compare No. XVIII, (3).) For this reason the adjective has in these three cases the characteristic termination of the ordinary pronoun; but in the other cases of the singular, and throughout the plural, it ends in *-en*.

Singular.

Masculine.

Nom. ein (Ihr, &c.) groszer Garten, *a (her, &c.) large garden*
Gen. eines groszen Gartens
Dat. einem groszen Garten
Acc. einen groszen Garten

(Feminine. No exceptional forms. Compare II above.)

Nom. eine rote Blume, *a red flower*
Gen. einer roten Blume
Dat. einer roten Blume
Acc. eine rote Blume

Additional Remarks on the Adjectives.—(1) Adjectives are in German frequently used as nouns. They are then written with a capital initial letter, but otherwise treated as adjectives: 'der Alte,' *the old one (man)*; 'die Alte,' *the old woman*; 'der Deutsche,' *the German*; 'ein Deutscher,' *a German*; 'der Gelehrte,' *the learned one, savant*; 'ein Gelehrter.'

The general and indefinite idea of a thing is expressed by the neuter gender: 'das Schöne,' *the beautiful*; 'das Grosze,' *the great.*

(2) In poetry the *-es* of the nominative and accusative neuter is occasionally left out: 'schön Wetter' (for 'schönes'), *fine weather.*

(3) Participles, both past and present, are treated as adjectives: 'der brennende Dornbusch,' *the burning thorn-tree*; 'das vergessene Wort,' *the forgotten word.*

(4) As adjectives are used *substantively* in German, the words *one(s)*, used in English to avoid repetition of the noun, must not be translated: 'Welche Bücher haben sie mitgebracht? Die alten,' *which books did you bring (with you)? The old ones.* 'Zeigen Sie mir bitte einige gute Bilder! Dieses ist ein besonders schönes,' *please show me a few good pictures! This is a particularly fine one.*

Neuter.

Nom. ein neues Buch, *a new book*
Gen. eines neuen Buches
Dat. einem neuen Buch
Acc. ein neues Buch

Plural.

Nom. meine (Ihre, &c.) } groszen Gärten, roten Blumen, neuen
Gen. meiner } Bücher
Dat. meinen groszen Gärten, neuen Büchern
Acc. meine groszen Gärten, neue Bücher

Note.—The general rule is that if a pronoun with the strong ending precedes, the adjective takes the weak endings; if no such pronoun precedes, or one without the strong ending, the adjective takes the strong ending. The latter is also the case when an indeclinable pronoun or numeral, or similar word, precedes. Such are: etwas, *some*; viel, *much*; nichts, *nothing*; genug, *enough*; allerlei, *all sorts of*; einerlei, *of one kind*; zweierlei, *of two kinds*, &c.; dergleichen, *such like*; solch, *such* ('solch' is also an adjective); zwei, *two*, drei, *three*, &c. *Examples*: 'mit etwas weiszem Papier,' *with some white paper*; 'allerlei Blumen,' *all sorts of flowers*; 'solch schreckliche Töne,' *such dreadful sounds.*

(5) The following adjectives are never used *before* a noun: abhold, *averse*; bereit, *ready* ('fertig,' *ready*, is used in all positions); gar, *done, ready* (said of food); gang und gebe, *current*; and a few others.

(6) The words used to denote the inhabitants of towns are formed by adding *-er* to the name of the town; those ending in *-en* sometimes lose this syllable: 'Bremen,' 'ein Bremer,' *a B. man*; 'eine Bremerin,' *a B. woman*; but 'Wilhelmshaven-er,' 'Dresden-er,' &c. These appellations are used again as *indeclinable* adjectives. *Examples*: 'die Londoner Börse' (*not* 'London B.'), *the London Exchange*; 'im Hamburger Hafen,' *in (the) H. harbour*; 'Frankfurter Zeitung,' *F. Gazette*; 'Münchener Bier,' *M. beer.*

These adjectives formerly ended in *-isch*. (Compare 'Die Kölnische Zeitung,' *the Cologne Gazette*, and 'der Kölner Dom,' *C. Cathedral.*)

The Comparison of Adjectives.—The general rule is that for the comparative *-er* is added, and *-est* for the superlative. Most monosyllabic adjectives modify the vowel when *-er* or *-est* are added: 'kalt,' *cold*; 'kälter,' *colder*; 'kältest,' *coldest.*

Note.—*au* never modifies in comparison: 'rauh,' *rough*; 'rauher, rauherst.' 'äuszer, äuszerst,' *extreme(st)*, from 'auszer,' is the only exception.

The following are among the commonest monosyllables which do *not* change the vowel in comparison: blasz, *pale*; bunt, *variegated*; falsch, *false, wrong*; flach, *flat*; froh, *joyful*; roh, *raw*; stolz, *proud*; voll, *full.*

Notes.—(1) Adjectives ending in the unaccented syllables *-el*, *-en*, *-er*, generally lose the *-e* in the comparative: 'edel,' *noble*, 'edler,' as: 'Eine edlere Frucht,' 'ein edlerer Mensch.'

(2) The superlative of 'grosz' is contracted into 'gröszt.'

(3) The *e* of the superlative ending is usually dropped, except after the 'hissing sounds' and *t, s, sz, z, sch*: 'lang,' *long*, 'länger, längst'; 'heisz,' *hot*, 'heiszer, heiszest.'

(4) Comparatives and superlatives are declined like other adjectives.

(5) The superlative, when not followed by a noun—*i.e.* when no direct comparison is implied—has a fixed (adverbial) form with *an*: 'Im Sommer ist das Wetter am (=an dem) schönsten,' *in summer the weather is finest*.

(6) The combination with *am* is the usual form of the comparative of an adverb: 'Dieses Pferd läuft am schnellsten,' *this horse runs fastest*.

(7) Note that the form with *am* usually corresponds to the English superlative without an article.

(8) *Irregular Comparisons:*

gut, *good*	besser	best, am besten
viel, *much*	mehr	meist, am meisten
hoch, *high*	höher	höchst, am höchsten
nahe, *near*	näher	nächst, am nächsten
wenig, *little*	weniger (*or* minder)	wenigst (*or* mindest)

Numerals.—A. *The Cardinal Numbers:*

0	null	13	dreizehn	50	fünfzig
1	ein	14	vierzehn	60	sechzig
2	zwei	15	fünfzehn	70	siebzig
3	drei	16	sechzehn	80	achtzig
4	vier	17	siebzehn	90	neunzig
5	fünf	18	achtzehn	100	hundert
6	sechs	19	neunzehn	101	hundert ein(s)
7	sieben	20	zwanzig	147	hundert sieben und vierzig
8	acht	21	einundzwanzig		
9	neun	22	zweiundzwanzig	200	zweihundert
10	zehn	30	dreiszig	1000	tausend
11	elf	35	fünfunddreiszig	2000	zweitausend
12	zwölf	40	vierzig	*a million*,	eine Million

Note.—Units always precede tens, and are joined by 'und' (as in *one-and-twenty*). *One*, when standing alone, is 'eins.'

B. *Ordinal Numbers.*—1*st*, der erste; 2*nd*, der zweite; 3*rd*, der dritte. From 4*th* to 19*th* inclusive add *-te* to the cardinal; from 20*th* onwards, add *-ste*: der fünfte, der sieb(en)te, der neunundzwanzigste.

The ordinals are declined like ordinary adjectives.

C. *Various Numerals.*—(1) *Adjectives* (a) *of a kind* add *-erlei* to the cardinal or adjective: dreierlei, *of three kinds*; vielerlei, *of many kinds*. (b) *-fold*, add *-fach* to the cardinal or adjective: fünffach, *fivefold*; vielfach, *manifold*.

(2) *Adverbs.*—*Once*, &c., add *-mal*: einmal, *once*; zehnmal, *ten times*; vielmal, *many times* (or 'vielmals'). Sometimes the independent noun 'das Mal' is used: 'zu drei Malen,' *at three times*; 'zu zehn verschiedenen Malen,' *at ten different times*.

(3) *Fractions.*—Add *-tel* to the stem of the ordinal: das Drittel, Viertel, Zehntel, Zwanzigstel, Neunundneunzigstel.

(4) *Half* (adjective) = halb: 'ein halbes Pfund,' *half a pound*; (noun) 'die Hälfte.' (*Note.*—'das halbe England,' but 'halb England'; 'halb fünf,' *half-past four*.)

(5) *The two* = die beiden; *both* = beide. (But note that *both . . . and* = sowohl . . . als auch.)

The whole = das Ganze; *whole* = ganz; 'der ganze Abend,' *the whole evening*, but 'ganz Deutschland,' *all Germany*.

One and a half = anderthalb; as, *e.g.*: 'anderthalb Mark,' *one mark and a half*.

Seventh Lesson.—Make a careful study of the German text and Carlyle's "Modal Translation."

Noch immer dient mir das Andenken jener Zeit zur glücklichen Unterhaltung, wenn ich unsere Berge und Täler zu durchwandern genötigt bin. Noch weisz ich mir den kleinsten Umstand zurückzurufen, womit ich euch jedoch, wie billig, verschone. Wochen gingen vorüber; Maria hatte sich erholt, ich konnte sie öfter sehen, mein Umgang mit ihr war eine Folge von Diensten und Aufmerksamkeiten. Ihre Familienverhältnisse erlaubten ihr einen Wohnort nach Belieben. Erst verweilte sie bei Frau Elisabeth; dann besuchte sie uns, meiner Mutter und mir für so vielen und freundlichen Beistand zu danken. Sie gefiel sich bei uns, und ich schmeichelte mir, es geschehe zum Teil um meinetwillen. Was ich jedoch so gern gesagt hätte und nicht zu sagen wagte, kam auf eine sonderbare und liebliche Weise zur Sprache, als ich sie in die Kapelle führte, die ich schon damals zu einem wohnbaren Saal umgeschaffen hatte. Ich zeigte und erklärte ihr die Bilder, eins nach dem andern und entwickelte dabei die Pflichten eines Pflegevaters auf eine so lebendige herzliche Weise, dasz ihr die Tränen in die Augen traten und ich mit meiner Bilderdeutung nicht zu Ende kommen konnte. Ich glaubte ihrer Neigung gewisz zu sein, ob ich gleich nicht stolz genug war, das Andenken ihres Mannes so schnell auslöschen zu wollen. Das Gesetz verpflichtet die Witwen zu einem Trauerjahre, und gewisz ist eine solche Epoche, die den Wechsel aller irdischen Dinge in sich begreift, einem fühlenden Herzen nötig, um die schmerzlichen Eindrücke eines groszen Verlustes zu mildern. Man sieht die Blumen welken und die Blätter fallen, aber man sieht auch Früchte reifen und neue Knospen keimen. Das Leben gehört den Lebendigen an, und wer lebt, musz auf Wechsel gefaszt sein.—GOETHE, *Wilhelm Meisters Wanderjahre.*

To this hour, when I chance to be wandering over our mountains and forests, the remembrance of that time forms my happiest entertainment. I can still recall the slightest particulars, which, however, as is fit, I spare you at present. Weeks passed on; Mary was recovered, I could see her oftener, my intercourse with her was a train of services and attentions. Her family circumstances allowed her to choose a residence according to her pleasure. She first stayed with Frau Elizabeth; then she paid us a visit, to thank my mother and me for so many and such friendly helps. She liked to live with us; and I flattered myself that it was partly on my account. What I wished to tell her, however, and durst not utter, came to words in a singular and pretty wise, when I took her into the Chapel, which I had then fitted up as a habitable apartment. I showed her the pictures, and explained them to her one after the other; and so doing, unfolded the duties of a foster-father in so vivid and cordial a manner, that the tears came into her eyes, and I could not get to the end of my picture exhibition. I thought myself certain of her affection, though I was not proud enough to wish so soon to efface the memory of her husband. The law imposes on widows a year of mourning; and in truth, such an epoch, which includes in it the change of all earthly things, is necessary for a feeling heart, to alleviate the painful impressions of a great loss. We see the flowers fade and the leaves fall; but we likewise see fruits ripen, and new buds shoot forth. Life belongs to the living; and he who lives, must be prepared for vicissitudes.—*Carlyle's translation of 'Wilhelm Meisters Wanderjahre.'*

XXI. *Notes and Explanations.*—l. 3. 'dienen zu' (with dative), *to serve for.*

l. 10. 'billig' = *just* (and also = *cheap*).

l. 27. 'es geschehe'—the conjunctive is used to express a doubt.

l. 28. 'um meinetwillen, seinetwillen,' &c., *for my, his sake.*

l. 30. = 'gesagt haben würde,' *would have said.*

l. 37. 'umschaffen,' *to transform.*

l. 43. Note that 'lebendig' has the accent on the second syllable, contrary to rule.

l. 44. 'ihr,' *to her.* Translate: *into her eyes.*

l. 49. 'gewisz sein eines Dinges (*genitive*),' *to be certain of. . . .*

l. 49. 'ob ich gleich . . . , *although I . . .* In present-day German one says 'obgleich ich.'

l. 68. 'angehören,' *to belong to* (with dative), poetic for the simple 'gehören.'

l. 69. 'wer,' *he who.*

XXII. *Prepositions.*—The prepositions require particular attention, not only on account of the various significations of some of them, but also on account of the *different cases which they govern.*

A. *Governing an Accusative only:*

bis, *up to, until.*
durch, *through*—*by* (instrumental, after the passive voice).
für, *for, on behalf of.*
gegen, *towards, against.*
ohne, *without.*
um, *at, (a)round.*
ausgenommen, auszer, *except.*

Examples.—'Ich bin ohne meinen Hut ausgegangen,' *I went out without my hat.* 'Werden Sie das Buch für mich mitbringen?' *shall you bring the book for me (with you)?*

B. *Governing a Dative only:*

aus, *out of.*
bei, *near, at* (also describes attendant circumstances).
gegenüber, *opposite.*
mit, *with.*
nach, *to* (a place), *after, according to.*
seit, *since.*
von, *of, by* (an agent), *from.*
zu, *to* (a person), *at.*

Examples.—'Er hat sich beim Rudern verletzt,' *he has hurt himself while rowing.* 'Ich musz nach der Stadt gehen,' *I have to go to town.*

C. *Governing an Accusative or Dative,* according to the meaning. The accusative is used when motion *towards* something is implied; the dative expresses rest, position, or motion *at* a place or *near* an object.

an, *on, at.*	über, *over, across.*
auf, *on, on to.*	unter, *under, among.*
hinter, *behind.*	vor, *before, in front of.*
in, *in, into.*	zwischen, *between.*
neben, *beside.*	

Examples.—'Kommen Sie, bitte, in den Garten!' *please come into the garden!* 'Waren Sie schon im (in unserem) Garten?' *have you been in our garden before?* 'Der Hund legte sich unter den Tisch, lag unter dem Tisch,' *the dog lay down (was lying) under the table.* 'Der Baum stand vor der Kirche,' *the tree stood in front of the church.* 'Der Baum wurde vor die Kirche gepflanzt,' *the tree was planted before the church.*

D. *Governing a Genitive only:*

(an)statt, *instead of.*	unweit, *not far from.*
trotz, *in spite of.*	während, *during.*
um-willen, *for the sake of.*	wegen, *because of, on account of.*

Examples.—'Trotz des Verbotes,' *in spite of the prohibition.* 'Während des Sommers,' *during (the) summer.* 'Wegen der Hitze,' *on account of the heat.*

Note the following contractions: 'ans, aufs, ins, durchs, fürs, ums = an das,' &c.; 'am, beim, im, vom, zum = an dem,' &c.; 'zur = zu der.'

XXIII. *Notes on German Pronunciation.*[1]—A. *The Vowels.*—A vowel is either short or long. It is long—(1) when doubled: 'Meer,' *sea*; 'Boot,' *boat*; 'Schāf,' *sheep.* (2) When followed by *h*: 'mehr,' *more* (pronounced like 'Meer'); 'Rahm,' *cream*; 'Bohne,' *bean*; 'kühl,' *cool.* (3) When followed by a single consonant only: 'lesen,' *to read*; 'schlafen,' *to sleep*; 'Rose,' *rose*; 'Schule,' *school*; 'Käse,' *cheese.* (4) The combination *ie* stands for long *i* (*i.e.* it is pronounced as in *believe*): 'sieben,' *seven*; 'Biene,' *bee*; 'Wien,' *Vienna.*

All vowel sounds are *pure* sounds in German; the English long vowels are *diphthongs.*

Below are given the nearest English equivalents of the German vowels. An *h* after a symbol indicates a *long* vowel.

GERMAN.	ENGLISH.	EXAMPLES.
a	The short sound of *ah*, or like *u* in *fun*.	das (with a short vowel); Sand.
ah	As *a* in *father*.	Vater, *father*; Rasen, *lawn*.
ä	As *e* in *bed* (see *e*).	hätte; Äpfel, *apples*.
äh	As *e* in *where*.	Ähre, *ear* (*of corn*); schälen, *to peel*.
	As *e* in *bed* (see *ä*).	Bett, *bed*; kennen, *to know*.
	As the *first part* of the diphthong in *fate*.	Seele, *soul*; Kehle, *throat*; Rede, *speech*.
	As *i* in *bit*.	Kind, *child*; Kissen, *cushion*.
	As *ie* in *believe*, *ee* in *bee*.	ihm, (*to*) *him*; Ziege, *goat*.
	Similar to *o* in *hot*.	Gott, *God*; Sonne, *sun*.
	Similar to the first element of the diphthong in *note*.	Sohn, *son*; Mond, *moon* (exception).
u	As *u* in *full*.	Butter, *butter*; Zunge, *tongue*.
uh	As *oo* in *moon*.	Kuh, *cow*; Stuhl, *chair*.
au	As *ou* in *house*.	Haus, *house*; Baum, *tree*.
äu } *eu* }	As *oi* in *boil*.	Häuser, *houses*; Eule, *owl*.

[1] German spelling is much more *phonetic* than English.

ö is the same as *eu* in French *peuple:* 'Götter,' *gods;* 'können,' *to be able to;* 'Löffel,' *spoon.*

öh is the same as *eu* in French *peu:* 'Söhne,' *sons;* 'lösen,' *to loosen;* 'König,' *king.*

ü is the same as *u* in French *lune,* but short: 'Sünde,' *sin;* 'Stück,' *piece;* 'Schlüssel,' *key.*

üh is the same as *u* in French *lune,* but long: 'Mühle,' *mill;* 'müde,' *tired;* 'kühn,' *bold.*

The letter *y* occurs only in words of foreign, chiefly Greek, origin. It is pronounced like *i* or *ü.*

Note that vowel sounds are *not* affected by a following *r,* but always pronounced in the same manner. Thus 'mehr' has the same vowel as 'lesen.'

B. *Consonants.*—All consonants not mentioned are to be pronounced as in English.

c before *a, ä, e, i, ü, ö* = *ts,* before all other letters = *k.* This letter is now used in foreign words and proper names only. 'Cöln,' also spelt 'Köln' (*Cologne*), is pronounced with *k.*

g is always hard: 'gehen, Gift.' (In some parts of Germany it is pronounced as a spirant.)

h is not sounded when it stands between vowels in the middle of a word: 'gehen = geh-en.' The combination *th* (now in foreign words and proper only) is = *t.* The sound of English *th* is not found in German.

j = English *y* in *young:* 'ja,' *yes;* 'Jude,' *Jew.*

qu = English *kv:* 'Quelle,' *spring, fountain.*

r should always be trilled with the tongue, or rolled with the uvula in the throat. The habit of pronouncing this sound like a spirant (= *g* or *ch*) is spreading in Germany.

s = English *z,* except when final. Initial *s* (in 'Seele,' *soul,* &c.) is always pronounced soft, as *z* in *zeal.* It is always hard when final, as in 'Haus' (*s* = *ss*), 'Hauses' (genitive, first *s* = *z,* second *s* = *ss*).

is always = *ss.*

st, sp, at the beginning of a word are = *sht, ship:* 'Stein,' *stone;* 'spielen,' *to play.*

v = *f* in words of German origin: 'Vater,' *father;* 'Vogel,' *bird;* 'viel,' *much;* 'vier,' *four;* and in a number of words now completely Germanised, as: 'Veilchen,' *violet;* 'Vers,' *verse.* In foreign words it is usually pronounced *v:* 'Lokomotive, Veranda,' 'Klavier,' *piano,* &c.

w = English *v,* as in 'wissen,' *to know;* 'Wasser,' *water.*

z and *tz* = English *ts:* 'zahm,' *tame,* for example, is pronounced *tsahm;* 'zwei,' *two* = *tsvay,* &c.

ch after *ä, e, ei, eu, äu, i, ö, ü,* is pronounced like a voiceless or hard *y,* or like an exaggerated *h* in *human.*

ch after *a, au, o, u* = Scotch *ch* in *loch.*

chs is = *ks,* if both *ch* and *s* belong to the stem of the word, as in 'Ochs,' *ox;* 'Fuchs,' *fox;* 'sechs,' *six.* If the *s* is merely added as an ending, as in 'des Reichs' (or 'Reiches'), the *ch* is pronounced as usual.

ng is never pronounced with an additional hard *g.* It is sounded like *ng* in *sing, singer* (not as in *finger*).

Note.—It is important to note that final *b, d,* and *g* are always pronounced hard—*i.e.* like *p, t, k.* The latter is also pronounced like *ch* by a large number of speakers. Thus 'Leib,' *body,* is pronounced *leip;* 'Wald,' *wood, forest* = *valt;* 'Berg,' *mountain* = *berk* or *berch.* This is a very important rule.

Note that there is no *liaison,* as in English and French—*i.e.* the final consonant of a word is never run together with the initial vowel of the next. Every initial vowel (*e.g.* in 'Eisen,' *iron,* 'aber,' *but,* &c.) is preceded by a peculiar glottal sound or stop.

C. *Accentuation.*—The general rule is that the first syllable of a word has the accent: 'Ga′rtenhaus,' *garden-house;* 'a′breisen,' *to leave, depart;* 'Ap′felbaum,' *apple-tree.*

Exceptions.—(1) Foreign words keep the accent as in the language from which they are taken: 'Natio′n' (like *nazio′hn,* as *-tion* is always pronounced *-zio′hn*); 'Fami′lie'; 'marschie′ren,' &c.

(2) Words beginning with the inseparable prefixes take the accent on the syllable following the prefix: 'vergessen,' *to forget;* 'besprechen,' *to discuss.*

(3) The so-called Double Particles, consisting of two indeclinable words, have the accent on the second syllable: 'dana′ch,' *after that;* 'dami′t,' *with it* (*therewith*); 'wesha′lb,' *why, what for?* &c.

A SURVEY OF GERMAN LITERATURE

It has been usual for writers on German literature to distinguish two Classical Periods centring round the years 1200 and 1800 respectively. Wilhelm Scherer, in his brilliant *History of German Literature,* expresses an opinion that there were in reality three such epochs. Although nothing beyond the most meagre fragments remain of the actual productions of this earliest period of literary activity, its influence on later ages is such as to entitle us to speak of it in the highest terms. Scherer goes on to say, that if we regard the year 600 as the culminating point of the first classical period, the scheme of the history of German literature will at once become clear. The development proceeds in a regular curve of alternating rises and falls. The highest points are separated by periods of six hundred years each. Each culminating point

is naturally followed by a sinking of the curve; there is a descent until literature touches its lowest point, when, through internal and external influences, an improvement begins to show itself, leading up to another period of brilliant intellectual activity. We thus obtain the following scheme, which may serve as the groundwork of this brief survey:

I. *c.* 600.—First Classical Period (conjectural): *The Heroic Age.*
  c. 900.—Period of Stagnation (Old High German Period).
II. *c.* 1200.—Second Classical Period: *Period of the Great Epic Writers, and of 'Minnesang'* (Middle High German Period).
  c. 1500.—Literature degenerates into a medium of party strife; the coarse and vulgar reign supreme in secular poetry.
III. Third Classical Period: *Period of Highest Literary Achievement;* the real *Classical Age* of Lessing, Herder, Schiller, and Goethe.

I. The Heroic Age.—If one possessed more complete information about the Heroic Age, one might, perhaps, have reason to describe it as the most characteristically German of all periods. It was the time following the gigantic struggles of the migration; the heroic exploits of the leaders in that great movement had not yet been completely forgotten, but were on the point of passing into the realm of legendary lore. Christianity was slowly superseding the old heathen religion. Wodan, Freya, and the whole assemblage of mythological personages lost their divine attributes and were made into human heroes and heroines; and in the course of continued oral transmission, the historical saga blended with the mythological legend into an inextricable mass of popular story. The all too short fragments of the *Song of Hildebrant*, written down about 800, are the only specimens of that vast body of epic lore that has come down to us. It tells the story of a fight between father and son, the conflict between the stern sense of honour and parental love. The end is not preserved; but we gather that the outcome of the fight will be the tragic death of the son at the hands of his own father. This and other ballad epics lived on in the memory of the people, to make their reappearance in a slightly altered form in the twelfth and thirteenth centuries. The best known of these is the *Nibelungenlied* (the Lay of the Nibelungs), which is often spoken of as the National Epic of the German race. In it are embodied the ideals and aspirations of the old genuine Teutons, unspoilt by contact with civilisation, but also untamed by the teaching of Christianity. Traces of the Indo-European mythology and nature-religion may be discovered everywhere in the rich and varied texture of this long epic. Siegfried, the hero, is the old sun-god, and Hagen, his murderer, represents the powers of darkness. Historical events, such as the invasion of Western Europe by the Huns and the destruction of the Burgundians, have contributed to the formation of the story. Other tales, mostly preserved in debased later prose-versions—for the taste for poetry was lost in the thirteenth century—relate the adventures of Dietrich von Bern (Theodoric the Great, whose capital was Verona); of Kudrun, a sea-king's daughter; of King Rother, who sailed to the Orient; of Laurin, king of the dwarfs, and many more. One of these epics dealing with Walter of Aquitaine was translated into Latin verse by a monk of St. Gall, and thus escaped oblivion.

A. The year 900 marks the lowest ebb of the older German literature. The Teutonic race had split up into various tribes, and the new nations were still in a state of transition. The high esteem in which the Latin language and literature were then held prevented the clergy, the only persons acquainted with the art of reading and writing, from cultivating their native idiom. Apart from dull and mechanical prose and verse paraphrases of the Scriptures, nothing of literary value is preserved from that dark period. One must, however, except the Low German *Heiland*, or *Saviour*, which is written in the old alliterative metre of the heroic age, and in which the author attempts to describe Christ as a German king, with apostles as His military followers, so that the story might be brought nearer home to the understanding of his hearers. It is a most interesting poem, the only one in the Low German idiom of any merit, and its author must have been well acquainted with both the contents and the diction of the National Epic. Another remarkable work of the same period is the Latin poem *Ruodlieb* (the hero's name), written by a monk in a Bavarian monastery, in which all the elements of the later romances, even of the modern novel, seem to be contained.

II. Period of Epic Writers and of 'Minnesang.'—The rise of chivalry is largely responsible for the flourishing state of German literature about the year 1200. The Crusades had brought all Western nations into closer contact, and had enlarged their vision by making them acquainted with the life and traditions of the Orient. French influence became for a time paramount in German higher society, and called forth the famous epics of chivalry for which that period is celebrated. Three great names are associated with this form of literature. Hartmann von Aue excels more as a master of language than an inspired poet. His polished verse served as a model for those coming after him. He seems to have originally been destined for the Church, and the effect of his monastic education may be

discovered throughout his works in his somewhat melancholy outlook upon life, and in the deeply religious tone of his moralising passages. The plots of his epics are all taken from foreign sources, chiefly French; and the same applies to both his compeers. This does not mean that they translated slavishly. They took over only the framework of the tale, the skeleton which they clad with flesh and blood of their own creation. In the re-telling of the events, they adhere with scrupulous care to the French originals; but in the character-drawing, in the ethical and philosophic treatment, they work as creative artists and thinkers.

Wolfram von Eschenbach, in his *Parsival*, pictures the noblest ideals and aspirations of chivalry, and his epic has been pronounced the greatest work of imagination produced by any mediæval poet. The hero, starting out on life's adventurous journey as the 'guileless fool,' pursues an aim similar to that of *Faust*, to whom he has often been compared. Wolfram expresses the central idea of his work more naively than does Goethe some six hundred years later. How is it possible, he asks, to combine our worldly aspirations with our duty towards God and religion? How can we live the life of the body without losing that of the soul? The answer, though only dimly indicated, is the same as in *Faust:*

Wer immer strebend sich bemüht,
Den können wir erlösen . . .

Parsival is brought up in complete ignorance of God and the world, and although at first he yields to the natural impulse of his passions, he is conscious of a dim desire for a higher life. This ideal he pursues, and nobly fighting his way through the darkness of doubt and despair, finally emerges into light, finding rest in the service of the Holy Grail. From this all too brief indication it must not be inferred that Wolfram's epic contains nothing but philosophic discussion. On the contrary, the poet delights in depicting real men and women, their passions and virtues; he leads us into the castles of the great, and into the camps of armies, into 'the romantic land of chivalry.'

The same may be said, perhaps with still greater justice, of Wolfram's contemporary, Gottfried von Strassburg, author of *Tristan and Isolde*. With regard to the 'moral purpose' of his work, he totally differs from the author of *Parsival*. He is frankly on the side of the worldlings. He tells us the story of the adulterous love of his hero and heroine without any moralising comments. It *was* so, he seems to say, implying that if two such beings were to meet again, the issue would surely be the same. Gottfried brilliantly represents that advanced section of mediæval society, in whom the 'doubt' so strongly condemned by the pious Wolfram had led to religious and moral libertinism. He writes from the point of view of men like the Emperor Frederick II, the ancestors of the typical Renaissance hero, whose conception of life is best expressed in Faust's words:

Das Drüben kann mich wenig kümmern;
Schlägst Du erst diese Welt in Trümmern,
Die andre mag darnach entstehn.
Aus dieser Erde quillen meine Freuden,
Und diese Sonne scheinet meinen Leiden. . . .

The National or Popular Epic has already been discussed. It has its roots in the Heroic Age, and now receives its final form. In the stream of lyrical poetry, where Walter von der Vogelweide occupies a pre-eminent position, two main currents have to be distinguished. The numerous writers of *Minnelieder*, love-lyrics, merely imitate a French genre that came into Germany in the train of chivalry. This originally Provençal type of poetry has for its main theme the praise of noble women, the cult of the female sex; but its sentiments no less than its form are almost wholly artificial. It is true that many of the best *Minnesingers* in Germany infused into their works some of the sincerity that should distinguish the true lyric; but it was reserved to Walter to write those exquisite little poems, having nothing of the conventional which pervades all troubadour minstrelsy, but which are in substance purely and simply the outpourings of his heart, only retaining the polished outward form of the fashionable poetry. He also wrote a large number of political ballads, passionate appeals for the unity of the German people, and for its resistance to papal interference in national affairs. These songs, couched in fiery language and perfect in verse and rhythm, travelled from one end of the country to the other, stirring the hearers to action, and thus performing the work of the more prosaic modern newspaper.

B. The Second Classical Period was entirely a creation of chivalry, of knightly society. When that society began to decay, its literature also rapidly declined. The thirteenth century witnesses the rise of the middle classes to power and self-respect, the ascendency of the town-dwellers, the burghers of the free and imperial cities, who now for the first time aspire to literary honours.

But this movement was not destined to produce any works of permanent value, at least not until, combined with other forces, it finally culminated in the glorious achievement of eighteenth-century classicism. The *Minnesang* deserted the stately halls and romantic castles of the knights and entered the walled cities of the Empire. In so doing it lost much: *Minnesang* turned into *Meistersang*. Love-poetry fell into the hands of sedate burghers, estimable men, to be sure, but pedantic in the extreme, of limited experience and puritanical in views. The old rules of versification were strictly adhered to, and just as the various trades had

formed closed guilds, so the writing of poetry was similarly organised into 'Schools.'

Composing and reciting poetry now became the holiday pastime of honest tradesmen and artisans. Among these 'poets,' only one, Hans Sachs, the cobbler of Nüremberg, is generally remembered. Living at the time of the Reformation, he had the courage to deviate from the rules of the school, confining the poet to strictly biblical subjects, and to write about current events. He was one of the first to hail the appearance of Luther, whom he describes, in the strange, overwrought allegorical fashion of the 'Meistersingers,' as the Wittenberg nightingale, whose beautiful song announces the coming of the dawn, driving away the powers of darkness and inaugurating the reign of light. Hans Sachs is chiefly remembered for his innumerable *Tales*, and rather coarse, but never lascivious, *Shrovetide Comedies* (*Fastnachtspiele*), many of which, with their quaint doggerel and vivid portraiture of contemporary characters, may still be read with enjoyment. Richard Wagner has immortalised the Nüremberg 'Meistersinger' and his companions in a work which by competent critics is considered to be his masterpiece.

The centuries following the Reformation are barren in works of lasting value. Satire of the coarsest description flourished; it was the period of the Gargantuan style of writing and thinking. The great upheaval, instead of lifting up the minds of men, had ended in creating two bitterly opposed factions, which conducted a violent controversy of calumny and vituperation couched in the language of Billingsgate. Brant's *Ship of Fools* ruthlessly attacks human nature in general, and contemporary society in particular, and so does the allegorical popular beast-fable, the Low German *Renard the Fox*. Both books were widely translated, and may be regarded as Germany's first contribution to world-literature.

While these things were happening on the surface, the voice of the simple people found expression in the rarely recorded *Volkslieder*, half-epic, half-lyrical in character. Very many of the best lyrics of this kind, for which Germany is justly famed, and which are contained in the collections of Herder, Arnim, and Brentano, Uhland, Erck, and others, go back to the fourteenth and fifteenth centuries. Closely bound up with the folk-songs is the religious hymn, which is the only form of real literature whose production was stimulated by the Reformation. Both in Protestant and Catholic circles, religious fervour found expression in beautiful verse, much of which survives in modern books of devotion. The names of the great Reformer himself, and of the Jesuit Angelus Silesius, may be mentioned in this connection. The importance of Luther's version of the Bible in the formation of the modern literary German language is discussed elsewhere.

When the first storm of the Reformation had blown over, signs of a literary revival made their appearance. But all hope of the rise of a national literature was destroyed by the awful calamity of the Thirty Years' War (1618–48). From it Germany emerged devastated, depopulated, mutilated in territory, and crushed in spirit. Grimmelshausen's powerful novel, *Simplizissimus*, with its harassing attention to detail, contains a true and horrible picture of the war, and is the only product of those troublous times that possesses permanent value.

The religious upheaval of the Reformation was preceded and accompanied by a revival of classical studies, by that Renaissance movement usually described as 'Humanism' when applied to the world of letters. Humanism had its roots in the universities, and was of an international character. It did not suffer so much from the effects of the war, and now became a powerful force in literature. Its immediate effects, however, were not altogether beneficial. The splendour of classical literature and art blinded men to the merits of their own native country's productions, just as it had done during the period following the introduction of Christianity. It also inspired an undue regard for the rules that they imagined governed Greek, and particularly Latin, poetry; and France having succeeded in building up a flourishing literature on the basis of these imaginary rules, the works of its poets were extolled as worthy of translation and imitation. We now enter upon a period which is characterised by a lack of national pride and self-reliance, by slavish adherence to foreign models, and by an undue estimation of the importance of external rules. The writing of poetry was considered a mere exercise of the intellect, an accomplishment that might be acquired by anyone, while genius was not regarded as a necessary qualification. This state of affairs is well illustrated by the grotesque title of a *Primer of Poetry*, which called itself *Nüremberg Funnel, for the pouring in of the Poetic Faculty in Six Hours* (1646). It was a work of dull imitations, of bombastic tragedies in Alexandrine verse, totally unsuited to the genius of the German language. Artificial and unreal pastoral poetry flourished and innumerable *Gelegenheitsgedichte*, occasional poems were composed with which even the most trivial events in public and private life were celebrated. At the beginning and end of this period we may fitly place two law-givers, pedantic critics who, themselves lacking divine inspiration, wrote treatises on the art of poetry, which they put into practice in works of no distinction. The elder and by far the more sympathetic one is Martin Opitz (1597–1639), who published his little treatise, *Buch von der deutschen Poeterei*, in 1624, and through it determined the character of German literature for several generations. Blind admiration of foreign models made him

transfer to German poetry the rules which French and Italian critics professed to have derived from Horace and Aristotle. If he sinned against the national spirit in many ways, he must be given credit for three important achievements. He confirmed the language of Luther in its supreme position as the medium of literature; he discouraged the indiscriminate introduction of foreign words; and reformed poetic rhythm, which had degenerated into a lawless doggerel during the centuries of depression.

The various 'schools' of poetry which literary historians distinguish in the seventeenth and early eighteenth centuries can be mentioned only briefly. They all own Opitz as their master: The first Silesian school, entirely given up to the imitation of foreign and classical models; the Königsberg or Prussian school, in which the influence of the unsophisticated *Volkslied* is slightly apparent; and the second Silesian, distinguished by the exceptional bombast of its style, its preference for the horrible and revolting, and its inclination towards the lascivious.

The Opitzian movement is brought to a close by another critic, the last man of note belonging to the formalistic school. Gottsched, the Leipzig dictator (1700–66), violently combated the excesses of the second Silesian school, and urged his countrymen to return to a stricter adherence to rule. His extremely narrow and uncompromising views were based on the works of the great French writers, Corneille, Racine, Molière, and Boileau, and for a time he ruled supreme and without opposition. About the year 1740, however, his ascendancy was effectively challenged by the Swiss critics Bodmer and Breitinger. The fight between the antagonists became very hot, and the controversies leading to the speedy downfall of the pedantic dictator were acrimonious in the extreme. Gottsched had declared that in poetry form alone mattered. Bodmer and Breitinger, however, dimly realised that poetic genius and animate fancy were after all more essential than the knowledge of formal rules. They further rendered an enormous service to their countrymen by directing their attention from French models to English writers, whose influence now begins to be powerful and beneficial. They were at one with Gottsched in insisting that literature should always have a moral purpose, and should 'imitate' nature, though they admitted, and even recommended, the 'wonderful' as a fit object of poetic treatment. Notwithstanding their own numerous shortcomings, they did useful work in breaking the spell of Gottsched's professorialism, and thus opening a path for the succeeding generation, who soon left both the Leipzig and Swiss censors still floundering in the morass of criticism.

III. Period of Highest Literary Achievement.— All these men wrote *about* poetry, and composed impossible verse without being poets themselves. The one to inaugurate the brilliant line of really inspired singers was *Klopstock* (1724–1803). He succeeded at last in harmoniously combining the three great forces in German contemporary mental activity: Christian piety, the national character, and the true spirit of classical antiquity. His poetry—the Miltonic epic *Der Messias* and numerous odes—produced an immediate and enormous effect on his contemporaries, who were pining for spiritual emotion after more than a century of arid rationalism. His writings do not, however, appeal in the same powerful way to subsequent and more realistic generations, who, admitting his greatness, fail to appreciate the exuberance of his imagination, which indeed too often loses itself in a vague infinity without shape or colour. The main themes of his poems are Christianity, Fatherland, Friendship, Love, and Nature. He is all sentiment; his characters lack individuality—they do not act, but merely feel. The keynote of his songs of love and friendship is a vague, sentimental yearning combined with a strong funereal strain.

By merely following the impulse of innate genius, regardless of critics and their rules, Klopstock set an example which was more valuable than either his choice of subjects or his method of treatment. He awakened a new national spirit, fortified the self-confidence of his countrymen, already encouraged by the brilliant victories of Frederic the Great. Klopstock fought against foreign influence by example; Lessing successfully continued the struggle by his active criticism. Having at first sided with the Swiss school, he soon turned to the direct study of Aristotle's critical writings. Homer and Shakespeare he declares the greatest of poets, and he defends them against the French and their followers. By examining their immortal masterpieces, he discovers the fundamental laws of art, and demands with irresistible fervour their application in a thoroughly national literature.

He devoted most of his energies to the reform of dramatic art. In his *Hamburgische Dramaturgie* he finally destroyed the superstition that the French classical tragedy and comedy were the only correct types of dramatic literature. Shakespeare was henceforth to be the model, if model there must be. Lessing's other manifold activities as historian, antiquary, philologist, enlightened theologian, must be passed over here. Whatever he touched, he handled with brilliant success. He proved himself the acutest of critics and dialecticians, a man of immense and comprehensive learning—in short, the finest and final product of eighteenth-century rationalism. Continuing what Luther so brilliantly inaugurated, Lessing perfected modern German prose, and if, on his own confession, he was not an inspired poet himself, he must yet be

regarded as the virtual founder of German classical drama.

Lessing forms a link between the old and the new, and the same may be said of Wieland (1733–1813), though in a different sense. The latter, too, came under the strong influence of English literature; but he modelled his style chiefly on contemporary French writers, whose light, scoffing, and even frivolous tone he often imitates. The most remarkable among his works are *Die Abderiten*, a novel containing in Greek disguise a humorous travesty of the life in a German *Kleinstadt;* and a romantic verse epic, *Oberon*, of which Goethe said that wherever poetry was appreciated, it would be loved and admired as a masterpiece of the art. Although most of Wieland's numerous novels and verse epics have long since ceased to be generally read, he has influenced the development of German literature considerably. Steering a middle course between Gottsched's strict formalism and Klopstock's excessive boldness of diction and loftiness of subject, he freed poetry from the pedantry of the former, and the extravagances of the latter. If Lessing is the father of modern prose, Wieland must be regarded as the creator of that poetic language which in the hands of Goethe and subsequent lyricists was turned to such admirable use.

The common feature of Klopstock, Lessing, and Wieland is the revolt against tradition, and the assertion of the rights of individuality. This sentiment was by no means confined to Germany. In all West European nations, a similar impulse made itself felt. Rousseau denounced civilisation as having demoralised humanity, and fervently preached the return to nature. In France the ferment broke out in political action, and the Revolution swept away the old institutions. The German citizen was debarred by the peculiar conditions of his country from taking part in politics. After the conclusion of the Seven Years' War, a long peace of thirty years' duration set in; but it did not bring with it the political union of the nation, which remained divided and without a voice in the government of the 350 odd states of the Holy Roman Empire. Activity was only possible in the field of intellectual pursuits. Schiller expresses this in several places, calling upon his countrymen to leave behind life's harassing worries and seek refuge in the land of the ideal, where alone real freedom may be enjoyed: *Werft die Angst des Irdischen von euch—Fliehet aus dem engen dumpfen Leben—In des Ideales Reich.* The spirit of patriotism called forth by Napoleon's oppressive policy, which was later on to take such effective form in the wars of liberation (1813–15), and which inspired the songs of Körner, Schenkendorff, and Arndt, had not yet become a force in national life.

In the seventies of the eighteenth century, the critical years of the 'Storm and Stress Movement,' the long pent-up energies of the nation broke loose and flooded the country with a mass of writings, most of which are now happily forgotten. Klinger's wild drama, *Sturm und Drang*, supplied later historians with a name for the movement, which in its own day was appropriately described as the *Geniezeit.* The spirit of free criticism had broken down all authority. Restraint of any kind was impatiently resented, and the time-worn institutions of society and organised religion were attacked and repudiated. Klinger, Wagner, Lenz, and the two Counts Stolberg may be named as members of that turbulent throng of writers, whose wild exuberance of spirit combined with strange eccentricities of conduct earned for them the name of 'original' or 'power geniuses' —*Original oder Kraftgenies.* Both Schiller and Goethe were drawn into the maelstrom, the latter being for a time the acknowledged leader of the wildest section. His novel, *Werther*, is the most notable and thoroughly characteristic product of that period, next to which we may place Schiller's *Räuber* and *Kabale und Liebe.* All three are masterpieces of enduring value. The stupid ridicule sometimes cast upon these works is totally uncalled for, and no one with a sense of true literary merit will fail to appreciate their high qualities. *Werther* took the world by storm; it was translated into almost every European language, and it was one of Napoleon's favourite books.

When the flood of the *Genieperiode* at last subsided, many of the most prominent and unruly among the young writers settled down in orthodox fashion; others are no more heard of. But there emerged from their ranks three men, the pride and glory of German literature: Herder, Schiller, and Goethe. *Herder* (1744–1803), the oldest of the three, is remarkable not for original and creative genius, but for his critical insight, as great if not greater than Lessing's. In the latter's mental constitution intellect and reasoning power prevailed. Herder's strength, however, lies in his unfailing æsthetic sense and unequalled faculty of recognising the great and essential in all art. Following the main current of contemporary thought, he enthusiastically emphasized the supreme importance of 'originality,' without committing himself to the extravagant notions of the *Kraftgenien.* In opposition to the formalist school, which declared poetry to be the 'invention' of mankind, he maintained that, on the contrary, poetry was older than prose. He calls it the 'universal language of the human race'; he points out that its best models are to be found in the popular poetry of all nations. He opened up the fountains of true and original poetry by fervently advocating the study of the Old Testament, of Homer, of Ossian, Shakespeare, and the folk-songs of all peoples, which latter he collected into an important volume, *Stimmen*

der Völker in Liedern. Herder's influence on his contemporaries was very marked. Goethe, for example, was deeply affected by his writings and personality.

It is quite impossible to give here anything like an adequate idea of the importance of **Goethe**, the greatest among German writers (1749–1832). In his long literary career, three periods may be distinguished. The first, ending with his arrival at Weimar (1775), may be called the period of storm and stress, and his chief production of those years, *Werther*, has already been mentioned. He was called to Weimar by the enlightened young duke, Karl August, sovereign of that miniature state, and as a consequence of this act the small Thuringian Court became the centre of German classical literature. Wieland was already there; Herder was brought to Weimar by Goethe; and Schiller soon followed. The second, or classical, period of Goethe's activity culminates in his acquaintance with **Schiller** (1759–1805), and may be said to terminate with the latter's death. These years saw the production of his great masterpieces—*Iphigenia, Tasso, Wilhelm Meister, Hermann und Dorothea,* and the first part of *Faust.* Schiller, having outgrown both the style and the extravagances of his early works, produced those dramas that will ever be the pride of the German stage—*Don Carlos, Wallenstein, Wilhelm Tell,* and others.

If we ask ourselves what it is that constitutes the perennial charm and imperishable value of these works, the answer must be: It is the perfect expression of the ideal of humanity therein expressed. Animated by the loftiest ideals, but free from prejudice of any kind, poetic genius of the highest order here undertakes to review and analyse human nature, endeavouring to comprehend and interpret in works of supreme artistic merit the mystery of life, and solve the riddle of human existence.

Of the two poets, Schiller is perhaps still the most popular in his own country, and is often called the national poet; but the highly wrought-up pathos of his dramas, ballads, and 'philosophic lyrics'—a genus peculiarly his own—do not appeal to foreign readers in the same way as do the artistically finished works of the more tranquil, essentially human Goethe.

Goethe's third period, from Schiller's death to his own, is a quiet garnering in of the fruits of a long and eventful life. His work will perhaps be best understood when one remembers that he himself described them as 'one long confession.' Whatever agitates his mind—his sorrows, joys, doubts, and struggles—he lays down in his poetry; and apart from *Faust*, the second part of which he did not finish until a few days before his death, he is at his best in his exquisite lyrics, which are unequalled in the world's literature.

By the side of the classical authors of the Weimar circle there had arisen out of the storm and stress movement another school of writers, whom it was the fashion to call the *Romanticists.* Here again we must distinguish between the critics and pathfinders, the brothers Schlegel, and the poets who put their ideas into practice. The Romantic movement is born out of the desire for a 'return to nature,' for a more national life, and a more complete union of poetry and life. But it sought to attain these ends in an artificial way. The chief features of the romantic school are: (1) The cult of the past, especially the Middle Ages; (2) the cult of the eccentric, the extravagant and the palpably unreasonable and impossible. The Middle Ages, with their imaginative splendour, their Gothic cathedrals, picturesque castles, their tales of wonder, adventure, and heroic achievement, appealed to the romantic mind by their contrast with the drab, monotonous aspect of contemporary life. The Middle Ages were the ideal period, whose departure they deplored, and in whose contemplation they revelled. Excepting a few lyrics, little is now generally read of the works of the Schlegels, Tiecks, Novalis, and their associates. The eccentric stories of Hoffmann and Kleist's dramas, however, have recently again risen in public esteem; and the lyrics of Eichendorff will only perish with the German language. But then neither Hoffmann, nor Kleist or Eichendorff, may be called romanticists in the accepted sense of the word. The more enduring fame of W. Schlegel and Tieck is based on their translation of Shakespeare, a marvellously accurate and yet poetic rendering, which has made the great British dramatist almost into a German classic. Stimulated by the romantic movement and its veneration of the productions of past ages, Arnim and Brentano, and after them Uhland, collected the German *Volkslieder,* whilst the brothers Grimm compiled the marvellous book of fairy-tales which has earned them world-wide fame.

It cannot be the object of this brief survey to deal at any length with the post-romantic movements. The men of the most recent period—the period in which we are living—have not yet been assigned their definite places in the temple of fame. It is impossible, however, not to say a few words about **Heinrich Heine** (1797–1856), who is held in much higher esteem abroad than he is in his own country, thus being the exact reverse of Lord Byron, esteemed by continental nations more than by his own. No one will deny that Heine was a great and gifted poet—one of the best lyric geniuses the world has ever produced. But his objectionable qualities—his biting sarcasm, his vindictiveness that recoils at nothing, the intensely realistic outlook upon life characteristic of the Jewish race—are perhaps more easily discovered and more deeply resented by his own countrymen than by foreigners.

The pity is that the worship of Heine seems to have blinded people to the merits of those great German singers that come after Goethe—Mörike, Annette von Droste, Theodor Storm, Liliencron, and many more.

German literature of to-day is in a condition of ferment. All the traditional forms of composition—the epic, the novel, and, above all, the lyric and the drama—are being experimented with to express the spirit of the age. The young generation of authors is pursuing this aim with much earnestness, and in some cases with success. In fact, a high authority has recently declared that of all European literatures, the German was the most modern in character and ideals, and that it best represented the tendencies of present-day thought.

COURSE OF READING

German literature is best approached through a study of Goethe, 'the head and body of the German nation' (Emerson). An excellent little book for this purpose is Herford's *Goethe* (The People's Books); Robertson's *Goethe and the Twentieth Century* (Cambridge Manuals) is equally valuable. Robertson's *Literature of Germany*, or his larger *History of German Literature* are very useful books. A very stimulating and well-written work is Franke's *German Literature, as Determined by Social Forces*. The best work in German is Scherer's *Geschichte der deutschen Literatur*, of which there exists an English version.

There are but few translations of the German classics; many of the translations have appeared in Bohn's Library, but they are very bad as a rule, and cannot in any way replace the originals.

Most of the German writers are available in cheap reprints, brought out by the firms of Cotta, Brockhaus, Hesse, Bong, and others. Single works can be obtained in the Reclam edition, which is the most representative.

Collitz, *Selections from German Classical Writers*, can be recommended. Anthologies of lyric poetry are *Die Ernte*, and Fiedler's *Oxford Book of German Verse*.

Particulars of editions of older writers will be found in the bibliographical appendix of Vogt and Koch's *Geschichte der deutschen Literatur*.

ESPERANTO

In every sphere of human activity two divergent principles present their claims—the principle of specialisation and the principle of co-ordination. These principles are not hostile, but are truly complementary. The microscope has its counterpart in the telescope; the scientist and the metaphysician are allies in the cause of truth. It is only comparatively recently that this omnipresent problem has manifested itself explicitly in the universal theatre of human society. The more we hear of the inviolability of the principle of nationality, the more do we hear of the validity of the principle of internationality. Esperanto is a linguistic instrument for international development, which neither violates nor impairs the course of national development. Its function is to coordinate national progress by facilitating international intercommunication.

There have been false prophets in our midst. During the last fifty years it has been repeatedly proclaimed that national barriers have been finally undermined by the engines of modern science. The nations, we were told, are in the melting-pot, and a true cosmopolitan people are in the making, embarrassed with neither household gods nor local spirits. Nor were there lacking signs of this seeming truth. Means of international communication increased with alarming rapidity. The telegraph, the aeroplane, the telephone, the steam-engine, the steamship, the motor, seemed verily to have pronounced a last requiem on the petty patriotism of petty peoples. And yet we are confronted with the coexistence of the opposite tendency—the assertion of national spirit increasing in proportion to the intensification of international sentiment. Recent European history exhibits a progressive disintegration of composite countries according to the principle of nationality. Recent wars reveal the overwhelming influence of national sentiment on the *morale* of armies. National sentiment does and will survive; and it is because Esperanto, the international auxiliary language, offers no violation to the legitimate claims of nationality that it has enjoyed and deserved such halcyon success. Note well that phrase, "international auxiliary language," for it epitomises the claims of Esperanto. The language was created as an international means of communication, and is not intended in anywise to supersede or destroy the national and domestic use of existing languages.

Necessity of an International Language.—It is only logical, before we weigh Esperanto in the balance at all, first to establish the fact that an independent international language is a real necessity. Why do we not accept one of the existing languages or resuscitate one of the dead languages to answer our purpose, granted that national isolation is no longer possible? If we happen to be English, the peculiar fitness of English will naturally suggest itself. Here ready to hand is the perfect instrument, by using which we do not commit ourselves to the impropriety and perilous responsibility of a special linguistic creation.

The arguments cited in favour of the adoption of English are familiar. The interests of English-speaking peoples are far greater than any other group of nations using a common speech. Moreover, English has, to a large extent, established itself as a means of communication with the East. The language, too, in structural evolution is more advanced than its European neighbours. It is answered that, though in currency English has considerable ascendancy, English-speaking peoples are nevertheless in a small minority when compared with the whole mass of civilised nations. Moreover, the *amour propre* of the more prominent of these rival claimants will never brook, and will successfully resist, the effrontery of such a national imposition. Surely it only shows gross lack of discernment and sympathetic obtuseness to make such claims for English to linguistic universality. The condition of things in the East, too, rapidly alters, and disintegration and national reassertion are inevitable. The spirit of nationality is sacrosanct, and all international movements must keep this in view.

But apart from national objections to their preferment, none of the living languages possess the intrinsic qualities necessary for the supreme international office. An international language must be easily acquired by all. Simplicity and regularity must be its essence. Living languages do not possess these essentials. As to the ancient languages, in their classic purity their structure is prohibitively complex. When simplified, rectified, and brought up to date in vocabulary, the result is a barbarous anomaly that commends itself to neither the learned nor the unlearned. An international language, therefore, must be neutral, and simple, regular, and homogeneous in construction.

The objector may grant that none of the existing national languages has all the requisites of a perfect international means of communication, but may not feel convinced that the demand for any innovated language is real and urgent; or, acknowledging the imperfection of the existing system of communication between nations, and acknowledging the need of greater linguistic facilities, he may prefer to await a natural linguistic evolution towards homogeneity and perfection rather than invoke a *deus ex machina* in the shape of a purely arbitrary and artificial linguistic creation. The demand for a complete international understanding is felt everywhere. Travelling, commerce, and art are incalculably handicapped by the language barrier. The case of science is less self-evident, but none the less the loss occasioned by the existing state of Babel to its furtherance and achievements is incalculable. Science is by its very nature neutral: its results become common property of all the peoples, but the present process of research is wasteful in time and material. Scientists in different countries are working, unknown to each other, on the same problems, and consequently there is conspicuous overlapping of results. Cases have been found where a lifetime has been devoted to the solution of a problem which, unknown to the experimenter, had already been solved in another country.

If all important results were recorded in the international language as well as in the national, the whole world's endeavour would be co-ordinated and systematised. As it is, the experimenter either labours in unenlightened isolation, or is compelled to devote months and years to acquire languages in order to get into touch with alien research. The demand for special scientific treatises in the various countries is small, and translations are consequently expensive. The translator, too, is seldom thoroughly conversant with the subject-matter. A translation into the universal language could be made once for all under the surveillance of the specialist; and the demand in the universal market would be sufficient to ensure cheapness of production. Those who have been present at an international scientific congress will be fully aware of the hopelessness of the multilingual system. By the confusion of tongues the very end of an international congress is defeated. Very different are congresses conducted in Esperanto. Again, by the adoption of an international language the standardisation of technical and scientific terms would be achieved with highly beneficial results. The suppositional promise of a naturally evolved international language need not detain us. There is no evidence of the coming event in fact.

The idea of an international language is not a contemporary innovation. Such languages have existed from time to time, but have invariably failed because they did not exhibit the two first necessities—neutrality and simplicity. In the Macedonian age Greek became the "common tongue" of half the known world. The Roman Empire tried to impose the Latin language, as well as Latin institutions, upon half the globe. In the Middle Ages Latin was the universal language of scholars, but its idiom became outraged and debased, and its vocabulary corrupted, when forced into new channels of learning. French for long was the universally adopted currency in diplomatic and artistic circles. In the Middle Ages various attempts were also made to build an *artificial* universal language. The schemes were based on the impossible idea that by classification and subdivision a complete knowledge of the universe might be obtained. A language built on the "philosophic" system would be self-explanatory when one was familiar with the principle of classification, the various letters indicating the genus, species, and subdivision in order. Languages of this type are designated *a priori* languages. They prove quite unpractical. Opposed to them is the type of artificial language called *a posteriori*. Such languages are composite. They borrow their vocabulary from existing roots, but their grammar and syntax are artificial in their homogeneity and regularity. To this type of language Esperanto belongs.

Other International Languages.—Of all artificial languages, excepting Esperanto, *Volapük* alone obtained any significant measure of international currency. This language was the invention of a Roman Catholic bishop named Schleyer, who was curé of Litzelstettin, near Constance. Its name is derived from the English words *world* and *speech*. It was too arbitrary and modificatory in its adoption of existing roots, as the name alone proves. The language was published in 1880, and it soon became widely popular in the leading countries of Europe. Ten years after its publication, in the height of its prosperity, it is said to have numbered a million adherents. Its decline was as rapid as its rise. An International Academy of Volapük was founded in 1887, but the house became divided against itself and could not stand. Modifications and improvements were suggested, and dissension arose as to their acceptance. Eventually the director, in opposition to the inventor, failing to carry his scheme for a reformed grammar, resigned.

Various Volapük academicians commenced constructing independent international languages. Meantime the rump Academy set to work on an entirely new language called *Idiom Neutral*. The report of the American Philosophical Society on Volapük is instructive in content. While the report fully acknowledges the urgency of the demand for an international auxiliary language, it rejects Volapük as inadequate for the purpose. It criticises it as being too arbitrary in construction, not inter-

national enough in vocabulary, and too synthetic in grammar. Thus died Volapük. Its life was short, but not in vain, for it showed that in an artificial language which is not fully established alterations are fatal.

Esperanto did not neglect the warning. It tolerates no faction or dissension. This inadmissibility of change that characterises Esperanto is not a proof of a stubborn dogmatism. Esperanto lays no claims to acquired perfection—nay, it contemplates a *gradual* perfection. But until such time as Esperanto is officially adopted for international purposes, Esperantists absolutely refrain from any amendment of the fundamentals. When it is finally established, then the consensus of usage among its master-writers will reveal any modification that demands official recognition.

Æsthetic Objections to Artificial Languages.—We have yet to deal with the æsthetic objections to an international language. There are those who are ready to acknowledge that an international language is indeed a labour-saving machine of incalculable commercial and material advantage, but utterly reject and repudiate it as a vulgar and diabolical invention, whose adoption would crush all the beauty out of the speech and thoughts of men. They rhapsodise on the untold wealth of a natural language, the infinite suggestions of its every word, and the luxuriance of its spontaneous growth. The mechanical uniformity, the dull monotony of a linguistic machine, they proclaim, is abhorrent to anyone capable of appreciating the spirit of language; the concomitant levelling of persons and nations is intolerable. Esperantists reply that their language is not an end in itself. It is not intended to exhibit the æsthetic and historic interest of the living tongues. (It has beauty of its own in style and character, but of that anon.) The language is frankly utilitarian, and its purpose in life is to open the widest fields of thought and activity to the greatest number. As to the dullness of a general uniformity and the vandalism of the levelling process of internationalism, the complaint should be launched against modernity at large and not against Esperanto. Science, democracy, and universal education are responsible for the melting-pot that is alleged to be destroying all the beauty and poetry of living. But, after all, jeremiads on the inevitable are unprofitable. Machinery has come to stay; Esperanto has come to stay; and if they come to destroy they also come to create, and to liberate the minds of men for higher things, nobler things, and greater things than ever went before. "Ni inter popoloj la murojn detruos" ("We shall break down the walls between the peoples"); "Amo kaj vero ekregos sur tero" ("Love and truth shall begin their reign on earth").

The function of language is to express the thoughts and feelings of men. Natural languages are full of anomalies and redundancies, which are by-products of their historical production and have no intrinsic value. These must be eliminated in an adequate international language, but without impairing its function. Inflexions and syntax must be reduced to a minimum of simplicity. The language must be absolutely phonetic. Thus the chief difficulties that embarrass the learner of living languages will be obviated. In vocabulary the principle of maximum of internationality of roots commends itself. Does Esperanto fulfil these conditions?

Origin of Esperanto.—The inventor of Esperanto is a Polish doctor of Jewish extraction, Ludwig Lazarus Zamenhof, who was born in 1859 at Bielostock. Poland is a polyglot country, and has been the scene of tragic intestinal carnage. As a boy Zamenhof was convinced that a prime factor in interracial misunderstanding was the language barrier, and he resolved to devote his life to its removal. Zamenhof thus describes his early conceptions of his calling.[1] "I was born at Bielostock in the province of Grodno (Russia). This scene of my birth and childhood determined the direction of my future aspirations. In Bielostock the population consists of four diverse elements—Russians, Poles, Germans, and Jews. Each of these sections speaks a different language, and is in disagreement with the others. . . . I was brought up to be an idealist; I was taught that all men were brothers, yet at the same time my surroundings made me feel that *men* did not exist; there only existed Russians, Poles, Germans, Jews, and so forth. This state of affairs continually disquieted my young mind—though many, mayhap, will smile at such 'world-sorrow' in a child. And as it then appeared to me that 'grown-ups' were all-powerful, I said to myself that when I grew up I would abolish the evil.

"Gradually, of course, I became convinced that things are not accomplished as easily as appears to a child. One after another I abandoned various Utopian ideas of childhood, and retained only the dream of one language for all mankind. At an early stage I felt that this could only be some neutral language, belonging to none of the existing nations. When I left school at Bielostock and entered the classical academy at Warsaw, I was attracted for a time to the ancient languages, and dreamt of a day when I should travel through the world and with impassioned words persuade mankind to revive one of those languages for common use. Subsequently—I forget how—I came to the firm conviction that this too was impossible, and I began to have vague dreams of a new, artificial language.

"I then made various experiments, inventing rich artificial declensions, conjugations, &c.

[1] Translated from the Esperanto.

But a human language, with, as it appeared to me, its endless series of grammatical forms and its hundreds of thousands of words which made the big dictionaries so formidable, seemed such an artificial and colossal machine that I more than once said to myself, 'Away with dreams! This task is beyond the powers of man.' But nevertheless I kept returning to my dreams.

"I learned French and German as a child, and could not then make comparisons or draw conclusions; but when in the fifth class at the academy I commenced to study English, I was struck with the simplicity of the English grammar, and more so owing to the sudden change from Latin and Greek. I then saw that richness of grammatical forms is only a chance historical occurrence, and is not necessary in a language. Possessed by this idea, I began to examine my language and to reject the unnecessary forms, and I noticed that the grammar melted away in my hands till it became so small as to occupy, without violating the language itself, only a few pages.

"One day I chanced to notice the inscription *Svejcar-skaja* (drink-shop), and afterwards the sign *Konditor-skaja* (confection-shop). This word *skaja* interested me, and showed me that suffixes make it possible to form, from one original word, several other words which need not be separately learnt by heart. This idea took possession of me, and I suddenly felt the ground under my feet. A ray of light had fallen on the big dictionaries, and they began to diminish rapidly before my eyes."

While yet in his teens Zamenhof had created the nucleus of his new language. In 1878 he communicated his ideas to some of his friends. They became enthusiastic partisans, and meetings were held where the language was put to test of speech. But only encountering derision outside, gradually his adherents fell away, and Zamenhof found himself alone. Disappointed in the infidelity of his first confederates, Zamenhof resolved to labour in isolation. Zamenhof was an oculist by profession, and it was only in intervals of leisure, during his five years university course in medicine, that he was able to devote his energies to his beloved language ("kara lingvo"). For some years after Zamenhof had begun his medical practice he still laboured at his language. He tried at first to find a publisher who would undertake the cost of publication. Finally, in 1887, Zamenhof was able to issue his treatise at his own expense. The author adopted the pseudonym of Dr. Esperanto ("one who hopes"), and his book was entitled *Lingvo Internacia. Antaŭparolo kaj plena lernolibro.*

Spread of Esperanto.—Unlike Volapük, the progress of Esperanto was at first slow. The first Esperanto association was founded in Petrograd in 1892, under the name of *La Espero.* During the first decade of its life the adherents of Esperanto were mainly Russians, with a few German and Swedish sympathisers. In 1889 *La Esperantisto,* the pioneer Esperanto newspaper, commenced publication in Nüremberg under the auspices of Trompeter. Subsequently it was censored in Russia, owing to the collaboration of Count Tolstoi, and was transplanted to Upsala, under the name of *Lingvo Internacia.* It has been published in Paris since 1902. Another early Esperanto newspaper was *L'Espérantiste,* founded in 1898 at Epernay by the great French apostle of Esperanto, the Marquis de Beaufront. The Marquis, when he first became acquainted with Esperanto, was on the point of publishing an international language of his own, but recognising the marked superiority of Zamenhof's production, he magnanimously abandoned his own invention, and devoted his wide influence and indefatigable energy to the promotion of the Esperanto cause. The movement in France was vigorous and widespread, and to-day France remains in the vanguard of the battle. In 1902 the first English association was founded by Mr. Joseph Rhodes and Mr. Ellis, and in 1904 the British Esperanto Association was founded. The official organ of the association is *The British Esperantist.* In the year 1902 the Spanish association was formed. Esperanto had now earned world-wide acceptance, and became an established fact, worthy of recognition as an important contributory factor in modern national and international progress.

In 1905 the first international congress was held at Boulogne. Twenty different nationalities were present at this momentous assembly, where the language was put to a crucial test in song and debate and drama. The great majority of the audience were familiar with the language only from books, or from conversation with their compatriots. Would there linger in the international use of the language subtle national idiosyncrasies of accent and phraseology, making universal understanding of the spoken word difficult or impossible? A thrill of intense expectation ran through the assembly as Zamenhof rose for the first time to address a world-wide assembly in the international language. Every word rang clear and distinct, intelligible to all. The full vocalic endings and logical harmony of the language proved to the delighted listeners that Esperanto had a rare beauty of its own. Moreover, they felt that it possessed a something ineffably illusive, yet intrinsic—a *living spirit* of its own. The Esperanto congress became an annual event. In Geneva, in August 1906, the second was held. The great Cambridge Congress came in August 1907, and gave an immense impetus to the movement in England. Congresses at Dresden, Barcelona, Washington, Antwerp, Cracow, and Berne bring the sequence up to date. Adherents now number millions, and

their hand-clasp encircles the globe. In 1907 an International Esperantist Scientific Office was founded in Geneva. The object of the institution is to establish Esperanto as an officially recognised international medium for scientific purposes; its official organ is the *Internacia Scienca Revuo*. Numerous other associations are being formed by Esperantists who have special interests of an international character—*e.g.* the *Tutmonda Esperantista Kuracista Asoĉio* (the Universal Esperantist Medical Association), the *Tutmonda Katolika Unuiĝo Esperantista* (the Universal Catholic Esperantist Union). Esperanto, of course, is absolutely neutral, and dissociates itself from any fixed dogmas or ideas; its connection with any special movement is purely as a speech-medium. It has no *credo* of its own.

Esperantist Declaration.—At the Boulogne congress a *Declaration* was adopted, giving an official account of the aims and scope of Esperanto. The Declaration runs as follows:

Deklaracio.	*Declaration.*
Ĉar pri la esenco de Esperantismo multaj havas tre malveran ideon, tial ni subskribintoj, reprezentantoj de la Esperantismo en diversaj landoj de la mondo, kunvenintaj al la Internacia Kongreso Esperantista en Boulogne-sur-Mer, trovis necesa, laŭ la propono de la autoro de la lingvo Esperanto doni la sekvantan klarigon.	Because concerning the nature of Esperanto many have a very false idea, therefore we, the undersigned representatives of Esperanto in different countries of the world, having assembled together at the International Esperanto Congress in Boulogne-sur-Mer, have found it necessary, at the proposal of the author of the Esperanto language, to give the following explanation.
1. La Esperantismo estas penado disvastigi en la tuta mondo la uzadon de lingvo neutrale homa, kiu, "ne entrudante sin en la internan vivon de la popoloj kaj neniom celante elpuŝi la ekzistantajn lingvojn naciajn" donus al la homoj de malsamaj nacioj la eblon kompreniĝadi inter si, kiu povus servi kiel paciga lingvo de publikaj institucioj en tiuj landoj kie diversaj nacioj batalas inter si pri la lingvo, kaj en kiu povus esti publikigataj tiuj verkoj kiuj havas egalan intereson por ĉiuj popoloj.	1. Esperanto is essentially an attempt to divulge over the whole world a neutral language for human use which, "not intruding upon the internal life of the peoples, and in nowise seeking to drive out the existing languages," should give to men of different nations the power of being mutually comprehensible, which might serve as a pacific language for public institutions in those lands where different nations are in strife about their language, and in which might be published those works which have an equal interest for all peoples.
Ĉiu alia ideo aŭ espero kiun tiu aŭ alia Esperantisto, ligas kun la Esperantismo estos lia afero pure privata, por kiu la Esperantismo ne respondas.	Any other idea or hope which this or that Esperantist associates with Esperanto will be his purely personal affair, for which Esperanto is not responsible.
2. Ĉar en la nuna tempo neniu esploranto en la tuta mondo jam dubas pri tio, ke lingvo internacia povas esti nur lingvo arta, kaj ĉar, el ĉiuj multegaj provoj faritaj en la daŭro de la lastaj du centjaroj, ĉiuj prezentas nur teorajn projektoin, kaj lingvo efektive finita, ĉiu flanke elprovita, perfekte vivipova, kaj en ĉiuj rilatoj pleije tauga montriĝis nur unu sola lingvo, Esperanto, tial la amikoj de la ideo de lingvo internacia, konsciante ke teoria disputado kondukos al nenio kaj ke la celo povas esti atingita nur per laborado praktika, jam de longe ĉiuj grupiĝis ĉirkaŭ la sola lingvo, Esperanto, kaj laboras por ĝia disvastigado kaj riĉigado de ĝia literaturo.	2. Because at the present time no one reviewing the whole world doubts any longer that an international language can only be an artificial one, and because, of all the very numerous experiments made in the course of the last two hundred years, all offer merely theoretical solutions, and only one language, Esperanto, has shown itself to be effectively complete, fully tested on every side, perfectly capable of living use, and in every respect completely efficient, therefore the friends of the idea of international language, conscious that theoretical discussion will lead to nothing, and that its aim can only be attained by continuous practical labour, have long grouped themselves round one single language, Esperanto, and labour to disseminate it and enrich its labour.
3. Ĉar la autoro de la lingvo Esperanto tuj en la komenco rifuzis, unu fojon por ĉiam, ĉiujn personajn rajtojn kaj privilegiojn rilate tiun lingvon, tial Esperanto estas "nenies propraĵo" nek en rilato materiala, nek en rilato morala.	3. Because the author of the Esperanto language from the very beginning refused once for all all personal rights and privileges regarding the language, therefore Esperanto is "the property of no one," either in a material or moral connection.
Materiala mastro de tiu ĉi lingvo estas la tuta mondo kaj ĉiu deziranto povas eldonadi en au pri tiu ĉi lingvo ĉiajn verkon kiajn li deziras, kaj uzadi la lingvon por ĉiaj eblaj celoj: kiel spiritaj mastroj de tiu ĉi lingvo estos ĉiam rigardataj tiuj personoj kiuj de la mondo Esperantista estos konfesataj kiel la plej bonaj kaj la plej talentaj verkistoj de tiu ĉi lingvo.	The whole world is the material master of this language, and any one who desires can publish in or concerning this language any works of any kind he desires, and use the language for any conceivable object; those persons shall be regarded the spiritual masters of the language, who shall be recognised by the Esperantist world as the best and most talented users of the language.
4. Esperanto havas nenian personan leĝdonanton kaj dependas de neniu aparta homo. Ĉiuj opinioj kaj verkoj de la kreinto de Esperanto havas, simile al la opinioj kaj verkoj de ĉiu alia Esperantisto karakteron absolute privatan kaj por neniu devigan. La sola, unu fojon por ĉiam deviga por ĉiuj Esperantistoj, fundamento de la lingvo Esperanto estas la verketo *Fundamento de Esperanto* en kiu neniu havas la rajton fari ŝanĝon. Se iu dekliniĝas de la reguloj kaj modeloj donitaj en la dirita verko, li neniam povas pravigi sin per la vortoj "tiel deziras aŭ konsilas la aŭtoro de Esperanto." Ĉiun ideon, kiu ne povas esti oportune esprimata per tiu materialo kiu troviĝas en la *Fundamento de Esperanto* ĉiu havas la rajton esprimi en tia maniero, kiun li trovas la plej ĝusta, tiel same kiel estas farate en ĉiu alia lingvo. Sed pro plena unueco de la lingvo, al ĉiuj Esperantistoj estas rekomendate imitadi kiel eble plej multe tiun stilon kiu troviĝas en la verkoj de la kreinto de Esperanto, kiu la plej multe laboris por kaj en Esperanto, kaj la plej bone konas ĝian spiriton.	4. Esperanto has no personal lawgiver, and depends upon no particular individual. All opinions and works of the creator of Esperanto have, like the opinions and works of any other Esperantist, an absolutely private character, and are binding upon no one. The sole foundation of the Esperanto language, which is once for all binding upon all Esperantists, is the little work *Fundamento de Esperanto*, in which no one has the right to make any change. If any-one departs from the rules and models given in the said work, he can never justify himself with the words "So desires or counsels the author of Esperanto." In the case of any idea which cannot be conveniently expressed by means of that material which is contained in the *Fundamento de Esperanto*, every Esperantist has the right to express it in such manner as he considers the most suitable, just as is done in every other language. But for the sake of complete unity in the language, it is recommended to all Esperantists to imitate as far as possible that style which is found in the works of the creator of Esperanto, who laboured most abundantly for and in Esperanto, and who best knows the spirit of it.
5. Esperantisto estas nomata ĉiu persono kiu scias kaj uzas la lingvon Esperanto, tute egale por kiaj celoj li ĝin uzas. Apartenado al la aktiva Societo Esperantista por ĉiu Esperantisto estas rekomendinda, sed ne deviga.	5. The name of Esperantist is given to every person who knows and uses the Esperanto language, no matter for what purposes he uses it. Membership of some active Esperanto society is to be recommended for every Esperantist, but is not compulsory.

In 1905, at the congress at Boulogne, an Esperanto *Lingva Komitato* (Language Committee) was instituted. To this committee

questions are submitted by Esperantists, and reports are issued on points worthy of consideration. All decisions are the result of the members' voting. The committee is not authorised to make any alteration in the *Fundamento de Esperanto*, which is inviolable, but to guard and foster the development of the language, preserving its purity, directing its procedure, and establishing its universality.

Let it be here noted that when the word *universal* is applied to Esperanto it refers to its *auxiliary* use: Esperanto makes no claims to equality with the best of the living languages as a *literary* or domestic medium. It was largely because Volapük laid claim to being a literary language, capable of expressing all the subtle suggestions, all the atmospheric niceties, all the cumulative richness of the living medium, that the project failed. Living languages have a history; their past penetrates deeply into their present, colouring it with indescribable shades, enriching it with illusive perfumes. The content of the words varies. Words are as jars, which one century fills with roses, blushing and fragrant, and other centuries store for the bygone sweetness of their pot-pourri, or as old bottles into which the centuries pour new wine. Words of a living language are a ceaseless growth; their soul is not commensurable, their spirit is not confined. But it is the very essence of an international language that its words should be in their signification static, rigid, definite, invariable. Again, a living language is rich in synonyms, plenteous in gradations, while an artificial language aims at eliminating every superfluity. Esperanto conforms to the demands of the strictest logical economy, yet what it lacks in richness of synonyms and suggestion, it to a great extent supplies by its illimitable word-building powers. As an international medium it is unsurpassed, as a literary medium it has a new but highly potential spirit.

The natural evolution of the European languages shows a gradual simplification. A chief feature is the displacement of the synthetic by the analytic principle—*i.e.* the substitution of independent propositions and auxiliaries for the inflexional system. Contrast the intricate Latin and Greek declensions with the English invariable nominative with its auxiliary propositions. English is thus furthest advanced in the analytic development; French takes the next place; Russian, with its complicated inflexions, is well in the rear. Again, consider the article. Latin had none, but the want was a logical imperfection, and in its corrupt days Latin adopted one. Greek had an intricate Protean article, with highly involved functions. In the modern world Russian has no article. German has a clumsy multiform instrument; French has made jetsam of several articular encumbrances. English, the pioneer, has evolved the invariable and masterful *the*. Esperanto observes the law, and follows the direction.

Again, compare the arbitrary French and German rules of gender with the English laws moulded on the physiological sex-basis. In the abandonment of adjectival concords, too, English leads the way. But all these languages possess numerous irregularities, the inalienable legacy of the past: these irregularities are a stumbling-block to learners, and have no special logical function. (Be it noted, however, that, in obedience to the spirit of the age, modern additions to the vocabularies are invariably regular. Contrast, for example, *I see, I saw*, with *I telephone, I telephoned*. Slang frequently takes an independent step towards uniformity —e.g. *I dig, I dug*, in primary signification, but in slang signifying *lodge—I dig, I digged*.) If, however, English outdistances her rivals in grammatical simplification, she lags far behind in phonetic homogeneity. A rigid phonetic basis is essential for an international language.

ELEMENTS OF ESPERANTO

Phonetics.—How does Esperanto utilise the hints in lingual construction that the natural evolution of modern living languages offers? Esperanto is absolutely phonetic. One letter one sound is its working principle.

The *vowels* are *a, e, i, o, u*, pronounced *ah, eh, ee, oh, oo*. All are long.

Of the consonants, *b, d, f, h, k, l, m, n, p, r, t, v, z* are pronounced as in English, but

c is pronounced as			*ts* in English		*fits*
ĉ	,,	,,	*ch*	,,	*churn*
g	,,	,,	*g*	,,	*gap*
ĝ	,,	,,	*g*	,,	*germ*
ĥ	,,	,,	*ch*	,,	*loch*
j	,,	,,	*y*	,,	*yes*
ŝ	,,	,,	*sh*	,,	*trash*

There are three diphthongs:

aj pronounced as English			*eye*
oj	,,	,,	*oy* in *toy*
aŭ	,,	,,	*ow* in *cow*

(*eŭ* occurs occasionally)

The accent falls on the second last syllable.

Grammar.—The following is a skeleton of the fundamental rules of the grammar:

(1) Esperanto has only one definite article, *la*, which is the same for all genders, numbers, and cases.

(2) Nouns always end in *o*: *e.g.* 'parolo,' *speech*.

(3) Adjectives always end in *a*: *e.g.* 'simpla,' *simple*.

(4) The plural of nouns, adjectives, participles, and pronouns (except the personal pronouns) is formed by adding *j* to the nominative: *e.g.* 'domoj,' *houses*; 'bonaj homoj,' *good men*.

(5) The accusative case always ends in *n*: *e.g.* 'Mi amas mian bonan domon,' *I love my good home*; 'Ni amas niajn bonajn domojn,' *We love our good homes.*

(6) Derived adverbs end in *e*.

(7) The comparative is formed by prefixing the word 'pli' to adjectives and adverbs, and the superlative by 'plej': *e.g.* 'pli bona,' *better*; 'plej longe,' *furthest*. 'La plej bona patro,' *the best father*.

(8) The personal pronouns are:

mi = *I*	ŝi = *she*	ni = *we*
vi = *you*	ĝi = *it*	vi = *you*
li = *he*	oni = *one*	ili = *they*
	si = reflexive.	

These pronouns form the accusative by adding *n*, and the possessive case by adding the adjectival ending *a*.

(9) The cardinal numbers are: unu, du, tri, kvar, kvin, ses, sep, ok, naŭ, dek, cent, mil. Tens and hundreds are expressed by the juxtaposition of the numerals—*e.g.* 'tricent okdek du,' 382. Ordinals are formed by adding the adjectival ending *a*—*e.g.* 'dua,' *second*; 'deka,' *tenth*; 'centa,' *hundredth*. Multiples are formed by adding *obl* (*e.g.* 'duobla,' *double*), fractionals by adding *on* (*e.g.* 'dekono,' *a tenth*), collectives by adding *op* (*e.g.* 'triope,' *by threes*).

(10) Verbs are not changed for person or number.

The present tense ends in *as*: *e.g.* 'mi parolas,' *I speak*.

The past tense ends in *is*: *e.g.* 'vi parolis,' *you spoke*.

The future tense ends in *os*: *e.g.* 'li parolos,' *he will speak*.

The conditional ends in *us*: *e.g.* 'ni parolus,' *we should speak*.

The imperative ends in *u*: *e.g.* 'parolu,' *speak!* 'li parolu,' *let him speak*.

The infinitive ends in *i*: *e.g.* 'paroli,' *to speak*.

There are six participles.

The present participle active is formed by adding *ant*: *e.g.* 'parolanta,' *speaking*; 'parolanto,' *a speaker*.

The past participle active is formed by adding *int*: *e.g.* 'parolinta,' *having spoken*; 'la kreinto' (the man who has created), *the creator*, from the root 'kre,' *create*.

The future participle active is formed by adding *ont*: *e.g.* 'parolonta,' *about to speak*.

The present participle passive is formed by adding *at*: *e.g.* 'parolata,' *being spoken*.

The past participle passive is formed by adding *it*: *e.g.* 'parolita,' *having been spoken*.

The future participle passive is formed by adding *ot*: *e.g.* 'parolota,' *being about to be spoken*.

All compound tenses and the passive voice are formed by the verb 'esti,' *to be*, with a participle: *e.g.* 'mi estas parolanta,' *I was speaking*; 'ili estas parolontaj,' *they are about to speak*; 'ĝi estas parolata,' *it is spoken*; 'ĝi estas parolita,' *it has been spoken*; 'ĝi estas parolota,' *it is about to be spoken*.

(11) Compound words are formed by joining roots together: *e.g.* 'samideanoj,' *partisans of the same idea*; 'vaporŝipo,' *steamship*.

(12) 'Motion to' is expressed by the accusative: *e.g.* 'Mi iris domon,' *I went home*.

(13) The prepositions have each a definite meaning, except 'je,' which is used when the sense does not show which of the others should be employed. They govern the nominative, except when denoting motion: *e.g.* 'En la mondo,' *in the world*; 'en la mondon,' *into the world*. 'Li ridis je mi,' *He laughed at me*.

(14) The *a* of 'la' and the final *o* of the nominative can be dropped for euphony in poetry or conversation.

(15) Numerous prefixes and suffixes of definite meaning are used in word-building. The following are examples:

mal- (opposite): *e.g.* 'sana,' *healthy*; 'malsana,' *ill*.
ne- (negative): *e.g.* 'nesana,' *unwell*.
ig- (causative): *e.g.* 'lerni,' *to learn*; 'lernigi,' *to teach*; 'lerniga,' *instructive*.
ge- (of both sexes): *e.g.* 'sinjoroj,' *gentlemen*; 'gesinjoroj,' *ladies and gentlemen*.
re- (repetition): *e.g.* 'veni,' *to come*; 'reveni,' *to return*.
iĝ- (inceptive): *e.g.* 'fidi,' *to trust*; 'fidiĝi,' *to begin to trust*.
-ec (denoting an abstract quality): *e.g.* 'bona,' *good*; 'boneco,' *goodness*.
-ej (denoting place): *e.g.* 'vendi,' *to sell*; 'vendejo,' *a market-place*.
-ar (collective): *e.g.* 'vorto,' *a word*; 'vortaro,' *a vocabulary*.
-il (instrumental): *e.g.* 'razi,' *to shave*; 'razilo,' *a razor*.
-in (feminine): *e.g.* 'patro,' *father*; 'patrino,' *mother*.
-ebl (denoting possibility): *e.g.* 'kredi,' *to believe*; 'kredebla,' *credible*.
-ist (agent): *e.g.* 'Esperantisto,' *an Esperantist*.

Cases and Concords.—It is sometimes objected that Zamenhof did not carry the process of simplification far enough. Was it necessary to employ an accusative case? Why is the agreement of adjectives with substantives in number and case enforced? English has abandoned these constructions; is not their employment in Esperanto an anachronism? Zamenhof did not retain the accusative case and the agreement of adjectives lightly. He desired his language to be as flexible as possible and as logical as possible. Without agreement a definite order must be given in the sequence; with agreement any order can be followed with perfect lucidity. Where there is agreement, direct translations

can be made employing the natural sequence of wording of any language. Thus in English the arrangement of the sentence, *The boy the father loves,* leads to ambiguity, but in Esperanto, 'La knabo la patron amas,' the meaning is indubitable. There is a sacrifice, but the gain far outweighs the loss.

Vocabulary.—The vocabulary of Esperanto is built on Western foundations. This was inevitable. The roots were chosen upon the principle of *maximum of internationality.* The *Universala Vortaro* contains 2642 roots translated into French, English, German, Russian, and Polish. Thus those who run may read the degree of internationality in each. Certain root-words are completely international (in the European languages)—e.g. *atom-*, *danc-*, *flut-*, *vagon-*, and most scientific terms. Such words form the first class. The second class consists of root-words that are common to two or more European languages. The following examples (spelt phonetically) are selected by Dr. L. Couturat and Dr. L. Leau in the *Histoire de la Langue Universelle*: *flam-*, *marŝ-*, *mast-* (G., E., F., I., R., S.[1]); *ankr-* (G., E., F., I., R.); *benk-* (G., E., F., I., S.); *marmor-* (G., F., I., R., S.); *flor-* (E., F., I., S.); *jun-*, *artiŝok-*, *fason-* (G., E., F., R.); *mus-* (G., E., I., R.); *fam-* (E., I., S.); *flag-*, *stal-* (G., E., R.); *emajl-*, *mebl-*, *trotuar-* (G., F., R.); *man-* (F., I., S.); *mon-* (E., F.); *bind-*, *blind-*, *dank-*, *fajr-*, *fiŝ-*, *fingr-*, *glas-*, *help-*, *jar-*, *land-*, *melk-*, *rajt-*, *ring-*, *send-*, *ŝip-*, *ŝu-*, *sun-*, *trink-*, *varm-*, *verk-*, *vort-* (G., E.). The third class of root-words have no degree of internationality. These Zamenhof has borrowed from Latin, or from the principal national languages. Thus from Latin he has borrowed certain particles—e.g. *apud*, *dum*, *sed*, *tamen*, and root-words such as *aŭd-*, *brak-*, *dors-*, *dekstr-*, *feliĉ-*, *proksim-*; from the Germanic languages the root-words *bedaŭr-*, *bird-*, *fraŭl-*, *flug-*, *flik-*, *knab-*, *kugl-*, *ŝajn-*, *silk-*, *ŝirm-*, *sink-*, &c.; from the Slavonic languages the root-words *bulk-*, *brov-*, *prav-*, *selk-*, *svat-*, *vost-*, &c. Thus the language is rendered as impartial and international as possible. All can acquire it with ease; to the scholar with a knowledge of two or more European languages it is mere child's play.

The advantages gained by teaching children Esperanto as a basic language are far-reaching. Reasonable, logical, free from redundancies and anomalies, the language does not tax the memory, but stimulates intelligence. Moreover, it has a great constructive virtue. The child learns the necessary roots and the fundamentals of the grammar, and then proceeds to build the language up for himself. Surely the study is then encouraging to the child, and a blessed substitute for the disheartening maze of grammar and syntax that is usually presented to his bewildered mind. Having thus learned to appreciate the positive nature of word- and language-building, and the true logic of grammatical expression, the child enters the more difficult fields of the living languages with confidence and hope, knowing that here, too, are chartered lands, here, too, are familiar voices.

[1] German, English, French, Italian, Russian, Spanish.

The green star, emblem of Esperanto, is in the ascendant: it is the tutelar sign of a mighty birth. With ever-increasing volume *La Espero*, the *Hymn of Hope*, rings through the universe:

En la mondon venis nova sento
Tra la mondo iras forta voko;
Per flugiloj de facila vento
Nun de loko flugu ĝi al loko.

No al glavo sangon soifanta
Ĝi la homan tiras familion;
Al la mond' eterne militanta
Ĝi promesas sanktan harmonion.

Sub la sankta signo de l'espero
Kolektiĝas pacaj batalantoj,
Kaj rapide kreskas la afero
Per laboro de la esperantoj.

Forte staras muroj de miljaroj
Inter la popoloj dividitaj;
Sed dissaltos la obstinaj baroj,
Per la sankta amo disbatitaj.

Sur neŭtrala lingva fundamento,
Komprenante unu la alian,
La popoloj faros en konsento
Unu grandan rondon familian.

Nia diligenta kolegaro
En laboro paca ne laciĝos,
Ĝis la bela songo de l'homaro
Por eterna ben' efektiviĝos.

L. L. Zamenhof

Translation of the Above

Into the world has come a new feeling: through the world goes a mighty voice. On the wind's light wings now may it fly from place to place.

Not to the sword, thirsty of blood, it draws the human family. To the world eternally at strife it promises a sacred harmony.

Under the sacred sign of hope gather the warriors of peace, and swiftly spreads the cause through the labour of the hopeful.

Strong stand the walls of a thousand years between the sundered peoples, but the obstinate bars shall leap apart, by sacred love dissevered.

On the foundation of a common speech, understanding one another, the peoples shall make in concord one great family circle.

Our zealous company shall never weary in the labour of peace, till humanity's fair dream shall be realised with everlasting blessing.

Institutions.—The *British Esperanto Association* has its headquarters at 17 *Hart Street, London, W.C.* It is a union of Esperanto societies throughout the Empire, and has been established for the following purposes:

(*a*) The promotion of the formation of new local groups.

(*b*) The distribution of information and the publication of propaganda literature.

(*c*) Organisation of examinations and awarding of certificates of proficiency.

(*d*) The promotion of arrangements for congresses at home and abroad.

The Association consists of Members, Fellows, and affiliated groups. The annual subscription for membership is 5*s.*; Fellows, 10*s.* Members and Fellows receive the journal, *The British Esperantist*, free. The Esperanto badge is a five-pointed green star.

There is an international monetary system in use among Esperantists. The working unit in this notation is the *spesmilo*, equivalent to 2*s.* sterling (*e.g.* 5*s.* 6*d.* = Sm. 2·750).

COURSE OF READING

The following instruction books and literature are supplied by the *British Esperanto Association* at the following rates (including postage):

A. *In English.*—*Commentary* (Grammar, &c.), by Major-General George Cox, B.A., 2*s.* 6*d.* *Ekzercaro*, by Dr. Zamenhof, with key, 1*s.* *The Esperanto Teacher*, by Helen Fryer, 7½*d.* *Esperanto Manual*, by M. L. Jones, 1*s.* 1½*d.* *Esperanto in Fifty Lessons*, by Edmond Privat, 1*s.* 8*d.* These books are all recommended by the Association.

B. *In Esperanto.*—*Fundamento de Esperanto* (5-lingva), by Dr. Zamenhof, cloth, 3*s.*; paper, 2*s.* (This is the pioneer classic on Esperanto.) *Kursa Lernolibro*, by Edmond Privat, 6½*d.* *Legolibro por lernantoj*, by Dr. Fisher, 9*d.*

C. *Dictionaries and Phrase-books.*—*Esperanto-English Dictionary*, by Edward E. Millidge, 5*s.* 3*d.* (This is perhaps the best dictionary for English students.) *English-Esperanto*, by O'Connor and Hayes, 1*s.* 8*d.* *Universala Vortaro* (official edition), 6*d.*

Esperanto Literature.—The following is a selection from Esperanto literature (translations, &c.): *Fundamenta Krestomatio*, a collection of prose and poetry, edited by Dr. Zamenhof, the standard guide for Esperanto style, should be in the possession of every Esperantist; cloth, 4*s.* 6*d.*; paper, 3*s.* 6*d.* *Eneido* (Virgil's Æneid), translated by Dr. Vallienne, 3*s.* *Interrompita Kanto, La* (E. Orzeszko), translated by Kabe, 9*d.* *In Memoriam* (Tennyson), translated by A. E. Styler, 1*s.* 7*d.* *Nova Testamento* (New Testament), 1*s.* 9*d.* *Tri Mortoj* (Tolstoi), translated by M. Ŝidlovskaja, 4½*d.* *La Vendetta* (H. de Balzac), translated by M. Merckens, 1*s.* 3*d.* *La Avarulo* (Molière), translated by Sam. Meyer, 9*d.* *Hamlet*, translated by Dr. Zamenhof; paper, 2*s.* *Ifigenio en Taurido* (Goethe), translated by Dr. Zamenhof, 2*s.* A translation of the Old Testament by Dr. Zamenhof is now in the press.

The best book on the theory, aim, and scope of Esperanto is *International Language*, by Dr. W. T. Clark, M.A. (1*s.* 3*d.*). *The Passing of Babel*, by B. E. Long, B.A. (7*d.*), is also practical and instructive.

Alice E. Stirling, M.A.

IV. ART

PAINTING

THE painter is he who, seeing the world around him more intensely than the layman, is able to communicate his ideas to others. Nature is ready at hand to all; both artist and critic may be able to see the reality of the world; the artist alone can express himself. There are three factors in all art: the subject, which we call "nature"; the technique of the special art in question; the personal point of view of the artist. Nature in relation to art is passive. The scientist will tell you what is contained in nature—in prose if he is writing or on an Ordnance sheet. Technical ability and a point of view remain to the artist. He looks on nature with the eye of genius, and represents it through the medium of his technique. In the finished work of art the three factors are inseparable. The painter's aim is to represent what he sees, contrasted, it may be, with what he knows exists. A painting is a unit composed of various parts. Each little space of a picture represents a natural phenomenon, but must not be viewed alone. Its *raison d'être* is its relation to the picture as a whole. As one looks at the same thing from different standpoints the relations of the parts change under the different influences of the light. To the statistician or natural historian one haystack is the same to-day, yesterday and for ever; to the painter all is change. The various colours and gradations of colour in a picture have a content of their own just as the individual notes of a sonata, but they have a marked influence on those surrounding them, and their worth is known only when the whole is grasped.

Italian Paintings.—We have no space, and there is certainly no necessity, to attempt to show the origins of painting. Fresco, in which colours mixed with water are applied to wet plaster instead of being mixed with oil, at first held the field, and the influence of the earlier Byzantine mosaics, as you so easily study them in St. Mark's, Venice, is very pronounced. Art was then the chaste handmaiden of religion, and by the thirteenth century you find schools of artists in every Italian community. The subjects were prescribed, and wholly taken from the Bible or the legends of the Saints, and no innovations were thought of in the representation. Pupils followed for the most part the colours of their master and learned his tricks. Perspective and anatomy were unknown, but the primitive lack of reality which is so fascinating in mosaic, where it has never been surpassed, leaves the modern student cold in fresco. Soon, however, the Italian curiosity which is the basis of knowledge asserted itself. The faces of the portraits become more lifelike, the action less stilted, and the personality of the artist revealing itself, we come to the great names in Italian painting. It is well to warn the enthusiastic seeker of beauty in painting that in the modern sense these painters are not loved for their pictorial ability. Many external and non-artistic qualities are put down to their credit. In the first place they are interesting historically—anything "early" has always a fascination for some people. Again, a game has been played by experts, the aim of which is to discover names for painters hitherto unknown, and to subtract from the work of well-known men the pictures on which their fame rests. This is a wholly diverting amusement. Again, the subjects drawn from biblical or ecclesiastical lives interest many people theologically inclined, so you will read hundreds of books on the identification of the figures on an Italian picture and the reasons for their attitudes. From a biographical point of view much has been discovered by ingenious men about the artists themselves, and people as a rule are much more interested in the life of a painter than in his work, and Italy at this time was the centre of the universe.

Apart from these interests there remain as artistic qualities, graceful drawing and harmony of design, with a display of colour which, if you shut out all you know of the effect of light in nature, may prove agreeable. They should be considered, having regard to the conventions of the day, not as pictures, but as decorative

patterns having no reference to reality. Thus viewed, they do not impress so much as stained glass or mosaic, but in many cases fascinate.

The first painter with whom we shall deal is *Cimabue*, who lived in the last half of the twelfth century. It is of his "Madonna" that the well-known story is told, how it was carried in triumph from his studio to S. Maria Novella through the streets of Florence. In it you see the link between Byzantine mosaic, with their stiff, formal limbs, drapery, and expression. He was followed by *Giotto*, whom admirers of Ruskin will praise, and whose work is best seen in Padua, Assisi, and S. Croce, Florence. He has unfortunately been cruelly dealt with by time, which has faded his work and permitted restorers to destroy what was left, but you may still observe some attempt to express animation in the figures, balance in the grouping, reality in the action. On the other hand, even at this early stage you lose just that fascination of frankly conventional art which the post-impressionists of our day have so well brought out. Of his school the *Gaddis* are not impressive, but *Orcagna* in his "Heaven and Hell" in the Strozzi Chapel, Florence, proves his skill as a delineator of physiognomy. There are hundreds of painters of this period to whom we cannot give a name, many of as great accomplishment as the popular heroes, and it is not till the beginning of the fifteenth century that *Massaccio* appears and forewarns us of the Renaissance. His frescoes are best seen in the Carmine Church in Florence, and show us where the Raphael of the cartoons got much of his inspiration, and in them you will note the growing interest in and grasp of perspective. This latter was logically applied by his contemporary, *Paolo Ucello*, one of whose battle-pieces is in the National Gallery, a welcome relief to the religious attitudinising of the period. *D. Venezcano* (1400–1461), on the other hand, especially at S. Croce, and *A. del Castagno*, of whom the National Gallery has a "Crucifixion," show the desire for realistic expression. and the latter's pupil, *Piero della Francesca*, combines this with not a little poetical imagination. But all were not of this curious frame of mind, and among the orthodox painters of the day none are more deservedly famous than *Gentile di Fabriano* and *Fra Angelico*. The former's "Adoration of the Magi" in the Florence Academy shows a delightful sense of bright colour combined with frank portrayal of animal and flower life. Alongside of him, and still less interested in the intellectual movements of the day, is Fra Angelico, the pious monk of S. Marco. At Florence, where his best work in fresco is seen, by the richness of his colour, his sincerity of purpose, and his *naïveté* of expression, he endears himself to everybody. His realisation of religious feeling is, if not strong, by no means sentimental, and refreshing if compared with Raphael or del Sarto. If, as is no doubt common, the visitor to Florence, his mind filled with the noble story of Savonarola, seeks soon after his arrival some wonderful surrounding for so great a theme, and makes a solemn pilgrimage to S. Marco, or even mounts to Fiesole for the older monastery, he will receive a sore disappointment. This drab building is now a museum with all the fuss of a Government department, and makes him hasten to retrace his steps. But the sight of the pictures of the gentle Frate, who deemed himself unworthy of promotion even in the Church, will quell his emotions. He will not find, he must not look for realism of the figure, for scientific perspective, even for natural atmosphere; he will obtain the point of view of a joyous religious soul, as delicate an artist as the Bible illustrators of an earlier day.

Fra Angelico's vision is unique, but his technique is continued by his pupil *Gozzoli*, whose huge fresco in the Riccardo Palace is wholly delightful, with its laughing groups of boys and horsemen. There is a good specimen of his work in the National Gallery. A better known painter is *Fra Filippo Lippi*, chiefly from Browning's poem, the unorthodox monk. His influence on Botticelli is well marked, and the fascination the latter's pictures create is shared in a smaller way by the master. The human, wondering expression of the Madonna appears here for the first time. The choir of angels in his "Coronation of the Virgin" in the Florence Academy is well known, but more beautiful are his frescoes of the lives of John the Baptist and Stephen in the Prato Cathedral. But in every one of his works you will note marked characters in the faces, evidently studied from the life in the monastery or the street, the unconventional but apt and usually pictorial pose of the main figures. *Filipino* followed in his footsteps, but his greatest disciple is *Sandro Botticelli* (1447–1510), with whom there blooms the full Renaissance.

No attempt need here be made to discuss the origin of this great movement, but it would be foolish to ignore it altogether. It must always be remembered, in thinking of this Italian period, that we have to put out of our minds all we know of modern Italy, and consider only the communities living in the different towns. We may then picture a wave of enthusiasm for the old classical world, its literature and art, sweeping over Florence or Venice or Rome and inundating the minds of the citizens. Put away also our ideas of a capitalist society, and picture art not divorced from everyday life but the joy not only of a man's leisure but of his work, and not only of a few people but of everyone. Say it was the creature of religion or irreligion as you will, it is sufficient to note that it was closely entwined with the life of every Florentine, Pisan, or Veronese. Then you may take up the life of a Medici on the one hand and see how the artists

circled round a wealthy patron, or that of a Cellini and read how the travellers and craftsmen of all kinds, notwithstanding they were content with shops instead of studios, had art in all their thoughts. Then you shall understand that just as nowadays in certain communities one interest, that of football, is paramount, so in the Italian city of the time the spirit of the Renaissance in one form or another was never absent, nor shall you wonder at the Cimabue legend nor Cellini's account, exaggerated though it may be, of the setting up of his "Perseus" in the Loggia. Thus the Renaissance did not create art in Italy, but it concentrated the rather vague aspirations of the people—no small work. And apart from that, though Phidias was unknown to scholars then as now, and the Greek and Latin professed was not all of the classical period, yet a subtle feeling of eclecticism was engendered in such men as Botticelli, Leonardo, and Pico Mirandola, which will attract the minds and sense of all when Renaissance architecture and story are dead.

Botticelli is as good an example as one may wish of the spirit of the age. In him you note as a painter great decorative merit, a striving after something less evident than the conventional unity of design we saw in his predecessors, a craving for atmospheric effect yet restrained withal. And as a thinker, one who modernised and adapted the Greek legends to his own use, having one eye on Venus and the other on the Madonna, one on Julian and the other on Savonarola; delicate in thought as though he blushed sometimes to express himself, but not too precious, giving real charm to the onlooker. In the National Gallery and at Glasgow we can easily appreciate the type of Virgin Botticelli had in mind, though none of them contains the essence so much as that of the "Pomegranate" in the Uffizi. But in these, beautiful and fascinating as they are, when you know them well you will feel that the design is too rounded, too melodious, of a too evident harmony of line born often of affectation. In his pagan pictures this is not so evident. The "Mars and Venus" is often criticised for want of classical feeling shown in the incongruity of the theme and the representation, but as line decoration we may here be greatly satisfied. Even if the legs are weakly modelled one can take exception to hardly any other part of the picture on the score of variety and rhythm. It is an excellent companion picture to Piero di Cosimo's "Procris" in the same gallery. But in Florence and especially in the "Primavera," we have Botticelli at his best in every way—in the beautiful atmosphere as if in a May morning, the draperies fluttering in the most delicate way, above all the sense of wonder both in line and expression as essential to all great art in whatever medium as it was extant in the Florence of the day. Botticelli has been dealt with at some length because of the unique embodiment of excellent workmanship and sublety of intellect to be surpassed only by Leonardo himself.

With him may fittingly be compared *Raphael*. The latter leaves the modern racking his brains to find why his reputation till half a century ago was so great. His colour will be found conventional, his design commonplace, his imagination, except in a few of his portraits, non-existent. You may trace most of his tricks in his predecessors; he seems merely to have made logical and therefore uninteresting the practice of men like Perugino, Fra Bartolommeo, and Mantegna. At last the enthusiastic Victorian in search of some merit in his idol will have to take refuge in some such vague and non-artistic quality as "religious feeling." *Michelangelo* is at the opposite extreme. His thought seems always to be above his execution, yet technical difficulties were always his delight. He will be discussed more fully in connection with the sister art of sculpture. But if Raphael's reputation has been blown away, that of *Leonardo da Vinci* (1452–1519) has increased. In his type of womanly beauty, culled though it was from his master, *Verrocchio*, you see the very essence of the Renaissance, and if ever a painter's life was worth writing it was his. In his work you will find a continued curiosity and strangeness, an inquisitiveness about everything, men, flowers, animals, all combined with great mastery of his medium. In some of his drawings in Milan you have, along with Botticelli's charm, far more beauty of line than Raphael ever attained to, and you feel that the painter was no sickly sentimentalist but a great philosopher, as he certainly was. The Louvre is worthy of a long visit to look only at his "Mona Lisa," "St. Anne," and "John the Baptist," and if you will compare them with the surrounding Italian pictures you will find the secret of all good painting, that it results in an impression that never tires. The colour of *Titian*, the faculty of Raphael, the design of *Tintoretto*, all seem of little lasting value before these masterpieces, and it is only when you listen to the still small voice of the Velasquez that you find one who could enter the lists with him. He is the only Italian we should like to live with, who has seen life and commemorated its truth to us. Contemporary with him is *Ghirlandaio* with his frescoes at S. Maria Novella and S. Trinita in Florence, a good all-round man; *Mantegna* of the much spoiled tempera paintings of Hampton Court; *Luca Signorelli*, the forerunner of Michelangelo in heroic anatomy; and *Perugino* and *Fra Bartolommeo*, the masters of Raphael. *Correggio* (1494–1534) is somewhat later. He is the link between Raphael and the Venetians. He keeps for the most part the conventional colours of the former, but allows for the play of light to an unusual extent. His

blues are proverbial, but one misses any touch of the *naïveté* of Botticelli or the strange reason of Leonardo.

With *Andrea del Sarto* (1488–1530) began that decay in painting in Italy which has been stopped only in our own time. He started the ideals of smooth sugary sentimentality and cheap dramaticism without any subtlety of technique. All is mannerism and copy of mannerism, till nothing is left except the aspirations of anæmic young ladies. He is followed by the *Caracci*, *Guido Reni*, *Domenichino*, *Bronzino*, *Salvator Rosa*, *Luca Giordano*, and many even less able workers. It is sufficient to guard the student against them.

When we move to Venice we are in another atmosphere. The Church here has rank only alongside the Republic, and the Republic itself is of less importance than the city itself, the most wonderful of all cities. Among the early painters we may mention *Carpaccio*, with his famous series of the life of S. Ursula in the Academy, and the *Bellinis*, who join themselves to Florence. They at once show the preference of their fellow-citizens for colour over form, and you have only to set a copy of the famous "Madonna" by Giovanni (1427–1516) in the Venice Academy beside a Florentine "Madonna" to see the unconventional design of the former. The "Doge" in the National Gallery is a splendid example of his talent in an unusual form. In the present state of criticism it is impossible to speak of *Giorgione's* work, for every year one hears of pictures being rechristened either in his favour or against him. But such pictures as the "Concert" in the Pitti, the "Antiope and Jupiter" in the Louvre, and the "Fête Champetre" in the National Gallery will have staunch admirers, one would hope, whatever name appears in the catalogue, for their beauty of colour-schemes and execution. They lead us inevitably to *Titian* (1477–1576). In him Venetian art attains its highest power, and he is one of the greatest artists of the world. He accomplished much and in most lines—portraiture, classical and religious subjects, all came within his grasp. At the National Gallery we gain a good idea of his genius in the "Venus and Adonis" and the "Bacchus and Ariadne." We notice the richness, range, and varying shade of his colour, the subordination of line, the quality of his paint, the modelling of the figures, the imagination and truthfulness of characterisation, the beauty and warmth of his flesh colour. His portraits, be it of a Pope or a courtesan, satisfy all ideals; it is only in his larger subject pictures that a modern would prefer, instead of the correct colour arrangements, a more impressionistic handling of the theme, having regard to the effect of light. But he really defies criticism. A modern artist would paint these pictures in a different way, but it is probably true to say that they could not be more pictorially painted, assuming the Titian manner to be right. One may well find faults in the famous "Assumption" at Venice, but Titian's "Mistress" and probably "L'Homme au Gant," or at anyrate the "Portrait of a Young Man" in the Louvre, are without fault. And these are by no means all. The Prado in Madrid has many of his greatest works, and the present writer has a profound admiration for the "Entombment" in the Academy at Venice.

Veronese's "Marriages at Cana" are well known, and his designs are not merely architectural, though very much in the grand manner, and the colour is usually cool. *Tintoretto* is of more importance, but not the world's wonder Ruskin imagined. All the works, however, in the School of S. Rocco, Venice, in spite of the bad lighting conditions, and Anstey's caricatures, repay minute inspection, and with those in the Ducal Palace, especially the "Bacchus and Ariadne," give the student a very complete idea of the painter. His style is easily noticed—the swinging line, dramatic expression, shadows and chiaroscuro. Often little gems of landscape should be noticed. There are two other Venetians one seldom hears about—*Palma Vecchio* of the beautiful S. Catherine in S. Maria Tornosa in Venice, and *Bassano*, whose trick of painting lace and such-like material is copied by Titian. After the death of these men, Venetian art declined till the eighteenth century, when three well-known names appear whom it is well to mention here. *Tiepolo* with his ceilings fails to impress the present writer, though they form excellent material to dance under, and of a piece with the usual Venetian palace furniture, so he cannot speak of them. *Canale*, *Canaletto*, and *Guardi* painted the canals and palaces of their native city. They are well represented in the National Collection, and of the three Guardi gives most pleasure, though why any of them should be the object of a cult, as they are, it is impossible to say. Whistler is said to have considered *Canaletto* the only old master worth looking at.

Spanish Painting.—Florence and Florentine life have been the source of unbounded admiration to travellers for centuries; Venice with its architecture placed in a perfect geographical position has seemed to sum up for most enthusiasts the honeymoon of life; Seville is a city of joy, but its attractions are less evident and less formal. No one building or set of buildings can be picked out as the moving cause of one's love for this southern city—the white or yellow wash of the houses, the donkeys, the patios, the glimpses of gipsy blood, the narrow, winding, irregularly paved streets, the women in their black velas or gorgeously coloured manilla shawls walking seductively down the Sierpes, and the sun blazing over all—all these combine to give Seville a unique atmosphere. So with the painters. Botticelli has his charm, Titian is unequalled, but *Velasquez* of Seville (1599–

1660) gives us the perfect artistic truth. If one might imagine a painter, having imbued himself with all that could be learnt of painting, going to sleep for an age, then suddenly awakening and unconsciously using the old knowledge but trusty to his own vision, we might get an idea of the fully developed Velasquez. In his early pictures, such as the "Surrender of Breda" or "The Topers," both in the Prado at Madrid, you find as accurate modelling, as decorative a use of line harmony, as in his predecessors, but gradually artificial means are put away, and art formed on observation takes its place. If you are looking for beauty of line in his greatest work you will get it. If you seek for gradation of colour no one surpasses him. But added is a unity of atmosphere comparable only to light itself, transferring all into a certain point of view. This makes the position and colour of everything in the picture inevitable; the displacing of the smallest part of it would wreck the picture; and, to attain to the end, the student will notice an inspired use of the paint itself. One feels before his pictures in the Prado a sense of humility raised by the work of no other artist. It is impossible to criticise and difficult to appreciate. One notes certain technical ideals attained, but with no surprise, knowing from the general impression of the whole that every value must be right. It is as if you began to analyse the vowel and consonantal sounds of a great poem. Was this intentional, you ask, this perfect adaptation of means to end, this subtle harmony of sound, one syllable intensifying another, here giving an echo to what has gone before, there contrasting with what follows, and over all a sense of restraint and restfulness in spite of the complexity? The subjects, of course, become unimportant. What does it matter that Philip III was not handsome, that the Infanta is dressed in crinoline? Do you not see the former before you, do you not feel the latter's body inside the stiff clothing? Some have complained that there is no riotous colour, that the tone of the pictures is low. One wonders what is meant. Are the blacks in the "Mœnippus" not rich enough, even if they do not sate? What gorgeous colour could give us such delight as the grandeur of "Las Meninas" with its wonderful sense of space yet so easily taken in by the eye? There is nothing to distract our attention from the general impression, but the surrounding figures are not ignored. Velasquez has viewed the scene with his artist vision and painted it for us for all time. His other great picture, "The Spinners," in the same gallery, appears, perhaps, better in reproduction than the other, owing to a greater accentuation of line motives and marvel of modelling. This is not so evident in the original, and the greater range of colour will appeal to some; but here again there is nothing formal or weak, and the quality of the flesh colour is superb, the whole picture being bathed in that cool, luminous atmosphere that we notice in all his great pictures, including the "Venus."

It is impossible to deal with the other pictures in detail. The Prado gives you all the stages in the painter's art. The landscapes may be noted as delightful works pointing forward to Corot and Whistler; the equestrian portraits are beautiful representations of those horses and riders one admires so much in Spain even to this day; the "Maria Teresa" is a miracle of inspired brushwork, the dwarfs fascinated the painter to excel. But away from Madrid one cannot ignore the earlier work. In the Louvre the "Infanta" claims attention to the detriment of the surrounding pictures, and in the National Gallery the "Admiral," whether by Velasquez or his father-in-law, is a magnificent performance. The "Adoration of the Magi" and the "Jong Philip" there are of his earliest period, the "Christ at the Pillar" is a product of his Italian journey, but also shows the influence of Ribera; the "Old Philip" and the "Venus" alone are works that show the fully developed artist. The former should especially be studied for the quality of the blacks, the latter for the depths of the surrounding space, and both for the brushwork. The "Venus" is unique, in that it shows a wider range of colour than any picture in Madrid. Both pictures show the characteristic of the impressionist period, though they have not the varied fascination of the chief examples at the Prado.

Contemporary with Velasquez is *Ribera*, the realistic portrayer of ascetic Christs and monks, and *El Greco*, the sober colourist who has lately become fashionable. He is not a second Velasquez, but no mean modeller and designer of pictures, as Madrid, Toledo, and Seville testify. Later comes *Murillo*, whose fame has deservedly undergone a cloud. He is chiefly known for his "Assumptions," the finest being seen at the Louvre, and for his "Lamino," both showing marked maudlin sentiment. He has all the faults of the late Italian school with a less wide range of tricks. *Zurburan* connects with Ribera and the early religious work of Velasquez. But it is much later that we find a great artist in *Goya* (1746–1828), one of the finest painters of the eighteenth century. When it suits his mood he can adopt all the graces of Gainsborough or Greuze, but he bathes his pictures in an atmosphere inherited from Velasquez alone. His draughtsmanship is superb, his colour points forward to Manet. And for imagination you may look in vain for anything so wild and penetrating as the etchings in "Los Capriccios," in which he proved himself a keener hitter and as great an artist as Hogarth. He may be studied in the Prado and the Academy of San Ternand, and Seville and the Louvre contain works of the highest quality. The double portrait of "La Maja" at San Fernando is his best,

and at once gives the lie to those who form their conception of the eighteenth century women from Watteau or Greuze or even Gainsborough.

Dutch and Flemish Schools.—While Italy sweetened in sentimental decadence in the seventeenth century, there arose in the north, in Holland and Belgium, painters of a totally different style, both in subject and workmanship. The name of *Rembrandt Van Ryn* (1607–1669) sums up for us all that is manly and virile if not realistic in paint. Dutch art before him had always had a somewhat homely cast, but by his genius he epitomised it for all time. Religious subjects did not appeal to him much, except in his early work, which is finished in the Italian style, but his paintings are full of high intellect. He is essentially a painter of character. He is a sort of Carlyle in paint, not caring for correctness of line or artificial harmonies of draperies, but like Carlyle, a great artist in light and shade. Beautiful nature as such was not necessary for his inspiration, and he did not attempt high colours on a wide range, but he went far in transforming the plain, honest, unsentimental things of this world into an artistically beautiful whole. His work was many-sided. Everyone knows his portraits of old men and old women, studies of wrinkled old age, of people who have experienced many vicissitudes in life. But he is not gloomy, and he is always a painter. He finds matter akin to his point of view in the many portraits of young men in armour or decked for a gala day, in a young woman not of noble but of honest Dutch blood, or again, and perhaps most characteristically, in the great series of portraits of himself. In all he took the subject nearest at hand, and delighted in the subtleties of chiaroscuro, specially revelling in the depths of shade. Of course it is all studio light he sees with; he had not the inner vision of Velasquez enveloping all, as Nature itself does, in a clear atmospheric impression, but one who looked vigorously at things, bringing out the character of his subjects, and making the picture a decorative whole even if to our modern eye it is a conventional brown one. But how more real it is than the contemporary colour schemes of the Italians, and how sound is his modelling and clear his flesh colour. An intellectual artist we may call him. It was not given him to appreciate wholly the beauties of light, but harmonies of shade he made his own. His works are scattered over most galleries, especially in the northern cities, but the portrait of himself and the old men and women in the National Gallery, the collection including the "Man in Armour" and the "Miser" in the Louvre, give us an adequate conception of his powers, while the "Girl in Bed" in the Scots National Gallery with its wonderful modelling and flesh colour shows a greater harmony of colour than almost any other. His landscapes are works of real beauty—his scenes are those of the Dutch farmyard and countryside, but viewed in a way that sometimes leads himself out of his century's brown trance.

Contemporary with Rembrandt are all the Dutch genre painters whom fashion has given such prominence to: *Teniers, Jan Steen, Terburg, De Hoogh, Vermeer of Delft*, and others. They have a charm for us all with their small paintings; here it is stern ugliness, there pathetic domesticity, another time provincial elegance. Again, there are no great subtleties of colour in their purview, but a palette ranging from brown to black, with an occasional flesh-colour or satin dress to enliven things and catch the light. Particularly noticeable are some wonderful examples of still life. All the characters in the paintings are absorbed in the daily doings of the Dutch housewives and their families; beauty is sought in the actions of the men and women, not in their faces, and most have the gift of story-telling—not heroic epic or drama, but good Iambic pentameter. Dull these works are, even if relieved by pleasant surprises, when seen in great numbers as at Amsterdam, Antwerp, Brussels, or the circular room in the Louvre, but no gallery is complete without some examples.

About the same time in Belgium a totally different master had appeared in *Rubens* (1577–1640). If Rembrandt is noteworthy for his intellectual interests, showing Stoic blood, Rubens is an epicurean. Brilliance of costume, abundance of sensuous flesh are his forte, especially the latter and therefore especially the flesh of women. His mythological or historical paintings and even his landscapes are all mere excuses to show off his ideals of women's beauty. Tradition held that in olden times women wore less clothes, so he accepted tradition willingly. By the swing of his drapery he reminds you of Tintoretto, but the subject and mood are changed. His technique is best perhaps in a negative way and the outcome of his interests. He was concerned mostly with women's bodies, and would not degrade them to bare sentimental uses nor even to turbulent dramatic effect. He loved bright colours, but was no slave to Italian harmonies, and especially in his portraits, *e.g.* the "Chapeau de Paille" in the National Gallery and in his "Three Graces" series, the best of which is in Madrid, he is always the North countryman in his sure draughtmanship. He designed an immense number of pictures, but a great part of them were actually completed by his pupils, *e.g.* the famous Medici series in the Louvre. His great defect is an absence of restraint and want of unified impression, but no one outside a Mid-Victorian drawing-room filled with antimacassars should call him gross. Among the great Northern race which has made its name in art, the Flemish, that peculiar people half

Celtic, half Teutonic, one great name appears, *Franz Hals* (d. 1666). His countrymen before him were almost exclusively devoted to religious paintings, whose influence—a bad one—is well marked on many pictures from England to the south of Spain, but with Hals a great advance was made, and we have come to take it now for granted in any gallery we enter and see his name in the catalogue that here at least we shall be inspired, whatever other works real or spurious it may contain. He is among the very few real portrait painters, and thereby with his colleagues Velasquez and Manet marches in the straight line that leads to modern methods. His appeal, like that of all great painters and great artists, is a quiet one, but it is insistent, or rather once it gets there it remains. What, after all, does it matter to us whether a portrait is a photographic replica of the sitter? A few years pass and he is unknown—the picture remains for all time. Thus given a distinct idea, not altogether character, not altogether technique, not altogether colour decoration, but a unity of all—these make the abiding work, the work we long to hang in our rooms, the work we take our best friends to worship before in our public galleries. But if you must analyse Hals' features and are not content with the general statement that he paints the truth, one would mention sureness of modelling, inevitableness of colour values, nothing of minor importance insistent, but a unity of outlook, subtle backgrounds, brilliant brushwork and texture. All these are needed to make these quiet commonplace pictures which one may boldly say shall attract when Titian is felt to be gaudy, Raphael effeminate, and Rembrandt narrow-minded.

Painting in Great Britain.—It is unnecessary in a sketch like this even to mention the early English painters. There are many works in our galleries and private houses of the seventeenth century, signed and unsigned, quite worthy of being put to a critical test, but for our purpose English painting may be said to begin with two foreigners, *Vandyke* and *Lely*. The latter, Sir Peter he became (1617–1680), was a Belgian who early came to England and became the most fashionable painter of his day in this country. The best place to study him is in the National Portrait Gallery, though much is ascribed to him which is the work of his pupils. He formed a rather individual style, not ambitious as to colour effects but with good design and modelling. This cannot be said of *Kneller*, who succeeded him in society's esteem and who is one of the worst colourists of well-known painters. *Sir Anthony Vandyke* (1599–1641), after the usual Italian tour, sought the patronage of Charles I, at first unsuccessfully, but in 1632 he became Court painter and is the most famous holder of that office. He is best known for the characteristic lace ruffles of his sitters and their delicate hands. He was an imitator of Titian in his portrait painting, but does not compare with him in glory of colour and complexity of design. But as a Court painter, working with excellent technique, facile brush, and more than correct taste in draperies, he completely succeeds, and no doubt greatly pleased his sitters, for honours of all kinds were showered on him. The portraits now lent to the National Gallery give a very adequate idea of his talent.

Luckily for English art Kneller's influence, at first very intense, was not permanent, and with *Hogarth* (1697–1764) we make a real start with native art. And it is refreshing in this eighteenth century, so prosaic in other mediums, to find works worthy of admiration. Hogarth is a child of the century in his anecdotal power, which is no greater nor deeper than that of Pope, but his technical ability is beyond that of the Georgian school. Perhaps the "Marriage à la Mode" series in the National Gallery shows him at his best. His colour and design are not of the highest, but one has only to compare him with Kneller to appreciate his efficient pictorial qualities. Contemporary with him lived *Joshua Reynolds*. Hogarth prided himself on his anti-foreign connection. Reynolds is a sort of Tennyson who has known and appreciated all the beauties, and it may be added the tricks, of the old masters; so much so, indeed, that his great fault is that his work is too professional. He lacked the quality of spontaneous genius which is above training and even knowledge. But for completeness, for variety of accomplishment and sound technical knowledge, he quite deserves the traditional place he holds in English art. It is only in the later nineteenth century that his ideals are seen to be too inelastic. His great rival, *Gainsborough*, was of a different mould. He was no leader of society and intellect; he contented himself with looking on the beauties of English scenery and womenkind and interpreting them in his own way. And with no mean result. His colour and brushwork have greater qualities than those of Reynolds, and his pictorial sense very often places him among the greatest painters of the world. Unfortunately, neither Reynolds nor Gainsborough is seen to the best advantage in our public galleries, for their finest work is scattered over the country in private collections. In the public mind along with these two *Romney* is associated, but it must be admitted that his gifts are of a lower order and a great part of his popularity is due to the prettiness of his sitters, though here again public galleries do not do him justice, for he frequently shows fine ability in design, especially in drapery. Alongside of these men there lived *Richard Wilson*, whose landscapes at their best have great charm and delightful pictorial qualities, though too often marred by pseudo-classicism. Scotland at the time had a painter in *Alan Ramsay*, who is too little known, for his best

work—he was very uneven—is in a manner not learnt from any master. The portrait of his wife in the Edinburgh collection shows very delicate handling, wanting in sureness no doubt, but pleasing in a marked degree.

Passing over Hoppner owing to the inaccessibility of his work, we come to *Raeburn* (1756–1822), the famous Scottish painter. His reputation has of late years been rather clouded among artistic circles, but no one who has studied such works as the "Colonel Macdonnell of Glengarry" (Edinburgh), the "Sinclair of Ulbster" (Glasgow), and the "N. Spens" (Edinburgh) can fail to say that from a modern point of view Raeburn was a most interesting if not exciting artist. As a colourist he sometimes achieves the highest things, though his shadows usually ignore local colour with its difficulties, otherwise his values are extremely good; but his simplicity of brushwork, satisfactoriness of design, his sense of atmosphere and, if you like such things, his characterisation, move us to admiration. His reputation but not his good qualities descended on *Sir J. W. Gordon*, one of the first of these respectable portrait painters one meets every year at the Royal Academy, but in this case the English president was far above his Scots colleague, for *Lawrence* (1769–1830) with many imitated vices was a man of much greater ability. The Augerstein portrait in the National Gallery and under half a dozen in the Portrait Gallery are well worthy of study. Those who like so-called history represented in canvas as a rest from the ecstasy of artistic ideals will find *J. S. Copley* and *Benjamin West* least puerile, but it is folly to waste time on these when we may look at the work of three personal artists of the day: *Crome*, *Turner*, and *Constable*. These three men stand at the parting of the ways. They have one foot on traditional soil, the other is raised to go forward into the sun.

Crome (1769–1821), or "Old Crome" as he is called, shows a delightful personality in his work, analogous perhaps to Crabbe in poetry. He profited much from Hobbema and others, but he is English of the English, and in such pictures as "Mousehold Heath" in the National Gallery, and the "Landscape" in the Tait Gallery, he shows himself as no mere topographical student, but one who had a shrewd eye for the truth. *Turner*, slightly later in date, is a mighty figure wrapped up in his art, seeing visions and communicating them to us as best he may. To him, nature is no slave, but a lover whose beauty it is his proud mission to show to the world. He has left to the care of the national collections hundreds of oil paintings, water colours, and drawings, so that no one need be ignorant of his worth. It is rather staggering to the untutored eye, even if he has read Ruskin. He will find a complete change from the Italians and even from Velásquez. But presume for a moment that the riot has some reason in it, allow yourself to be caught up by the artist into his heaven, and untold delight will result even if it is accompanied by a little shame at the orgy. The defects are of course obvious. A Titan cannot in the nature of things be an artist, though he may breed them. His view is not often the truth of the impressionist—a scene which the eye takes in at a glance; restraint is wanting and a unifying harmony. Some of the pictures are like the full blast of the brasses of an orchestra, not the music of a symphony. It is magnificent, but it is not the highest art. Some well worthy of attention in the National Gallery are the "Fighting Téméraire," "Ulysses deriding Polyphemus," "The Brook," "A Frosty Morning." His etchings and drawings are unfortunately outside the scope of this sketch. Turner left no followers. *J. Constable* (1776–1837) has influenced directly or indirectly every landscape painter after him, for the French movement viewed his works exhibited in 1824 with open eyes, and Corot and his contemporaries followed. Like every true artist he knew that what exists in nature is of less importance to the artist than what is seen, that selection must always be made. His tone is exquisite; no one before him represents the freshness of English scenery with so much beauty. The sense of space, the sombreness of shadow (sometimes too black), and withal his design is never commonplace. He made the great discovery, undreamt by his predecessors, that the world was not of a uniform or graded brown tinge; to do that he had to go out bravely into the open air, feel the strength of the wind about him, smell the flowers and shrubs, and listen to the sound of running water. But hero that he was, he braved the hidden dragons of tradition and took his paint-brush along with him; with the result, of course, that painting came to its own—no longer was it an exercise of the study, an imitation of old masters' recipes; and wonderful genius that he was, he did not jump to the other end of things, but escaped the botanical craze of detailed classification and painted what his eye saw. All this and more you will recognise in the wonderful "Cornfield" in the National Gallery, the "Haywain" and the "Vallery Farm" and the exquisite pictures and sketches in the Victoria and Albert Museum. It was, however, the followers of Old Crome who attracted most attention—the Norwich school, of whom the greatest was *J. S. Cotman* (1787–1842), but he is most admired for his water colours and drawings.

We have made no mention of some later eighteenth-century men. *Morland* (1763–1805) deserves close study. His pictures of inns and other typically English spots with their stables and horses (there is a good stable in the National Gallery and another in the Victoria and Albert Museum) are apt to be overlooked by the busy visitors, but his technique on nearest sight will

be found admirable and unique among his kind. *Etty* (1787–1849) when at his best is also too much ignored, but no one interested in flesh colour will pass his pictures by. *Landseer* needs no introduction, and the present writer is unable to praise him, but *Wilkie's* fame is founded on surer talent. In the National Galleries of London and Edinburgh alike you will find work to interest you quite apart from their anecdotal value, and if you *do* happen to visit the latter capital, the Scotsman *Philip* will not at all remind you of the Velasquez you have worshipped in the Prado and with whom his contemporaries named him, but nevertheless he may captivate you not a little by his colour. These and their colleagues for the most part had a necessary minimum of good workmanship, and as their aims were not primarily artistic, it is perhaps fairer to ignore them than to test them too critically. With them we leave for a time the eighteenth-century art of our country, not unsatisfied. If we think of the dull literature of the day—the great prose age—we find as a whole a much higher achievement in painting than in poetry. Turner may vie with Blake, but we have still Constable soaring aloft. The stars of Reynolds, Gainsborough, and Raeburn blaze far more brightly than those of Pope, Dryden, and Gray; their intellects are not inferior and their workmanship is far above that of their friends. And if we turn to other countries, we still find cause for national pride.

Painting in France.—French painting starts with the two Italian-inclined men, *Nicholas Poussin* (1594–1665) and *Claude Lorraine* (1600–1682). These two were the introducers of that extraordinary representation of landscapes as consisting of studio-coloured trees, Roman ruins, with a few seventeenth-century nymphs thrown in just to enliven things up. They influenced French and British art till the day of Turner and Constable, and gave the world that idea of French correctness which the present European war will at last destroy. In the eighteenth century, Voltaire, Diderot, and Rousseau did achieve this, but they reached high literary standards. When we look at the painters we are still more disappointed. Yet the artists of the day thought that they were making a revolutionary change when they transferred to the leadership of Watteau from that of Poussin. The twentieth-century critic cannot find much real change. *Watteau* and the others transformed the habitation of the gods from spurious Elysian fields to elegant courtly groves, but to call these "fêtes champêtres" and "petites waisons" a return to nature is something the present writer cannot understand. Go to the Wallace Collection, or the Louvre, and analyse your sensations. True, these pictures represent the conventional idea of the French courts, but are they any the better for so doing? The colours are bright, and in Watteau's case the brushwork good, the design not strictly Italian, but if one is therefore impelled to call them decorative, let him pause and think, say, of the post-impressionists of to-day and he will at once see how feeble the sense of decoration dwelt in Watteau, *Boucher*, Pater and the rest. He will surely murmur, "If this is nature, then let us pray for convention." If we think there is beauty in Watteau, let us remind ourselves of Leonardo, Velasquez, and Hals. Or again, how inferior they are to the Venetians they imitated, There is as little subtlety in their combination of the colours as there is in their thought, and if in one or two men's faces a trace of character has crept in, the women are all of the same type with small features and piquante faces. And Boucher with his eternal blues and roses is even less complete and must be put in the same category. Contemporary with these two was *Chardin*, but of a very different nature. Again there is no subtlety of technique—he paints the lower classes as he finds them, but there is little genius in his observation, or at any rate in his representation of it on canvas. *Fragonard* has touches of Chardin and Boucher both in his work, giving puttiness to what is called lower life. And *Greuze* is known to all, at one stage of our life—Greuze with his attempt at stern morality and his success in showing sentimental women and children with often pasty faces not differing much in texture from the surrounding clothing. Rousseau had arrived and his readers were bathed in tears. This, then, was an antidote to classical legend, for the Greeks knew no sentimentalism. The works of all these men at their best may be seen at the Louvre and in a small way in the Wallace Collection, while Scotsmen have some wonderfully good paintings by Watteau, Boucher, and Greuze in their National Gallery. If one is satisfied with this traditional idea of France there is no more to be said. But even if true—and we recalling Pascal, Voltaire, and the French Revolution cannot so regard it—it must always be remembered that representation is only a small part of art. The brute is evident to us all; it is the artist's *métier* to uplift the brute to meet its God, as Meredith has said. These men, no doubt, were all gifted, but talent is not genius. The true French spirit is far better typified in the work of *Degas* and his brethren. They had, as we shall see, the piercing eye which is the foundation of art—that and the master-hand to show their sight to the world. Watteau and the others may have seen such men and women around them, but their art, in spite of its bright colour, would in that case be little better than photography, with a moral attached.

They were succeeded by still one more outburst of quasi-classicism about 1760. This return to Greek ideals was housed at Versailles, and all went happily as a marriage bell until the inevitable crash. Watteau and Boucher

were dethroned—it is said that David's pupils shot breadcrumbs at their pictures—and *Madame Vigée Le Brun*, whose paintings you meet in the Louvre as friends of your youth, reigned as Aspasia. But *David* was the first spokesman of these Romans, and it must be admitted that if there is no trace of the Elgin Marbles in his work or of the real ideals which inspired Pheidias or Sophocles, yet as far as the generation knew its Rome he sternly tried to venerate it both in his life and his painting. He was great neither in colour nor in line, but as the originator of the archæological picture in France and England he must, one supposes, have some place in our thoughts. His best-known work is the "Madame Récamier" in the Louvre, but his portraits of men are more worthy of attention. Following him, colour is banished from the apex of art and classical noses and correct draperies for the criteria of painting. But he had not everything his own way, for *Prudhon* combined a love for Leonardo with that for many women (as who does not?), and succeeded often as a minor Correggio and in some drawings. His life was gentle, and therefore apart from his work he is worthy of mention. But soon we come to *Ingres*, less of the "Source" than the portraits and sketches, the not altogether faultless drawer and the not altogether cold classic that his fight with the Romantics would make us believe; and certainly not the originator of the Royal Academy nude. Not then so wicked as usually reputed, but unfortunately on the wrong side, for the Romantics had arisen and France at last was to be free from the artificial aspiration to a dead and half-known ideal. It is quite unnecessary to relate the tale of the Revival. Rousseau, Goethe, Thomson, Scott, Wordsworth all had their share; Constable was the immediate cause. About 1830 a school arose in France with the warrior Delacroix at its head, which, reinforced by all the great names in literature of the day—Gauthier, Victor Hugo, Sainte-Beuve, Baudelaire—set forth in a new battle of the books. Many a hard knock and word did either side receive and give, but the victory lay with the Realists and Romantics, though, of course, the French Salon like our own Academy carried on the routed tradition. On the other side we get the great names, especially in landscape, of *Rousseau, Diaz, Millet,* and *Corot,* which, combined as they now are with the impressionists —for Corot united the two and the newer men pay homage to their elder brethren—stand for all that is best in modern French painting. And in dealing with them we may ignore *Bouguereau, Lefèbvre,* and even *Meissonier,* as well as many others less well known. Probably no school is more companionlike to the layman who wishes to understand pianting. These men of 1830 are not supreme artists, nor technicians; one of them may be a realist, another a poet—both non-artistic qualities—all have a very sound standard of workmanship.

He who would understand Wagner will find Mendelssohn *intime* to begin with, provided he has a good ear; the embryo lover of Shelley will first appreciate Tennyson. This is not to say that Corot was as commonplace as Tennyson nor so merely facile as Mendelssohn, but it has to be owned that so ingrained in our minds is the photographic point of view with its acceptance of traditional "browns" as the most prominent colour in nature that the truth of twentieth-century sight which is the monopoly of the artist, the child, and the savage comes but slowly and gradually. It must be remembered that, for example, the art of playing football is not recognisable in a moment, yet most people seem to think that the man in the street has an artistic vision quite sufficient to criticise any picture put before him; and if one ventures to question it, the delphic utterance of "I know what I like" is deemed to cover unplumbed depths of stupidity. The chiefs of this *Barbizon School*, as it is called from the little village to the north of Fontainebleau where they lived, are *Corot, Rousseau, Dupré,* and *Diaz,* and the forest was their inspiration—the forest and the light of the sun. *Rousseau* was the first in time and he bore the brunt of the opposition. He saw Nature as a thing to be studied minutely and reverenced, then having knowledge he could express his mood, but always through Nature. He is essentially a lover of form, especially as contrasted with Corot. A thoroughgoing Impressionist would call him meticulous—he seems to love every leaf of the trees—but he is no English Pre-Raphaelite. He is of the true line of landscape-painters, and one who perhaps did as much as anyone to show Nature in its native colours. It is open-air work, not dramatic, not really poetical, without the inspiration of Monet's colour, but real without being merely representative, rather cold and plain perhaps, sometimes a little prosy, but with catholic taste and always with great workmanlike qualities. *Corot* is quite different. All visitors to modern galleries have learnt to recognise the cool, shimmering silver of this poet of Fontainebleau. It was late in life that he came to his own and abandoned classical futilities, but not too late, for he ever retained the joyous soul of a boy. And his cheerful temperament is abundantly seen in his work. But it is in no sense sentimental if lyrical. He is a greater colourist than Rousseau, though he limited his range so much and confined himself to aspects of early morning and later evening—a personal choice in keeping with a disposition that neither knew nor cared for any violence or drama or crude effect. The figures in his landscapes, the remnant of his earlier devotion, seem out of place, for drawing was not his forte, but they never spoil the delicate beauty of the whole.

The realm of painting is the poorer if it excludes the point of view of such a man, founded as it was on love of the brute elements. His is a gentle theme, quiet and orderly, but full of beauty. Dupré, again, is the dramatist of the group, the lover of storm and thus of Nature—of the wind and the water, and therefore a colourist, an enthusiast indeed, even a fanatic, but all for art's sake. *Diaz*, who combined a voluptuous love of the inmost recesses of the forest with popular nymph-painting, thus became the wealthiest painter of the day. Of the others more or less of this school it is sufficient to name *Daubigny* of the picturesque country scenes, *Troyon* whose animals are not the only satisfying parts of his pictures, and *Charles Jacque* whose etchings and paintings of sheep and farm buildings have excellent qualities. The works of all of them may be studied best at the Louvre, but most galleries have good examples of Corot, Diaz, and Rousseau, and their pictures are wonderfully equal in merit. The National Gallery is very representative, owing to some recent bequests.

Impressionism.—Our glance at the work of Velasquez has forestalled, as is only right, any detailed examination of the theory of Impressionism. Its essence, we have seen, is the painting of the natural fact as seen, subordinating and transforming all the parts of the picture to one impression under the influence of light. We have noted how the Barbizon school began the study as applied to landscape; we have now to observe how its results affected even studio pictures. The giant figure with whom the movement is associated is *Edouard Manet*, who appeared before the public in a new guise in 1862, and with the well-known pictures "Déjeûner sur L'Herbe" (now in the Musée des Arts Decoratifs in Paris), "Olympe" (Louvre), and other pictures raised a storm of indignation against him and his colleagues in succeeding years that did not subside till after his death. The two pictures mentioned must not be cono fused with examples of Impressionism—they are not so. Both were disliked far more for their subjects than their technique, and it is wholly with the latter that Impressionism is strictly concerned, though it has certain other results. They are merely bold experiments in harmonies of colours, unadulterated by any so-called romantic gloss, but not as yet showing the influence of light, and Goya, if anybody, is his master. It was not till about 1870 and when joined by *Degas* and *Monet* that his full powers are to be seen. Then there followed such beautiful canvases as "The Fight of the 'Kearsage' and the 'Alabama,'" "The Bar at the Folies-Bergères," "Jeanne," "A Garden," "Bal de l'opera," "Le Bon Book." He died in 1883 when the movement was just beginning to be taken seriously. It is most unfortunate that his best works are all in private collections and only occasionally gathered together for exhibition. The Caillebotte collection in the Luxembourg gives no idea of the versatility nor profundity of this master by whose influence modern art has been created. The Dublin Gallery is much better, but the visitor to Paris should always make a point of visiting the galleries of M. Durand Rull, a dealer who has done more perhaps than anyone else to encourage the work and bring about a just appreciation of the Impressionists. One frequently in odd places meets some of his early work—Mr. Cowan of Edinburgh has a beautiful deck-scene painted when the artist was yet a sailor—all show the curious eye seeking unusual effects. No painter is less commonplace. The man in the street will scoff at the harmonies just as he did with Wagner; the student will find all his work of supreme interest, and they are all pictures to live with. They set up a wholly individual point of view, subtle and therefore requiring some patience before it is grasped. When it has been reached one goes through the pleasurable experience of seeing all things in the colour of Manet. His great contemporaries are *Degas* and *Monet*. The former, who still lives in Paris, is as stern a lover of his art as any artist the world has ever seen. In spite of malign opposition, in spite of a bravely satiric vein of his own, he has never ventured into the fray; he has painted for the thing's sake, and if people do not appreciate, then that is their fault. Unfortunately, too, if they do seek to appreciate they meet with no warmer greeting; and the present writer has a very clear recollection of how he was received when, filled with youthful enthusiasm, he ventured to approach the master. His best-known works are of ballet girls in group or by themselves, and his unique vision has vested these stiff white figures at rest or in motion with a beauty no painter of the Madonna has ever achieved. Influenced by two directly opposite tendencies, the composition and colour of the Japanese and the draughtsmanship of Ingres, he has combined both with extraordinary effect; and no one has ever shown the wonder of artificial light as he, and the harmonies he produces in a combination of black and white put a Venetian to shame. He has also painted many pictures of race-meetings, nudes (especially while bathing), café scenes and landscapes, while in a pastel of his own he is a master. He is better served than Manet in the Caillebotte collection, and there is a good example of his work in—of all places—the Victoria and Albert Museum; but, the painter's own studio being as suggested inviolate, few opportunities are given of seeing his work, and as usual with these painters they do not allow their works to be photographed, so that few people have even a passing idea of what it is like.

If Manet was the man who bore the brunt of the battle, if Degas is the greatest artist of

the group, *Claude Monet* is the painter who has most revolutionised technique, for it is largely due to him that the theory of broken colour or chromatism has been applied. In every gallery nowadays one notices these pictures, which have to be looked at from some distance. If looked at near at hand, they will show a mere conglomeration of colour spots; at the proper distance, the division of tones, the complementary colours unite and reconstitute the colour, broken up as it has been into its component parts, and the effect is far richer than the detailed and minute finish of the Pre-Raphaelites or Academicians, for the impression formed on the visitor by this means is exactly what the painter had in his own eye and has communicated to us by his brush. Monet's pictures are all poems in praise of the sunshine—at its brightest when there are no shadows in the scene, dazzling to the eye; at other times with wonderful shade, with no hint of black. It follows from this that he and his followers cared nothing for historical or literary ideas in a picture. They painted the earth, selected its beauties—hayricks, riversides, trees—and the result is matter for worship. The term Impressionist arose from the name given to one of Monet's pictures, and at first given in derision it was enthusiastically adopted as a true badge by his followers, and it has been shown here to be the keynote of all art. In his work we have not to flit our eye from one side of the picture to another; we do not retire to the botanical laboratory and count the number of petals in a flower—we stand at once before the rich fertility of Normandy with its gorgeous colour. We need no moral, no legend, no literary touch of any sort; here is a reading of earth—pagan as it used to be called, certainly truly classical as if Pan were still abroad. But why the god of the twentieth century should be dissociated from nature in its most beautiful guise it is difficult to see. Yet there has always been an idea abroad that the Impressionists were rather immoral—the only reason being that not being in the pulpit they forgot to preach. *Renoir*, again, is totally different. He exercises himself with the Paris that all visitors wish to see—scenes of all kinds in the open streets, inside cafés and theatres—everything is as "natural" as one could imagine, but everything is responsive to the artist's purpose. He is perhaps chiefly concerned with the flesh of his subjects and the effect of light upon it, but he has many moods, and his glorious colour values, his cleverness, his gay manner—a Frenchman he is if ever there was one in intellect and execution—all appear whether in landscapes, nudes, or portraits, and make him probably the most thoroughgoing representative of the group. In addition to these immortals, we have *Sisley*, *Pissarro*, and the *Pointillists*. *Sisley* is a most poetical artist. *Pissarro* adopted the technique of the *Dotists*. Where other Impressionists were content to indicate complementary colours in splashes of colour according to need, the Neo-Impressionists, or Pointillists as they are appropriately called, have made the theory of broken colour into a science of dots of equal sizes with rather a mechanical and disturbing effect. Seen at a distance, however, the colour of a good artist in this medium is extraordinarily rich in effect, which, of course, is the result desired. This departure has had its inevitable reaction in the *Post-Impressionist* school, which by a totally different route seems to reach the same goal. It is mentioned here in connection with English present-day painting, though Paris is its domicile.

An artist whose name has been omitted because he is of no definite school is *Boudin*, and he is one of the most beautiful painters France has given birth to for many years. It is most unfortunate that the few pictures he did sell have been scattered so widely in private collections and that few of the famous galleries have examples of his work. Luckily our own National Gallery has two very beautiful seascapes. His painting breathes of the sea and coast he so intimately saw. He was not exactly an Impressionist of the broken-colour school, but otherwise he unwittingly subscribes to all their ideals. For richness of colour, adequacy of values, truth of impression and gaiety of atmosphere he is with hardly an equal in his best work. He lived and died unhonoured.

. . . .

A note must be made of the *nineteenth-century Dutch painters*. After the seventeenth century, art in Holland deteriorated and became more degenerate in the succeeding century, but with modern days Holland has again lifted her head among the artistic nations. *Joseph Israels*, *Jacob* and *Matthew Maris*, and *Anton Mauve* may be taken as representative of a group of artists whose work is a source of continual delight. It is not altogether a native effusion, for it owes much of its inspiration to France and England, but it has given as much influence as it took. *Israels* painted popular subjects, with strong sentiment but sound draughtsmanship. His domestic studies, if they bring tears to the layman, bring joy to the artist, for his cleverness in draughtsmanship and atmospheric effect is remarkable. *Matthew Maris* has as delicate a touch as a vision. But he is far removed from "preciousness," sound workmanship showing in all his paintings. His brother *Jacob* has brought the art of selection to a high point. He simplifies the world around him to a very exquisite harmony. *Anton Mauve's* pictures delight us at every turn. Again there is a beautiful atmospheric effect, a delicate vision, exquisite workmanship and simplicity based on cleverness. Others who might have been mentioned are *Bosboom*, *Neuhuys*, *Mesdag*—all real little masters of this charming group. The

interiors of Dutch houses, peasants, canals and the sea all come under their purview, and they delight us all with their imaginative representation.

Present-day Painting in Britain.—Before discussing the great movements in the nineteenth century, a note must be made of one of its chief painters who held aloof from all of them, *George Frederick Watts*. Trained in no particular school, he confined himself to two great branches, allegory and portraiture. The former are his best known, and few galleries are without some example. It is true that they make their appeal for the most part to people who patronise art because of an acquaintance with literature, but mythological as their titles may be, the essence of their mission is easily understood by the multitude. That mission was a typically nineteenth-century one, refined, intellectual, but rather dull—Tennysonian indeed, and their technique of a similar kind. His portraits, large collections of which are in the Tate and National Portrait Galleries, always show strong character drawing, some of his heads being specially well modelled.

The movement with which Mid-Victorian life in England chiefly concerned itself was that of the *Pre-Raphaelite Brotherhood*. It was of a piece with the Gothic Revival in architecture and shared with it the praises of the dictator, Ruskin. Certainly British painting in 1848 had reached a very low level, and something —whether right or wrong—was needed to instil life into its dry bones. Much has been written and refuted about its aims, but to a modern eye there is one bond of connection between all the members of the society, viz. that they endeavoured to go to what they called Nature, to get behind conventional representations of the world and come down to earth. Too much need not be made of the name they adopted, though one of the outcomes of the movement was a general and uncritical eagerness to possess early Italian works. Their method of working out their salvation was scientific—minute detail being of supreme importance. *Dante Gabriel Rossetti*, the poet, was the ruling spirit, and attempted to carry out in his pictures what he most successfully did in his poetry. He had not, however, the necessary painter's equipment, and in any case he seems to have confused the ends of these two differing arts. What is thought and imagined cannot be described in the same way as what is seen. His best work includes "Lileth," "Beata Beatrix," and the "Beloved," and are chiefly noticeable for a certain sensuous langour in the women painted and a remarkable disregard to lay out the qualities of the medium he worked in. *Ford Madox Brown* is the chief story-teller of the company, but he again was unaware of the limitations of his art, the power of pure paint restrained by a decorative master. *Burne-Jones* did greater things. He had a fine appreciation of colour and would have been a great designer of stained glass if he had paid more attention to glazing. In his pictures he shows similar defects to those noted in the case of Rossetti, but there is reason to suppose that with a different training his technical equipment would have been greatly developed. "King Cophetua" in the Tate Gallery, "The Depths of the Sea," and "Laus Veneris" are among his best paintings. *Holman Hunt's* religious paintings are well known and much discussed for non-artistic reasons. *Sir John Everett Millais* by his subject pictures and portraits attained to the highest honours before his death. He was a fine colourist and an obedient maker of likenesses, but in a number of his paintings excellent decorative effects are achieved. The Tate Gallery and Royal Academy give a fair idea of his talent, though the "Eve of St. Agnes" is in a private collection. The movement has had many followers, though they are now less common than twenty years ago.

Strictly opposed to the Pre-Raphaelites, if not in theory (for both aimed at reality) at least in practice, are the *English* Impressionists—the members of the Glasgow School. Of these we may be justly proud, for they have shown that at home we can lay claim to as great artistic fame as any other country in Europe. The influence of Manet and his followers inaugurated the movement, but one has only to look at the many Scotch pictures in continental galleries to recognise that the Glasgow men were anything but imitators of the French. It is most unfortunate that their work is so widely scattered, but in any exhibition the catalogue should be scanned for their names. Chief among them are *Sir James Guthrie*, President of the Scottish Academy, *J. Lavery, G. Henry, E. Hornell, J. Paterson, E. A. Walton, I. Austin Brown, Joseph Cranhall, W. Y. Macgregor, D. Y. Cameron.* Guthrie's portraits are masterpieces and show him in line with the greatest painters. His draughtmanship, colour, and brushwork are all of the highest quality and his decorative schemes of unerring beauty. And succeeding years show no lack of power, as witness his "Sir William Turner" in the Academy of this year (1914). Always there is the same masterly handling. His landscapes, as shown by the "Midsummer" in the Scottish diploma collection, fulfil the true Impressionist ideal. If Guthrie is complete, *Lavery* is exquisite, and no living painter probably shows greater genius in his work. Paris, Venice, and other continental towns have secured examples of his work, but Glasgow's "R. B. Cunningham Graham" is a picture any gallery or any painter might be proud of, and if one is reminded of Velasquez, both the sitter and artist have reason on their side. Like many Impressionist painters, Lavery has been influenced by Japan in his decoration. The exhibition of this year of a representative

series of his work in London showed him a many-sided if unequal genius. He has even become a fashionable woman's painter, but he seems more at home painting sunlight on a beach or sketches of Pavlova. Lately he has given us beautiful Swiss nature-studies, one of which the Edinburgh Gallery has been shrewd enough to purchase. Another great name is that of *George Henry*, but in spite of the fact that he is now an Academician his work is too little known. It is of exquisite merit, and both in portraiture and figure painting he excels. True decorative beauty governs all his work, for he is a designer *par excellence*, and joins hands with Lavery in showing forth the joyousness of human life. *Hornel's* thickly-painted, richly-coloured Japanese-like children appearing out of and as part of some gorgeously lit vegetation appeal to us all, even if we sometimes crave for a somewhat different subject. But really we cannot have enough of such brilliance of colour effects. *James Paterson* is perhaps the most individual artist of the group. His landscapes fulfil all pictorial conditions to a high degree, but over and above that he interfuses all with a sensitive poetical atmosphere. He thus, as few men have, represents the inner reality of a scene, with no false sentimentalism and no outside literary appendage, but by the beauty of his own vision and a delicate appreciation of the subtle colour harmonies of the natural world. His water-colours are of supreme distinction. Needless to say, his work has been sought after on the Continent as well as at home. It is interesting to note in passing that his son, H. C. Paterson, is gaining a name among the younger Edinburgh artists as a painter of undoubted talent. *Walton* is the fourth of the Glasgow portrait painters who are thus shown to have an extraordinary wealth of ability, for it must be remembered that little as is the mention made of these and the remainder of the group, any one of them by himself would lift his native country from obscurity to artistic fame. Walton has the same varied powers as Guthrie. Whether he paints some academic notable crudely clothed, a little girl, or an imaginative water-colour, he succeeds in all in obtaining justness of drawing, tone, and atmosphere. A collection of the work of the late *Joseph Crawhall* in this year's Scottish Academy showed to a wider public the genius of this great painter of animals and animal life. One has only to compare him with Landseer to appreciate what Impressionism has done for art. Here, what is seen is depicted, but with no want of selection. The unessential is ignored and beauty of pictorial representation is achieved. Whether it is a fowl or a gorgeous Spanish bull-fight that is the subject, over all the artist's touch reigns. *D. Y. Cameron's* fame rests mainly and surely on his genius as an etcher, but as a painter he every year adds something of high merit. He has painted portraits and figure studies, but of late years most of his compositions have dealt with mountain scenery. Coupled with an exquisite observation of nature, natural to an etcher, he within a small compass of tones creates broadly-handled effects of great dignity and beauty. *W. Y. Macgregor* as a colourist has few peers among landscape painters, and seems to come nearer his French colleagues than the other Scotsmen. He always shows clear thinking in his schemes and a consequent sureness of touch that give the appreciative onlooker untold delight. Other painters of this movement all producing remarkably able work are *Alexander Roche, George Pirie, Whitelaw Hamilton, Harrington Mann,* and *Macaulay Stevenson,* the imaginative landscapes of the last named being far too seldom seen, although the Glasgow Gallery has a beautiful specimen of his art.

Two men who cannot be classed as Impressionists greatly influenced the Glasgow School, *J. M. Whistler* and *W. McTaggart*. The former, who in nationality prided himself on being an American gentleman, spent so much of his life in London that he must here have notice. In many ways he was the greatest artist of the century. Influenced at first by the French, but relying on an extraordinary and peculiar individuality of his own, he created a style of his own that reminds me now of Manet, now of Japan, now of Velasquez. But even then a lot has been missed out. He worked in most mediums, his etchings and lithographs and decorations being especially sought after, though as an etcher he has not quite the same fame as during his life. His "Nocturnes," wonderfully imaginative compositions, usually of low tone but extreme delicacy, gave rise to heated discussions, including a famous libel action. Since then critics have been led by the hand to the Thames at night and admitted the reality of Whistler's vision. His best-known works are the portraits of Carlyle (Glasgow Gallery), Mrs. Whistler (Luxembourg), and Miss Alexander (Mr. Alexander). The appeal of the first two is irresistible to everyone, both in the quiet insistence of the design and the inevitableness of the draughtsmanship. But unfortunately the third is still in the hands of a private person, though he has been generous in lending it to several exhibitions of the master's work. One can think of no more beautiful picture to characterise all that is best in late nineteenth-century art. Here is art for art's sake become beautiful and true, and no more is wanted. The warmths of the black and white harmonies, the human element of the little girl not too conscious but unafraid, the charmingly intricate folds of the dress, the quality of the paint in its representation of dress-stuff and hair, the value of the black shoes and hair-ribbon, the beautiful spacing of the figure—everything even to the much-

thought-out signature of the artist make for the delight of the eye and the satisfaction of the mind. His other portraits are numerous, but all remain secluded in private collections, and Whistler was never an Academician. The other artist we have mentioned, *W. McTaggart*, seems to have discovered Impressionism by himself. Most of his paintings represent scenes by the seaside, often with delightful glimpses of children on the beach. They are masterpieces of their kind, showing great study of colour effects and genius in representing what was seen. He exerted, as has been said, a very great influence on his Glasgow colleagues, who could not but recognise in him one of the greatest painters Scotland has produced. Even his sketches are worth going miles to see, and he was not over-appreciated by the lay public in his lifetime.

Another Scotsman who became deservedly famous in his short life was the Aberdonian, *Robert Brough*. Though not of the Glasgow School he shared many of the ideals of the French Impressionists, and his work though unequal is very often so clever as to amount to genius. At his death at the early age of thirty-two he was one of the most fashionable painters of women in London, but here fashion had somehow gone on right lines. The Tate Gallery has his "Fantasie en Folie," the Edinburgh collection a beautiful portrait, and Venice two of his works, but again for the most part municipal collections have ignored him.

To return to England, mention must be made of those who have not to any great degree deviated from the straight path of academic tradition. Best known are the archæologists or false-delineators of antique life. Chief among these have been *Lord Leighton*, *Sir Alma Tadema*, and *Sir Edward Poynter*, to name whom is to show how popular such work is, so that nothing more need be said of them. Of one, the late *Albert Moore*, it must be owned that he was an artist in spite of his supposed love for antiquity of the picture-palace style. Both in composition and from a decorative point of view his works are of great merit, and he did not deem it necessary to overload his themes with the curious expressions of Greek sentimentality discovered by these antiquarians. An attempt to form a school was made some years ago by *Stanhope Forbes* and his wife, with no little success. These Newlyn painters, while really in tradition of J. F. Millet or perhaps Joseph Israels, have added an English note in their representations of fisher life. If not exciting, their technique is quite workmanlike. It is quite unnecessary here to mention the many popular Academy favourites. These will be sifted by those who take the trouble to appreciate what has been written about their more able brothers. It is quite wrong, of course, to suggest that all popular painters are bad workmen—for one thing, they have very often quite remarkable photographic if inartistic powers.

It is sufficient for our purpose to mention a few who have individualities of their own. Of the older men, two lived short but important lives. *C. G. Lawson* showed promise of combining the best of what had previously appeared in English landscape painters with a point of view all his own. One of his best is to be seen in the Tate Gallery. There, too, one may mark the great talent of *C. W. Furse*, who also met an early death. His "Diana of the Uplands," in spite of being reproduced so often, is a very notable work. Still with us, however, is *Mr. Mark Fisher*, whose distinguished landscapes pat our national pride on the back when we meet with them in a gallery. He is more in line with Constable than with the Impressionists, but has something of the latter's brilliance of colour effect. The work of *Charles Sims*, *Monat Loudan*, *La Thangue*, *Shannon*, *S. J. Solomon*, *P. W. Steed*, *Augustus John*, *Glyn Philpott*, and other members of the New English Art Club is always full of interest, being of great distinction and ability.

. . . .

A word must be said in conclusion of the new movement in art in France, Italy, and England. It has been noted how Impressionism in Paris took on a rather too logical and scientific road. Within the last few years a reaction has set in, culminating in what are called *Post-Impressionism* and *Futurism*. The former is rather a vague term, and it is with great bravery that one attempts to illustrate it. But roughly it may be taken to express the aspirations of those artists who, becoming weary of degrading art to a mere method of applying paint, have dared to bring out the more purely pictorial aspects of their art. This can of course be done in many differing ways. In Paris, Florence, Venice, and London, to mention only a few places, one meets with pictures with frankly a purely decorative character. They are probably inspired by Eastern art, and not a few of them have adopted Byzantine conventions with very good effect. They are anti-Impressionist in their aim, *i.e.* they do not seek to represent what we call reality, but adopting certain conventions of a primitive kind they seek to appeal to our admiration in exactly the same way as, say, many Japanese prints do. But they are quite frank in their methods. A red tree is unknown to our visual organs. But in certain compositions such a representation will, combined with the remainder of the picture, give us a far greater natural impression than a photograph. These ideals have been applied with success to the minor arts, especially embroidery. In its purity these ideas have no famous exponents, but many of our younger artists have been influenced by them in no small degree. They lie at the root of the extremely clever and artistic work of such men

as *James Pryde, W. Orpen, R. Connard, Gerald Kelly, S. J. Peploe, J. D. Ferguson*, and quite a number of young artists in Edinburgh, among whom we may mention *W. O. Hutchison*. Indeed, at the moment they are far the most interesting painters of the day, especially as they seem to connect themselves, unconsciously no doubt, with movements in the spheres of music, poetry, and even philosophy. Probably the movement has its limitations, as it is difficult at first to see how they can be applied to portraiture. But in landscape and subject painting they seem to have expressed ideas in their work, not really new indeed, but which have been only unconsciously and perhaps illogically or unreasoningly held by the greatest artists of all times.

The other reactions are of two kinds, *Cubism* and *Futurism*. The former is a technical change. As the Neo-Impressionists saw all things in points, so the Cubists see all things in cubes. Their pictures can only be criticised by their results. They themselves say that it is only some people in the world who see things as they do, and it is unquestionable that in modified form at any rate their technique appeals to our vision. Probably it is a phase. For heightening the colour of a picture it has enormous effect. They have adapted their ideas to the sister art of sculpture, but here the statues he has seen do not in any way connect themselves with the present writer's acquaintance with the human form.

COURSE OF READING

There are few subjects more written about than painting, yet there are practically no standard works either in English or any other tongue. It has been the aim of the present writer to fill the gap for the average unprejudiced onlooker, on whom in the last resort depends the fate of artistic endeavour. The artist may pretend to despise the criticism of the man in the street, but he is economically dependent on him, for it is as essential to painting well as to live well that the means of existence should be at hand. No wonder then that his livelihood is a precarious one. Most of the books on painters and painting deal with the lives of the artist, and a man has not lived till he has died. That is the reason so many great artists get no recognition at all. It is hoped that a perusal of these pages will at least concentrate the willing critic's eyes on the work of the painter There are literally thousands of books written about pictures which never mention the works themselves, but it is not sufficient to tell the student that visiting galleries alone will teach him how to appreciate pictures. No more will the slight knowledge of drawing imparted in our board schools. Far more valuable than either is an acquaintance with the painters themselves, if only, as is not at all usual, they will or can tell you what they mean to say. A golden rule would be, "Go about as much as possible with painters, see as much of their work as possible, find out what other artists say about it, lend to all artists a presumption that they know what they are talking about, read but do not repeat what the critics say, and go and see the pictures again and judge for yourselves. Having formed an opinion, see different work and test your old opinions a few years after." Above all, try and find out what the artist is saying. If you do not agree with his representation, analyse your disagreement and give the artist credit for common sense. You will gradually form a point of view of your own. Unless you are an artist you will not be able to express yourself in paint, but that is not your fault; you will become what all artists of any medium pray for—a sympathetic appreciator.

When you have got a point of view, it is very interesting to compare it with what others have written about theirs. The best-known writers are *Ruskin* and *Walter Pater*. The former is a much more valuable critic of architecture than of painting, but he always stimulates. His *Modern Painters* opened the way to enthusiasm for Turner and the English Pre-Raphaelites, but it is difficult to follow him in his thunderings for or against Titian, Tintoretto, and other Italians. His attitude to Whistler and want of attitude to Manet and his school rather damn him in the eyes of a twentieth-century student, and how such a Mid-Victorian will fare when we have settled down after the war remains to be seen. *Pater* is fantastic and looks at pictures from a literary point of view, but is always supremely interesting. *The Renaissance* and the *Miscellaneous Studies* both contain important contributions to æsthetics. From much the same standpoint J. Addington Symonds wrote his *Renaissance in Italy*, which gives the Italian ideal as seen by the cultured Englishman before the days of Marinetti at its best. It is quite unnecessary to read Crowe and Cavalcaselle's tomes. The only book containing the essentials of painting is R. A. M. Stevenson's *Velasquez*, a small but wholly invaluable work, worth far more than all the tomes on æsthetics ever written. It gives a complete apologia of the Impressionist ideal. The same author's *Rubens* is no better than hundreds of books of a similar kind written every year. That is not to say that these should not be consulted. They are very handy for reference, but the unfortunate fault of nearly all of them is that the writers do not come down to earth and tell the reader why they like or dislike the pictures in question. They tell everything about the writer's mother and his love affairs. The best series are those of Bell and Methuen.

Quite original and excellent on the other hand

is the lately published *History of Painting* by Haldane McFall, which is of far more real value, however much one may disagree with it, than Professor Muther's *History of Modern Painting*, so much of which seems irrelevant to a non-German. In a different form Heinemann's *General History of Art*, divided into countries, is specially handy and ably done—Sir William Armstrong writing the English part. A most excellent account of French Impressionism is given in *C. Mauclair's* little volume, of which there is a good English translation. Oscar Wilde's works and Whistler's rhapsodies amuse and suggest more than they instruct. Modern critics are not a little alive to the deficiencies of their predecessors, and the work of such men as *D. S. McColl* and *Baldwin Brown*, even if enclosed in extravagant bindings, should be consulted whenever opportunity offers. A very sound notion of the aims of the nineteenth-century artists may be formed from them. The Pre-Raphaelite mode of thought is not very intense or obscure, but most of the brotherhood have written much about it. It is not recommended that any books on æsthetics be read with the exception of *Bendetto Croce*. The treatises of German philosophers and their English imitators should be specially guarded against. At the other extreme, time spent on technical manuals of painting and pigment even by unknown authors is never wasted. Midway between these are Reynolds's *Discourses* and such *Lectures* as those of *Clausen*, *Holmes*, and *Herkomer*. Of the magazines devoted to painting, the *Studio* and the *Burlington* are the best. *Rhythm*, which fulminated for and gave illustrations of novel themes and modes, is unfortunately now defunct. Scattered through newspapers and magazines, sometimes declining into book form, are the interesting utterances of *Roger Fry*, *W. Sickert*, *Mark Phillips*, *Bone*.

A word must be said about reproductions. If you wish to take a living interest in painting you must be warned against photographs and black and white drawings. These have a place of their own in the social life of the day, but they engender colour blindness. At best their medium is an unnatural convention. Five minutes spent in the open air, whether in sunshine, rain, or dark, will teach you more of colour than a year of gazing at costly reproductions of paintings you have never seen. On the other hand, when you have loved a picture and formed some notion of it, a reproduction, however limited, will prove a trusty friend, recalling at odd moments vanishing delight. The little booklets of *Gowans and Gray* are specially suited to the penniless student, and it is a pleasing exercise to mark one's criticism of the painting on the margin to help the memory in future reference, and ensures the necessary recalling of the original on which alone one's criticism and appreciation can be based. It is needless to add that one of the aims of this article is to depreciate such patronage of art as is evidenced by the annual purchase of a book of the year's Academy pictures.

J. MACPHERSON.

SCULPTURE

Greek and Roman.—The modern educated man desirous of appreciating contemporary sculpture and learning how it has developed need concentrate his mind only on the work of Greece, Rome, Italy, and modern Europe. It is not proposed in the following sketch to attempt an appreciation or even an enumeration of the extant remains of such early races as the Egyptians, Indians, and Chinese. If the field is limited the quality of the examples will prove of quite sufficient interest.

The earliest Greek work left to us need not detain the student. Examples are scattered in the great museums and show the usual primitive defects. They consist mostly of reliefs stiff in form, wanting in knowledge of the anatomy of the body, conventional in drapery, and stilted in pose and suggestion of action. The frieze of the Treasury of Cnidias or the pediments of the Temple of Ægina at Munich, the Ludovici throne at Rome, and a few separate statues in Delphi and elsewhere are the best examples of the work before the fifth century B.C.

But before mentioning the earliest of the masters, Myron, it is perhaps useful to make a note of the general attitude towards Greek sculpture. In the mind of the man in the street there are two notions, one that the Greeks sought mere types and repeated them *ad nauseam*, and secondly, that the greatest types are the Apollo Belvidere and the Venus de Milo. As to the first, it must be taken very guardedly. It is true that the old artists repeated the same theme over and over again just as the Italians painted their Madonnas and Crucifixions, but in its nature this is not so great a fault in sculpture as in painting. In the latter art the very colours became stereotyped; the modelling of the body can never so degenerate in the hands of a master.

Just because the sculptor is limited in his sphere, within that sphere the room for ingenuity is very great. Again, just as in painting, a great master was copied by his pupils in succeeding generations, but once more the tricks are not so easily acquired. And the Greeks, because of their intimate acquaintance with the naked form in athletics, could never pardon any great departure from reality. They might idealise in certain little details, but so great care was taken by the athletes and the race as a whole of their physique that the sculptor did not require to base his ideals on anything remote from everyday life. As to the second tenet of the average man, it must be clearly understood that the centre for admiration has completely changed. When Winckelmann and Lessing, who were the originators of the modern interest in Greek sculpture, wrote their books, they knew nothing of the Elgin Marbles and other really Greek work. They held up for the admiration of the world what are now known to be only copies of original works, and decadent copies at that. As will be shown, the early work and the later is easily distinguishable, and the demerits of the ancient idols are exactly of a piece with the debased qualities of any other art.

Myron is famous for his athletic studies. Instead of the old rigid awkward poses of the subjects we get activity shown in every muscle: legs and arms are bent in play and the body itself responds to the complicated attitudes represented. His most famous statue is the "Discobolus," or quoit-thrower, the original of which has been destroyed, but the two chief copies by artists very near in date to Myron are the Massini Discobolus in the Palazzo Lancelotti in Rome, and two torsos, one in the Vatican, the other in the Museo delle Terme. His chief characteristics are the muscular distortions of the body, conventional hair, and the indifferent expression of the face in marked contrast to the exertion of the body. The only other statue, copies of which we have, is the Marsyas, the best example being in the Lateran Museum. It represents a satyr standing back in fright, and is supposed to belong to a group in which Athena is the central figure. The bronze statuette of this subject in the British Museum is a much later copy showing none of the master's qualities. Other statues of which we have little or no trace depicted beasts of all kinds and a Hermes. His influence is to be noted in the athletic subjects of the metopes of the Parthenon, the statue of which there are a number of copies of an athlete pouring oil, and the Diomede in the Paladium.

Next we come to the greatest sculptor of all time, *Phidias*, under whose supervision all the so-called Elgin Marbles, the pediments, metopes, and friezes of the Parthenon at Athens were executed, easily the greatest groups of sculpture in the world, now in the British Museum. It is unnecessary here to represent the arrangement of the figures of the pediment or to try

and identify the figures. It is sufficient to note the leading characteristics of the artist as shown by them. It is of course impossible to discuss the wonder of the work as a whole, it is so incomplete, but taking the figures separately and mutilated as they are, they are still the most wonderful examples of sculpture in existence. Perhaps the quality which distinguishes them most from all that has gone before and after is the unique drapery. Hours can be spent minutely examining the details of the three "Fates," as they are called. You may first note the general scheme of each, the harmony of the whole so simple yet so subtle in its unity. Then you recognise the absolute truth of the representation, the form of the body showing underneath the skin and it in turn underneath the thick folds. But take the folds themselves and you will find extraordinary delicacy of treatment—little spaces of light and shade and rest for the eye, yet everything, in spite of the complexity of line, so simple and unified. They are like a symphony of music—wealth of detail governed by simplicity of idea. And compare this after a time with later work, say the Venus de Milo in the Louvre. Notice how perfect the adjustment is, how the sculptor has sailed straight between the Scylla of convention and the Charybdis of exaggerated dramaticism, how virile everything is, yet how untouched by sentimentality. Then glance at the modelling of the bodies again, noting the absence of all staginess in the attitudes, how certain parts are brought into prominence, but never unduly so. Inevitableness and sureness of touch create a great calm over all. Then in the exposed parts, see the delicacy of the flesh tints, to be seen more markedly in the male figures, Theseus and Thyssus, or in the nostrils of the horses. Having drunk in these and other impressions it is interesting to run along the frieze recognising the hand of the master sculptor. A lot of it, of course, was the work of Phidias' pupils, but one cannot help feeling in many parts that either the work was executed by Phidias himself or that there must have been some other genius in his employment. These are the only examples we can with certainty ascribe to Phidias. He was known to antiquity as the author of colossal statues such as the Athena Parthenos and the Zeus at Olympia. A copy of the former in Madrid gives us some idea of what it was like, but another Athena, the Lemnian, a work in bronze, survives in a copy in Dresden and a very beautiful head in Bologna. The quiet and unaffected masterliness of the Parthenos is reproduced again, though in a different way, in the beauty of the hair and the contour of the face, while the Dresden statue gives us some echo of the drapery. In the Museo delle Terme at Rome there is an Apollo which is sometimes ascribed to Phidias. It is an early work of real beauty.

If there is any truth in the slight cast on Greek art, that it tended too much to generalisation and mechanical reproduction of the human body, the fault must be laid on *Polyclitus*. The contemporary, if a little earlier, of Phidias, it was he who seems to have worked out the correct tricks of his art and embodied them in a textbook called the *Canon* and illustrated by a statue. His is the type of Greek art in general as giving the supreme place in technique to proportion, and this, of course, while creating a unique sense of rest in his work, is apt to lead to monotony; but that the Greeks do not think so is shown by the fact that they at least considered him their greatest artist. His most famous statues were two bronzes, the "Doryphorus" or spearbearer, and the "Diadumenos," which represents an athlete placing a victor's wreath on his head. Both have been much copied. We have no early examples of the Doryphorus, but those we have, though only Roman copies, all show more or less the same spirit. Probably the best—it is in marble—is at Naples. The man steps forward, leaning on his right leg, the left foot being raised and hardly touching the ground. The figure as a whole is heavy, or, as we should say, stumpy, and the muscles are all well marked. By his left arm he carries a spear on his shoulder, and the rather bullet-shaped head is inclined in the same direction as the right leg. There is little expression on the face, and the hair, closely curled, does not disturb the original contour of the head. As contrasted with this type we have the Diadumenos, a later bronze, in many of the copies varying very greatly from the earlier work. Polyclitus belongs to the Argive School, with those heavy characteristics already noted, while most of the copies and all the best ones show marked Attic influence, representing much more slender proportions, less impassiveness, and more delicacy of expression. Whether this is wholly due to the copyists or partly to a change in the sculptor himself is doubtful. The Vaison copy in the British Museum is what we should expect from the author of the Doryphorus. Against that may be placed a bronze head in the same museum, remarkable for greater freedom in the hair and the absence of heaviness in the face. And at Cassel and Dresden these qualities are seen to be still more strongly marked, and in addition the texture of the skin is more "Attic." In a complete copy of the Diadumenos found at Delos, and now in Naples, the muscles are far less marked, and when all these are taken together it seems impossible to escape the observation that in his later stages Polyclitus toned down the heavy characteristics which have always been associated with his name. On the other hand there is a great difficulty. The whole tendency of Greek and Roman art was towards effeminate work, lightness of proportions, attitudinising, and sweetness of expression shown by the texture

of the marble. One more example must be mentioned, a very beautiful bronze head in the Louvre, found at Beneventum. Another statue of this master's which has given rise to much discussion was the "Wounded Amazon." The copies fall into two classes. In the first, the wound in the right heart is practically ignored, and the right hand of the woman is raised over the head, thus bringing out the muscular indications we noted in the Doryphorus, an action which naturally would intensify the pain. This is probably the true Polyclitean idea, and as good an example as any is that in Lansdowne House. The others, of later date, show the Amazon pitying her wound, and she draws away her garment from the sore. In the first the drapery is simple and the second more elaborate, the hitching up of the centre part being wholly delightful.

The average man to-day, as was the case in Greek times, when he thinks of Greek or even classical art, usually remembers the various statues of Venus to be met with in the great museums of the world. *Praxiteles'* Aphrodite is the mother of them all. In it was summed up all the feminine loveliness of the time, and it was only in later decadent years that the true glory of his work was spoiled by copyists. The only extant example of his genius is, however, a Hermes, but if we are inclined to regret that the more famous statue is lost, we in this case have cause for unbounded joy in that we really possess in a state of excellent preservation a really original statue of the period. It is almost complete, the right arm and lower parts of the legs alone are wanting. Hermes holds in his left arm an infant, Dionysius, who stretches forth probably to catch a bunch of grapes offered by the destroyed right arm. The figure rests easily and the head is inclined in the direction of the child, but Hermes looks past it. There are no obtrusive muscular indications as in the work of Polyclitus, and the proportions are altogether more slender, yet the modelling is sure and the surface of a beautiful texture giving full effect of light playing on the flesh and a delightfully impressionistic treatment of the hair; the drapery too on the left arm is a masterpiece of restrained realism. But to his contemporaries it was as a sculptor of women that Praxiteles was known, and his love for Phryne, an unconventional lady of the day, has become proverbial. The best-known statue was made for the Cnidians, and the best copy we have, though the drapery at the feet is a late addition, is the Vatican statue with that name. Venus is represented as just entering her bath, her left arm letting fall her garment on a vase and her right probably shyly veiling her nudity. But it is incomplete. One of the chief points to note in the posture is the absence of all exaggerated feelings of modesty. The Venus de Medici, on the other hand, shows a consciousness of sex and spectators unknown in the earlier copy. And again we may notice the sure modelling of the body, especially the chest, the delightful harmony of line and the great ease of the whole figure, poised for the most part on the right leg. The rounded features should also be noted and contrasted with the exaggeration of these qualities leading to sensuality in later copies. A fine head known as the Kaufmann head is to be seen in Berlin, but a still better one and one that is by some considered an original of an Aphrodite or Phryne is the so-called Petworth head, which shows the play of light and shade in a remarkable degree, as well as slighter and more detailed features. Another beautiful copy well worthy of inspection is the Aberdeen head in the British Museum. What is called the Townley Venus leads us on to the class of which the Venus de Milo and Arles in the Louvre are the best known. They represent a woman with the lower part draped, and a still finer and less effeminate copy is seen in a torso in Athens.

We have seen that for the most part the great age of Greek sculpture maintained an impassive expression, but with *Scopas* we find the commencement of that characteristic which is so evident a feature of Hellenistic and later work. Yet he is probably rather older than Praxiteles, that is, he flourished in the beginning of the fourth century B.C. The largest remains of his own or his pupils working under his influence are the sculptures of the Temple of Tegea, parts only of which exist for us. His peculiarities all indicate a passionate outlook on life. The eyes are especially characteristic. Just over the outside corners a small part of the brow wells out, overshadowing the upper eyelid with a remarkable effect, and this is intensified by the distant gaze produced by the widely opened eyelids shortened in length. The nostrils too are dilated, and the lips not completely closed lend a note of passion to the whole face. There is a much mutilated statuette in Dresden, evidently a copy, though a late one, of a Mænad, formerly in the Temple, which shows the lengths this sculptor went in his realism. The subject of course would be just to his liking, but the execution, judging even from this copy, was far removed from later developments. Nearer home in the British Museum we have a very beautiful Cnidia Demeter which repays the closest attention. The story of this goddess wandering through the world in sorrowful search for her daughter and refusing to be consoled is perhaps the most beautiful in Greek mythology, and the idea is completely realised in this work. The passion of a Mænad is not here, but the combination of intensity of feeling and the restraint to be associated with a goddess, albeit a mother, is perfectly understood. The drapery is subtly designed, showing at once confusion and harmony in a most masterly manner, and the whole gives us the representation of true

sorrow as opposed to sickly sentimentalism. If it is a copy it is by a pupil who was very near to Scopas in feeling and execution. Of another work by this sculptor, the Meleager, we possess an excellent copy, also in the British Museum. The famous statue in the Vatican is a late copy, but in the Villa Medici at Rome there is a beautiful earlier copy which it is most instructive to compare with it. English readers will get an object-lesson on the difference between the two copies from a plate in Professor Gardner's *Six Greek Sculptors*. A glance will show the vacant inanity of expression in the Vatican copy and the refined realism of the Medici head. The famous "Ares Ludovisi" is another copy of the artist's work. The remains of the tomb of Mausolus, now in the British Museum, if not wholly by Scopas, must certainly have been executed by those under his influence; and as a typical example mention may be made of the Charioteer from the frieze, the design of the wind-blown drapery and the whole body, mutilated though they are, being very characteristic.

The last name in the great age of Greek sculpture is that of *Lysippus*. Till some years ago the "Apoxyomenus" in the Vatican was supposed to show best the chief qualities of this delineator of athletic life, but Professor Gardner and others have preferred to look on it as rather a late copy, and have given more attention to an "Agias" found at Delphi, which they say sums up, it may be, his earlier style. He was well known to the Greeks as an adapter of the Polyclitean athletic ideal. His works show far more lightness in every way. The stumpiness is gone and elasticity takes its place. By a readjustment of the older proportions of the body, especially in the legs, the height of the victor is increased. The muscles have a less primitive obtrusiveness and greater firmness. But it is in the treatment of the face that the difference between the two sculptors is most marked. The Agias connects with the Scopas style with a variation. The eyes by somewhat similar means become concentrated, the gaze intensified, the face itself is made smaller, the hair is more impressionistic. In the Apoxyomenus, on the other hand, though there is a touch of all these traits, everything bearing on the height being intensified, the general expression is far less dramatic and realistic, being far more generalised, and the muscles of the body are more learnedly detailed. Lysippus was the Court sculptor to Alexander, and executed many commissions for those who devoted themselves to his cult, so that most of the emperor's busts we see in museums show his influence. One of the best in the Agias style is a head in the British Museum, easily recognisable from its coils of hair hanging down on each side of the face. The expression is a very fine one, from an artistic point of view, the eyes showing the manner of both Scopas and Lysippus.

The Hellenistic Age.—After the fourth century, as has been noted so often, sculpture declined, becoming more generalised in expression, effeminate in sentiment, and dramatic or "stagey" in action. But in what is called the Hellenistic age, *i.e.* the years immediately following the fourth century, there were executed some works which still hold our admiration. Of these, passing over the set of Niobe's children in the Uffizi Gallery in Florence, mention must be made of a beautiful statue of a young man excavated at Subiaco, now in the Thermæ at Rome. If the pose shows how late it was carved, the modelling and delicacy of the flesh texture is worthy of prolonged study and leads us back inevitably to Praxiteles. But the best-known statue of this period, and not unworthily so, is the "Victory" from Samothrace, which has such an imposing position in the entrance staircase of the Louvre. In spite of all the dramatic power and restlessness of the drapery, there yet remains not a little of that artistic restraint we saw in the Parthenon "Fates," and the modelling of the figure seen through the dress is superb. Better known, but with much less good reason, is the so-called "Dying Gladiator" or Gaul at Rome, in which the faults observable in later works appear. There is no divine seriousness: little inevitableness of technique and none of composition, and the hair and expression show how subsidiary in the sculptor's mind was his art to dramatic feeling—all the world to him was a stage.

Mediæval Sculpture.—It is perhaps unusual to separate the sculpture of our churches and cathedrals from the architecture, but for the sake of completeness it is convenient to do so. After the Roman world ceased to exist and the influence of Roman copyists of Greek work no longer dominated the artistic world, there is a big gap before sculpture proper came to its own again with the Renaissance. But the gap is not so large when we glance at the architectural sculpture of the period. We then find that, though in a different direction, the sculptor's art was by no means without expression. As has been noted, every workman was an artist in stone in the mediæval period; the guilds would permit no scamped work, and thus the men whom we should now call masons produced sculpture that all the world journeys to see. In the Romanesque period we do not find much ornamentation either in the fronts of the churches or in the carving of the capitals, but to the twelfth and thirteenth centuries it abounds in all countries. In Chartres Cathedral, probably the finest building in France, the early figures show strong Byzantine influence, but little injured as they are they give great æsthetic satisfaction. These along with the later work make the sculptures on the west front and the north and south porches the noblest display in the country. They are untinged with Roman

decadence. If primitive, they show extraordinary delicacy of treatment and beautiful execution. They are not things by themselves, but, like the stained glass within, they deeply intensify the effect of the building as a whole by their individual merit. Of much less equal merit and later in date are the figures in Amiens. Those on the west front yield in importance to those in the transept, especially on the south side. They have not been so well preserved as those at Chartres, but they form fitting companions to the woodwork of the choir in making the open Bible of this people's church. To mention one other town—Rouen possesses work of still later date (fourteenth century) in the Cathedral, St. Ouen, and St. Maclou. In these we do not observe the same delicacy of treatment as in the earlier work, and comparison of the three towns' fronts gives an excellent illustration of even at this time the flamboyant trend of the sculptor's tool.

The excellence of the earliest sculpture of the cathedrals at Florence, Pisa, and other towns of Central Italy, pales before the brilliant richness of the capitals of the Doge's Palace in Venice. Ruskin has treated so fully of these, and so justly on the whole, that it is unnecessary to repeat anything here. They repay hours of minute examination even under a broiling sun, and no building ecclesiastical or secular can show greater wealth. The best of them fulfil all the canons of sculpture of any age, and the worst would induce admiration, if they were not put to shame by their more lifelike and exquisite brethren. At the other extreme are the famous figures inside and outside Milan Cathedral, which in spite of their costliness seem to infringe all the ideals of architectural sculpture, while taken by themselves they leave the onlooker unimpressed. They might all have been ordered from a first-class Birmingham firm.

It cannot be said that in quantity England can compare with France in the sphere of architectural sculpture, and indeed it has been the fashion to ascribe any that does exist to foreign workers. Yet there are no real grounds for doing so. Some of the most interesting early Christian sculpture in the world is to be found in the Celtic stones or crosses of Scotland and Ireland, which show in a remarkable way both decorative ideas and exquisite execution. It is unfortunate that for the most part they are not easily accessible. They are formed, of course, from conventional geometrical patterns, but they and their contemporary work in bronze and parchment show how highly trained the native workers in the monastery or in the workshop must have been. As in other countries the earliest stonework shows great primitiveness. At first the architects of our churches scorned decorative detail, nor did the Norman style leave much room for it, and it is not till the early English period that we find any prominence in a building given to sculptured figures or capitals. As to the latter, it may be stated at once that with the development of English Gothic the carving in low-relief of capitals, corbels, &c. reached an excellence and refinement of natural representation unsurpassed in any other country. In fact, in the writer's view, the fresh directness of these representations seem to him the crowning glory of English work, and thereby usually distinguish it from that of other foreign countries. More ambitious are the famous angels in the spandrels at Lincoln, which are in the best style, the attitudes and expressions of which have no false notes, but are noteworthy for exquisite workmanship. At Salisbury and Westminster they are almost as good, but pride of place must be given to Wells for its varied wealth of sculpture. Here all details are delightful in their purity and satisfying in their design. Only less rich is the west front of Exeter, though the stone has weathered badly. Purbeck marble, a native Dorsetshire limestone, because of its polish gave rise to a new school of workers, chiefly to be seen at Westminster and the Temple Church in London. In turn it gave place to alabaster and wood, chiefly used for tombs. Being easily worked, it failed to exact the highest skill from its carvers. But the downward turn had been taken, the difficulties surrounding the earlier workers had made artists of them, but with the Perpendicular style we share the flamboyant nonsense of our continental friends.

Italian Sculpture.—We have now to return some years and trace a unique development of sculpture in Italy from the earliest Gothic period to the full Renaissance. Our first great names are the *Pisani, Nicola* and *Giovanni* of the thirteenth and *Andrea* and *Nino* of the first half of the fourteenth centuries. In the hands of these and their pupils the art is still subordinate, or rather a part of architecture, and as a result reliefs of all kinds abound. It must always be remembered, and we note it especially in architecture, that the Roman element never really disappeared in Italy. Men of artistic sense seem at no time to have been quite indifferent to such remains as were public of the earlier art, though they may have misunderstood their ideals. Thus we find that in Nicola Pisa's pulpit the influence of classical vases is remarkable. The northern artists had no such examples before them, so we find a fresher, more realistic treatment in their carving as in their architecture, for both were one and the same. Other examples of the early Pisan school are the Sienna pulpit, a fountain in Perugia, and the pulpit of S. Andrea Pistoja. The last, by Giovanni, shows much less imitation of traditional types, freer imagination and execution. But attractive as it is to dwell on their works and those of Andrea, whose bronze gate in the Baptistery must never be overlooked in admir-

ing Ghiberti's later work, we must hurry on. The beautiful sculpture of the Doge's Palace has already been mentioned, and is of this period. As has been noted, it is worth risking the contumely of being a prefervid Ruskinite to say that in execution, composition, beauty and richness of detail and quaintness of imagination they surpass anything of their time. Orcagna, a pupil of Andrea, is best known for his gorgeous shrine in Di San Michele in Florence. His profession of goldsmith is very evident in it, yet its architectural design is carried out with consummate success. We now pass to the Baptistery gates at Florence, and if we wish a lesson in the achievement of Ghiberti, all we have to do is to test in the Bargello the decision of the judges in the competition, for Brunelleschi's and the winner's trials are still to be seen there. Again, it is most interesting to compare Ghiberti's first gate with his second essay. The latter, though the more famous, shows the beginning of that intense love of experiment, of pushing knowledge to its limit, which unfortunately is not an artistic quality. We admire the wonderful perspective, the audacity of the realistic execution, but we shall probably return to the first gate as better realising the ideals, if limited, of bronze relief. Only ten years separates the lives of *Ghiberti* and *Donatello* (1386–1466), and with him sculpture regains its primacy as an art. His works are excellently and completely shown in original or cast in the Bargello. The St. George made for the outside of Di San Michele may interest English visitors for its subject, but the David sums up best the essence of the artist. Purity of sentiment, mastery of technique, and singleness of purpose characterise all his work. Chief are the little John the Baptist, the organ stalls in the Cathedral Museum, the delicate relief in S. Croce, the "Judith and Holofernes," the bas-reliefs of the pulpit and the reliefs and statues in the old sacristy of San Lorenzo, and the equestrian statue of Gattemalata in Padua. It is doubtful whether anyone has embodied so adequately the Florentine ideals of the period as did Donatello: you note in his work the first flush of a great corporate movement in intellect in art, and perhaps above all that tendency towards the rhythm of music that Walter Pater considered the minor reality of all art. His pupil *Verrocchio* is one of the most remarkable names of all time. The statue of the Condottieri Bartolommeo Colleoni before the Scuolo di San Marco in Venice is the greatest equestrian statue in the world. It is not wholly his work, for he died before its completion, and its details were filled in by *Leopardi*. Horsemen might take a lesson in riding from its muscular display, but it is far from being a mere feat in modelling. No line of the work is out of place, the proportions of horse and rider are, one would think, perfect, the exact position of the horse on its pedestal is itself a bit of decorative and realistic genius, and there is over all the true artistic quality of restraint. But he was not a one-book man. His bronze of David in the Bargello is famous, and justly so, for it is also the prototype of the notorious Leonardo face, Da Vinci being his pupil, but it may be studied for no mere facial coincidence. Many refuse to the form of the body and its drapery the quality of truth to the subject, but to the present writer at least such criticism seems misplaced. One sees in the curious half-shy, half-boastful figure the essence of the Bible story humanised. Here is a young boy with a big cuirass in the first flush of victory. He is not quite sure whether he has done right or wrong, but the roguish feeling will out. The quaint dress intensifies the expression, making all of a piece—an altogether delightful study. None of his other works come up to these two, but those in the Bargello are well worthy of attention.

The sweetest name in Italian art is undoubtedly *Luca della Robbia*, the inventor of that glazed terra-cotta ware which has charmed posterity as much as it charmed his own patrons. Apart from that it is sufficient to mention his organ loft to be compared with Donatello's in the Cathedral Museum. Both are very beautiful in different styles. His terra-cotta work is remarkable for delicacy of modelling and line, sweetness of portraiture, simplicity of theme, and a perfect adaptation of style to medium. The best place to study them is again in the Bargello, but luckily we have one or two specimens in South Kensington, and they are to be found all over Florence. His nephew, *Andrea*, of the infants opposite the Spedale degli Innocenti in Florence, was no unworthy follower, but after him his descendants kept the secret of manufacture, but did not inherit the ability of its inventor. Luca was content with delicate blues and whites: gaudiness of colour, crudeness of design, and feebleness of execution are the characteristics of the later work, which unfortunately are most to be met with in our museums. Better followers of Luca were the sculptors *Rosselino*, *Mino da Fiesole*, and *Benedetto di Magani*. The first named is best known for a wonderful monument to the Cardinal de Portyallo in San Miniato in Florence. The canopied design is a masterpiece of its kind and the figure admirable in execution. It is not too much to say that it reaches the highest watermark in Renaissance work of this description, and is a splendid touchstone for judging other sculptured monuments. Mino fares well in the comparison, though his work is mannered, and Benedetto's best claim to fame, and it is not a formidable one, lies in the pulpit in S. Croce. *Desiderio da Settegnano* was given rather to exaggerated ornamentation, but this does not prevent his monument to Carlo Marsuppini in the same church from being a

masterly piece of work. In the Bargello there are many works, small in size but delicate in technique, of all these sculptors which ought not to be overclouded by the greater masterpieces to be seen in this museum. *Andrea Sansovino* of Florence continued the floridness of the late fifteenth century, and his pupil *Jacobo* of Venice, whose statues on the Scala d'Oro are not nearly so fine as his bronze doors to the sacristy of St. Mark's, is entitled to great fame only as an architect. For sculpture had fallen once more upon evil days. The "Mercury" of *Gian Bologna* (1524–1608) in the Bargello is famous, and if it had not been so much re- or perhaps misre-produced we might more appreciate its undoubted cleverness; but other works, notably his equestrian statues—one opposite the Palazzo Vecchio, the other in the Piazza dell' Annunziata (the latter in spite of the literary association of Browning's "Statue and the Bust")—fail to impress us.

Benvenuto Cellini (1500–1571), that most adorable literary rogue, was made of finer stuff, but even he delights us more as a figure than as an artist. Probably the famous Perseus in the Loggia de Lanzi and the few statuettes in the Bargello do not give us a satisfactory notion of either his versatility or the excellence of his technical abilities. He stands to us now as the ideal of the artist craftsman, a personage the best men of the twentieth century are seeking to revive. It was not only as a jeweller that he turned everything he touched into gold. Contemporary with Cellini there lived the overpowering *Michael Angelo Buonarroti* (1475–1564), whose life and work stand out as a rock overshadowing all around him. Painter, draughtsman, poet, architect, scientist, and politician, he excelled all others by the power of his thought and the excelling nature of his technique in the art of sculpture. His best-known works are the "David" in the Academy, and the "Pieta" in the Cathedral of Florence, a more famous "Pieta" and the "Moses" in Rome, the "Bound Captives" in the Bargello, Louvre, and Boboli Gardens, and the tombs in S. Lorenzo, Florence. Of these we may take the last as illustrating his style. His life was a weary one. One of the first intellectuals of the Renaissance, a man of extraordinarily deep religious feeling, he was doomed to be the plaything of successive unappreciative patrons. Like every great thinker, he arrived at no melodious and simple philosophy of life. He was never satisfied. All this is displayed in his work, most of which, probably intentionally, is left unfinished. The tombs are placed in the new sacristy of S. Lorenzo designed by the sculptor, and commemorate the two Medici princes, Guiliano and Lorenzo. The former, surrounded by Day and Night, is a cheerful figure, full of energy and confidence. With what a proud grasp does he hold the baton. He is exactly the opposite of the traditional strong quiet man the stage and novels produce for our admiration. He is full of "trenchant force and will like a dividing spear," a prince of the Renaissance world. Opposite this tomb lives for ever the epitome of the intellectual life of man. Full of gloom this idealised figure sits, pondering over life and giving no answer to his thoughts. Beneath him sit Evening and Dawn, so different in their attitudes: the imagination runs riot in conceiving what these figures represent. No artist in any medium has so successfully depicted the higher life of man, man's nature or highest self, than did Michael Angelo in the sacristy. It is unnecessary to add that the lives of the Medici do not correspond. His technique is noticeable for the wonderful anatomical modelling, the beauty of the flesh colour, the truth of the light and shade, the reality of the postures, the absence of all prettiness or sentimentality. The designs of the individual figures and of the whole form one glorious symphony, intricate in detail, grandly simple in their harmony. A divine quiet overrules all and compels worship. No other church or edifice gives rise to higher emotion than this sacristy. Death is shown in her victory, death with doubtful hope of better things, but it is the death of men who have fully lived. Some of the figures, as also much of his other works, are unfinished, and it is questionable whether the artist, like Rodin, with whom he interestingly compares, intentionally adopted this impressionistic manner. It is unnecessary to argue the point, as it is evident that in no cases except the "Bound Captives," at which he was at work when he died, do the statues suffer any detraction because of their condition. It is interesting to note for students that wax models of the tombs, purporting to be originals but showing somewhat different designs, are to be seen in the Scottish National Gallery.

French Sculpture.—We have suggested how Italian monuments took on a *baroque* quality, but it may be added that in other countries Renaissance sculpture presents a sorry spectacle. The difference between the old mediæval work, so lovingly executed, is evident in nearly every country. Here and there—in Nuremburg in particular—you find minor work such as altar-pieces and statuettes which redeem the age from oblivion, while again a few tombs stand out in our minds as connected with better days. Floridness, however, abounded. The Louvre has some fine specimens of the work of *Goujon* and his colleagues, the contemporary of *Gian di Bologna*, but this and succeeding generations were very barren of any real sculpture. Perhaps Spain is as interesting as any country from the point of view of sculpture of the seventeenth century. Religious enthusiasts of that land now as then loved coloured images on their

altars to carry during Holy Week. *Montañes* is the first and greatest name, and his best work is in wood. Every town in Andalusia and every church in Seville boasts one of these painted Madonnas, but the genuine statues, for example in the unapproachable University Chapel of Seville, should not be ignored. *Puget* (1622–1694) is the best of his time in France, and later *Pigalle* and *Houdin* introduced that inanimate type of art founded on rank ignorance of technique which passed for so long as classic there and in England, to be varied only by profound sentimentalism. *Rude* and *Carpeaux*, on the other hand, had a personal if decadent vision which had enormous influence on more modern sculptors. The best-known figure in the later eighteenth century in Italy was *Canova*, but it cannot be said that either at the Frari Church or at S. Croce his work is at all impressive. England is justly proud of *Flaxman's* designs, but his large pieces of sculpture are failures, and the later *Chantrey* will not keep anyone's interest away from modern work.

The change, the awakening to reality we have seen in painting, came from France, and in no art was there greater need. Painting had realised itself long before the Franco-Prussian war, but it may have been the very success of the Fontainebleau school, satisfying as it did to a great extent most of the aspirations of artistic man, that allowed the sister art to wander divorced from reality in the desert. True, there were some able men working at the time, *Idrac*, *Gérome*, *Beguer*, and *Frémiet*, but it was not till after France had recovered her place in the nations and was full of patriotic vigour that results of her ambition became evident. Four men are conspicuous in the movement: *Jules Dalou*, *Rodin*, *Meunier*, and *Bartholomè*. The first, as we shall see, in his " refuge " during the Commune bequeathed his influence to England, but on his return to Paris he wielded a still greater because more general sovereignty. He is the link with the older men. He accepted the older traditions, but gave them life. To take the dead first, Meunier, a Belgian, introduced the working-man into his art, but not with any sentimental object. He saw the nobility of labour, the sorrows of the miner, that modern hero of chivalry, he looked on them as expressing most powerfully the deepest and truest feelings of modern life, and above all he represents his vision in consummate technique and design. His best works are " Le Guron " and other miner studies, and "Ecce Homo" in the Brussels Museum.

Rodin is a different personality. He is the prince of moderns, reminding you at once of Phidias and Michelangelo. To the deep sentiment of Meunier he adds the thought and imagination of an intellectual man, and before everything he has infused glowing life into his works. He knows life in its infinite variety—sensuous pleasure, wracking doubt, voluptuous love, frenzied despair, all are grasped clearly by him and transformed into marble or bronze. His modelling, one would think, is the perfection of plastic art, sensitive and sure. Never once do you find in all his varied imagination one touch of affectation nor any feebleness of design. The best gallery to see his work in is the Luxembourg, which has given him only his due in housing the splendid collection there. Amongst them are to be noted "The Kiss," "The Hand of God, "St. John the Baptist," and the "Danaide." "Le Penseur" is fittingly placed in front of the steps of the Panthéon.

Bartholomé is probably the greatest and finest sculptor of the modern school, but unfortunately there is no gallery to exalt his name in the public eye. He does not depend on any subtlety of intellectual imagination; his subjects are what are called popular, that is to say subjects of everyday interest and therefore of the essence of life, but no one is further from the commonplace. He has all the brilliance of the traditional outlook on life of his countrymen, but, refraining from fireworks, contents himself with a purely plastic ideal, and the result is wholly satisfying. The Luxembourg has one beautiful specimen of his work in marble.

Sculpture in England.—To make any attempt at a complete glance at English sculpture we must unfortunately retrace our steps a moment. We have seen the work of Gothic days to be of great interest. After the fourteenth century, however, there is little to excite us till the nineteenth. The porch of St. Mary's, Oxford, has been ascribed to *Nicholas Stone*, and the shades of Inigo Jones would probably not be insulted. The Botanical Gardens are a much better memento, though his contribution to Holyrood Palace is not without merit. *Colley Cibber's father* is the maker of the two mad figures on the Bethlehem Hospital, but *Grinling Gibbons* is the best English absorber of the Renaissance, and his James II in St. James' Park, though ludicrous in subject, is excellent in technique. Far from it in every artistic quality was the work of the rest of the " classical " school. We have seen how Greek artists, while merely representing conventional and traditional ideas, were so familiar with the human body that they never, even when the subjects seemed least promising, forgot the " brute " that is in nature. If a God was represented, he was a super-man, not a generalised idea with all human elements ignored. Seventeenth-century sculptors did not grasp this. They aimed at vagueness of theme, thinking they had reached a truly classical mode of expression when they showed in marble a repose which was based wholly on lifelessness. Greek sculptors, however, if they ignored the accidents of life, did not thereby lose vital force. Westminster and St. Paul's are full of this period's work. *Flaxman*

is as good a representative of his time as any, and he is rightly most famous for his illustrations and not for his statues. This spirit, or lack of spirit, lasted till the middle of the nineteenth century, for *Chantrey* (in spite of his busts) and *Foley* need not detain us, for only a little later in date there came our greatest sculptor, *Alfred Stevens* (1818–1875). The model of his Wellington monument should be studied very closely in the Victoria and Albert Museum, and every design in the room at the Tate Gallery, as well, of course, as the monument itself at St. Paul's. Both from the sculptor's point of view and that of the architect this is a work of outstanding genius. The figures, for example, of Truth and Valour for variety and harmony of design and beauty of detail make them comparable with the greatest works in marble, while the sculpture at Dorchester House repays any trouble there may be in getting permission to inspect it. The work of *G. F. Watts* is rather eclectic. His "Vital Energy" in Kensington Gardens is well-known, but the "Clytie," a bronze of which is in the Tate Gallery, and the group at Eaton Hall, are still more worthy of admiration.

Stevens was unacknowledged in his day, and his designs met with ludicrous indifference. The originator of the modern English school is *Jules Dalou*, whom we have noticed among his French brethren. During the Commune he taught in England and instilled with great success the true methods of his art into his pupils. *Hamo Thornycroft* was the first to show his influence by his "Artemis" at Eaton Hall, a singularly beautiful composition, and the "Teucer" in the Tate Gallery. Trafalgar Square, Westminster, and the Strand all show his admirable work. *Onslow Ford*, again, is more commonplace, though his "Irving" in the Guildhall Gallery is a fine piece of work. *J. M. Swan* is a remarkable technician, best known for his studies of animals. *Alfred Gilbert* teems with ideas and works them out in the cleverest of ways. Few who pass through Piccadilly Circus can pause to look at the Shaftesbury Fountain, but its beauties are worthy of a more secluded resting-place. Winchester has a greatly conceived statue of Queen Victoria from his hand, and others of his works are the bronze "Icarus," the statues of Earl Howard at Bedford and of the Duke of Clarence at Windsor, and the reredos in St. Albans Cathedral. Of the men whose work we can see at the Academy, mention must be made of *Sir George Frampton, Sir W. Goscombe John, H. A. Pegram, Albert Toft, W. R. Cotton, Gilbert Bayes, Bertram M'Kennal,* and *Alfred Drury*. The last named is well seen in the War Office sculptures, and the work of the first two is noticeable for good technique. More ought to be said of *Mr. Derwent Wood*, who with *Mr. Harvard Thomas* is probably the best of the younger men. "Lycidas" and "Thyrsis" by the last mentioned have been much abused, and both have won ultimate fame for their exquisite workmanship. *Mr. Epstein* has a manner of his own, very fascinating in its outlook and very clever in its technique. Of the Scotsmen, *Mr. Pittendrigh Macgillivray* and sometimes *Mr. Birnie Rhind* show how eager sculptors in Edinburgh and Glasgow are to blot out the misconceptions of their predecessors: and it is a matter for congratulation that they are well employed even by official bodies.

COURSE OF READING

The works of the brothers Gardner form the best reading on Greek and Roman sculpture, especially the *Handbook of Greek and Roman Sculpture* and *Six Greek Sculptors*. The mediæval period is dealt with in most of the chief works on architecture, and Ruskin's *Stones of Venice* give all the necessary information about the Doge's Palace. Otherwise cathedral sculpture is noticed only in guide-books and short essays in such journals as the *Architectural Review*. Renaissance sculpture, on the other hand, has been much written about, and all the chief sculptors have many biographies. Lord Balcarres' *Donatello* is one of the best. Addington Symonds gives prominence in his *Renaissance in Italy* to the art, usually with ability, but one must be fully warned against reading these books before seeing the originals. Frenchmen naturally have not been slow to dwell on Rodin's genius. Sir W. Armstrong is enthusiastic over A. Stevens, but it must be admitted that there is very little literature on modern sculpture.

Another method of instructing students is used, namely, the making of casts. These vary very much in value. Even the British Museum has a great many bad casts, but modern communities in Britain are waking up to the necessity of having competently cast reproductions of the most famous works. Far-away Aberdeen has an excellent collection. Many instructive days may be spent in the South Kensington Museum.

J. MACPHERSON.

ARCHITECTURE

Greek and Roman Architecture.—Any description of early Egyptian and Asiatic architecture would put a sketch such as the present quite out of proportion. As much space as possible must be given to the ideas and examples which the ordinary traveller meets on the Continent or at home. If he is lucky enough to study remains in Egypt or India he can easily consult expert opinion on the subject. All that is intended in the following brief review of Architecture is to stimulate if possible in the man-in-the-street an appreciation of the churches and buildings he comes across at every turn, and thus perhaps give more opportunity to the artists themselves, who without such apprecia-

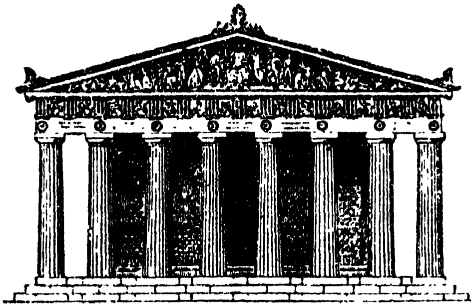
Greek Corinthian Column. Monument of Lysicrates

tion must remain caviare to the general. There are writers in these days brave enough to disparage all modern architecture, attempting to find salvation *pro tanto* in Egypt. A humbler aim is here held, and all that needs to be noted is that for the most part the trend of Egyptian art is antagonistic to that of Europe, though, especially in small details, there are numerous resemblances between the old and the new.

For our purpose, then, we may ignore even the dimensions of the Pyramids and the great Sphinx and make a start with a fully fledged style, that of the Greeks. The chief aim of this race in all its art was "nothing in excess," and it is fitting that in those temples which were their chief buildings the maxim should be given supreme place. Thus we find that after the practical aim of the building had been found out the architects chiefly busied themselves with the sense of proportion. That is the secret of Greek architecture, and thus the cause of its great simplicity and dignity. Indeed it can hardly be disputed that the Greek principles of construction are taken from the earlier mud-dwellings. The arch was very seldom used. The temple was simplicity itself. It consisted of an inner shrine, within which was placed the statue of the god or goddess. This was surrounded in the shape of a parallelogram by pillars constituting the *naos* or *cella*. Surrounding this was another pillared space composed either entirely of columns or with side-walls. An entrance porch to the naos (*pronaos*) with sometimes a back-temple (*opisthodomus*) completed the building. The whole was usually raised on three steps. On the two end façades a triangular pediment was placed, often filled in with sculpture. On the top of the columns there rests the entablature, consisting of three parts. Immediately above the capital of the pillar there is the plain *architrave*, above that is the sculptured frieze, and still higher the cornice. In the frieze above each column is placed the *triglyph*, another of which is placed in the space between. The space between the triglyphs is called the *metope*, and was usually filled with reliefs. In the column we have, besides the shaft, the *abacus* or capital, supported by a moulding called the *echinus*. The columns are of three kinds, giving rise to the different styles employed. The oldest is the Doric, later comes the Ionic, and latest and very little used in Greece is the Corinthian. The form of these three pillars is easily recognisable from the illustrations given. It is to be noted that the Doric column has no separate base rising immediately from the steps below.

The chief building in the Doric style was the Parthenon in Athens. It is, of course, one of the best-known buildings in the world, and most museums have models of it in some form or other. The famous Elgin Marbles in the British

Museum (*see* Sculpture) form the pediments and friezes of the building. It was the chief temple of Athens's patron goddess, Athena or Wisdom, and stood in the Acropolis. It was built in the greatest period of Greece's prosperity, in the reign of Pericles, about 438 B.C.,



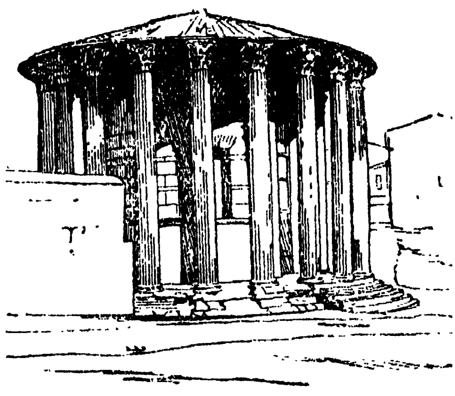
The Parthenon

Phidias being responsible for most of the sculpture. Its entrance gateway or *The Propylæ* is perhaps the chief other Doric building. Its interior is in the Ionic style, and the combination of the two is exceedingly harmonious. Less severe than the Doric, its birthplace was Ionia, *i.e.* Attica and Asia Minor, the latter place affording most extant remains. Chief of these were the temple to Artemis at Ephesus, the temple of Nikeapteros, and the Erectheion, both at Athens. In the latter was the famous porch, the pediment of which was supported by sculptured female figures (Caryatides). The Corinthian style is not found in general use till the Roman period. The Choragic monument of Lysicrates at Athens—a much-reproduced work—is the best-known example. The style is more ornate than is consistent with the simple native Greek ideal.

Roman Architecture.—After the Hellenistic period (*see* Sculpture) Greek architecture gives place to Roman. Superficially the styles are the same, constructionally and artistically there is a world of difference. Let us notice a few changes. The Greeks built their temples of huge blocks of marble placed one on the top of the other without any mortar binding them together. The blocks are very carefully worked and finished. The Romans had no time for this, so they invented the use of concrete faced with brick, stone, or marble. This had the great advantage that it could be employed anywhere, irrespective of geographical conditions, and that the greater part of the walls could be constructed out of almost anything and by unskilled workers. It is to be noticed carefully that in neither case was there any vertical thrust, so important a problem in Gothic architecture. The Romans bound together all the material used into one mass of concrete—dead, so to speak. If stone and mortar had been used, as in modern buildings, the walls would have been pushed out without buttress or other support.

Vaulting was another of their discoveries. The Greeks contented themselves with the waggon-head vault, by means of which the roof is supported on only two sides of the rectangle by semi-circular arches. The Romans intersected the two arches, thus giving the roof support at its angles, and leaving the rest of the wall free to be used for windows. They also developed the use of the dome. Both its use and that of the arch no doubt were learnt from the Etruscans. Enormous spaces of any shape were covered by means of the arch, the cupola, and the dome—granted only, it must be repeated, that concrete was used in the construction. Indeed the Romans departed altogether from the Greek ideal. The latter aimed at external beauty and simplicity. The Romans invented all sorts of engineering devices, rendered necessary by the fact that two or three stories were given to their buildings instead of one; and using the orders mostly for ornament and in great profusion, centred their greatest attention on the interior decorations.

Of temples in Rome itself we have what are now the churches of S. Maria Egziaca and S. Lorenzo, those of Venus and Rome and of Jupiter Ionaus, besides many columns of others. There were also circular temples, the most famous being the Pantheon and the temple of Vesta, both

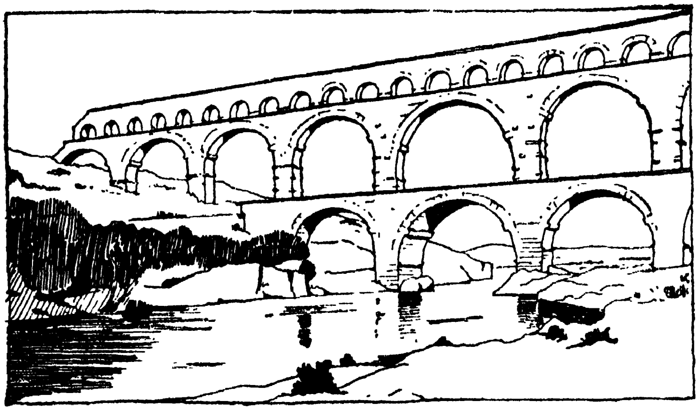


Temple of Vesta, Rome

at Rome. The bronze doors in the former are considered to be originals.

Apart from the Forum or public meeting-place, of which each city had at least one, the most interesting Roman buildings are the Basilicas and the Thermæ. The Basilica or Law Court was a simple rectangular building with aisles, having an entrance at one end and a raised dais, often in an apse, at the end, in which the magistrates sat. The best-known example is that of Trajan at Rome. Its date is about A.D. 98. The

Baths of Caracalla show us what the Thermæ were like. Not only is there accommodation for 1600 bathers in the central buildings, but apartments and shops of every kind, recreation rooms, halls for lectures and plays abound in the enclosure. The inside was gorgeously decorated with marbles, mosaics, paintings, and sculpture. A part of the great hall (*tepidarium*) of the Thermæ of Diocletian was converted into the church of S. Maria degli Angeli by Michael Angelo. Amongst other buildings of which remains exist are the amphitheatres and theatres (Coliseum, Verona, Nîmes, Seville), triumphal arches (Titus, Septimus Severus, both at Rome), aqueducts (Pont du Gard, Nîmes), and bridges (Cordova), palaces (Cæsar's, Rome, and Diocletian's, Spalato). Besides these there are the ordinary houses of the Romans, which can be so well viewed at Pompeii and Herculaneum. The "city" itself cannot give us such a true idea of the Roman atmosphere as produced in architecture as these towns which were overwhelmed by Vesuvius in A.D. 79. The "House of Pansa" there shows all the different rooms and their uses, and bears an interesting comparison with our own modern dwelling-houses.



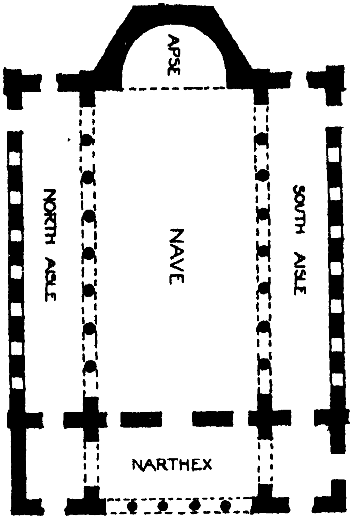
Pont du Gard, Nîmes

Romanesque Architecture.—The link between these early Christian basilicas and what we call Gothic architecture is found in the Romanesque churches. We have seen how the first Christians, on the State recognition of their religion, probably housed themselves in the buildings of the older cult. Now Roman, now Byzantine, now barbarian influences arose, but we have very few remains till we come to the eleventh century. We may take Italy first as showing the Roman influence more. Here the basilica plan of buildings still survived. Galleries are common, brick faced with marble is more frequent than stonework, the openings are small and simple of the Roman semi-circular form, the window tracery is primitive, the roofs are sometimes flat, sometimes vaulted, there is seldom a triforium, and often no clerestory. Transepts are rare and domes common, and the apse is universal, with often a raised choir and crypt. One of the best examples is the Cathedral of Pisa, of the last half of the eleventh century. The tiers of small pillar arcades in the west façade are very simple and beautiful. The Leaning Tower, a century later in date, the foundations of which gave way during its construction, is well known, and the circular Baptistery is not so fine as that of Florence. The domes of the two Baptisteries should be contrasted with one another and with that of St. Paul's. Internally the red and white marble gives the building a more Roman aspect than is noticed in the Northern European work of the same period, and the columns here, as elsewhere, should be compared with the common English Norman type, so much thicker in circumference and lower in height, and with its cushion capital.

A much smaller but no less beautiful church is that of S. Meniato, Florence. The basilica plan has in it been developed, the building being divided into three parts by piers. The open and richly coloured timber roof is a marked feature as well as the variegated strips of marble, the pavement, the raised choir, and the crypt. It forms a striking contrast to the later churches in the city. In the south, as for example in the Cathedral of Monreale in Sicily, Mahometan and Byzantine influences are to be noted in the lanterns at the crossing, the mosaics, and the roof, while in the north there is a good example of the Roman atrium in S. Ambrogio, Milan.

In the South of France in the eleventh century the Latin influence was still predominant. The basilica type of church without aisles is common, domes are a feature, and, as at S. Front, Périgneum, we see a very interesting adaptation of the Byzantine style which Venice favoured. But it is in the north, in Normandy, that we see

the beginnings of the new trend of thought, and probably the best examples are to be found in Caen in La Trinité and St. Etienne. The west front of the former brings us at once into a new atmosphere. The simple round arch has lost its Latin completeness, the plan has taken on



Basilica Plan St. John Studion, Constantinople

that beautiful cruciform shape that was so well suited to its purpose: the builders, indeed, seem in the grouping of the openings and certainly in the vaulting to have started on that journey of strife which was to form an architecture different not only in name and form but also in idea from what had gone before.

Passing over German Romanesque as not being essentially different from Italian, the Apostles' Church at Cologne and the Cathedral of Worms being good examples, we may step at once into England and point out the beginnings of ecclesiastical architecture here. As most of our readers will begin to study by the examples around them, it has been thought best to explain such terms as are necessary in this part of the sketch as occasion arises. Ruskin once said that one could learn to distinguish the different architectural styles and the nomenclature of the art in less time than is usually devoted to the first lesson in a card game. Certainly no one need fear any dull study in order to obtain a passing knowledge of the buildings around them.

Pre-Norman Remains in England.—Firstly a word must be said about the pre-Norman remains in England. Our earliest building is of course Stonehenge, and it may be dated about 2000 B.C., but apart from it we have nothing till we come to the Celtic buildings of the seventh to the ninth century A.D. We have already remarked in the Sculpture section on the beautiful tombstones erected by these people, but unfortunately we have few buildings in any state of completeness. Ireland contains several strongholds and two wonderful monasteries in Kerry. Perhaps the most common feature of this early period was the round tower, an admirable example of which is to be seen adjoining the Cathedral of Brechin in Forfarshire.

Saxon work was far inferior to Celtic in beauty—indeed the latter can hardly be surpassed in its detail, geometric though it be, but there are many more buildings of the Latin period to excite our interest. The best known is the church at Earl's Barton with its famous tower. Others worth visiting are Wrexham, Bradford-on-Avon, Bunworth, and S. Regulus, St. Andrews. Perhaps the most noteworthy thing to observe in these is the masonry, which is of rubble with "long and short" courses. The windows are usually rounded, though sometimes triangular. It cannot be said that these ancestors of the English of the eighth to the tenth centuries were artists. The buildings are rude in the extreme, and it seems curious that they ousted so thoroughly the Roman basilicas which must have existed all over the land at the time.

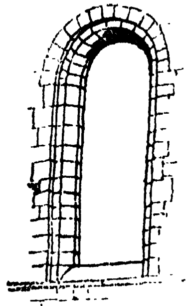
Example of Saxon Arcading

Norman Work.—With the Norman Conquest (but how far due to this it is futile to discuss) there was introduced a new style which later came to be known as Gothic architecture. But its essential spirit is to be noted in the Earlier Norman work. First, however, a few definitions may be given of the parts of the typical cathedral and church. It is usually in the form of a Latin cross. The main arm is called the nave, and in England is the westmost and central part, having on each side at least one aisle parallel to it. The eastern arm contains the choir and high altar. In England it is almost invariably square shaped, in France apsidal or rounded, often with a set of chapels or *chevet*, and it is always on a higher level than the nave, being reached by steps. The transepts are the short arms north and south between the choir and the nave, and they also frequently have aisles. On the Continent chapels abound at all extremities, and there are often double aisles wholly composed of chapels. England's great characteristic is the circular or octagonal chapter or clergy house. The nave, aisles, and choir are usually under separate roofs. The nave is higher than the aisles by two arcades: the lower one, which is blind, giving to the aisle, is the *triforium*; the upper, giving light to the church, is the *clerestory*. Various differences in the plans, such as double transepts, will be noted later, and nothing need now be said about towers. Now the chief point a beginner has to

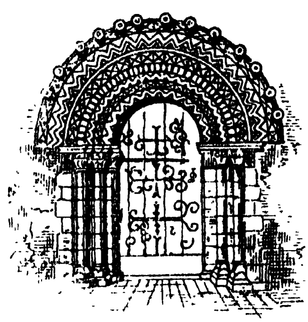
remember about a cathedral, or indeed any building, is that the architect has, apart from fulfilling the purpose of the edifice, to be ever mindful of the principles of construction. The lay mind is always a little curious about the building of a staircase, but he has to have a long acquaintance with architecture before he completely grasps the enormous problems a builder has to face.

This is not the place to go into technical details, but it must be stated at the outset that the great secret of understanding a Gothic building—and here it may be contrasted with its Roman predecessor—is to appreciate in some way that a church is an *organism* palpitating with life. Gothic architecture is based on the arch, and the purpose of the architect is to lay together, realise, and adjust all the mathematical forces which go to support the building. One must think of the stones, not as dead pieces of matter but as sensitive centres, accumulating energy now in one direction now in another; and the architect's task is to harmonise the riot. He cannot say "Peace" where there is no peace; he has to recognise every force and counteract it delicately and harmoniously. The arch has one part to play, the pillar or column another; the ribs of the roof catch and disperse the forces overhead and guide them downward; the *buttresses* or outside piers counteract the enormous lateral movement, and the turrets on the top of them keep them in their place. The transepts relieve the accumulated force of the nave, the towers at different points are all brought into concrete action, and last but not least, when openings are wide and the walls thus weakened, the flying buttresses rise up aerially and counteract the stress. A church indeed is a thing of beauty, but it is not that alone—the mind of the artist has been at work, and woe betide his structure if his knowledge is unsound. Keeping these points in mind, we shall find that the history of architecture shows no arbitrary change of tastes, but rather the development and evolution of man's mind—loving, on the one hand, to prove its constructional ingenuity and on the other its taste for pure ornament.

In the examples that remain to us of the Norman period we see the beginnings of Gothic aspiration. The chief characteristics are those of all early work. Its main feature, of course, is the semi-circular arch, either alone or in groups, and in later work intertwined. The pillars of the arch are short and very massive: the capital, of a square cushion shape, is very noticeable. The doorways are beautifully enriched with the well-known zigzag ornament. Walls are very thick, and the mortar-work is usually of inferior quality. The whole appearance of the buildings is massive. Timber roofs are frequently used, but sometimes the vaults are of a waggon or barrel type. Towers are square and of great mass, often with blind arcades and parapets. The best early example we have of the style is the St. John's Chapel in the Tower of London. The height of the triforium in it is characteristic of the time, and the apsidal

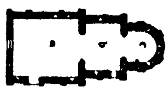


Norman Window



Norman Doorway

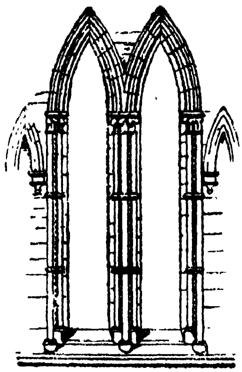
end connects it with continental buildings. Most of our cathedrals are of this period, though they have undergone many changes since. Durham and Oxford are perhaps most complete, the nave of the former showing greater variety than, say, St. Albans or Norwich. But examples especially of small churches are to be met with all over England and Scotland, a good Scotch church being that of Leuchars in Fife. They are all easily recognisable for the characteristics mentioned. The period lasts from 1066 to 1170.



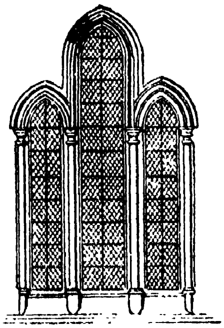
Plan of Norman Church

Gothic Architecture in Britain.—With the coming of the pointed as distinguished from the rounded arch, Gothic architecture in the strict sense begins, and England was as early in the field as any country with what is called the *Early English style*. Discussions as to the origin of this arch are quite unnecessary. It is sufficient to state that the problem of vaulting, introducing as it did at its diagonals arches of different diameters and the interlacing of the semi-circular arches, showed the way, and the typical ecclesiastical form which has so fully embodied the aspiring ideal was the outcome. Builders came to learn that massiveness was not the only quality in judging the strength of a support, but for a time we find, as was natural, both types of arch used in the same building. Again, much has been written on the French origin of the English style illustrated by Westminster Abbey, but whatever truth there is in this it may be at once observed for those who are patriotically inclined that English Gothic developed in its own way, with peculiarities unknown across the Channel or anywhere else. Lincoln's choir shows the earliest work, but the best illustration of the ideals of the early thir-

teenth century is the cathedral of Salisbury, a building as beautiful from a constructional and artistic point of view as any other of any time or place. Apart from the lancet shape of the openings perhaps the most noticeable trait of the style is the more slender size of the columns and the "dog tooth" ornament which



Early English Lancet Window



Early English Window

is not found on the Continent. This is carved by a chisel instead of the axe of the Norman period. The famous Five Sisters in the transept at York Minster so beautifully grouped are of this period, and quite comparable with them are the ruined east ends of Tynemouth Abbey and Elgin Cathedral, the well-known nine altars at Fountains Abbey, and the nine altars of Durham.

This grouping of the lancet windows in detail and as a whole is what we may justly term English in its delicacy of execution and beauty of proportion, and we miss such a treatment at Chartres and Amiens, wonderful as these are on account of other qualities. There is no exaggeration, no false simplicity, but a restrained harmony that gives a most completely artistic delight to the beholder. If anything were needed to intensify the pleasure of such a one, it was colour, and this was supplied in wondrous wise by the thirteenth-century stained glass. Unfortunately we have little of this in England, but York still retains for our admiration—though much bespoiled by later glaziers and their patterns made unrecognisable—the early grisaille or silver-coloured glass in the Five Sisters. Still better grisaille, though not in nearly so impressive a position, is to be found at Salisbury, and at Canterbury there are some medallion coloured windows of beautiful hues. More will be said about this medium later. Of west ends no more lovely examples could be found than the porch at Ely, which is a perfect gem of design. It is to be noted that the usual English west front is far less elaborate than in France, yet of this period we have two of the richest, Lincoln and Wells. The former cannot pass the test of Ruskin's *Lamp of Truth*, it being a first principle of construction that there should be no shame on the face of a building to tell how it has been built. Wells, on the other hand, disfigured as it is by later additions and over-adorned, is one of excellent proportion and design. An attempt is made to roof by means of vaults oblong and not square compartments. To sum up the chief characteristics of this period, which lasted till the end of the thirteenth century, we observe simplicity but delicate purity of execution, and a firm grasp of proportion as the essence of architectural beauty.

In the earliest pointed period two lancet windows were often grouped together, and the space above or *tympani* had been pierced, giving what is called *plate tracery*. As time went on, however, greater elaboration was attempted, and the stone-work between the lancets itself was made as slender as possible, becoming a *mullion*, and the upper part above the heads of the lancets was *cusped* with geometrical designs. The buttresses with the increased size of the windows become more important, and the ornamentation in every place in capital or cornice is more naturalistic. A very beautiful feature of the style is the clustering pillars, several slender shafts surrounding a central column. At first geometric (*trefoil, quatrefoil,* &c.) designs were most popular, but later, with greater mastery of the constructional schemes, more daring and flowing tracery was adopted. To this period belong those wonderfully compact chapels and chapter houses which are so beautiful a feature of the English style. As good an example as any is St. Etheldreda's Chapel in Holborn, now restored to the Roman Catholic Church, where the east and west windows show elaborate work at its best. The vaulting now becomes more complex, and lierne ribs, *i.e.* those unconnected directly with a support, appear and provide the artist with stuff for his chisel. Merton College

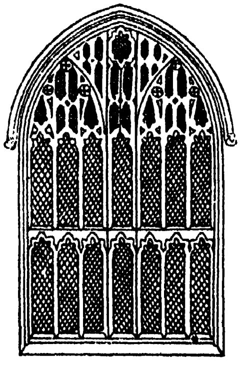
Decorated Capital

Chapel and the Lady Chapel at Ely also show beautiful work, but it is probably in the chapter houses that the skill of the English architects is best to be seen, and of conspicuous merit are those at Salisbury, Westminster, Wells, and York. They give great opportunity for displaying nicety of proportions and charm of decoration. But it must not be thought that the most beautiful work of the time is only of small dimensions. The nave of York, the nave and choir of Exeter, and nearly the whole of Lichfield and the choir of Carlisle are all of the *Decorated Style* which flourished in the fourteenth century. Exeter especially ought to be visited to appreciate the beauties already named in roofing, tracery, and column, and the proportions of Lichfield are even more satisfactory.

Perpendicular Style.—Towards the end of the fourteenth century in England, as on the Continent, the imagination of the architect began to run riot, and what is called the *Perpendicular Style*, so much abused by Ruskin, came into being. Though peculiarly natural in detail, it is simply an extension of the tendency from simple to complex that we see in all the architecture of the time. The ideas of the architects and builders could not be restrained by mere geometrical designs. They first naturalised the ornament and then made the whole building an excuse for showing their ingenuity and daring. Ornament grows in wild profusion everywhere like weeds. Any part of a building formerly necessary and now rendered unnecessary because of greater mechanical skill remains in order to have placed upon it some ornamental device. The simple building of earlier times,



Perpendicular Window

Perpendicular Niche

showing its construction on its face, completely and artistically fulfilling its purpose, gives place to a building that deceives the eye at every turn if only it shows the taste of the day. Everything solid is tapered down, ornamented, or panelled so that no suggestion of heaviness may remain. Churches are carved in the form of a lyric at the great expense of artistic truth. Pillars become mere wisps of stone; but windows on the other hand increase to such a size that there emerges only a wall of glass. But miracles of ingenuity result. In England we have no flights of engineering such as at Beauvais, but the roofing attains a hitherto unknown architectural and artistic importance.

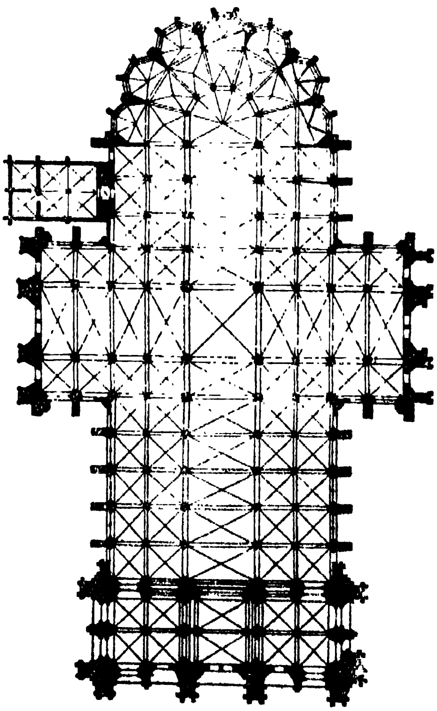
In detail the chief changes to be observed are the tracery of the windows giving the name to the style. Their mullions have a decidedly perpendicular effect, and it is interesting in different examples to notice the gradual change from the older geometrical designs to the later flamboyancy. There is also a tendency to split the windows into compartments rendered necessary by the huge area covered. The arches, again, are much more square or "dumpy" in appearance, often of the "ogee" shape, and with a square moulding over the top, the spandrel being filled in. The typical column consists of four shafts of the same great height as in the preceding style, but the carving of the capitals is much more conventional, though not in England tending so much to the Corinthian acanthus shape as on the Continent. One feels, however, the absence of that loving intimacy with the natural objects represented, or even the delicate if homely beauty of the expressions, which are so marked features of thirteenth-century work. The roofs are marvels of cleverness, as for example the famous fan vaulting of Henry VI's Chapel, St. George's Chapel, Windsor, and King's College Chapel, Cambridge. This is a unique characteristic of the English Perpendicular style, and if it is formed at the expense of truth and restful simplicity its daring is accompanied by real beauty of exquisite ornamentation and in the chapels referred to crowns the adventure. It is the "looping the loop" of architecture, wholly justified by success. The many accessories of a cathedral, such as canopies, choir stalls, screens, and fonts, of this time are specially numerous. The stained glass ceases to serve its purpose as a light-giving agent, and becomes an excuse, and a very bad one, for the painter's leaving his last. He tries to ignore his material, and uses glass as if it were canvas, never having learnt that its very conventions, if rightly regarded, are the main source of its beauty.

An interesting difference is seen in most of the Scottish churches of this period. The Perpendicular style is seen in very few examples, but foreign influences—mostly French—are far more observable. This is especially so in the window tracery which often, as seen well in King's College Chapel, Aberdeen, takes on a pear shape. A large central mullion is a curious feature of these windows. Melrose Abbey, Elgin and Aberdeen Cathedrals among others show foreign influence. The little Chapel of Roslyn near Edinburgh owes its inspiration to Portugal—not, however, with really artistic result.

Gothic Architecture in Other Countries.—Having grasped the essentials of Gothic architecture in our own country we may look at the Continent and note how the same principles have been worked out there. We find less difference than ought to be expected, chiefly owing to the fact that there was such an intimate relation between the different branches of the Church wherever situated, and more so the omnipresence of the same monastic communities. France as the home of the new change deserves first mention, and indeed when the student has become acquainted with his country's buildings no more enjoyable task can be set him than to take a tour or tours to the cathedrals and churches of France. Here he will find the same development as at home—first the exit from Romanesque, secondly the fully developed style, thirdly the flamboyant mistakes. And in France above all places he will find constructional problems at the root of all the changes. The Abbey Church of St. Denis near Paris, begun in 1140, shows the change commencing, for though it retains Norman characteristics in its round arches its plan and manner belongs to the later style. Close on its heels were built the great cathedrals of Notre Dame de Paris, Chartres, and Laon. Probably Notre Dame will be the first French cathedral visited by the Englishman, and though not nearly so exquisite an edifice as, say, Chartres or Amiens, it will prove at once to him the difference in taste of the English and French schools. It could never be mistaken for an Early English building even without its later additions. The west façade attracts at once; the flying buttresses, the curious lengths and heights of the nave, triforium, transepts, and chevet, the wonderful rose windows, all give it what it really must have, a very foreign look. Similar to it is Laon Cathedral, but it is far outclassed by the Cathedral of Chartres, for many reasons the noblest church of the Gothic style. It is easily visited from Paris, and should be early studied. The general impression is one of great simplicity and rest, caused to a great extent by the beautiful proportions of the towers and spires, so harmoniously are they designed. The sculptures are mentioned in another article; they adorn a west front and north and south porches of exceeding merit; the early stained glass—the most beautiful in the world—completes perfectly this religious building. One has only to be present at one of the fêtes to be transported to an ideal French atmosphere, a community in joyful worship.

Beautiful as Rheims Cathedral is—and it resembles in many respects Chartres—Amiens represents French Gothic at its best developed point. The structural problems of height and breadth which so much involved French architects are here solved with artistic accuracy. Sculpture is again prominent, but it is in the interior that we get the most impressive idea of the building. A far greater feeling of vastness is obtained by its beautiful proportions than in larger cathedrals; the position of the windows makes it more "open" a Bible than any other—a result that is greatly intensified by the simplicity of its vaulted roof. It is, in short, worthy of all the adulation given to it by Walter Pater and Ruskin, even apart from what is often considered its chief glory, the rich carving in the choir. In Beauvais Cathedral the architects reached their downfall; built to show that there were no limitations to the law of support, the choir vaulting fell before the church was completed. Of the later buildings the two cathedrals at Rouen are the best specimens. They show work of all the different periods, and thus lose the harmony of the earlier work, but from a student's point of view they are all the more interesting. In these and other cathedrals and in such churches as the Sainte Chapelle of Paris, the Abbey of S. Michel, S. Pierre, Caen, and S. Maclou, Rouen, the details especially of the carving and tracery should be compared with English contemporary work. In the later churches in the flamboyant style one will notice the absence of our Perpendicular features.

In Italy a very different style was evolved, owing to the fact that Roman influences were



Plan of Cologne Cathedral

never really ousted by Gothic principles, and no such development as we have noted in England

and France takes place. Milan Cathedral at once shows the difference. Its chief merit is its size, and the expensive stonework. Further south, Florence Cathedral is noteworthy for the famous Campanile of Giotto and its dome, which is its great glory. It is to be observed that brickwork faced with marble is nearly always used, and this is probably one of the main causes of the difference in style. The Frari Church in Florence is a good example of Native Gothic in its purest manner. Spain is even less interesting as showing natural characteristics of the period. Most of her cathedrals owe what inspiration they have to the French. The dome is a feature of the cathedrals at Zamora, Tarragona and Salamanca, and the famous towers of Burgos with their rich ornamentation are interesting, and Seville is the largest Gothic cathedral in the world, but the ecclesiastical architecture of this country is chiefly remarkable for the Moorish characteristics to be afterwards mentioned. In Germany the deservedly famous Cathedral of Cologne, though it was completed only in the last century, requires to be noted. Its plan is specially good. Its towers and spires are very effective, and the long nave with its outside row of chapels making at the apse a beautiful chevet, are its chief features. Other cathedrals claiming attention are those of Strasburg—of early date —Freiburg and Ulm.

Domestic Gothic Architecture.—Very little need be said of the non-ecclesiastical buildings of this period. Only the stronger castles of the day have survived, and these are very rarely in their original state. When they do so they exhibit in their arches and pillars all the characteristics of the date in which they were built. In England the chief early example is the Tower of London with its very simple plan and unmistakably Norman characters. Later you have the moats, outer and inner courts, and dining halls, and gradually the modifying of the military features and consequent increase in the domestic apartments. A very good building to study is Kenilworth Castle, which, originally built in the early twelfth century, has well-defined additions till the end of the sixteenth century: other well-known buildings are Penshurst Place, Kent, Westminster and Crosby Halls, London, Cranbourne Manor, Dorset. Timber buildings of both early and late style are best seen at Chester. In Scotland as in England, there are several old Norman towers or keeps in more or less interesting states of preservation, and the circular tower to be developed in Renaissance times comes into being during the Gothic period. The crow-stepped gable of the "lands" in the old houses in Edinburgh, along with their great height, and planned as they are round a courtyard, shows the same French influence observed in the churches.

Up and down France and Belgium, especially in the old towns, one meets houses, even streets, of great beauty. That of Jacques Cœur in Bourges shows beautiful details in its window and wall tracery of the fifteenth century, and the Palais de Justice, Rouen, is the best municipal building of about the same date. It fits in appropriately with the street architecture of this noble French town, which, along with its two wonderful cathedrals, make it, apart from Venice, perhaps the most interesting architectural city in Europe. The Hotel de Cluny in Paris will not be passed by, by lovers of the "Bou Mich."

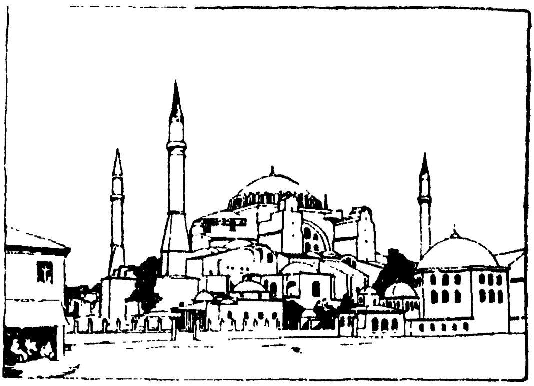
The history of Belgium is that of gallant municipal endeavour, and it is sufficiently expressed in architecture, especially in its town halls. Of a peculiar style, rectangular in plan, and several stories high, with their simply decorated front, steep roofs, and high tower or belfry exquisitely if a little curiously proportioned, from the point of view of anyone who takes a non-German view of culture (and it is for those that this is written) they yield to none in æsthetic interest. Nearly every community has one or more of these halls, but specially remarkable are (or were) those at Bruges, Louvain, Brussels, Ypres, Ghent, and Liège. In the houses the crow-stepped gables and dormer windows are exceedingly picturesque.

In Italy the Florentine domestic buildings yield in importance to their Renaissance successors if we miss out the Palazzo Vecchio and the Loggia dei Lanzi of the thirteenth and fourteenth centuries respectively. The tower of the former is as interesting as it is well known. But when we move to Venice the earlier period assumes the same excellence as in ecclesiastical work. Venice is, in spite of its conventional lovers, still a city completely wonderful and beautiful. The palaces, whether still in their former glory or used as dilapidated warehouses, in the Grand Canal or in some small, evil-smelling waterway, still claim our unbounded admiration. And they belong to nearly every period. The earlier Romanesque buildings are interlinked with Byzantine details, the fully developed Gothic style of the fifteenth century typified by the Doge's Palace abounds everywhere, a Renaissance work of every sort jars or pleases one, as the case may be, at every turn. Of twelfth century work, the Palazzi Loredan and Farsetti, now used as the Municipal Offices, and the Ca' da Mosto are good examples, though restored in parts. They are simple in design, but fascinating in their fresh primitiveness. Byzantine influences are well marked in the Palazzi Sicher, and Laibante, and Businelli, the windows of the last-named being noteworthy. Of the Doge's Palace manner there are very many good buildings, notably the Palazzi Gunstani and Foscari, which stand together on the Grand Canal; but the most famous palace of this style is the Ca D'oro. Small in bulk but exquisite

in detail, this gem of architecture, defaced though it has been, still epitomises the joyful exuberance of Venice. In any other city it would look gaudy, and its exterior was once gilded; here it fits in most beautifully with the sky and the water. Its three arcades of gorgeously carved pillars are relieved by the simplicity of the further side of the building. But the Palace itself now claims our attention. Its fifteenth century work has undergone various restorations, but it still remains the most beautiful domestic building in the world. It consists of three divisions; a wide arcade below supports a gallery above, which is surmounted by a much higher story of pink and white marble in lozenge shape. The sculptures are dealt with elsewhere. The proportions are curious and at first puzzling. The lower arcade seems, in spite of the massive pillars, to be top-heavy, partly due to the raising of the pavement of the Piazzetta which it adjoins. But this adds perhaps to the variety. The upper gallery, with its quatrefoil spandrels and ogee-shaped arches, is the most richly decorated part of the building, while the walls above prove a very effective and simple setting to the profuse decoration beneath. The architect in this has transposed the ordinary architectural tradition, but to the present writer at least the result is altogether satisfactory, the marble facing of the wall giving sufficient relief to an otherwise heavy treatment. This part is pierced by two balconied windows, one to each façade.

Byzantine Architecture.—Everyone knows vaguely that the capital of the Roman Empire was shifted in A.D. 323 by Constantine to Constantinople in the old Greek colony of Byzantium. The architecture we now discuss is the style developed there and at other places under its influence. Constructionally, even in its advanced form, the style did not differ from its predecessor. Superficially we note first of all the absence of the orders with their pediments, and in their place as most noticeable a beautiful grouping of domes. The walls are made with concrete, but mortar-bound brick has a greater place, being in the later forms used with great ornamental effect. But there is no advance to the Gothic solutions of stress. The interiors are covered with mosaics and other decorations, and faced marble is used extensively, both outside and inside. The chief Byzantine church is that of Santa Sophia at Constantinople, erected in the beginning of the sixth century. It is now, of course, converted to Mohammedan uses—whether temporarily or permanently it is not at the present moment wise to say. In plan there is a central space covered by semicircular arches supporting the great dome. Around this are grouped entrance porches and other chambers, all dome vaulted. A prominent feature is the number of galleries. The simplicity of the interior is counteracted by the exuberant wealth of colour produced by the marble arches, mosaics, and hanging lamps.

Nearer at hand, and more familiar to the English traveller, is the famous St. Mark's, Venice. To the western eye at first sight this church, which is not much debased by Gothic additions, looks garish, but closer observation removes the impression. No building in the world so well typifies the ideals and history of its surroundings. It was built for the most part in the late eleventh century after a Constantinople



S. Sophia, Constantinople

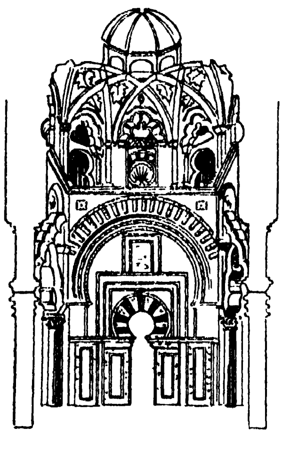
model, in the shape of a Greek cross covered by domes. The wealth of colour detracts from any great idea of space, but it has other attractions. Nowhere else can mosaic in its best form be studied, and the early examples here are themselves worthy of a prolonged visit to Venice. It is sufficient to note that they carry out in the most delicate manner the modern artistic truth that conventions, when observed with respect and not despised, add so much to the beauty of the general impression that they oust verisimilitude from its chief place as a factor in art. In early mosaic work art is quite unembarrassed by Nature. The different examples of marble and other stones used provoke a comparison. In the *Italian Gothic* a general monotony is produced by the unskilful way in which the exteriors are faced with chess-board varieties of colour. If you have a small acquaintance with different stones you will recognise at once on the western entrance to St. Mark's up to a dozen different marbles. Especially if uncoated by dirt (these pillars are cleaned every few years) the different grains catch the eye at once, producing the necessary complexity or intensity of view. In the ordinary Italian façade the eye takes the whole pattern in at a glance; in any of the sides of St. Mark's a far more varied, what might be called musical, harmony is achieved. The gaudy impression is given wholly by bad mosaic work and late additions. There is a world of difference between richness of colour and tawdriness. No

reader of Ruskin will overlook the exquisite carving in the incised capitals and some of the sculpture, so delicately and artistically do they represent the outlook of the tenth and eleventh centuries on Nature.

In St. Vitale, Ravenna, Byzantine influences are very marked, while the Londoner will get a fair idea of the style in the new Westminster Cathedral.

Moorish Architecture in Spain.—As has been previously noted, no attempt is here made to sketch Saracenic architecture in Egypt and Syria, but travellers in Spain would rightly take it amiss if no mention were made of the wonderful style of the Moorish or Arabic remains in Andalusia. These belong to a period as extensive as from the eighth to the fourteenth centuries, but it is a commonplace to say that in a country the most national in the world every branch of thought or sphere of life has been touched by the existing facts, and most beautifully so. All these delightful belfries we pass in the town or country of Southern Spain owe as much to the East as the skin of the most popular bull-fighters, but apart from that there are wonderful buildings not much corrupted by the antagonistic forces of the West.

Earliest in date (A.D. 786) is the mosque at Cordova, now the cathedral, originally second



Section of Mosque at Cordova

only to Mecca in importance. Instead of the Christian four aisles we have nineteen, and the general impression as one enters is that of a forest of low (30 feet) pillars. Looking at them closely an extraordinary tale is told, for you will find original Roman Corinthian pillars standing cheek by jowl with Greek, Arabic, and Byzantine columns. The arches are of the proverbial horseshoe variety, and originally it is to be remembered no outside walls existed. The chief Mihrab or praying tower is specially beautiful, the walls being, as always in this style, covered with richly coloured stucco in the form of texts from the Koran, no natural representation in ornament being allowed. The central part is architecturally and needlessly deformed to the use of the church, and there is a considerable amount of imitation work. The Court of the Oranges outside, the exterior of the tower, and the doors are less important than in the other buildings now to be named.

The Alcazar or King's Palace at Seville is a small edition (thirteenth century) of the Alhambra, though many admire it more. It is sufficient to say that in the original doors, stalactite roofing, and wall ornamentation the visitor will find perfect æsthetic delight, and his western eye will receive a shock in the glow of the colours. The Giralda, which is the old tower of the Gothic cathedral, is the most perfect specimen of exterior Saracenic work of the kind. From the inside, up which you climb without the use of steps, you can study its exquisite geometrical ornamentation. In the view of the present writer it is, even apart from some later additions, in its proportions, decoration, and general effect the most beautiful tower in Europe. Its height is 275 feet, and except for the belfry was built in the late twelfth century.

The Alhambra at Granada, of the fourteenth century, is the most famous building or group of buildings of the style, and it contains in itself perfect specimens of all the peculiarities of it. To begin with, its general situation, its courts, gardens, and fountains make this king's palace a veritable castle in Spain. The woodwork of the doors, so rich in its carving, the glory of the walls with their blue and gold stucco decoration above and tiling below (the lustre examples are specially fine), the peculiar pillars and capitals, the Moorish arches, the stalactite roofs, the joyous glamour of the vegetation, are summed up only by the sense, so subtly felt yet omnipresent, of pure running water. It is indeed an Arabian dream of beauty and wonder.

Renaissance Architecture.—As this sketch is meant for the untutored, it may be well at the outset, even at the risk of repetition, to state the differing principles of Gothic and Renaissance architecture. When travelling abroad one is universally met with a pathetic question, not confined to American pork-butchers nor anæmic girls, "Now this is Gothic, isn't it?" The distinction is fundamental. In the twentieth century, when an architect sends in his plans of a church for competition, he in many cases has to decide what style he is to adopt. No such choice occurred to his ancestors. Architecture is a living expression of the age. The architects of Chartres or Salisbury were not trained in the history of architecture, the style was in the atmosphere surrounding them; out of this their genius created a work of art. We have seen in the case of painting and sculpture how the Renaissance worked. True the

artists imitated ancient models such as they knew them, but even in their errors they gave vent to their point of view. And some reaction from the Gothic ideals of the fifteenth century was necessary. We have remarked how flamboyant or decadent the architecture of that time was—many different aspects of life joined together to make the change. The Gothic church fulfilled the ideals of the Christian worshippers as a whole; we now in the sixteenth century are more concerned with secular nobles —we see fewer examples of churches and more examples of palaces. In the churches themselves we seem to lose hold of that individual interest in each detail of the work that typifies so well the contribution each citizen (and they were all churchmen) made to the religious faith. More concretely, the chief changes are these. The early classical styles—Doric, Ionian, and Corinthian—with their columns and entablatures and semi-circled arch, emerge. The dome takes the place of the tower. The vaulting is Roman without ribs. Instead of a dazzling complicated harmony of antagonistic lines there is a severe simplicity of conventional and geometrical form, the general impression being horizontal instead of perpendicular. The walls of stone—or, as was very common, marble —are smooth, affording little or no play of light and shade. Above all else, perfection is sought and attained by elimination of all conflicting lines. We have noticed that the essence of a Gothic building is the battling of forces; the ideal is fought for, and being high, cannot be reached; in the Renaissance building all is sacrificed to an uninterrupted impression of proportion.

Italy must have first place, and Florence was the home of the movement. Most of the sculptors of the day were also architects—Della Robbia, Ghiberti, Donatello, Mino and Benedetto. But in Florence the "duomo" puts everything else in the shade, and Brunelleschi is its famous designer. However little Florence Cathedral may impress one apart from the Campanile and the Baptistery—and the conventional symmetry of its marble facing and ignorance of the wonderful stained glass are the main factors in this—the dome itself must always rank as a brave and beautiful work. The Pitti and Riccardi Palaces by Brunelleschi and Michelozzo are as good examples as any of the heavy strongholds of the Renaissance nobleman. The atmosphere of modern Florence is always rather depressing in spite of the host of artistic gems in it and the kindliness of its people, and these palaces are there not out of place. The churches of St. Spirito and San Lorenzo are worthy of attention. In Rome the most famous palace is that of the Farnese. In all these palaces special note should be taken of the different plans, the orders in the façades, the presence or absence of square or round-headed windows, the exquisite ornamentation of brackets, &c. Given the cramped medium, it must be admitted that the architects evolved very dignified and symmetrical work. To most people the Renaissance is synonymous with St. Peter's, Rome, and St. Paul's, London. St. Peter's had a very chequered career. The chief names to be remembered with it are Baamanto and Michel Angelo. The former designed the dome, which was subsequently altered by the latter, to whom most of the plan is due, but who died before the cathedral was built, and in turn had his designs upset by successors. The chief additions are the façade and the colonnade of the Piazza. The Corinthian columns both inside and outside will fix this style in the student's memory. The walls of the interior, like those of many Scotch churches, are of painted plaster; but on the whole the desired effect of grandeur, dignity, and harmony is fully attained.

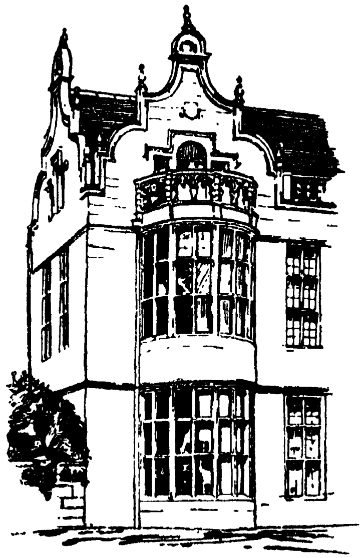
Compared with earlier work the Renaissance palaces in Venice have less of that typically joyous note which is so marked a feature of this most beautiful of cities. In point of fact one usually ignores them, but they have peculiarities of their own which are very interesting to the student. The Vendramini and the Pesaro Palaces are best known, but noteworthy features of nearly all of them are the grouping of the windows, the balconies, and the ornamentation of the churches. S. Maria della Salute owes its splendour to its position and grouping. The courtyard of the Doge's Palace is as unhappy as St. Mark's Library is completely happy. Both are by Sansovino. The Library is worthy of minute inspection, its proportions being perfect. The architect of St. Giorgio Maggiori, Palladio, is better seen in his native town of Vicenza, where the Palazzo del Consiglio with its double series of arcades cannot be over-praised. The Palladian style, simple, even severe but practical, is the foundation of a lot of what is best in English Renaissance work.

France, in adopting the spirit of the age, was reluctant to dispense wholly with the Gothic style which had proved so faithful a servant in earlier days. Thus with good but ineffective intention she strove to combine the two, often with most incongruous effect. The transition stage is best worked out in the châteaux of the Loire, and of these the Château de Chambord is rightly the most famous. The circular towers and the dormer windows are noticeable remnants of the earlier times. The Château de Blois with its famous spiral François Premier staircase and the Château de Chenonceaux are other well-known examples. In Paris of secular buildings we have the Louvre and the Tuileries (which shows in itself the progress of the style down to the middle of the nineteenth century), the Luxembourg, and Versailles, the last of which is as ineffective outside as within. Of churches

St. Eustache and St. Etienne-du-Mont show the transition feeling, and one would say represent the French spirit as few other churches in Paris do. No one will overlook the double staircase in the latter church. Close at hand is the Pantheon by Soufflot, of the eighteenth century—a most admirable Renaissance building. The Invalides Dome and the Madeleine, the latter of the nineteenth century but a good copy of Roman work, are also noticeable. The Palais Royal and the Sorbonne do not add much to one's architectural knowledge.

Germany copied French absurdities and incongruities, but rarely escaped the dumpiness that is so characteristic of the nation. The Pillerhaus, Nuremburg, and the Cloth Hall at Brunswick most successfully, perhaps, escape the general lack of delicacy. Belgium, on the other hand, shows in many specimens of street architecture a quaintness quite unalloyed with gross detail, and the Antwerp Town Hall shows a most interesting adaptation of Renaissance orders and ornament to practical purposes. Spanish attempts to conceal the passion and splendour of her aims in a dead language could not be of much beauty. The town hall in Seville is imposing and rich in detail, and Charles V's Palace at Granada is Italian in spirit, but the well-known Escorial near Madrid, with its different buildings, is the greatest monument of this period in Spain, both in its plan and execution.

curious buildings. Holland House and Hatfield House are the best known. Curiously shaped chimneys are a feature of these buildings, porticos, and arcades are common, and the classical orders are used indiscriminately.



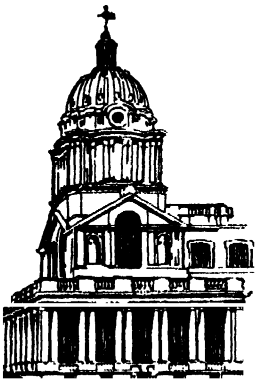
English Renaissance. Lilford Hall, Northants, 1635. (Gotch).

Renaissance Architecture in England.—The architecture of the Renaissance in England is interesting nearly as much for its mistakes as for its success. It is to a great extent the history of the English country house. After Henry VIII's death in 1509 there seemed to creep in a catholicity of taste equalled only by its ignorance. The result was a welter of antagonistic forces. Most of the Tudor chaos, as it has been well called, is due to the free hand given to barbarous German architects or workmen. Whenever we find Italian, French or Belgian influences gaining we get no small delicacy and refinement of taste ornamenting the native love of practical usefulness. When German ideas predominate all is gross and furthermore dull. In the Elizabethan, which is the first of the Renaissance styles (1558–1603), we have Wollaton Hall, Kirby Hall, and Knowle House. In all the hall, staircase, and upper gallery are the chief features. Several parts of Oxford and Cambridge colleges, too, belong to this time. But though the country house is the English equivalent of the Florentine palace, some of our town houses, especially the easily recognisable half-timber ones of Chester and London, have a delicate charm of their own. *The Jacobean Style* (1603–1625) continued the incongruity. Special mention must be made of the formal terraces and gardens which surrounded their

But it is to Scotland that we have to pass for artistic buildings of the sixteenth century. The so-called baronial castles of the day, well known for the pepper-box turrets, prove to us that even at this comparatively late date dour Puritanism had not quite eliminated æsthetic feeling. Founding their architecture on the French, with whom they were so friendly, they developed a style of their own which for beauty of design and excellence of adaptation of means to end is unsurpassed. The best-known examples are Bothwell, Crichton, Cawdor, Craigmillar, Linlithgow, Fyvie, and Holyrood.

With Inigo Jones we take a step to a clearer appreciation of the aims of the Florentines. His best work is seen in Greenwich Hospital, St. Paul's, Covent Garden, and the Banqueting House, Whitehall, part only of a wonderful palace designed but never executed by him. It was he who first introduced the art of Palladio to England, and Inigo Jones had lovingly studied at Vicenza and Venice those buildings we have already mentioned. If St. Mary's Porch, Oxford, and Heriot's Hospital, Edinburgh, are truly his, they simply show early work. His name cannot be too much held in honour in our architectural history. He understood his material and the style he worked in—above all he cleaned out German weeds which so hampered the development of an English Renaissance style.

Probably Sir Christopher Wren is the only architect whose name is known to the man in the street. The Fire of London in 1666 gave him an opportunity of town-planning such as few men have ever had, but as is always the case, he was not allowed a free hand. In fact one of his chief merits (and it is in architecture one of the first class) is his adaptation of buildings to cramped surroundings. Passing over some work in Oxford, we come to the London churches and St. Paul's. The former are as well worthy of attention as any Renaissance buildings. The true spirit of the day gave this mathe-



Portion of Greenwich Hospital

matician boundless opportunities for exercising his constructional ingenuity, but over all he has super-imposed effects of great dignity and simplicity. St. Stephen's, Walbrook, is justly famed for these qualities, and nothing is more characteristic of the City church than the Bow and St. Bride's churches. Other works of his are the dome of Greenwich Hospital, the Monument, and the old Temple Bar. St. Paul's as we see it now was not Wren's first design for the cathedral, but it is undoubtedly his best. Especially externally, viewed close at hand or from Ludgate Hill, or taking the magnificent dome by itself, it must be pronounced the most successful Renaissance building on a large scale in Europe. His undoubted practical qualities are given full play in the East of Hampton Court, which was rebuilt by him. And here in a new material—brick dressed with stone—he shows to great æsthetic advantage. The Tom Tower at Oxford must not be ignored among his minor work.

After Wren's death his followers, in their attempts to imitate Palladio and others, seemed to have quite overlooked what may be called "reason" in architecture. Any little nook or cranny in a house inside or outside was made the excuse of so-called classical ornament. This movement is, of course, at once comparable with its sister art of literature in the "Georgian era," but even Pope could see the faults in architecture when it interfered with his comfort even if he ignored the analogy in his own art. Kent, Gibbs, and Chambers (of Somerset House fame), are the least bad. Vanbrugh is nearly always ugly. It is refreshing to find genuine practical Renaissance ideas in the buildings of the brothers Adam, who are best known for their interior ceilings and chimney-pieces. Few towns in any country can show such really beautiful work as the Register House and the north side of Charlotte Square, Edinburgh. These are far better than the larger old University Buildings.

Modern British Architecture.—The Classical Revival of an archæological architecture was succeeded by the Gothic Revival of the second half of the nineteenth century. A late offshoot of the literary movement named the Romantic Revival, and giving expression to the ideals of Oxford Puseyism, its chief herald of course was Ruskin. The results were various. Firstly, a much finer appreciation of the Gothic work of the Middle Ages: secondly numerous mistakes in restoration: thirdly, gross copyism of Gothic details without the spirit and workmanship of the old guildsmen. The Houses of Parliament, Westminster, are the firstfruits of the movement, to be followed by the imitation series of earlier work by Sir Gilbert Scott and his friends. At its best, say in St. Mary's Cathedral, Edinburgh, you get negative correct qualities of various kinds degenerating into dullness, along with certain beauties of stonework. But over all there is the sense that the building is a mere exercise in mimicry, freedom, and variety, that delight which usually developed into humorous touches and is so inseparable from the Roman Catholics churches abroad. And when freedom was shown it usually took the form of Street's Law Courts or Waterhouse's Insurance Offices. Here and there, however, up and down the country one does find Gothic churches which show a brain behind that will not be hampered by the mere littles of a style: who, if he is unable to get workers to carry out the spirit of the olden days, attempts a new formula which they may understand. For architecture, as must be repeated, is the expression of men's adaptation of means to an end. Our wants create the end; the artist cannot satisfy them with a scholastic study totally divorced from surrounding circumstances. By this test even so fine a building as St. George's Hall, Liverpool, by Elmes must fail. Notice must be taken of the work of J. G. Jackson at Oxford, Basil Champeys there, Cambridge, and Manchester, and Sir Rowand Anderson at Edinburgh. These men, while clinging to the older ways, do not become garrulous. The leader of modern English architecture was the late Norman Shaw, and he has founded a school

which is doing important and beautiful work in all our chief cities. He made it his business to learn the beautiful features of Continental domestic architecture, and from those he seems to have sifted out those which would best suit our English atmosphere. The result is a truly individual style, anything but grotesque, refined in feeling, rich in detail, always adapted to its purpose. His chief buildings are the Gaiety Theatre, the Piccadilly Hotel, and the Alliance Assurance Office, all in London. His development is seen from the New Zealand Chambers, Leadenhall Street, and New Scotland Yard, both from his hand. He and his followers or colleagues are not unmindful of the great names of Inigo Jones and Wren, and there is reason to believe that at last our cities will be adorned by buildings which are other than hideous lies. Other names of present-day workers are Mr. Belcher of the Institute of Chartered Accountants, Mr. W. Young of the War Office, Mr. Reginald Blomfield, Sir Aston Webb in his latest work, Mr. Marshall Mackenzie, whose Waldorf Hotel might be more exciting, and many provincial architects in Glasgow, Edinburgh, and Dublin if nowhere else.

COURSE OF READING

Unlike painting, books on architecture are specially valuable and indeed necessary. They must always be accompanied by illustrations. The best known general history in English is that of Ferguson, but a more modern book is Banistin Fletcher's, the photographs and sketches in which are specially valuable. A good deal of minute detail which could not be dealt with in the short space given to this article can be followed out in these books. And it is worth doing thoroughly. It adds intensely to the appreciation of a great cathedral to understand in some way the principles of, let us say, roofing employed. To start with, however, the booklets on the subject in the *People's Books* and the *Home University Library* should be kept at hand. They are written from a very different standpoint.

Probably, however, if external stimulus is needed to interest the student nothing could be found better than Ruskin's masterpiece, *The Seven Lamps of Architecture*. If one is left cold by this there is no use going further. The same writer's *Lectures on Architecture*, delivered in Edinburgh, and the *Stones of Venice* and some of Walter Pater's essays will follow. It is not necessary to agree with all the social, far less the artistic, aims of Ruskin. His greatest detractors will be the first to recognise the enormous persuasive power of the writer. Stimulated by Ruskin, and it is hoped having obtained a fair acquaintance with the aims of the architects of different ages from these pages, the reader will be ready to attack the large histories. For the different periods and styles one may consult the works of Flinders Petrie and Lethady for Egyptian and Greek periods respectively, and of course, the British Museum's catalogues and pamphlets are invaluable in their completeness of up-to-date information.

The number of books on English and French Gothic and Renaissance churches is countless. Few, however, give more than excellent illustrations of some less known buildings. Otherwise the larger histories already mentioned are recommended, and give all the necessary information. It is a very interesting avocation to obtain guide-books of the local churches and mansions and test their accuracy by one's knowledge. The general principles of architecture, as Ruskin said, may be learnt as easily as those of a new card game, and in England and France it is not necessary to take long railway journeys to find beautiful examples in stone. Photographs, especially privately taken, are of surpassing value in this study. Unfortunately picture postcards are not often taken from an artistic point of view.

Lately various publishers have formed volumes of photographs of our chief cathedrals. West's *Gothic Architecture in England and France* is a very handy volume, and Blomfield's *Smaller History of Renaissance Architecture* may be used as a companion to it. Scotsmen are rightly proud of the engravings in Billing's *Baronial and Ecclesiastical Architecture of Scotland*. Heinemann's *Ars Una Series* under the headings of the different countries gives an excellent account, with small but good illustrations, of each nation's work.

J. Macpherson.

V. HISTORY OF MUSIC

THEORY AND APPRECIATION OF MUSIC

MUSIC as an independent art is entirely the product of western nations: when it has flourished elsewhere it is almost entirely in association with the dance or with poetry. Slow in its development, lagging centuries behind the sister arts, music is only now taking its proper place in the scheme of things, and its highly-organised language is at last being recognised as a full and complete medium for the expression of the inner life. The desire exists in everyone to express those thoughts and feelings which lie at the depths of our nature, to give utterance to those vague yearnings that are too deep for words. By art alone can this self-expression take form. And, when words fail, one or other of the arts may succeed. To many, music is but a beautiful thing, a pleasure, no doubt, but, as a means of expressing thought, hardly to be taken seriously. As music is developing, more and more is asked of it, and the wider seems the scope of its powers.

No biography will teach the true musician the inner nature of Beethoven so fully as does a study of his symphonies and sonatas. The unmusical man, reading the diary of Samuel Pepys, misses the very finest qualities of that interesting gossip if he does not fully comprehend how the diarist loved music before all things. As in the lives of men, so in the lives of nations. The popularity of Tschaikowsky's Pathetic Symphony reflects the pervading pessimism of the late nineteenth century quite as accurately as the writings of poets and novelists. The relation of music to life is much more intimate than is generally believed, and the fact that the nineteenth century saw the most rapid developments of music is provocative of thought when we remember the enormous concurrent developments in social, political, and industrial affairs. There is in it a fine study of cause and effect as interacting forces. The rapidity of development is characteristic of twentieth-century music as well. There can be no going back to the state of things when simplicity and paucity of material prevailed. Music can never be the same as if Wagner, Strauss, and Elgar had never lived. It has acquired and is acquiring new powers, and its activity to-day is one of the signs of the times. Time was when to be manly was to be strong physically, to be brutal, and to despise the influences of the arts: to-day, on all hands the refining influence of music is recognised, and its place in the life of nations is steadily increasing in importance.

HISTORY

The history of music begins with the history of mankind, and with the oldest of all instruments—the human voice. Research has done much, and year by year the mists which obscure the dawn of civilisation are being pierced; but, even so, the beginnings of music are a matter of surmise. Yet surmise may be truth, and probably we must go back to nature for the origin of the musical art. Musical sounds are not necessarily music, for they may lack graduated pitch and rhythm; and the cries of human beings and animals can hardly come under the category of music. But some cries, though lacking in clear definiteness, are often associated with certain expressions of feeling and become recognisable by repetition. The cuckoo call is the rudest of musical tunes. If two such cries be combined and make an impression by changes of pitch in time, an elemental form of music has arisen. After all, "singing is but beautiful speaking," and music may well have arisen in crude vocal efforts to express pleasure or pain.

Ancient Music.—Research has taught us much about the music of Eastern nations. Monumental remains in Egypt show us that the art was practised in the homes, while bands of singers and players provided vocal and instrumental music in the practice of religion. Hebrew music was probably taught orally, but no examples have come down to us: the biblical records are explicit and familiar. They show its importance during war and in the service of the Temple. Slabs and bas-reliefs indicate the martial nature

of Assyrian music, and massed bands of instrumentalists seem to have accompanied their forces into battle. The Romans had no distinctive music of their own, but acquired the art from the Greeks, and it is from the music of the Greeks that modern music is derived. Though little is known of its practice in Greece, the theory of music is largely commented on by Greek writers. It was a vital part of their religion, and was an essential component in the scheme of Greek education. Our chief interest lies in the scale which they employed.

Many people are so accustomed to our modern scales, that it comes as a surprise to find that they are not natural, but conventional. The notes and intervals of our major and minor scales were not chosen to be used in harmony, for harmony was unknown before the fifteenth century. Music did not come out of the scales; the scales were evolved as a result of long experimenting, both conscious and unconscious. If the reader plays a series of eight white notes on a piano, beginning with C, he will notice that no black notes lie between the third and fourth and between the seventh and eighth notes of that scale. Thus the series of four notes from C to F comprises two whole tones and one half-tone, and similarly the series from G to upper C comprises two whole tones and one half-tone. Each of these groups of four was called by the Greeks a tetrachord. By combining two such tetrachords, (1) C to F, and (2) G to upper C, we get our modern major scale, which, only so far as distribution of intervals is concerned, represents the Greek Lydian scale. If D be now made the starting-point, the first tetrachord, D to G, will have its half-tone between the two whole tones, and the second tetrachord, A to upper D, will have its half-tone in the same position. This was the Phrygian scale of the Greeks, so far as distribution of intervals is concerned. Similarly scales of eight notes can be built upon each of the other white notes of the scale, E, F, G, A, and B. The varying position of the half-tones gives each of these scales a distinctive character. All of these scales were employed in Greek music, and different qualities were found in them—one being considered manly, another inspiring, and another voluptuous.

Mediæval Music.—Music as an art had its origin in the Church. About the year 330, Pope Sylvester founded a singing school in Rome, and the singing, built upon the old Greek scales, must have been unisonal, and antiphonal. Later in the century Ambrose, Bishop of Milan, formulated what is known as the Ambrosian chant and provided the Church with four scales, taken from the Greek system. These were known as the Authentic Modes. Four others, known as the "Plagal Modes," were added in the sixth century by Pope Gregory the Great. The Ambrosian chant became in time the Gregorian chant, and this chant was the basis of ecclesiastical music in Europe throughout the Middle Ages.

Without some means of recording musical sounds, music could make no progress. Letters had been used by the Greeks and Romans. In the eighth century these gave place to "neumes," or a series of characters written like the letters, above the syllables with which they were associated. These neumes only indicated the rise and fall of the melody. By the tenth century a long red line was used, all neumes on this line representing the note F. One note fixed, the rest was easy. A yellow line drawn horizontally became the C line. Hucbald, a Flemish monk, added more lines, but Guido of Arezzo, a Benedictine of the eleventh century, is considered the real founder of our modern system. He is generally credited with the disposition of notes on the staff lines, and is called the father of solmisation since he employed the terms ut, re, mi, fa, sol, la (taken from the initial syllables of an old Latin hymn) for the notes of the scale.

When men began to sing in two parts, some distinction had to be made in the relative value or length of notes. Franco of Cologne, in the twelfth century, invented a system of measured time notes, by varying the shape of the symbol. Besides this he invented rests, and distinguished between dual and triple time. Our breve and semibreve come from his system.

For centuries music was purely melodic. The Greeks may have known something of harmony, but one of the first writers upon harmony was the monk Hucbald. He added a second part to the chant or *cantus firmus* then invariably sung by the tenor part. This added part consisted of a series of fourths or fifths below the melody, following it in parallel motion. Thus,

It will be found a very distasteful sequence to the modern ear.

Once men knew how to add a second part, ornamentation progressed, and thus grew up the art of descant. Franco of Cologne recommended motion in contrary directions, and as music was entirely written for voices, men preferred a style wherein each part was a melody in itself. The art of descant in time merged into the art of counterpoint, and this music of the Church was the music of the Middle Ages. Organs had been introduced, but they only played the voice parts as support.

Counterpoint is the art of "weaving two or more melodies together in such a way as to observe the rules of harmony." Composers began to imitate the descanters, whose crude extempore efforts gave way to more scientific processes. Instead of a free descant, the air itself was used in developing counterpoint.

Thus, the air, having been announced by the treble (say), was handed over to the tenor (say), who repeated it while the treble sang a different tune over the original theme. The highest development of this was found in fugues of Handel and Bach; but the Middle Ages were also the days of counterpoint.

Secular music was cultivated at the time by the Troubadours, Trouvères, Jongleurs, Minnesingers, and at a later date by the Meistersingers; and the names of Richard Cœur de Lion, in the company of the Troubadours, of King Thibaut of Navarre, and Adam de la Hale, among the Trouvères, hold high place. Those who know the Wagner operas will be acquainted with the Minnesinger Wolfram von Eschenbach and the Meistersinger Hans Sachs.

Not a great deal is known of English music in these early days, but one specimen of the music of the period is of outstanding merit. "Sumer is icumen in" is quite the finest piece of counterpoint or "polyphony" of those days. It is a "canon," wherein the air is carried by each of the voices in turn with perfect design, ingenuity, and pure beauty.

The Netherlanders.—The social and political condition of Europe was against artistic developments in the fourteenth century, but with the opening of the fifteenth there were signs of revived energy in the practice of the art. This is said to be due to the inspiration of John Dunstable, but the glory of the period is the great Netherlander school, which carried counterpoint to a high state of perfection. The first important composer of this school was William Dufay of Chimay. He is said to be the first to use secular airs as plain songs in the service of the Mass. One song used by him—"L'Omme armée"—was employed by almost every composer of contrapuntal music. John Okeghem was another noted composer of the century, but Josquin des Près, born about 1450, was the flower of the period. He aimed at pure beauty at times, and his elegance of style and command of technical devices led Luther to say, "Josquin is master of his notes: they must do as he wills: other composers must do as the notes will." During the fifteenth and sixteenth centuries, the Netherlands produced a large number of musicians who won high positions in Germany, France, and Italy. Amongst these was Adrian Willaert (1480–1562), chapel-master at St. Mark's, Venice, who frequently arranged that his voice parts should come together in successions of chords, and thus achieved broad mass effects. His successor at St. Mark's, Cyprian de Rore, made a study of chromatic harmony, and showed how beauty could be attained away from the Church modes. Arcadeldt was famous for his madrigals, and Orlando de Lasso (1520–1594) had a reputation second to none throughout Europe. His "Penitential Psalms" are characteristically beautiful.

The mathematical side of music made a strong appeal to these Netherlanders, and often originality and ingenuity took the place of beauty. They invented all sorts of curious music—"crab" canons, where the second voice sang the first voice part backwards, inverted canons, where the second part was the first theme written upside down, riddle canons, and other highly difficult and technical varieties in the manner of musical puzzles. The spirit of the music was often lost in the letter.

It fell to the Italians to depose the Netherlanders from their high estate before the close of the sixteenth century. The old plain song had dignity and was the basis of Church music. But the introduction of popular airs had a scandalous effect upon the service of the church. Tunes associated with frivolous words were introduced, and congregations sometimes sang these airs to the popular and ribald words with great gusto. The state of Church music attracted the attention of the Council of Trent in the middle of the sixteenth century, and a complete reform of Church music was resolved upon. It was at this juncture that Palestrina produced his three great Masses, of which the chief is known as the *Missa Papæ Marcellæ.* These Masses embody the finest and noblest expression of the polyphonic style, and in their lofty devotional spirit form the most serenely beautiful religious music ever written. Palestrina's control of technical resources conceal the underlying art, and the most exquisite effects for voices along with pure choral beauty are the outcome of his instinct for vocal composition. Pure melody, exalted feeling, and simple means are always present in his work, and the austerity and lack of passion are quite in keeping with the requirements of the Mass. But with Palestrina comes a turning-point in the history of music. Polyphonic music for voices never rose to a higher pitch, but the early writers of opera and oratorio were soon to turn the thoughts of musicians towards new lines of development.

English Music.—When Henry VII gave peace to England, the country had time to revive her interest in the arts. Under the Tudors,—themselves no mean musicians,—music became a vigorous pursuit. Before the Reformation there had been a very capable school of native musicians, and when the country turned from the old Church, and had to revise its liturgy, many of the older composers gave the Reformed Church the benefit of their services. The name of John Marbecke is familiar through his adaptation of the traditional plain song to the needs of the Reformed liturgy. Then Thomas Tallis and William Byrde wrote music for both the old and new rituals. These were also the days of famous organists, and the names of John Taverner, John Redford, John Sheppard, and Christopher Tye stand high in the esteem of musicians.

It was in Elizabeth's reign that music was held in highest esteem, and was an essential part of the education of a gentleman. This was the great madrigal period. The madrigal was a favourite form of composition with Netherlander and Italian composers, but some of the most beautiful were written by Englishmen. "In Going to my Lonely Bed" is ascribed to Edwards, and was written in the middle of the sixteenth century. It is a singularly charming composition. But the publication of the "Musica Transalpina" had greater force in directing native musicians towards this class of composition, while "The Triumphs of Oriana," a collection made in praise of Queen Elizabeth, contained contributions from Thomas Bateson, Michael Este, and that fine writer of Church music, Orlando Gibbons. Much fine music was also written by Thomas Weelkes, John Dowland (the lutenist and composer of "Songs or Ayres in Four Parts"), John Wilbye, and John Benet. Besides the writing of glees and madrigals, other forms of composition flourished. Richard Farrant excelled in Church music; John Bull composed characteristically for the organ, while the virginals—an early forerunner of the piano—were supplied with plentiful music of dance variety, such as pavanes and galliards. England held her own worthily in those days, and music was held in higher repute than it has ever been since.

The Transition Period.—The year 1600 has been taken as a convenient date from which to start the study of modern music, and the early seventeenth century saw many and complete changes in the development of the art. Polyphonic music, constructed entirely upon interwoven melodies, gave place to monodic music, wherein one principal melody was prominent and was supported by harmonies of a subordinate nature. The old Church modes were supplanted by the modern major and minor scales, and instrumental music began to be cultivated as a thing independent of association with the voice. Further, opera and oratorio had come into existence and played a strong part in all these developments.

Opera had its rise in a deliberate attempt of some Florentine classical scholars and amateur musicians to revive Greek drama. These dilettanti met in the house of Giovanni Bardi, Count of Vernio, and it was their intention to use music as a means to intensify the effect of poetry of the drama. Contrapuntal music did not suit their purpose, and believing that Greek drama was chanted, these amateurs invented a new style, which they hoped was like the declamatory style of the Greeks. A contemporary writer says, "The new music is a kind of melody so sung by a single voice that the words are well understood." This was what we now call "recitative," and its invention is due to Bardi's circle. Connected with this group were Galilei, father of the scientist, Cavaliere, Rinuccini the poet, Caccini, and Jacopo Peri, whose *Dafne*, written in 1597, is, though lost, considered to be the first opera. *Eurydice*, by the same composer, was first performed in 1600, and, except for some choral writing, was in the style of the new recitative. But the first real genius in the operatic style was Monteverde (1568–1643), whose operas, *Orfeo, Arianna, and Il Ballo della Ingrate*, show great developments. His melodies had greater freedom, and his harmony was much in advance of his time. He realised that music in association with words must add significance to the underlying emotion, and so he used sharp dissonances. Monteverde also employed a large body of instrumentalists, and was one of the first to use pizzicato (plucked) and tremolo effects. Cavalli (1599–1676) in his chief work, *Giasone*, foreshadowed the use of the aria, which to this day is the leading feature of popular Italian opera.

Oratorio takes its origin from St. Philip Neri, founder of the Oratorians, who encouraged the performance of biblical plays with music for the edification of the people. But it was Cavaliere, one of Bardi's circle, who wrote the first oratorio, *La Rappresentazione dell' Anima e del Corpo*, which was produced in 1600. The earliest oratorios were performed upon the stage, and dramatic qualities were then, as now, the chief feature of the musical form. The development of oratorio was similar to that of opera, and the aria is found dominating both art forms at this and later periods. Carissimi and Stradella worthily sustained the aims of Cavaliere. Allegri and Frescobaldi were also noted writers of Church music.

The *Eurydice* of Peri attracted great attention throughout Europe, and early specimens of opera are also found in France and Germany. The favourite form of musical dramatic entertainment in England was the masque, of which Milton's *Comus*, set to music by Henry Lawes, is a fine specimen.

The modern style of instrumental music also had its rise in Italy. Vocal music reached a high state of development long before independent instrumental music had made a true beginning. The viol, lute, and organ had been used entirely in association with the voice, but, with the improved state of instruments, music for instruments began to be written independent of the voice. By the time that the organ needed less physical effort for its execution, and the viol and violin superseded the lute—a most difficult instrument to keep in tune—instrumental composition began to flourish. Those forerunners of the pianoforte, the clavichord, virginal, and harpsichord, were still in an early state of development, but nevertheless there are *Queen Elizabeth's Virginal Book* and the *Parthenia* to be studied as specimens of instrumental composition. A chest of viols, of different

sizes to correspond with the various voices, held the same place in a sixteenth-century household as a piano does to-day. These viols at first played vocal music, and if any vocal part was awanting, the corresponding viol filled in the part. It was an easy step from this to the writing of music fit for either playing or singing. So instrumental music gradually acquired a status of its own.

The Later Seventeenth Century.—In Italy opera continued to develop under Cavalli and his successors, for in that country opera-houses sprang up in all the chief centres. The aria, built upon a symmetrical plan and having nothing to do with the dramatic development of the plot, became a very popular feature in opera. In thus departing from dramatic fidelity the prominence of the vocalist was increased, and it fell to Alessandro Scarlatti (1659–1725) to establish the Aria da Capo. This is an interpolated air with a strong first section, a contrasted middle verse, and a third part which is a repeat of the first. It was admirable for the vocalist, but foreign to a sincere operatic scheme. Scarlatti founded the Neapolitan School, and his works are noted for the excellence of the vocal qualities. He also began the practice of writing a three-movement prelude to his operas which in time developed into the modern orchestral overture and, later, into the modern symphony.

Doubtless the growing importance of the violin gave Scarlatti some inspiration towards increasing the importance of the orchestral part. During the seventeenth century the great violin-makers lived and flourished. The Amati, Guarneri, and Stradivari families were all of Cremona, and there soon arose a school of Italian violinists whose works are epoch-making. Corelli (before all others), Vivaldi, Tartini, and Locatelli wrote immense quantities of music for the instrument. Corelli's work has abiding qualities. Its simplicity, dignity, and freshness are charms that outweigh any feeling of old-fashioned structure and expression.

The characteristic feature of French opera is the ballet. When Cavalli's operas were brought to Paris this lack of a ballet was felt, and it was left to Jean Baptiste Lully (1633–1687) to supply the want. Lully was in control of the Paris opera-house, and in 1672 began a highly successful career with *L'Amour de Bacchus.* With a clear eye for spectacular effect, he gave the Parisians what they wanted. His treatment of the overture was a solid piece of work, and his influence upon music of a purely instrumental kind was considerable. Lully's most noted successor was Rameau. He wrote with much charm and variety, and his *Castor and Pollux* was for long a favourite in France. Besides this, he was notable as a writer of theory. His artistic ideals were more refined than those of Lully, and his works have dance tunes interspersed that give them special charm. The French also excelled at this period in writing attractive music for the harpsichord, and the grace and fancy of the compositions for this instrument have much merit. Couperin (1668–1733) wrote abundantly for the harpsichord, and his suites—called by him *ordres*—are collections of dances, vivacious in rhythm and dainty in their musical attractiveness. Rameau also excelled in writing for the same instrument.

This was also the period when organ-playing and composition were growing in importance, since that instrument had by that time arrived at a fairly complete condition. Italy had its Gabrielis and Meruto (all organists of St. Mark's, Venice), and Frescobaldi, organist at Rome; Germany its Reinken; and Denmark its Buxtehude—all of whom were noted performers and composers. The northern composers were also engaged in the art of dramatic choral writing in the form of the church cantata.

In England, one name stands out before all others—that of Henry Purcell. Charles II had brought from his wanderings a taste for French music, and Pelham Humphreys had introduced it into English circles, but no contemporary composer will bear comparison with Purcell, who was equally great in church and theatre music. He carried on the fine tradition of English church music, yet was in close touch with the most advanced methods of his day. He anticipated Bach in his methods of obtaining characteristic effects of harmony, and as organist of Westminster Abbey produced a large number of odes and church music of the highest quality. As a writer for the stage his little opera, *Dido and Æneas*, has richness of idea and rare excellence, while his solo-writing was always distinguished by close attention to the meaning of the words. The thirty-seven years of his life were years of great accomplishment, and it is not without significance that he has been called the greatest native composer before the time of Elgar.

Contemporary with Purcell were many English composers, whose names are familiar to those interested in church music. Aldrich, Dr. Blow, Matthew Lock, the writer of the famous *Macbeth* music, and Michael Wise have honoured places among musicians of the time.

The Age of Bach and Handel.—Germany came late into the field with composers of the first rank, but once the Teutonic supremacy was established, it never lost its eminent position. The German mind had not been carried away by the Italian enthusiasm for the monodic school, nor had it lost its interest in counterpoint. The chorale was a prominent feature in the worship of the Reformed Church. Religious sincerity, concentration, and intense seriousness gave firmness and fibre to its music, and these qualities are found to perfection in the works of Handel and Bach.

George Frederic Handel (1685–1759) began his career as an instrumentalist in the orchestra of of the Hamburg Opera House. While still a schoolboy, he wrote motets for the church of his native town, Halle in Saxony, and his first opera was produced before he was twenty years old. Residence in Italy gave him an insight into Italian methods and brought him a fluency in writing for voices which served him well in later years. Coming to London in 1710, he wrote about forty operas on the Italian plan to suit the tastes of the day. He made huge fortunes, and, like other operatic impresarios, lost them. The friend of princes, he was the patron of London charities, and in time became a naturalised citizen. Operas, oratorios, cantatas, church and occasional music, flowed from his facile pen, and his fine organ concertos are the product of his intimate knowledge of that instrument, of which he was one of the greatest executants in those days. But his greatest work is found in his oratorios. *The Messiah, Judas Maccabœus, Israel in Egypt, Samson, Jephthah,* and *Theodora,* are the flowers of his genius. In these works Protestantism had its fullest expression, and their austerity, severity, and massivity are in full keeping with the serious Teutonic mind of his day. The giant personality of the composer is shown in their lofty conception and execution, and the force of his genius left its stamp upon our musical life for a century and a half.

John Sebastian Bach, born in the same year as his great contemporary, is the most completely Teutonic of all composers. Unlike Handel, he was not a public man, but wrote as opportunity, occasion, or inspiration demanded. He came from a family of musicians, and in his early days heard all the great organists. A student of Italian music, he never succumbed to its influence. The chorale was popular from Luther's time, and, round the themes of these grand old hymns, composers loved to exercise their contrapuntal skill. From this sprang the fugue, whose musical form gives it special suitability for the organ. For richness of idea, fertility of invention, and sheer beauty of design, the organ works of Bach are unapproached. Even when writing for clavier, voice, or chorus, this style, so intellectual, sincere, and serious, was ever present. In writing for voices, he cared less for the delights of melody than Handel did, but the Christmas Oratorio, the St. Matthew and St. John Passions, and the mighty B minor Mass, are superb creations, always significant of the inner life of man. Nothing is bald or meaningless: everything is expressive, and these characteristics are found in every line of the enormous quantity of music which he has left. The *Forty-eight Preludes and Fugues for Well-Tempered Clavier* are specially important. Before Bach's day, a clavier had only a few of its keys in perfect tune. When an instrument was invented, tuned equally well for all the keys, he wrote the immortal *Forty-eight,* to show that a composer was no longer limited to a small number of keys. These were not mere exercises, but works of wonderful beauty in themselves. Besides this, he reformed keyboard fingering, and brought to perfection the Suite, in which sets of dances are arranged in a form most agreeable to the artistic sense. He died in 1750. The legacy of Bach is the greatest treasure in all the literature of music. Three of his sons were distinguished musicians: Emanuel being credited with the honour of developing the sonata on modern lines.

The early eighteenth century saw Domenico Scarlatti, a noted writer for the harpsichord, and Pergolesi, a short-lived but inspired writer. Both flourished in Italy. Italian *opéra-bouffe* also had a beginning then; William Boyce, Thomas Arne, and Nares, were composing characteristic church music in England: Rameau was carrying on Lully's work in French opera, and Hasse and Graun were producing notable works in Germany.

The Later Eighteenth Century.—The type of polyphonic music, in which Bach and Handel were supreme, was not sustained by later men, and the pendulum swung to the harmonic and melodic side. This tendency was enforced by the violin-playing and execution of the great Italian executant-composers Corelli and his successors. The genius of the violin is for pure melody where one outstanding tune is associated with secondary harmonies of simple design. In contrapuntal writing—*e.g.* such a chorus as "And the Glory" from *Messiah*—all four parts are equally important: a solo violin part cannot be on an equal footing with the accompaniment. The Italian composers found their best medium of expression in the sonata. This was at first a suite of dances, of an alternately quick and slow nature. Its improved form came from the Germans.

Instrumental music was making great strides and operatic overtures were being detached from their surroundings and enjoyed for their own sakes. The general plan of the orchestra was the same in the eighteenth century as it is to-day; its treatment by composers has only differed as instruments and their execution have improved. The sonata, symphony, and string quartet are all products of this period, and the general plan of each is the same. The first movement is usually based upon two themes which are developed upon a fixed plan, though much is left to the ingenuity of the composer: the second is a slow movement, the third a minuet or scherzo (quick movement), and the fourth a presto, often written in rondo form. This is built upon a psychological plan, with alternately fast and slow movements, varied to suit the needs of the listener in matters

of expression and emotion; and the giants of this period are Haydn and Mozart.

Joseph Haydn (1732–1809) is called the father of the symphony, because he established the sonata form and applied it to the symphony. His reputation as a youthful composer brought him the patronage of Prince Esterhazy, an Austrian amateur, to whose household he became attached, at first privately and later as chapel-master. Here he had rare opportunities for experiment with a private band, for which he wrote an immense number of symphonies. The early ones are based on simple ideas with elementary design, but his development was rapid, and the later symphonies show far richer ideas and wonderful sense of form. He separated the movements of the symphony and introduced the minuet. So also his string quartets are slender things in his early days, but they are vigorous, finished products of real genius in his later days. Besides over a hundred symphonies, eighty quartets, twenty-five concertos, twenty-four trios, forty-four sonatas, nineteen operas, fifteen masses, several cantatas, and hundreds of dances, he composed the oratorio *The Creation.* Haydn was sixty-five years old when he wrote it, yet its freshness, simplicity, and significant orchestral and choral writing give it charm to this day. All Haydn's music is delightfully fresh and graceful: a child-like naïvété is often found in it, combined with a graceful sweetness that makes his vocal and instrumental music irresistible.

Mozart (1756–1791), the most precocious and gifted of musical geniuses, was Haydn's pupil. He composed a concerto at six years of age, and went on a triumphal tour through Europe as a harpsichordist at eleven. His short life was one of great activity, and he is equally great as a writer of opera, symphony, quartet, sonata, and choral work. The great symphonies in G minor, E flat, and C major are amongst his profoundest creations. Grace and refinement mark all his chamber music, while his sense of musical form gives perfect balance and fitness to everything he wrote. His operas were on the Italian plan, with a plentiful supply of arias and concerted pieces. *Idomeneo, Nozze di Figaro, Don Giovanni,* and *Zauberflöte* are his best-known works. His last great work was the *Requiem,* to which a romantic story is attached. Never before his time had the independent treatment of instruments been so fully exploited, while his sense of orchestral colour was wonderful. Haydn owed much to Mozart in his later works.

The works of Haydn and Mozart make a turning-point in the history of instrumental music, and the whole range of the tone-art was immensely widened by their efforts.

Operatic music at this period was completely under the sway of the vocalist, and dramatic fidelity was sacrificed to the demands of the prima donna. Gluck (1714–1787) attempted its reformation on more rational lines, putting the drama on an equal footing with the music. In his *Orfeo and Eurydice,* dramatic propriety was no longer sacrificed to musical or vocal effect, but music was used to enforce dramatic sincerity. Arias were not despised, but were appropriately employed, and *Che faro senza Eurydice* is a gem for all time. His reforms were further developed in *Alceste* and *Iphigenie,* and his famous quarrel with Piccini ended in complete victory for the reformer. Before Gluck's day the orchestra had never been significantly employed in reinforcing the emotion of the drama. Grétry also wrote popular French opera at this period.

Music also flourished in Germany, where the theorist Pleyel, and Dussek, writer of pianoforte music, and Romberg, composer of *The Lay of the Bell,* were fine composers.

The Age of Beethoven.—Ludwig van Beethoven (1770–1827), who had known Mozart and had had lessons from Haydn, perfected what these masters had established. With little opportunity for hearing good music in his youth, his wonderful genius was of slow development. His life was one long struggle with misfortune. The responsibilities of his early years, his unhappy love affairs, and the terrible affliction of deafness gave his life a sombre and gloomy hue; yet his work is the true culmination of the period that precedes him, and at the same time foreshadows the developments that were to revolutionise music during the nineteenth century. His early works are all in the accepted form of the day, and he crowned the work of Haydn and Mozart with the perfect treatment of the sonata form in his piano and violin compositions, early symphonies, and quartets. But the full fruition of his genius came in later days. The Septet and Kreutzer and other sonatas were complete productions of their kind, but the immortal nine symphonies, the great string quartets, the later piano sonatas, the violin concerto, the one opera *Fidelio,* the noble *Coriolan* and other overtures, and the impressive piano concertos have a concentrated force, a reflective intensity, and a universality in expressing the joys and sorrows of humanity, that are unrivalled in musical art. To accomplish his aim, he never hesitated to expand his forms and modify his designs to suit the demands of his noble purpose. In writing for orchestra, he used the instruments with a fitness and freedom never before attempted, and, if he wrote to a programme, he never sought to portray what stimulated him, but sought rather to portray his feelings under the influence of the stimulus. Austere and intellectual, inspired by spiritual passion and profound thought, the works of Beethoven sweep over the complete range of emtional experience, and his name is surrounded with an epic glory.

Beethoven lived when the Romantic Revival was prevalent, and others beside him were influenced by the spirit of the times. Franz

Schubert (1797–1828), son of a humble schoolmaster, and starting his career with a poor musical education, showed his powers as a song-composer very early. He hold important appointments at times, but his life was rather erratic, and he knew trouble. During his short life, masses, symphonies, quartets, operas, and cantatas, were produced with marvellous rapidity, for he was one of the most facile composers who ever lived, and though his music is diffuse at times, it has the charm of fresh and abiding melody. But his highest achievement is found in the hundreds of songs which he wrote. Before Schubert's time poetry had been associated with melody, and melody only. In spite of varying moods, most of the verses were sung to the same air, in hymn-tune fashion; but moods vary with the verses, and, unless the music is appropriate to the mood, there can be no artistic whole. As harmony developed with the use of modulations, greater fitness between words and music was possible, and the first great results are found in Schubert. His gift of melody was luxuriant and apt to run away with him, but in his great songs, like *Lindenbaum*, *Erlking*, *Wanderer*, *Ständchen*, *Haidenröslein*, and many others, the melody moves in a way that a good reciter would employ. Again, the accompaniments are not a mere secondary harmonic groundwork to support the melody, but the descriptive piano part seconds the emotion of the words and deepens the significance of the poetic emotion. Schubert is the progenitor of the modern art song.

Germany was the centre of an active musical life at this time. Hummel, Steibelt, Ferdinand Ries, and Weber were noted composers, and of these Carl von Weber (1786–1826) is the chief. The Germans were seeking a type of opera suited to their sterner taste and musical intelligence. Weber, already noted as a pianist, had set to music national songs, which had been very popular during the Napoleonic campaigns. His appointment at Prague to organise a real German opera led to the production in 1821 of *Der Freischütz*, in which there were no traces of Italian traditions. Its supernatural story and use of folk-song appealed to the German mind. It anticipated Wagner in its attempt to emphasize dramatic unity, but, for the musician, the wonderfully expressive orchestral part, gorgeous in colour and dramatically expressed, is its greatest charm. This opera was followed by *Preciosa*, *Euryanthe*, and *Oberon*, whose overtures are as fresh to concert audiences to-day as on the day when they were written.

In those days Italy had her Boccherini, her Viotti, a noted writer for violins, Clementi, a prince amongst teachers, Salieri, and Cimarosa. In France, Cherubini, also a writer of fine church music, Boieldieu, and Mehul, were upholding the standard of French opera, and England found in Dr. Crotch and Thomas Attwood writers of dignified church music, while John Field is credited with the invention of the Nocturne.

From Beethoven to Brahms.—This period covers some seventy years, and is the greatest period of development in musical history. Only the Elizabethan era in English literature can rival this age in the production of so many artistic geniuses. It was a period not only of progress and development, but of revolution. Opera can never be the same since Wagner's mighty reforms: instrumental music is vastly more expressive since Berlioz's day, and its possibilities have been so far increased that to-day we cannot see their limits. Oratorio has revived in a new form since Elgar wrote *Gerontius*; Liszt and Chopin revolutionised piano virtuosity; and the song under Schumann, Hugo Wolf, Brahms, and others, has been cultivated in a manner worthy of its lyric importance. It was a period of great activity, when composers not only built upon the foundations of their predecessors, but found new avenues of expression and fresh fields for musical operation. The older classic forms were found too narrow and confined for the new aims, and fresh forms were invented. The established rules of harmony, tonality, and musical structure were rudely upset, and the full fruits of these revolutionary forces we are only just beginning to realise. Some aims were too high, and some experiments too wild, but greater permanent changes have been experienced by music in the last hundred years than in any previous age.

Italian opera was on the old lines. It was frequently a mere string of arias and concerted pieces, all written for the exemplification of favourite vocalists' powers, and dramatic unity was sacrificed to the needs of the prima donna. There was a plentiful supply of musical material for this purpose. Rossini (1792–1868) in his *Barber of Seville*, *Gazza Laddra*, *Tancredi*, *Semiramide*, and a host of others, gave the Italians the fluent melodies and vocal cadences which they loved; but his melody was never vulgar, and much of his music is scholarly. Donizetti in *La Favorita*, *Lucia di Lammermoor*, and *The Daughter of the Regiment*, did the same thing in an agreeable way, and Bellini had his day of popularity with *Norma* and *Sonnambula*.

The best-known musician in the early days of the century was Spohr (1784–1859). His operas, like *Jessonda*, had considerable vogue, and his oratorio *The Last Judgment* had something of the romanticism of later days. But, outside his symphonies, concertos, cantatas, and quartets, he is of prime importance for the attention he gave to compositions for the violin. He had an extraordinary instinct for the instrument, and his *Violin School* is invaluable. As a composer, his music has a chromatic quality in advance of his time, but his *sugary* harmonies give it undue sentimentality.

France was particularly successful in the production of light operas, which were distinguished by much nimble wit and dainty finish. Auber in *Fra Diavolo* and Hérold in *Zampa* were successful writers of the time. The chief figure in the Parisian operatic world was Meyerbeer, an extraordinarily clever musician. He knew French character, and, recognising the Gallic love of scenic display and spectacle, hit the popular taste in *Robert le diable*, *Le Prophète*, *Les Huguenots*, *Dinorah*, and others. His music suited the needs of pompous spectacles, and has been not unfitly described as a "huge pill of clever artificial emptiness." The great operatic geniuses of the age were Verdi and Wagner. Verdi (1813–1893) began his career by writing operas on the usual Italian plan of arias, chorus, and recitative, without much respect for the dramatic continuity of action. *Rigoletto*, *Il Trovatore*, *La Traviata*, *Ballo di Maschera*, and *Sicilian Vespers*, were all in the manner of Scarlatti and Rossini. Sensuous melody, shallow but catchy airs, made these operas popular in every opera-house of Europe. But in 1872, he brought out *Aida*, a work of much pathos and nobility of conception, and more dramatically sincere than anything he had written before. In his old age he wrote *Otello* and *Falstaff*, which showed further advances. In them there is the old Italian love of musical beauty, but the orchestration is richer and more expressive, and organic unity is achieved by throwing over the old forms used in his early works. Verdi had the advantage of a fine librettist in Boito, himself a composer of high merit, whose *Mephistophele*, though episodic, is nobly composed.

In Charles Gounod (1818–1893), France had an operatic composer of far finer calibre than Meyerbeer. *Faust* is touched with the true spirit of romanticism, and has melodic beauty of an alluring kind. It is more satisfactory on its lyric and picturesque than on its dramatic side, and its voluptuous airs are imbued with much of a mystic character. His other operas, *Philémon and Baucis*, *Reine de Saba*, and *Romeo and Juliet*, provide *prime donne* with favourite airs. Contemporary with Gounod and natives of France, were Bizet, whose *Carmen* is a fresh and sparkling work; Ambroise Thomas, composer of the charming *Mignon* and *Hamlet*; Delibes, writer of attractive ballet music; Massenet and Chabrier.

Wagner.—Germany was represented in opera by Nicolai, who wrote a bright version of *The Merry Wives of Windsor*, and Goldmark, whose *Queen of Sheba* has spectacular and musical merits. But the commanding figure in the world of opera is Richard Wagner (1813–1880). What Gluck and Weber attempted, Wagner established. Knowing the theatre from his youth, he was early acquainted with the works of Weber and Beethoven. At first he wrote in the manner of Meyerbeer, but the strong dramatic character of *Flying Dutchman* (1842), and its striking orchestration make this opera the first of a revolutionary series. Then followed *Tannhäuser*, *Lohengrin*, *Meistersinger*, *Tristan and Isolde*, the tetralogy known as *The Ring of the Nibelungs*, and *Parsifal*. Poetic text, music, and stagecraft were all of equal importance, and each opera shows advance in the accomplishment of this ideal. His scores were orchestral symphonies, seconding the stage action and flowing uninterruptedly throughout the course of the play. His harmonic progressions were most daring for his time, his chord relationship most advanced, and his use of the brass and wind sections of the orchestra was novel in the unusual importance given to these instruments. By the free use of *Leitmotiv* he associated each character with a definite musical figure, and the richness of his score and scope of his conception have left an indelible mark upon the development of modern music. Wagner's life was a stormy one, but his strong personality kept him from deviating from his high purpose, and though at times he attempted what was hardly dramatically possible, the *Ring* is the greatest achievement in operatic composition.

The most popular composer during the middle part of the nineteenth century was *Felix Mendelssohn-Bartholdy* (1809–47). All the good fairies were present at his birth, and the gifted youth had the advantage of an education in a wealthy and artistic household. His precocity was soon seen, for the beautiful *Midsummer Night's Dream* overture was written before he was twenty years old. In every department of musical composition except opera (*Lorelei* was unfinished) he left worthy contributions to musical literature. The *Hebrides* overture is choicely picturesque, the *Songs without Words* are admirable material for budding pianists, the Violin Concerto is a vital thing, the Scotch, Reformation, and Italian Symphonies are rich in expression, the chamber music and songs are agreeably melodious, and the choral works, *Hymn of Praise*, *St. Paul*, and *Elijah*, are eminently dramatic for their day. Mendelssohn was a writer on classical models, and his propaganda in the matter of Bach is unforgettable. But his facile pen led him to write much that was obvious and trite, though in his finest moments he is on a level with the greatest. We are only to-day breaking away from the thraldom of the oratorio form as fixed by *St. Paul* and *Elijah*.

In choral work, Gounod had written *The Redemption*, a disjointed work with some good choruses, and César Franck, a composer little appreciated till after his death, showed in his *Beatitudes* wonderful qualities of sincerity and feeling. Schumann's *Paradise and the Peri* and Berlioz's impressive *Damnation of Faust* had high merits. The Bohemian composer Dvorak, towards the end of the century, used his skill

in picturesque writing and highly-coloured orchestration with dramatic effect in his *Spectre's Bride*, and wrote a beautiful *Stabat Mater*. But the highest standard was reached by Brahms in the heavenly *Song of Destiny*, the *Triumphlied* and the *German Requiem*. In England the church organists turned out hosts of choral works on the Mendelssohn pattern, of which Sterndale Bennett's *Woman of Samaria* and Sullivan's *The Golden Legend* are good types.

The cult of the song developed as the century grew. Gluck's theories made people think of the intimate connection between words and music. Mozart, Haydn, and Beethoven had approached the ideal, but Schubert was the first to express himself fully in this art-form. Melody was no longer the one factor in the musical scheme; the harmonic background of the accompaniment was equally effective in deepening the significance of the music, and the great song-writers fused these into an organic whole. Mendelssohn's songs were agreeable enough, but not in the best line of art. Schumann, born a year after Mendelssohn, was a composer whose music had all the associated qualities which great poetry demands. He was the real musical exponent of Heine. Deep feeling and warm colour stamp all his songs. *The Two Grenadiers*, *Ich grolle nicht*, *Du bist wie eine Blume*, and all the Dichterliebe series are perfect examples of the song-art. Carl Loewe's *Edward*, Liszt's *Kennst du das Land?* Hugo Wolf's *Verborgenheit*, Brahms's *Sapphic Ode* and *Feldeinsamkeit*, Dvorak's *Biblical Songs*, Grieg's *Swan* and *Ich liebe dich*, are a few specimens of the best songs of the century. The latter years of the century saw this cult of the art-song carried forward by almost all composers of note.

Even greater developments were made in instrumental music. *Frederic Chopin* (1809–1849) was the poet of the piano, and his music breathes the artistic proclivities of his native Poland. His preludes, nocturnes, waltzes, mazurkas, sonatas, scherzos, ballades, and studies, are the creations of an original genius. They are full of delicate charm and freshness of idea; tenderness, refinement, and perfect finish take the place of strength and vigour. Classic forms were unsuited to express his inspirations, and he wrote with great freedom and with a novelty of rhythm and harmony that has high romantic qualities. His piano works are a never-ending source of joy to players and audiences.

Robert Schumann (1810–1856) was also a true romantic, and could not express himself within the limits of classic bounds. A ripe scholar and thinker as well as a pianist spoilt in the making, he took to composition as an afterthought. His short piano pieces, *Papillons*, *Carnaval*, *Kinderscenen*, *Novelletten*, and the fantasia *Faschingsschwank aus Wien*, are all highly imaginative works. Rhythm did not appeal to him as to Chopin; poetic sensibility was more to him than form. He sought out new modes suited to the art of expression, and many of his pieces have definite names which are clues to his poetic intention. The same sensitiveness and freedom from formal restraint mark his symphonies and chamber music. The *Pianoforte Quintet* is one of his finest works.
